Curtain, drapery, and upholstery material stores were a thriving segment of the general home furnishings retail industry during the 2000s. Consumers focused on the home and personalizing their environments, and the industry recognized these lifestyle directions by providing stylish yet relatively low-priced products. Even during recessionary down times, consumers frequently replaced window treatments rather than overhauling the entire room. Reupholstering or purchasing slipcovers for existing furniture was also an alternative to redecorating a room. Furniture covers went from a specialized industry to a more mass-produced segment with many options readily available in discount and chain stores. The popularity of futons also benefited the upholstery segment because the versatile furniture can be covered with a variety of ready-made or custom-made slipcovers.

There were approximately 6,081 establishments engaged in the retail sale of draperies, curtains, and upholstery materials in 2003. There were some 16,640 people employed within this industry. California, Florida, and Texas represented the majority of establishments with 1,638 stores. Together, they generated approximately \$4.2 billion in sales. The majority of the establishments employed fewer than five people. There were a total of 5,146 establishments that fell into this category.

The industry was divided into five categories that included drapery and upholstery stores, curtains, draperies, slip covers, and upholstery materials. Draperies represented the largest category with 3,483 establishments. Their sales represented about \$498.4 million, comprising more than 57 percent of the overall marketplace. Drapery and upholstery stores numbered 1,646. Combined, their sales were \$246.1 million, and they represented more than 27 percent of the market.

Curtain and drapery stores were adversely affected by shifting trends in home decorating fashions. Many stores changed dramatically to accommodate the new trends by adding a wider variety of merchandise both for windows and for the home itself. Chains like Blinds to Go emerged, concentrating on providing a single product. The upholstery fabric segment generally benefited from shifting trends in consumer tastes. New technological developments brought a wider range of upholstery fabrics to consumers and retail outlets, leading to increased con-

sumer interest and increased business for retailers. Furniture stores offering custom upholstery services in a variety of prices and styles, such as Custom Expressions, emerged in major markets across the country, sparking consumer interest in upholstery, which trickled down to more established stores selling only upholstery fabrics.

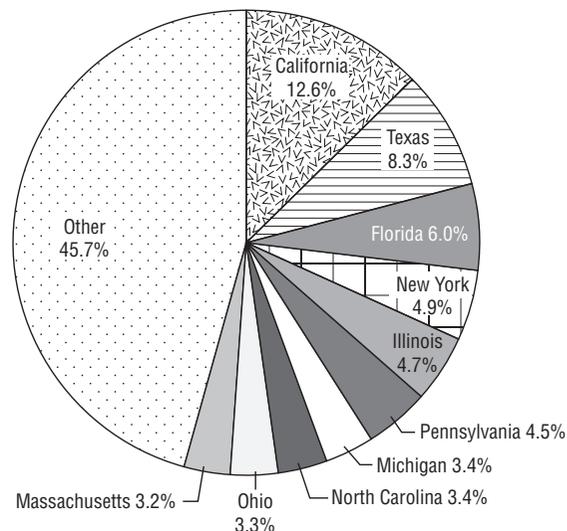

BACKGROUND AND DEVELOPMENT

Many of the establishments in the retail curtain and drapery industry were family-owned enterprises located primarily in commercial districts of residential areas, both urban and suburban. These establishments catered to both new homeowners with a limited decorating budget and older customers with more money to spend. The typical store offered ready-made curtains and draperies, custom-made window treatments, a selection of alternative window treatments such as miniblinds and vertical drapes, and, in some cases, kitchen and bath textiles. Kitchen and bath sales helped boost profits, compensating for flagging curtain and drapery sales. To sell their products, curtain and drapery stores relied heavily on attractive displays of merchandise. One type of store display was the vignette, or small wall-window-bed display. Designed to give a customer an idea of how a coordinated room might look, these displays changed every few months to incorporate a new product line. The vignette's components were easily interchangeable and adaptable. The displayed products were obtained from a host of major manufacturers, who showcased their products at seasonal trade shows attended by buyers or owners of curtain and drapery stores.

A prime example of a family-owned, privately-held curtain and drapery business was Curtainland, a small chain of stores in the suburban New York area. The company was founded in 1975 by the Kanan brothers, who had previous experience in the retail furniture and appliance business. The first store, and the three subsequent Curtainland outlets, were located in areas with a recent influx of new suburban residents. The Kanans believed that the window-treatment areas of department stores did not offer as much variety as their specialty retail business. Curtainland stores aimed to combine a wide selection of products with prices even with or lower than their competitors'. The company tried to hire sales associates with some interior design experience. Curtainland's ability to provide knowledgeable and committed service helped insulate the company from downturns in the soft window-treatment business. The Kanan family played a key role as buyers for Curtainland stores, obtaining the company's merchandise from quarterly trips to curtain and drapery manufacturers' showrooms in New York City. Curtainland stores stocked miniblinds, vertical drapes, curtain and drapery rods, and pleated shades, as well as ready-made curtains, draperies, and matching bedspreads. Bath accessories such as rugs and

By percent of total number of stores

SOURCE: D & B Sales & Marketing Solutions, 2003

shower curtains also accounted for some of the store's merchandise.

Prior to the 1980s formal draperies were standard fixtures in living room, dining room, and bedroom areas, while lighter-weight curtains were the primary window coverings in more informal rooms such as kitchens and bathrooms. In the 1980s the curtain and drapery store industry was dramatically affected by shifts in home decorating tastes. American window-blind manufacturers developed new technology that opened up a whole new area of hard window treatments—the aluminum miniblind. This versatile shade came in a variety of colors and styles, was relatively inexpensive, did not require dry-cleaning, and gave any room a modern look. Soon Taiwan restructured its lightweight plastics industry to produce vinyl imitations of the miniblind that were cheaper than miniblinds manufactured in the United States. By the 1990s miniblinds were standard window coverings in millions of households across the United States, which had a detrimental effect on curtain and drapery sales. As a result, many curtain and drapery manufacturers and retail outlets did not survive the change in style, and they were forced to exit the business or adapt their product lines to capture other segments of the home-furnishings business.

The curtain and drapery manufacturers in operation during the 1990s offered a limited product line, with an emphasis on custom services and quick delivery. Specialty curtain and drapery stores also were damaged by competition from home-decorating areas of department

stores, which employed more aggressive marketing tactics than the typical specialty curtain and drapery store. J.C. Penney was one example of a department store that invested money in its home-decorating departments to revive flagging overall sales.

CURRENT CONDITIONS

The entry of discount retailers into the home-furnishings market has negatively affected the industry. Stores such as Kohl's and K-Mart offer a wide selection of ready-made curtains and draperies in the latest styles at bargain rates. Discounters' sales have thrived as they turned their domestics divisions into extremely competitive destinations. While K-Mart created its program based on sharp merchandising and the reputation of home fashions expert Martha Stewart, Target had its design staff establish a fashion direction conforming to larger style trends. *Discount Store News* noted, "One of the big questions that remains about the domestics market isn't whether major discounters will win more share of the market but rather what share of market they will leave for other retailers."

INDUSTRY LEADERS

In the late-1990s the leaders in the curtain and drapery industry were stores that specialized in home goods as a whole. The leader was Bed, Bath & Beyond, Inc., of Springfield, New Jersey, with \$1.4 billion in sales in 1999, which represented a 31 percent sales growth from 1998. The company operated 240 warehouse-type stores in 38 states nationwide and employed 9,400 people. Bed Bath & Beyond posted sales of \$4.5 billion for 2004. Linens 'n Things, Inc., of Clifton, New Jersey, held the number two spot with \$1.3 billion in sales in 1999, a 22 percent increase over the previous year. Linens operated nearly 200 superstores in 38 states and had 9,700 employees in 1998. Overall, the emphasis shifted towards "one-stop shopping" where individuals could furnish an entire house with one trip to the store. The company generated sales of \$2.4 billion for 2003.

Otherwise, the industry was dominated by smaller, specialized companies such as Plainview, New York-based Curtains and Home, Inc. Most of its stores were along the eastern seaboard in New York, Pennsylvania, Maryland, and Virginia. The company was known as a retailer of affordable curtains, drapes, and other home furnishings, such as shower curtains and table linens. Three D Departments, Inc., based in Irvine, California, was another large retailer of curtains and draperies, as was Hunter Douglas, Inc., based in Upper Saddle River, New Jersey. The company offered a variety of blinds, shades, and draperies. Hunter Douglas also sold its window treatments to Home Depot, Fortunoff, and J.C. Penny.

An innovative Connecticut-based business, the Drapery Exchange, Inc., stocked draperies on consign-

ment and sold them to consumers at a reduced price. Local interior designers turned over their leftover inventory of custom-made drapery and window treatment ensembles, originally created for design showrooms, designer showhouses, or magazine layouts. The Drapery Exchange then sold these custom-made goods at a substantially reduced price.

Window Works, of Pompano Beach, Florida, was another aggressive participant in the curtain and drapery store industry. The company was the franchiser of over 100 custom window treatment stores across the country and relied heavily on sophisticated advertising and a contemporary look in its outlets to attract upscale but price-conscious consumers. Custom-made blinds accounted for a large part of store sales, but Window Works also stocked an array of products from drapery and curtain manufacturers.

MISCELLANEOUS HOME FURNISHINGS STORES

Establishments in this industry are primarily engaged in the retail sale of miscellaneous home furnishings, such as china, glassware, and metal ware for kitchen and table use; bedding and linen; brooms and brushes; lamps and shades; mirrors and pictures; venetian blinds; and window shades. Establishments primarily engaged in the retail sale of miscellaneous home furnishings by house-to-house canvas or by party-plan merchandising are classified in **SIC 5963: Direct Selling Establishments**.

NAICS CODE(S)

442291 (Window Treatment Stores)

442299 (All Other Home Furnishings Stores)

Businesses involved in the sale of miscellaneous home furnishings are as varied as the goods they sell to consumers. They offer everything needed to furnish a home from kitchenware to linens, and lamps and shades to venetian blinds and window shades.

Three factors have contributed to the steady demand of home furnishings: increased housing activity, growth in real disposable personal income, and declining consumer debt. Also contributing to the success of home

furnishings sales was the fact that they could be purchased seemingly anywhere. Discount stores, as well as department stores, stock a wide variety of items for the consumer, and their prices vary with the brand name and the type of store that sells them. Of the several different types of retailers that sell home furnishings, one of the fastest growing was the specialty retailer that attracts upscale consumers. These stores may be independent operators or part of a chain and provide quality merchandise with moderate price tags. However, price is not all that attracts customers. Specialty retailers tend to carry unusual and distinctive items that attract consumers who can't find them anywhere else.

Independently owned specialty stores, which held the sales-per-square foot crown with a median of \$339, were as varied as the products they sell—whether it's cutlery, pottery, lamps, lampshades, window treatments, draperies, or kitchenware. Consumers find such stores in shopping centers and malls, along commercial highways, or in country towns and back road, cottage-style boutiques. Because home furnishings cover such a broad spectrum of products and prices, and because modern distribution methods bring items manufactured halfway around the world to the smallest American town, this industry continues to perform well.

Growth in sales of furniture and other household equipment was steady during the 1990s. According to the U.S. Census Bureau, sales figures for each year between 1984 and 1997 never varied by more than 10 percent. In 1997, there were approximately 18,661 miscellaneous home furnishings stores, which employed an estimated 135,359 people and had sales of \$14.3 billion.

By 2001, according to the U.S. Census Bureau, there were an estimated 17,384 establishments engaged in the retail sale of miscellaneous home furnishings. There were some 174,026 people working within this industry with an annual payroll of \$2.7 billion. The total number of home furnishings retailers had risen to 24,059 in 2003, according to D&B Sales & Marketing Solutions, but there were fewer employees, with 151,371. That year, the average sales per store were about \$1.1 million. The home furnishings industry posted \$78 billion in sales for 2002. States that accounted for the majority of retail stores and market share were California with 3,327, Texas with 2,024, Florida with 1,965, and New York with 1,553. Together, they shared more than 36 percent of the overall market.

Kitchenware accounted for the majority of the market in total number of stores, as well as in market share. There were 2,460 stores that sold kitchenware, accounting for more than ten percent of the market. Miscellaneous home furnishings stores numbered 2,316; housewares, not elsewhere classified, had 2,188; pottery had 1,829; window furnishings had 1,465; lighting, lamps,

and accessories numbered 1,138; and bedding, including sheets, blankets, spreads, and pillows, numbered 1,343. Combined, they controlled more than 42 percent of the market.

The overall industry remained fragmented with a lot of opportunity for growth. Rosalind Wells, chief economist for the National Retail Federation, predicted a five percent increase in the home furnishings industry for 2004, due in part to the strong housing market.

Dollar General Stores, Inc. dominated the market with recorded sales of \$1.8 billion for 2002. The company opened a total of 622 new stores during that same year. Bed Bath & Beyond planned on opening approximately 85 new stores, with each retailing about \$160 to \$185 per square foot. For 2003, the company posted \$3.7 billion in combined sales by its 581 existing stores. Linens 'n Things generated \$552.8 million that year. According to *Retail Traffic*, Bed Bath & Beyond and Linens 'n Things together accounted for about seven percent of the market. Kirkland's, Cost Plus World Market, and Pier 1 Imports combined made up five percent of the market. Bombay Company, located in Fort Worth, Texas, had also been posting positive results with sales of \$596.4 million in 2003, which \$29.8 million were derived from online and mail order sales. Another leading company was Michael's Stores, Inc. with sales of \$177.8 million for 2003.

Mass merchandisers had also been gaining a lot of the home furnishings market. For example, Costco, with its Costco Home store, like other mass merchandisers can offer its merchandise at lower prices since the company can purchase merchandise in larger quantities from vendors.

According to the *Market Share Reporter*, gift specialty stores or chains accounted for 34.37 percent of the retail accessory sales in 2002. Discount department stores represented 13.54 percent; home accent specialty stores had 12.5 percent; mail order, the Internet, or TV had 10.42 percent; department stores had 6.25 percent; furniture stores or chains had 5.21 percent; home improvement centers had 4.17 percent; and all other markets shared 13.54 percent.

SIC 5722

HOUSEHOLD APPLIANCE STORES

This industry covers establishments primarily engaged in the retail sale of electric and gas refrigerators, stoves, and other household appliances, such as electric irons, percolators, hot plates, sewing machines, and vacuum cleaners. Many such stores also sell radio and television sets. Retail stores operated by public utility companies and primarily engaged in the sale of electric and gas appliances for household use are also classified in this industry.

NAICS CODE(S)

443111 (Household Appliance Stores)

INDUSTRY SNAPSHOT

According to the U.S. Census Bureau in 2000, there were 29,600 appliance and electronic stores, with 9,800 dedicated solely to the sale of appliances. Despite the weak economy of the early 2000s, the appliance industry showed healthy sales. According to the Commerce Department, retail sales of appliances grew at an annual rate of 7.5 percent during the first nine months of 2002, compared to a 3.9 percent increase in overall retail sales.

At the beginning of the twenty-first century, household appliances were often sold in discount stores, such

as Kmart or Wal-Mart, but household appliance superstores like Best Buy and Circuit City were on par with, if not better placed than, discount stores and department stores. Household appliance stores sold everything from washers and dryers to digital satellite systems, from radios to home theater systems, from personal computers to cellular phones, and from audiocassettes and compact discs to videocassettes, DVD players, and electronic accessories.

According to the Consumer Electronics Manufacturing Association (CEMA), electronic appliances and accessories purchasing increased in the late-1990s, especially in the newer product categories. Household appliance superstores continued to deploy newer and slicker marketing strategies to keep up with the increasing competition. Sales of consumer electronics were expected to rise along with many sectors of the retail industry.

ORGANIZATION AND STRUCTURE

The appliance industry is a low-growth, relatively mature industry offering acceptable gross margins and relatively low inventory turnover. The latter, combined with the large amount of space required for storage, makes for relatively low competition compared to other sectors of the retail industry. Throughout the mid- to late 1990s, the industry experienced significant consolidation, and this is expected to continue. A number of important players have gone out of business, including Sun Television and Appliances Inc., Newmark and Lewis, Home Center and Federated Group, Crazy Eddie, Fretter, and Highland Superstores. In addition, 40 Silo stores and 110 McDuff/Video Concepts stores owned by Tandy were closed. Many other regional chains faced decreasing profits and sales as a result of competition from larger stores such as Best Buy and Circuit City.

Small stores, which sell only household appliances, were becoming increasingly rare and were being out-muscled by larger chains. The market has shifted toward superstores, which offer a comprehensive range of household wares and home office supplies, in addition to low margin consumer electronics. As in other sectors of the retail industry, there is a movement toward a no-frills warehouse-type format, which allows stores to offer a dominant selection in every category in which they compete, while creating significant cost efficiencies relative to the more traditional formats. The megastore format has the potential to generate a much higher profit per square foot. The large store size creates savings in fixed store costs—including rent, labor, service, and overhead. The idea in a mixed format superstore is to use appliances as a draw into the store. If the store can satisfy customers in what is usually the first household purchase, it can usually retain them for subsequent electronic and personal computer purchases.

In the United States, consumer home appliances and consumer electronics are an important and sizable part of total retail sales. These items together account for about \$68.5 billion in sales annually. With consumer electronics, sales are usually renewed on a regular basis by the introduction of new technology that substantially widens the scope of the industry. According to P. J. Muldoon of McDonald and Company Securities, "Over the course of the century, there has been a pattern of at least one 'revolutionary' product per decade: the gramophone (1920s), the radio (1930s), the black-and-white television (1950s), the color television (1960s), the component audio system (1970s), and the video cassette recorder (1980s). There is additional impetus to growth in this retail segment from a steady stream of enhanced forms of existing items (for example the proliferation of improved television formats—stereo, with remote, big screen, etc.). Historically, because of these factors, retail sales of consumer electronics generally grow at above-average rates relative to retail sales and consumption."

BACKGROUND AND DEVELOPMENT

The first household appliance store was established in 1827 in Salem Village, Massachusetts, by Amasa Goodyear, according to J. Leander Bishop in the *History of American Manufacturers*. She sold housewares such as coffee and tea pots, waffle irons, brass andirons, and cast iron gridirons in addition to a range of hardware goods.

The early household appliance stores usually sold a combination of housewares and hardware products, according to Earl Lifshey's *The Housewares Story*. They took shape as independent units and as departments within large stores. Of the latter, Lifshey writes: "It was the emergence of the department stores in the latter half of the past century that spawned the housewares department as we have come to know it. The conditions and economies of those days encouraged the expansion of housewares departments. Some of the great department stores . . . had houseware departments of enormous size, owing less to the extensive assortment of items than to the practice of maintaining large stocks of goods on the selling floor. Such refinements as cost accounting and the pressure for getting maximum sales per square foot did not come until much later."

The turning point in the industry took place around the time of the Civil War. During the early and mid-1860s, a number of key developments occurred: the electrification of people's homes; a rise in the standard of living; improvements in transportation systems, particularly the railways; increased capital; the development of plate glass, which made store windows possible; and the rise of retail advertising. The advent of electricity, in particular, revolutionized the household appliance store industry, making possible the invention of the range of

items that have become synonymous with the business, such as refrigerators, electric cookers, and vacuum cleaners.

Electricity had been around for a long time, however, before there was a significant demand for household appliances. George H. Jungen, a former vice-president of the Baitinger Electric Co. in New York City, described the situation in an interview with Earl Lifshey in the December 20, 1937, issue of *Retailing Home Furnishings*: "Electricity was first used in factories and office buildings long before being introduced into the home. Electrical appliances—such as they were at the time—couldn't be readily purchased by interested consumers from dealers simply because there were few or no such dealers around. There were only five firms (in New York City) then handling electrical goods: Stanley & Patterson; Latham; Manhattan Electric; Western Electric; and J. H. Burnell. Most of their business was done on electrical equipment. When people wanted to get an electrical appliance, it was only natural, therefore, that they should think of getting it from the people who furnished them with other electrical supplies." Consequently, many of the larger household appliance stores, such as Lewis & Conger and Hammacher Schlemmer, issued catalogs and mail order services to encourage sales.

As late as 1914, department stores as prominent as Marshall Fields in Chicago were debuting their "household utilities" departments, selling kitchen utensils, laundry requisites, refrigerators, sewing machines, vacuum cleaners, and electrical sundries. The real invasion of household appliances had yet to come. It was only in the 1940s and 1950s that many of the appliances Americans in the early 2000s take for granted became a part of the average American household. Since then, new products have appeared with increasing predictability. In the early 1980s, consumer demand for electronics led to large sales and profit growth; many companies flourished. By the mid-1980s, however, the environment became more competitive, the market for VCRs became saturated, and the recession of the late 1980s slowed overall sales.

In 1993, the overall market for home appliances improved but remained difficult, and competition was expected to remain stiff. P. J. Muldoon stated: "From the better tone of housing markets in 1992, it appears that the trough in this segment has been reached and that demand for consumer durables will rise. The overall industry environment—namely, generally sluggish demand and the declining trend in pricing—continues to call for a strategic orientation toward grabbing more market share. Surviving operators have to properly prepare financially and strategically. Those that survive will be presented with considerable growth opportunities. This potential will be enhanced further in the more distant future when the next blockbuster is introduced."

Despite the rise and proliferation of superstores, a greater number of small stores were in the industry. According to *Dun's Survey of American Business 1993*, most stores in the industry were small or medium sized. In 1993 there were 14,201 outlets that generated annual sales between \$100,000 and \$250,000—more than twice as many as in any other sales' range. There were 5,669 small retail outlets that had between \$50,000 and \$99,000 in sales revenue, and more than 3,000 stores had sales of less than \$50,000. There were progressively fewer stores in the higher revenue brackets: 6,351 outlets had sales between \$250,000 and \$500,000; 4,769 had sales from \$500,000 to \$1 million; 3,902 had revenues from \$1 million to \$5 million; and only 620 stores had annual sales in excess of \$5 million in 1993.

The industry as a whole experienced sales growth in the first quarter of 1993. In a 1993 survey by the Salomon Brothers of 75 percent of all household appliance stores, 67 percent of stores reported unit sales growth. These figures were significantly higher than those for the third quarter of 1992, when 17 percent of stores reported flat sales and another 17 percent experienced a decline in sales. Moreover, many retailers experienced an upsurge in sales in April and mid-May of 1993. The following leading brands carried by many household appliance stores helped increase retail sales: General Electric, Whirlpool, Maytag, Roper, Hotpoint, Kelvinator, Amana, Tappan, Speed Queen, Frigidaire, KitchenAid, Sharp, and Jenn-Air. According to Russell L. Leavitt, "buyers cited manufacturer promotional activity and the financial position of consumers along with low interest rates as primary factors contributing to the stronger appliance sales."

With regard to inventory levels, the Salomon Brothers report found that 47 percent of household appliance retailers considered their inventory levels to be consistent with demand. Another 42 percent considered their stocks slightly above target levels, and 11 percent of buyers believed inventories were too low. Retailers considered their inventories of laundry, cooking, dishwasher, and microwave supplies as mostly on target, while many stated that their inventories of refrigeration equipment and room air conditioners were often high.

In terms of the range of inventory, the mix of product lines at the retail level were concentrated toward mid-priced products in the early to mid-1990s. A greater proportion of stores were stocking lower-priced refrigeration, cooking, and laundry products. According to retailers, premium brand merchandise made up 17 percent of overall appliance sales in the first quarter of 1993. The trend among appliance store retailers was to broaden product range in an attempt to increase market share.

Although personal computers were expected to be one of fastest selling products at household appliance

stores through the mid-1990s, toward the end of the decade, high definition TV, consumer electronics, and digital products in all categories gained considerable market share.

Price wars, acquisitions, expansion, and slick marketing strategies were the name of the game in the mid-1990s. Household appliance superstores were carrying practically every type of electronic equipment a home would need. Household appliance stores were becoming a one-stop shop for consumers. Use of better displays, in-store catalogs, and extended service plans were helping lure customers and further boost sales at household appliance stores.

According to *HFN*, a Salomon Brothers survey found that major appliance retailers expected sales to be flat and inventories to be higher between May 1, 1995 and April 30, 1996. These forecasts were based upon sales for January through April 1995. However, the household appliance stores were ahead of the market figures with their new marketing strategies. Prices increased by approximately 2 percent. Sales softened and promotional activities expanded. Almost 55 percent of retailers reported an increase in appliance sales.

In the mid-1990s major electronics and appliances retailers were showing definite trends of expansion. Montgomery Ward's acquisition of New England based Lechmere and Circuit City's purchase of 18 former Silo store leases in the Los Angeles area validated this trend. Circuit City plans included growth by 180 stores between January 1994 and January 1997. Minneapolis-based Best Buy Inc. had expanded in the southeastern and western United States. Best Buy introduced seven Concept III stores, the largest stores in this chain, in Los Angeles in the mid-1990s. Best Buy also opened several stores in the Washington, D.C. area, and Cleveland areas for the first time.

Along with the expansion were new marketing strategies and promotions to increase sales. Besides opening new stores in geographically diverse areas, many companies boosted profits through employee training. The willingness of appliance superstores to reinvent themselves through product diversification was established with Best Buy's introduction of gourmet kitchen appliances at its outlets in May 1996. This move also reflected the tough household electronics and appliances market of the mid-1990s.

According to an article in *HFN*, the appliance industry had prospered despite increased competition: "Notwithstanding the burgeoning of mass merchants with their capacity to slash prices, manufacturers selling directly to consumers, and the growing appeal of Internet shopping, independent electronics and appliance dealers as a whole fared reasonably well during 1997, as reflected by several key performance measures."

Included in those measures was a lowering of wholesale cost due to retailer participation in buying groups, exciting new electronic and technological advancements, and increasing interest in home theater products. Those stores that offered appliances as well as furniture and electronics fared best, typically averaging an 18 percent gain over 1996.

Another factor encouraging the industry was the increase in housing development. The North American Retail Dealers Association (NARDA) reported that it had risen to a 12-year high in 1999. "January '99 housing starts jumped 3.8 percent over the robust numbers posted in December '98. This surge sets a pace for 1999 housing starts to reach 1.8 million." As a result, appliance and electronic sales were expected to remain strong into the next millennium as more consumers would be purchasing new items.

Demographics were also key in the success of this industry. Appliance stores in general target 35-to-64 year olds. With a 35 percent growth rate, this population segment grew faster than any other in the late 1990s.

In 1998, the U.S. appliance market was also seeing a decline in prices. Due to increased importing from China, Japan, South Korea, and Mexico, increased pressure was placed on price. This factor resulted in lower prices for the consumer as American manufacturers were forced to provide quality, innovative products at lower costs to compete with foreign imports.

While many stores such as Best Buy and Circuit City saw gains in 1998, some smaller, regional stores succumbed to the pressure of the rising superstores. Sun Television and Appliance Inc. went bankrupt along with Fretter Inc. and Highland Superstores in the mid-1990s. Rex Stores Corp. saw sales decline in 1998, as did Tops Appliance City Inc. In 1999, though, Rex Stores did see some growth in sales.

In 1998, the industry saw sales of \$68.5 billion as consumer demand for appliances remained steady due to the stable economy, consumer confidence, and the increase of new housing developments. The majority of appliance stores were fairly small-scale operations with only a few workers in the early 1990s; however, a continuing trend toward consolidation of the market in the late 1990s led to the leadership of superstores and warehouses in this industry. Although these megastores comprise a minority of the industry's stores, the low prices that they are able to offer due to their economies of scale make competition against them extremely difficult for smaller stores. Due to the success of these retailers, appliance stores tended to diversify their product range. By the late 1990s, most household appliance stores offered a wide range of products—including consumer electronics and office supplies.

CURRENT CONDITIONS

Following the terrorist attacks of September 2001, consumer confidence plunged. A survey of 5,000 U.S. households in October 2001 indicated that 26.8 percent expected to buy a major appliance within the next six months, compared to an average 29.6 percent who planned a major appliance purchase between March and September of 2001. However, by October 2002, the monthly survey indicated a rise in consumer confidence, with 27.9 percent of those polled expecting to buy a major appliance in the following six months.

According to forecasts by the Association of Home Appliance Manufacturers (AHAM) in January 2003, an estimated 67,685 major appliances were shipped in the United States in 2002, with an estimated shipment of 68,746, or 1.4 percent increase, during 2003. Most appliance categories showed low but consistent levels of growth. Portable dishwashers and room air conditions both declined in shipments as in-built units and center air become standardized in new homes. Increased tariffs as well as shortage of key components due to U.S. production slowdowns have caused prices spikes in certain sectors of the major appliance industry. As tariff restrictions are eased and U.S. steel productions speeds up, prices are expected to level out.

INDUSTRY LEADERS

Of the variety of companies engaged in retailing household appliances, either exclusively or as part of a range of product lines, Best Buy Company Inc. led the industry with sales of \$19.6 billion in fiscal year 2002 with sales of \$10.8 billion. Home Depot, the nation's largest home improvement chain with total sales of \$58.2 billion in fiscal 2002, sells a wide array of goods, including household appliance. Lowe's, Inc. has emerged as the nation's second largest home improvement chain, with 2002 revenues of \$26.5 billion, and in 2002 it held an 18 percent share of the home appliance market share.

Sears, with total annual revenues of \$41.3 billion, also maintained a large share (39 percent) in the appliance industry. Throughout the late 1990s, the company was attempting to reduce its costs and restructure itself to meet the demands of a changing market. Circuit City Stores, once one of the nation's leading appliance dealers, opted out of the appliance market in the early 2000s to fill their floor space with more business-related goods, including office furniture. Heilig-Meyers Co. also a notable company with sales that reached over \$2.4 billion, filed for Chapter 11 bankruptcy in February 2003.

Best Buy, Inc. was the country's largest specialty retailer of brand name major appliances and consumer electronics in 2002 with sales of \$19.6 billion. The company attributes its rise to the top to its Concept II, which was introduced in 1989. Before implementing this new

sales strategy, Best Buy's stores were much like those of competitors Circuit City and Silo—their sales were largely driven by a highly visible commissioned sales force that pushed high margin goods. Only display items were exhibited on the shop floor, and prices were not necessarily discounted. Concept II takes into account the fact that most shoppers dislike aggressive salespeople, preferring instead a self-service format, a wide selection of stock, and low prices.

F. B. Bernstein of Merrill Lynch Capital Markets explained the strategy fully. “The Concept II prototypes have a no frills warehouse appearance, virtually all the merchandise is displayed on the sales floor, and they adhere to a lowest price policy. They feature fewer brand names than competing stores, but almost all the leading brands are carried; merchandise is displayed by vendor, rather than the more traditional merchandising by price point. They also have far more selling space than traditional consumer electronic retail stores; the additional space is mostly being utilized for expanded assortments of computers.”

Concept II had a dramatic effect on the economics of Best Buy's business. Sales increased dramatically, while gross margins and store expenses were reduced. The net effect of these changes was improved profitability. Concept II eliminated commissioned salespeople and reduced the overall number of salespeople in the store. With the success of its Concept II stores, Best Buy established a new marketing strategy with the Concept III stores in the mid-1990's. These stores, which were similar to the Concept II stores, were the largest stores in the chain. Concept IV stores were introduced in 1998. These stores were 45,000 square feet dedicated to digital displays, merchandise grouping such as Home Theater and Digital Imaging, and superior customer service. With \$1.4 million in net income—an 87 percent increase over 2001—Best Buy employed more than 289,000 workers in 2002.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, there were 73,360 employed in the appliance store sector in 2001, a large percentage of whom were part-time sales associates. All sales-related occupations totaled 34,990, or nearly 48 percent, of the entire workforce. The mean annual salary for a sales associate was \$26,440; managers and supervisors earned a mean annual salary of \$42,750; general and operational managers earned a mean annual salary of \$57,670; and chief executives earned a mean annual salary of \$85,640.

RESEARCH AND TECHNOLOGY

Like all sectors of the retail industry, household appliance stores have been strongly impacted by new technologies, particularly computerization, the Internet, and

advanced electronics in the late 1990s. Computerization revolutionized the control of inventory flow and the ordering of stock and allowed more stores to move to a just-in-time system of delivery. Management information systems have made information collection and analysis faster and more accurate. Research has focused on new management techniques to keep up with the fluctuating market.

Pricing continued to be studied especially closely in the late 1990s, and an increasing number of industry retailers switched from promotional sales to every day low pricing (EDLP). *Standard and Poor's Industry Surveys* stated: “For retailers, the benefits of an EDLP strategy versus a high/low strategy can be significant. Most important are reduced costs: advertising outlays for sales are eliminated, a more even flow of merchandise improves inventory management, and labor costs are reduced since prices no longer need to be marked down. Moreover, the equation works both ways: lower costs can be translated into lower price.” Most of the bigger chains have undertaken detailed studies of their business and have sought ways to reduce costs, increase efficiency and productivity, control inventory, and rationalize operations.

Another change in the late 1990s was the advent of online retail shopping. While commodities such as books, CDs, and apparel were much easier to sell online, the appliance industry has not backed down from offering products online. This industry is expected to see solid growth in Internet sales by 2001. Best Buy and Circuit City offered some appliances online in 1999. The National Retail Federation expected that more than 40 million households would be shopping online by 2003.

Increased technology in the appliances themselves is also expected to have an impact on this industry. Electronics are changing how many basic appliances work. In an *HFN* article, Ron Kerber—Whirlpool Corp.'s executive vice president and chief technology officer—stated that electronics are “going to be a huge impact on this business. They will control functionality; they will add functionality.” Sales are expected to rise with the introduction of such innovations as advanced cooking controls that could time the start and stop of cooking, either in an oven or microwave; advances in refrigeration, dishwashers, and clothes washers; and new products for home dry cleaning.

SIC 5731

RADIO, TELEVISION, CONSUMER ELECTRONICS, AND MUSIC STORES

This category encompasses establishments primarily engaged in the retail sale of radios, television sets, record players, stereo equipment, sound reproducing equipment, and other consumer audio and video electronics equipment (including automotive). Such establishments may also sell additional product lines, such as household appliances; computers, computer peripheral equipment, and software; musical instruments; or records and prerecorded tapes. Establishments in this industry may perform incidental installation and repair work on radios, television sets, and other consumer electronic equipment. Establishments primarily engaged in the installation and repair of these products are classified in **SIC 7622: Radio and Television Repair Shops**. Establishments primarily engaged in the retail sale of computer equipment are classified in **SIC 5734: Computer and Computer Software Stores**, and those selling electronic toys are classified in **SIC 5945: Hobby, Toy, and Game Shops**.

NAICS CODE(S)

443112 (Radio, Television, and Other Electronic Stores)

441310 (Automotive Parts and Accessories Stores)

INDUSTRY SNAPSHOT

Despite a sluggish economy that turned stagnant following the terrorist attacks of September 11, 2001, and exacerbated by U.S. military involvement in Afghanistan in 2001 and 2002 and Iraq in 2003, the sales of consumer electronics continues to grow. Americans spent \$96.2 billion on electronic goods in 2002, a 3.7 percent increase from the previous year. Total expenditures in 2003 were expected to top \$99.5 billion. Although consumer electronic giants Best Buy and Circuit City retained their

dominant market shares, high-end consumer merchants did feel significant negative effects of the recessive economy as consumers refrained from big-ticket purchases.

According to the Consumer Electronic Association (CEA), digital products have led the industry's growth. DVD players were in 35 percent of U.S. homes in 2001 and expected in 50 percent of all homes by the end of 2004 and over 60 percent by 2006. Spurring the sales of DVD players is the unprecedented deflationary prices. The average price for a DVD system in July 1998 was over \$500; by December 2002, the price had fallen to \$129, with some units selling for as little as \$59. Along with DVD players and systems, the industry has also seen extensive growth in sales of flat panel televisions, portable MP3 players, and "Home Theater in a Box" units.

ORGANIZATION AND STRUCTURE

Many radio, television, consumer electronics, and music stores were chain stores in the late 1990s. This structure enabled larger companies to purchase equipment at a sharp discount and to pass those savings along to the consumer. Chain stores have become more prevalent in the industry because smaller stores have found it increasingly difficult to compete with the chains' low prices.

One major change in the retailing strategy of consumer electronics stores has been a shift toward scrambled merchandising. This trend has been evolving since the 1970s and refers to the growing tendency for stores to become larger and to carry more diverse product lines. In 1998, there was 20 square feet of retail space per person in the United States. Most retailers expanded their merchandise lines to fill this space, and the superstore became prevalent in the industry. Radio, television, and consumer electronics stores fit into this niche nicely, because their broad scope encompassed many aspects of consumer product lines. In addition to providing a wide variety of products, most large retail outlets are able to offer their goods at substantially lower prices. Such discounts reflect changes in consumer buying patterns and the need to adapt to the reality that adults between the age of 40 and 50, the largest single group of consumers, are making purchases to replace current equipment. Consequently, as middle-aged Americans begin to save money and are more hesitant to purchase on credit, they are purchasing fewer expensive items.

Superstores typically carry an inventory of 40,000 items, compared with the 25,000 items that are carried by an average store. Because chain stores and superstores purchase such large quantities of products for their stores, manufacturers offer them substantial discounts on merchandise. For this reason, chain establishments and superstores are able to sell their merchandise to consumers at prices substantially lower than those found in small

stores. Additionally, the largest chains are cutting back on sales staffs and stores display merchandise in a warehouse style without expensive displays.

BACKGROUND AND DEVELOPMENT

The Industrial Revolution that began in the late 1700s was the genesis of modern retailing. The mass production of saleable items began as factories started to manufacture formerly handcrafted goods. The western frontier and the movement of railroads also created a demand for goods, and marketplaces helped to distribute merchandise to remote locations. The general store was the first outlet that offered a variety of merchandise. As retail became more sophisticated in the mid-nineteenth century, the general store was replaced by specialty stores grouped together. The chain store, a configuration utilized by most modern consumer electronics outlets, had its beginnings in the late nineteenth century when the concept was pioneered by such retailers as the F. W. Woolworth Co.

The discount store became popular when the population shifted from cities to the suburbs after the end of World War II. Demand for household items increased, and new homeowners were anxious to purchase goods at less-than-retail prices. At the same time, the trend toward reducing customer services also developed. Discount stores kept their costs low by maintaining low-rent facilities and a minimum sales staff. Suburban consumers were receptive to this opportunity to save money, and discount stores grew substantially during the 1980s and early 1990s.

Technological advancements have made consumer electronics equipment available to the general public at an affordable price. Consumer electronics have proliferated in American homes and have become more reasonable as new developments drive the prices for existing technology downward. The formerly prohibitive costs for television sets and radios have become affordable to almost all households, and the development of videocassette recorders and compact disc technology has placed sophisticated electronic equipment into the hands of all interested consumers.

Retail sales of home electronics equipment continued to grow slowly and were less sensitive to changes in business conditions than were durable goods. During 1991, for example, sales of nondurable goods, such as those included in this category, increased by 2 percent. During the same period, however, total retail sales of durable merchandise decreased by more than 1 percent.

Overall, the sales increases that were once seen in this industry dropped because of market saturation. Approximately 98 percent of American households own at least one color television set, and future sales growth was expected to be seen due to replacement and upgrading. Similarly, more than 77 percent of all U.S. households

that own a television set also own a videocassette recorder; consequently, this product line also was nearing saturation. Despite an abundance of electronic equipment, the sales of the top 10 best-selling consumer electronics products totaled nearly \$28 billion in 1990. These products included televisions, car stereos, home computers, and VCRs. Potential for increased growth existed as new technology was refined and enhanced.

While sales continued to rise slowly, future growth depended upon technological improvements. Long-term growth depended on such promising innovative products as home theater equipment, compact discs, large-screen televisions, and high-quality loudspeakers. Demand for camcorders, televisions, videocassette recorders, and auto sound equipment was expected to decline as these technologies reached their saturation points.

There were more than 10,000 radio, television and consumer electronics stores in the United States in the early 1990s. Many of these stores were owned by nationwide chains, such as Tandy Corp., the parent company of more than 7,200 Radio Shack stores.

A mini-shakeout of firms took place in the early 1990s as market saturation became more prevalent. Some companies began dropping out of the U.S. electronics market, and some chains were similarly closing their doors. Highland Superstores Inc., for example, pulled out of the Chicago and Midwestern markets after performing as the area's largest-grossing electronics and appliance retail chain. Competition in many markets continued to pit superstores against each other and led to increased price wars.

At this time, the retail trade sector accounted for more than 20 percent of all jobs in the United States, according to *U.S. Industrial Outlook 1993*. Radio, television, and consumer electronics stores sold nondurable goods, a category that accounted for 60 percent of all U.S. retail sales in 1991. These establishments were included in the department stores category, and 1992 sales totaled \$189 billion. Between 1987 and 1992 the industry grew slowly but steadily, with annual sales increasing an average of 5 percent.

Overall retail sales improved in the mid 1990s, after battling the recession of past years. Consumer electronics retailers reported an increase in sales during the 1993 holiday season, with the highest sales in large screen TV and CD players. Profit margins were affected by intense competition between retailers, which resulted in below-cost retailing according to *Television Digest*. Smaller retailers were the hardest hit, with the giants like Best Buy and Circuit City benefiting most.

Tandy Corp. started another trend during the mid- to late-1990s with new Gigastores. Tandy opened its sixth Incredible Universe Gigastore in Hollywood, Florida, at-

tracting 35,000 shoppers on the opening day. This store had 185,000 square feet of retail space and featured a 40-foot magazine department and an in-store McDonald's restaurant. However, Incredible Universe Stores steadily lost business.

The factors that led to this failure included customers' dislike of the theme-park atmosphere, a nationwide consumer slowdown, and an overly aggressive expansion strategy. Tandy Corp. reorganized management, reduced expansion plans, and changed its advertising campaigns. The Incredible Universe superstore chain was redesigned with the baby boomers as the target audience rather than teenagers, focusing on products rather than the store itself. The efforts of Tandy did not pay off, however, and Incredible Universe was sold in the mid-1990s.

During the mid- to late-1990s, large superstores started increasing their product lines to include retail computers and related products, resulting in a growth in their clientele. Evolution of new technology resulted in a great demand for new electronics products like Web TV, digital satellite television systems, and home theater systems.

Toward the late 1990s, consumer electronics once again were seeing profits. According to *Electronic Business*, "consumers increased the amount of discretionary income spent on televisions, stereos, computers, telephones and emerging new technologies like digital cameras and DVD players."

Among those consumer electronic stores reaping the benefits of the stronger economy and consumer confidence were large superstores such as Best Buy and Circuit City. Sales at Best Buy increased 21 percent in 1998 and a 25 percent growth was predicted for 1999. Circuit City increased its electronics sales by 48 percent in 1998, and the store expected to see a 20 percent gain in 1999. Tandy Corp. also was turning a profit with its Radio Shack stores. In October 1999, sales increased by 15 percent, the tenth consecutive month of double digit gains.

These profitable stores were growing in size, too. In 1998, Circuit City opened 37 new superstores and also focused on targeting smaller markets. Best Buy added 28 new stores to its business—up from 13 in 1997—and planned on opening 45 in 1999. Radio Shack also was growing in size. According to Tandy Corp., 94 percent of Americans live or work within five minutes of a Radio Shack store or dealer.

As new technology was being introduced, many stores teamed up with high-profile electronics companies. In 1999, Radio Shack agreed to sell Sprint PCS phone service in its stores as well as DirecTV satellite service. It also struck a deal with Microsoft in 1999 to offer Microsoft's Internet services to Radio Shack customers.

The Internet played a role in the consumer electronics industry. Offering products online— *e-tailing* —

became more popular in the late 1990s. In October 1999, Tweeter Home Entertainment Group and Outpost.com offered audio, video, and consumer electronics to online shoppers. Circuit City also opened an E-Superstore in 1999. The Web site was fully integrated with its stores, allowing consumers to purchase items online and pick them up at the closest retail outlet. Radio Shack and Best Buy also were online-shopper friendly. With online sales expected to increase dramatically by 2003, consumer electronics stores focused efforts on remaining competitive with online sites that offered electronics products.

While sales gains were being seen in 1998, there was consolidation and bankruptcy as a result of the success of these larger chains. Tandy revamped its image by renaming itself RadioShack Corp. and sold its Incredible Universe as well as its McDuff Computer Chain businesses. Campo Electronics, Lechmere, and Sun TV closed. Smaller regional stores that survived the hard economic times of the early 1990s and the onslaught of the superstores either changed ownership or decreased in size.

CURRENT CONDITIONS

By the early 2000s, consumer electronic sales were being led by DVD players. According to the CEA, in 1997 approximately 350,000 DVD players were sold in the United States, for a total market value of \$172 million. By 2001, sales reached 12.7 million DVD units for a total market value of nearly \$2.5 billion. Sales were expected to continue to rise, reaching near 20 million units sold per year by 2005. However, because the DVD unit saw such a rapid decline in price (from an average of over \$400 per unit in 1998 to under \$100 in 2003) units sold will grow at a much faster rate than total market value. In an attempt to stem the price erosion, DVD player manufacturers were adding new features and upgrades to push prices back up. DVD players that have the capacity to record hit the market, with a price tag between \$700 and \$1,500 per unit. When the price of the DVD recorder is pushed down around the \$300 level, sales are expected to increase significantly.

The future of the videotape and videocassette recorder (VCR) brings mixed reviews. Some in the industry see the rise of the DVD player as the death for the VCR. For example, Circuit City, the industry's second largest performer, has stopped selling videotapes, focusing strictly on DVDs. However, others see a continued long life for the VCR alongside the DVD player in U.S. living rooms. According to Video Software Dealers Association (VSDA), although 35 million U.S. households owned a DVD player by the end of 2002, 94 million U.S. households owned a VCR. Even though DVD sales were expected to outperform VCR sales in 2003—with an estimated 45 million DVD players in U.S. homes—95 million were expected to own VCRs. The recording capa-

bilities of the VCR as well as well-established public and private libraries of videocassettes would keep the VCR a viable product in the near future. However, when the DVD recorder hits the watermark prices of \$299 and then \$199, consumers might expect a more rapid decline in VCR sales.

Along with DVD players, other digital consumer electronics were storming the market. Digital television, which provides high-definition, flat-screen capabilities, continued to post impressive sales numbers. Digital television sales exceeded 2.1 million units in 2001, and digital satellite systems neared a 20 percent penetration level. According to research conducted by Strategy Analytics as reported by *Communications Today*, 29 million U.S. households were expected to own high-definition televisions by 2008, with over half of those households connected to a high-definition television service.

INDUSTRY LEADERS

In 2002 Best Buy, headquartered in Minneapolis, Minnesota, was the largest retailer in this industry with sales revenue of \$19.6 billion. Salespeople did not work on commission, and merchandise was arranged by brand name instead of by price range, both unusual practices in the superstore industry. Additionally, Best Buy limited the number of brand names it carried in order to keep costs down in the firm's more than 550 stores.

The success of this chain was largely attributed to the rollout of its Concept II, III, and IV stores. These concepts highlighted marketing features, increased store size, reduced expenses, and increased sales. In fiscal 2002, Best Buy's net income was \$570 million, an increase of 44 percent over the previous year. The company employed 94,000 workers, a 25 percent increase from 2001.

Circuit City Stores Inc., the nation's second largest specialty retailer of brand name electronic equipment and consumer appliances, operated more than 620 Circuit City Superstores and 20 mall-based stores. The company carried a full line of merchandise at its superstores and posted sales of \$12.8 billion, resulting in a net income of \$219 million.

Founded in 1949, Circuit City was run by Richard L. Sharp, whose computer programming skills helped the company to design a sophisticated inventory system that provided for efficient movement of equipment in addition to trimming shrinkage losses by as much as 30 percent. By working to reduce theft to less than half of the industry average, Circuit City added as much as one percentage point to its pre-tax margin of 4.5 percent. Other strategies that contributed to the firm's success included knowledgeable salespeople and a wide product selection.

Each successful industry leader has taken its own road to success. Best Buy succeeded by using barebones display

techniques and relying on consumer knowledge, while Circuit City focused on in-house efficiency and knowledgeable salespeople. Tandy blanketed the United States with stores that stock the company's own merchandise.

RadioShack (formerly Tandy Corp.) was America's third largest retailer of consumer electronics, with a 2002 sales revenue of \$4.6 billion and 39,100 employees. The company's operations included more than 5,100 company-owned and 2,000 franchise operations.

Tandy was incorporated in 1960 and purchased Radio Shack in 1963. The company became a leader by emphasizing the importance of gross profit margins and focusing on a small inventory of its best-selling items. In addition, Tandy worked to keep Radio Shack's prices competitive by limiting its inventory to private label items and investing in advertising. Finally, the firm paid its workers a modest salary and used bonuses as incentives to promote hard work.

Tandy has a strong history in the electronics industry despite a miscalculation in the personal computer market in the 1980s. Because Tandy's TRS-80 computers were not able to run IBM software, Radio Shack's 19 percent share of the PC market dropped to less than 9 percent in the early 1980s. Tandy built its name by focusing on improving on other's developments, rather than on innovation, and by utilizing its own in-house manufacturing divisions. However, the corporation began changing its original focus in the early 1990s by funneling money into research and development to keep abreast of new computer developments.

Additionally, Tandy reevaluated its focus on computer manufacturing and securing its roots as a retailer. Incredible Universe outlets and mini-malls that imitate the European "hypermarkets," were Tandy's latest venture. The huge emporiums contained karaoke contests, childcare facilities, restaurants, and extensive product lines including more than 300 types of television sets, and 40,000 audio and video titles. The stores had to sell \$100 million annually at each location to be profitable, and their focus was expected to remain on maintaining the lowest prices.

Unfortunately, the concept never caught on. Tandy sold its Incredible Universe and focused on its Radio Shack stores in the late 1990s. With the company's alliances with Sprint PCS, Microsoft, and Compaq, its sales were seeing strong gains in 1999. To accentuate the company's new direction, it changed names to RadioShack, Inc.

WORKFORCE

The consumer electronics industry employed 477,560 people in 2001, according to the U.S. Department of Labor, Bureau of Labor Statistics. Of this total,

over one-third are filled by retail sales associates, who earn a mean annual salary of \$21,840. All sales-related positions account for over 56 percent of industry's workforce. Nearly 15 percent of the workforce is in office and administrative support positions, with a mean annual salary of \$23,990, and nearly 5 percent are management positions, with a mean annual salary of \$70,660. Like other retail environments, consumer electronic stores depend heavily on part-time sales associates and cashiers and tend to high additional help during busy seasons, such as Christmas.

RESEARCH AND TECHNOLOGY

While technology advancements and research focused mainly on e-commerce and the Internet in the late 1990s, the need to rely on functions at a store level remained strong. According to Bruce Van Kleeck, a vice president of the National Retail Federation, "the Internet and electronic retailing as well as other back office enhancements, are occupying a lot of attention and investment, but retailers can't afford to neglect their stores. They should be thinking about what technologies are available to beef up their store-level productivity and improve the shopping experience for the customer."

Some technologies that retailers were taking advantage of in the late 1990s were: traffic counters, designed to analyze consumer traffic in stores; shrink reducers, which gave details on customer-employee ratios; wireless networks, which utilized Ethernet systems that enhanced in-store networking and extranets, as well as simplifying upgrades and inventory checks; and digital video ITEC, a network designed for digital video and audio programming within the stores.

At a consumer level, research and development continued to drive the markets and create demand for more sophisticated electronic equipment. Prices subsequently reflected the demand, with costs for new products gradually dropping as technological advances became more widespread. Developments such as recordable compact discs became vital to the audio market as it became more saturated in the late 1990s. Overall, the market for consumer electronics is predicted to rely heavily on new innovations and technology. As market saturation of electronic items rises, innovations are expected to fuel consumer purchases of improved equipment and replacement units.

SIC 5734

COMPUTER AND COMPUTER SOFTWARE STORES

This industry consists of establishments primarily engaged in the retail sale of computers, computer peripheral equipment, computer printers, and computer software. The wholesale distribution of these products for business or professional use is classified in **SIC 5045: Computers and Computer Peripheral Equipment and Software**.

NAICS CODE(S)

443120 (Computer and Software Stores)

INDUSTRY SNAPSHOT

This retail industry underwent tremendous growth in the 1990s, culminating with sales nearing \$400 billion in 2000, a 12 percent increase over 1999. However, by 2001, a weakening economy, stiff competition, and price deflation hit the industry hard. Sales declined by 7.7 percent in 2001 and another 8.5 percent in 2002. Although the industry rebounded slightly in 2003, the computer industry is positioned for restructuring. Business customers, who account for 70 percent of all computer sales, have slashed information technology (IT) budgets, and consumers have become saturated with megasystems and have little need for more processing speed or storage capacities. Unit sales remained flat in the first two years of the 2000s, with 128 million PCs shipped in 2001 and 125 million PCs shipped in 2002.

Computer stores are finding stiff competition from online sales and manufacturers-turned-retailers, especially Dell, whose sales operations have been a bright spot in the sagging market. Big-box computer stores grew so rapidly during the 1990s that customer service was compromised. Referring to this image of poor service, James Mathewson noted in *Computer Use*, "Friends don't let friends buy from superstores." Now those stores are trying to overcome their poor reputation for servicing their customers.

Trends that will shape the twenty-first century include the increased importance of mobility and wireless connectivity. Laptops are pegged to take over lagging desktop sales, and desktops are expected to be smaller in order to appeal to consumers who no longer want big boxy units. Cords and wires are also seen as negative components so new wireless, integrated functionality is expected to draw customers into stores.

ORGANIZATION AND STRUCTURE

The Office of Computers and Business Equipment (OCBE) stated that in the late 1990s, computers were "sold through most marketing channels, including corporate account resellers (22 percent), direct response telemarketers (15 percent), consumer electronics stores (12 percent), value added resellers (VARs) (11 percent), computer superstores (10 percent), computer specialty dealers (7 percent), and mail order firms (6 percent). Other outlets include direct sales forces, mass merchants, office product retailers, and systems integrators." Little market shift was expected, except of course, in terms of Internet retailing.

According to an August 1999 *Chain Store Age* article, "many changes took place in the computer retailer landscape." Large office superstores and computer su-

perstores continued to drive down prices and strengthen their position in the market, forcing traditional stores to diversify product lines in order to keep up with competition. That segment of the market was expected to see continued growth into 2000, as was direct response and mail order sales. Small computer specialty stores and VARs were expected to decline, as many manufacturers opted to ship product to the larger store versus an independent dealer, resulting in product shortages for the smaller dealer. The increase of "e-tailing" also put a strain on traditional store sales.

BACKGROUND AND DEVELOPMENT

The first computers were developed in America during World War II, but it was not until 1953 that computers were sold commercially by companies such as IBM, General Electric, Honeywell, and RCA. These companies were involved in the manufacturing of computers for scientists, mostly at universities. The early commercial market was geared mainly towards large industry, which could afford the new and expensive technology. Eventually, these industry pioneers also started to market smaller and slower computers at a wider market.

By the 1960s, more than 5,000 computers were in use in the United States. During the 1960s, the number of computers doubled every two or three years to more than 40,000 by 1970. As computers grew in number, they became more reliable and faster; however, their cost was still high.

Until the 1970s, the United States and Canada led the world in computer use and sales. Since then, technologies overseas have met those of North America, and computers worldwide were estimated to have grown at a rate of 20 percent per year.

The commercial sale of personal computers and easy-to-use software, developed in the 1980s, boosted the retail industry. Retail sales of computers were no longer directed only at large businesses; the target market for computer and software dealers extended to small businesses, schools, and individuals for at-home use.

Personal Computer Sales. In 1990 an estimated 9.5 million personal computers (PCs) valued at nearly \$28 billion were sold through retail outlets in America. Personal computers are general application computers with local programming abilities. PCs are grouped into two types, stationary and portable. Stationary systems are mostly desktop, deskside, or "tower" systems, which made up about 80 percent of PCs sold in the United States in 1993. The remaining 20 percent were portable systems such as laptops, notebooks, and handheld or pen-based systems.

The availability of PCs in a variety of retail outlets increased dramatically in the late 1980s. The furious

competition spurred reduced prices for consumers. According to Link Resources, by 1993, 67 percent of small businesses (those employing fewer than 100 workers) had PCs. Another large market for PCs has been home worker households; in 1993, home worker households purchased more than two-thirds of the PCs sold to the home market.

Workstation Sales. Businesses in this industry also sold low-end workstations. Workstations are single and multi-user microprocessors, with the low end of the market very similar to PCs. Since their introduction in the early 1980s, workstations have been sold mainly for scientific and engineering use. In the 1990s, they became more popular with businesses, which use them for electronic publishing, financial services, and office automation.

Software Sales. Software products sold by retailers in this industry included word processing programs, computer games, accounting packages, and software components for on-line services. In 1993, the leading software packages sold through retailers in America were: MS-DOS 6.2 Upgrade, Adobe Type Manager Font, TurboTax for Windows, Quicken 3 for Windows, and MS Works 3.0 for Windows. According to the Software Publishers Association, sales of PC applications software alone reached over \$3 billion in the United States and Canada in 1993.

Software dealers rely strongly on product trends set by technological developments and software producers. Software products available on the market increasingly are concerned with meeting the needs of children, families, and small businesses. In 1993, the consumer software market was considered the fastest growing segment of this industry.

Marketing. Compared to other retailers, companies in this industry have spent relatively small amounts on advertising. This trend is in part due to the fact that the major computers and software manufacturers, as opposed to the retailers, carry out product advertising. Low advertising has also been a result of this industry, as a specialty retailer, advertising mainly in computer magazines and on-line services, as opposed to the more costly mediums of television and radio.

Price Wars. In the early 1990s, this industry was characterized by competitive price wars. Intense price reductions began in 1991 and set industry records the following year, with reductions for computers averaging 33 percent. In general, retail computer sales shifted from small computer dealers to the large chain computer retailers, in particular the mass merchandisers who could sell computers at discount prices. In 1992, 30 percent of personal computers sold in America were through traditional computer dealers, a 50 percent drop from only five years before.

Another channel of distribution has emerged from the price wars in this industry. Computer sales have also been made through computer flea markets, which cater to small dealers. In 1992 *Business Week* reported that computer sales at these flea markets, generally held at large convention halls, were made at discounts of up to 80 percent off of the average retail prices.

Sales through mail-order systems were the fastest growing sector of the computer retail industry in the early 1990s. According to International Data Corp., shipments in mail-order computer sales increased by an average of 75 percent among the industry leaders in 1993. The potential for profit, though, made the mail-order market an increasingly competitive one. In 1993, a previous industry leader in mail-order computer sales, CompuAdd Corp., filed for bankruptcy. According to the *Wall Street Journal*, the company had been "stung by falling prices and an aggressive marketing war among leading vendors."

Specialty store reaction to this shift in distribution channels was most evident in the actions of industry leaders. In the early 1990s, CompuAdd Corp., a PC manufacturer and retailer, converted several of its storefront retail operations into computer superstores. Dell Computer Corp., a PC manufacturer and mail-order retailer, began selling its computers through Soft Warehouse, Inc. a superstore operator. ComputerLand, one of the industry's top three retailers, responded to these changes in the market by converting 50 of its boutiques into larger mass-market outlets and converted most of their remaining 380 small stores into direct sales offices.

In 1993, there were 132 companies in this industry in America. These companies' total sales for that year were \$4.3 billion. However, according to the International Data Corp., there were at least another 3,000 small companies, often one-person operations, dealing in computers in the United States; these companies were more difficult for industry analysts to track because entry into the business had become relatively easy with standardized technologies and such dealers constantly entered and left the business.

Unlike computers, software continued to sell mostly through specialist software retailers. However, this trend was changing as more office supply outlets and department stores carried these products, and the number of computer superstores that sold software increased. In addition, software products became easier to use and therefore did not require the specialty expertise offered at most software retailers.

Specialty software retailers were also affected by the sales of computers with software packages pre-installed by computer manufacturers, a trend which increased with the competition among suppliers. This arrangement

shifted purchasing habits of consumers from the more expensive software previously necessary to operate their computers to less expensive complimentary software that adds specialized features, such as tax accounting and computer game packages.

This was a fast changing, highly competitive, and technology driven industry during the mid-1990s. Retailers were profiting a little from PC sales, and the market was becoming over-saturated. A fierce battle for market share forced prices down. The rate of returns for PCs was higher than the vendors and retailers desired. Some retailers were even treating PCs as loss leaders.

Personal computer sales dropped to 10 to 15 percent from 25 to 30 percent during 1995. Weak sales led to the bankruptcy and closure of many stores. Tandy Corporation was one of the victims, with the 1997 sale its Incredible Universe and Computer City outlets, due to falling sales. Nester Retail Group was another victim. This chain also reported its failure to keep up with competition from Circuit City and Best Buy.

Unable to keep up with the increasing competition and continually declining profit margins, Best Buy was scaling back its expansion plans. According to *The Wall Street Journal*, Best Buy attempted to compensate for its diminishing gross profits by offering an assortment of non-computer items that carried larger margins. This move indicated the financial difficulty that large computer retailers were facing.

One trend the industry adopted was to concentrate its marketing efforts on higher margin computer peripheral equipment, such as printer supplies and cables, as well as providing technical support. Add-on and accessories, such as tape-drives, computer cases, cabling, and joysticks, were also used to make up for the low PC profit margins. Innovative means of selling these accessories were being adopted.

Software sales were also targets of innovative marketing strategies. CompUSA introduced the software sampler program in 1996 to allow customers to sample software before purchasing it. Companies like Microsoft were jumping on the innovative software marketing bandwagon and creating in-store boutiques for consumer electronics stores and computer superstores in 1996.

Retail information systems executives revealed, in an industry survey to *Computerworld*, their beliefs that the key to their success would be a stronger focus on the consumer, but the average computer shopper would be skeptical of their understanding of this concept. They felt superstores could help customers find products by installing video kiosks throughout the store to give directions.

With the focus on consumers, computer retailers were also becoming increasingly aware that female con-

sumers were purchasing a larger amount of the computer hardware and software that was entering homes. In 1995, women purchased 49.6 percent of the hardware and 32 percent of the software. Women were also influencing the design and looks of computers.

Toward the late 1990s, the computer retail industry was growing in leaps and bounds. In 1998, sales were up 13.8 percent—PC software sales increased 15.6 percent to \$4.6 billion and accessories and supplies increased by 15 percent to \$5.3 billion. From a manufacturer's standpoint, U.S. shipments of PCs were expected to be more than 40 million in 1999 and nearly 55 million in 2001.

While the demand for computers increased, profits and revenue were under pressure at retail outlets. With the onset of low cost home computers, bottom lines at stores such as CompUSA did not reflect the increased demand for computers and software. IBM lost \$1 billion in 1998 on its PC operations. Some stores shifted gears towards higher margin goods like digital cameras and home theater equipment.

As pressure increased, stores looked to marketing and advertising campaigns to attract consumers. Circuit City, for example, offered a "Free PC" program in June 1999. By teaming up with CompuServe, the store offered the eMachine for free with mail-in rebates with the stipulation that the customer had to sign a three-year contract for CompuServe Internet Service. These rebate programs became more popular in the late 1990s, and large superstores used them to entice consumers away from smaller stores.

Computer stores also faced competition from the Internet and brand name manufacturers. Companies such as Hewlett Packard, Dell and IBM offered their products online, leaving consumers the choice in avoiding the retailer all together. There were also an increasing number of online sites offering computer goods. According to a 1999 *PC Magazine* poll, 46 percent of Internet sales were computer related and Dell Computer Corp. was a favorite among computer shoppers. Software was also a top sales generator in terms of online sales. Software accounted for 6.7 percent of online sales in 1997.

The proliferation of manufacturers into the retail sector was driven by the saturation of the business-to-business market. As corporations and government agencies began to be looked upon as replacement markets, the individual consumer and small business became a target for manufacturers like Dell, Hewlett-Packard, Apple, and Compaq. In the late 1990s, these companies focused on marketing campaigns and strategies that would increase customer awareness of the products they offered.

From the consumer point of view, the increase in technology and decrease in price, was beneficial. Price dropped by 10 percent in 1998—shoppers could pur-

chase a complete system for under \$1000—and price was expected to keep falling into 2000.

CURRENT CONDITIONS

Slumping desktops sales can be blamed on several factors. In the recessionary economy of the early 2000s, businesses cut IT budgets dramatically. According to a survey of 100 chief information officers, conducted by Merrill Lynch & Co. as reported in *Business Week* in January 2003, 63 percent of those surveyed said that their companies were reducing their IT budgets below 5 percent of revenues, the current average for IT spending.

Another reason for stagnated desktop sales is that computer manufacturers focused most of their efforts during the 1990s on increasing processing speed and storage capacity. By the early 2000s, many computer owners had all the speed, memory, and storage needed to operate existing software programs. *Online Reporter* noted in the fall of 2002: “This is 2002, not 1992. As far as the home market is concerned, people just aren’t going to put boxy, noisy, cable-ugly boxes in their living room. And the software is going to have to do a better job of integrating and implementing the consumer’s desired digital media technology and networking.” It is likely that both business and retail customers will wait to purchase another computer until software applications demand that they trade up.

During a period when the IT industry as a whole is experiencing its first period of decline in the past two decades, the notebook computer remains a bright spot. Price decline and an increasingly mobile workforce have spurred sales. Bucking the industry downward trend, sales were predicted to grow by nearly 9 percent in 2003.

Because computer processing speed has surpassed software requirements, the short-term future of the industry will likely revolve around the demand for wireless networking so that all computer and electronic equipment will be seamlessly connected within an in-home or in-office integrated system. As prices decline on handhelds, multi-purpose digital phones, and cutting-edge mini-computers, consumers can expect the market also to surge in these areas.

INDUSTRY LEADERS

CompUSA, headquartered in Dallas, Texas, was the largest computer retailer with revenue of \$6.3 billion, 19,700 employees and 225 stores across the United States before falling on hard times in the early 2000s. CompUSA, Inc. was founded in 1984 as a provider of software to deep discounters and corporate customers. By any measure the company has been tremendously successful, parlaying a discount sensibility and vast product holdings into a position as an industry leader. In 1988, the company opened its first superstore; by 1993, it owned 45

outlets in 28 metropolitan areas and claimed half of the superstore computer market in the United States.

Once nearly bankrupt, CompUSA was a thriving retail chain in the mid-1990s. According to *Business Week* part of the company’s success rests in its decision to bolster services such as training and support to deal with falling margins in the retail end of the business. CompUSA recorded a \$16.8 million loss on \$2.1 billion of revenue in 1994. CompUSA announced record earnings of \$1.2 billion for the second quarter of the 1997 fiscal year.

CompUSA bought the Computer City chain from competitor Tandy Corporation in late 1997, but CompUSA was unable to make a profit on its Computer City stores, which continued to lose money. Increased competition in the industry led the company to weak sales in 1998, and it closed 14 stores in 1999. In March 2000 the company became a private company after being purchased by Mexico-based retailer Grupo Sanborns, which is working to revamp the computer giant’s bottom line.

Consumer electronics stores like Best Buy and Circuit City, were considered some of the biggest competitors of CompUSA. As Best Buy’s home office category averaged roughly 35 percent of total sales each month, its leadership in the computer market was growing as was Circuit City’s. Department stores like Wal-Mart also had competitive computer retail departments focusing on software.

WORKFORCE

More than 20 million workers were employed in the retail sector in the late 1990s. According to the National Retail Federation, in 1999, a large percentage of this industry’s work force was made up of sales staff, including managers, with the remainder of the work force in technical support, marketing, and administration. Retail buyers and merchandise managers in this industry negotiate prices with suppliers and wholesale distributors. Technical support staff handle customers’ problems with both computer hardware and software; as computer backgrounds are required for these positions, salaries ranged from \$30,000 to \$60,000 per year, depending on the type of products sold. Sales workers, who directly service customers, often work on a part-time basis, with a starting salary at minimum wage, plus commissions on sales, depending on the store. For retail sales workers at the managerial level, salaries averaged \$450.00 per week. Stores that did not offer commissions with salaries frequently featured bonus plans as sales incentives.

The job outlook for retail sales and marketing staff was expected to increase at a healthy clip for several years. Technical support staff was expected to be the fastest-growing sector of this industry, as well as IT professionals. Part-time positions for non-technical sales

staff have often been available due to a high turnover rate; in addition, sales staff is often hired on a temporary basis during peak selling periods, such as Christmas.

AMERICA AND THE WORLD

The United States and Japan continued to be the top producers of computers and related equipment throughout the late 1990s. This dominance has been reflected in retail sales, but retail stores have not been a primary factor. Direct and mail-order sales dominate the international market for the retail sales of computers.

According to the OCBE, "reacting to a saturating U.S. market and increasing foreign competition, U.S. suppliers continue to look abroad for sales and expanded market share, with some companies selling as much product overseas as they do domestically. Foreign vendors also seek to become global players, as reflected in the efforts of major Asian suppliers to enlarge their presence in the huge U.S. market." American computer exports were expected to increase to \$70 billion in 2003, an increase of nearly 10 percent. Demand was expected to remain strong in Canada and Europe, with the largest PC markets being Germany, Great Britain, France, and Italy, and Latin America. Exports were expected to increase to Asia, as the economy recovered from a recession due to the Asian economic crisis. While Japan has been one of the major exporters of PCs, computers became more popular there in the late 1990s. Skepticism about the benefits of PCs, limited office space, and the relatively higher prices when compared to the West, made it difficult for American dealers to penetrate this market, but nevertheless, the United States has boosted its presence in that area.

In the late 1990s, American superstores selling computers and software entered the European market, which was dominated by a few European retailers, such as Vobis Microcomputer AG of Germany. CompUSA and other major chain outlets saw Europe as a potential market for the discount computer store concept. While at first successful, *Advertising Age* noted in 1992 that "industry observers are skeptical that the superstore concept can survive long term in Europe—at least outside the U.K." As many as 50 to 80 American superstores were planned to operate in Europe by the end of the century.

The implementation of The Information Technology Agreement (ITA) was also expected to have a great impact on this industry. The agreement, which would eliminate tariffs on certain products, went into effect in July 1997 and the United States should benefit in terms of exports and as a global player. Nearly 95 percent of information technology products in world trade fall under ITA. Some countries involved in the agreement include the United States, Canada, the European Union, Japan, and Switzerland.

RESEARCH AND TECHNOLOGY

Like other retailing businesses, establishments in this industry have continued to increase their reliance on computers at a physical store level, which have simplified many routine buying functions of retail buyers and have improved efficiency of in-store sales staff. Many computer and software retailers rely less on sales staff for inventory counts and increasingly on point-of-sale computer terminals, which provide up-to-date inventory and sales information. Point-of-sales data that are fed into a computer system are taken from the item's bar code and includes information such as price, model number, color, and size.

These stores continued to also look for ways to make shopping easier for the consumer through advanced technology. For example, Circuit City began using Wyse Winterm Windows-based terminals in the summer of 1999. Offered by Wyse Technology, these terminals allowed for consumers to customize computer options by accessing vendor information. Chief information officer of Circuit City commented that the company, "searched for a cost-effective and high-performance solution that would allow us to offer our customers high levels of customer service through our build-to-order kiosk stations and service center applications."

Advances in Internet retailing have also changed the face of the typical computer retailer. The National Retail Federation predicts that by 2003, some 40 million households will be online. In an effort to satisfy that trend, computer retailers scrambled to get their products available online in the late 1990s. Stores like CompUSA offered store branded computers in 1999.

Research and development of new products greatly affects this industry. Technological developments in the late 1990s in computers, communications, and electronics spurred the growth of information and entertainment services. Alliances among different technologies produced inexpensive video, sound, and graphics and text services in digital form and in interactive settings. Products in this combined information and entertainment market are designed for personal, educational, and business purposes, and have included asynchronous transfer mode equipment and communications and systems software. Industry analysts expect enormous growth opportunities for this segment of the retail market upon entering the twenty-first century.

company Best Buy to close 160 Musicland stores and forced Wherehouse Music to shut down 120 stores and file for bankruptcy.

As the industry struggled, fingers were being pointed in different directions. The Recording Industry of America Association (RIAA) was placing the blame squarely on the shoulders of those who promoted the piracy, bootlegging, and illegal free downloading of music. Although Napster, the once popular Web site that provided free file swapping, was defeated in the courts and dissolved through bankruptcy, others, including KaZaA and Listen4ever, stepped in to take over. Others blamed the industry’s demise on lack of creative and inspiring new music available on the market and the overpricing of CDs as the main culprits.

ORGANIZATION AND STRUCTURE

By far, the largest portion of industry market share went to the large national chains, such as Tower Records and Musicland in the late 1990s. Megastores, such as Tower Records, with more than 10,000 square feet of floor space in each store, catered to an eclectic public, stocking thousands of titles in each store. Variety, price, and long hours ensured the megastores’ success. They offered more titles than any other single retail source, carrying esoteric items as well as current hits, and they maintained long operating hours to ensure accessibility.

Many of the larger, big city stores such as the Tower Records on Sunset Strip in Los Angeles were common post-show entertainment for young people. Because these large chain stores buy in bulk quantities, they often receive discounts and thus frequently offer the lowest prices in town. Chain stores tend to have a strict hierarchical organization: sales clerks, buyers, and assistant managers work under a store manager, who in turn answers to company officers. Individual megastores frequently have a large degree of autonomy but rely on the buyers’ and managers’ knowledge of the local market to keep product returns to a minimum.

Small-store chains, like some Musicland outlets, work in much the same way, but without the variety or the long hours. While megastores tend to be free standing, smaller chain stores are usually located in shopping malls, offering customers convenience. They cater to a more general clientele than the megastores, usually centering collections on current hits and reliable standards. With fewer local employees, the smaller chains have clerks and managers but generally do not employ buyers, relying instead on the parent company for inventory selection.

Both the larger and smaller chains use both independent and record company distributors. Many of the largest record manufacturers have branch offices that distrib-

SIC 5735

RECORD AND PRERECORDED TAPE STORES

This industry includes establishments primarily engaged in the retail sale of phonograph records, compact discs, prerecorded audiotapes and videotapes and disks. Establishments selling computer software are covered in **SIC 5734: Computer and Computer Software Stores**, and businesses engaged in the rental of videotapes are included in **SIC 7841: Video Tape Rental**.

NAICS CODE(S)

451220 (Prerecorded Tape, Compact Disc and Record Stores)

INDUSTRY SNAPSHOT

The prognosis for the retail music industry in the early years of the twenty-first century is not promising. Sales of compact discs (CDs) fell almost 9 percent during 2002 and were expected to continue to fall. Brick-and-mortar retailers were losing ground fast to online outlets and downloaded music. While CDs sales had dropped, sales of recordable compact discs (CD-Rs) experienced triple-digit growth. The declining revenues pushed parent

ute records locally. Independent distributors cover the smaller labels and independent record companies, as well as the larger labels in the geographical areas not covered by branch distributors. Chain retail outlets buy from these distributors in bulk, warehousing the units until they ship them to their individual stores. The advantage of this system is, as mentioned above, the price break that bulk buying allows. The disadvantage is in the lack of flexibility for the smaller chains, where individual stores frequently have no control over their own merchandise.

In many areas of the country, small and independent record stores still flourish despite the predominance of chain stores. These stores tend to carry a limited and specialized collection, catering to a specific, local clientele. Large college campuses, for instance, can frequently support stores specializing in rock, jazz, and/or classical music in addition to the local chain outlet. Independent record stores tend to buy products from one-stop distributors.

One-stops are sub-distributors who buy from the larger branch offices and independent distributors and sell to the retail outfits too small to be regular distributor accounts. Because of the smaller quantities and the markup of the one-stops, prices tend to be slightly higher than in some of the larger chains. Because the floor space is smaller than the megastores, the selection tends to be less diversified, although frequently in the specialized stores (e.g., classical only) the selection within one area may be as good as the megastore and better than the small-store chain. The organization of the stores is localized and less stratified; the owners usually manage and work in their stores and employ only a limited supplemental staff. The advantage for the shopper at these smaller stores is the personalized service the knowledgeable staff can provide.

Department and variety stores also sell a small selection of records and tapes, sold as a concession or on consignment from a distributor known as the rack jobber. Rack jobbers buy from large independent and branch distributors to fill display racks at supermarkets, department stores, variety stores, drugstores, discount houses, and bookstores. They deal in the biggest hits of the year, the most popular standards, and the cheap cut-outs and discount collections. "Cut-outs" are the items dropped from production and sold at greatly reduced prices; discount collections are compilations of the most popular works of the standard classical composers and jazz artists, as well as collections of older popular hits, and are designed for the general public rather than the musically-educated listener. The rack jobbers target people who might never go into a record store. They either lease retailer space, taking all of the sales in a concession arrangement, or they split the income from the sales with the retailer in a consignment arrangement.

Different types of mail order and direct-to-consumer sellers also compete with these retail outlets. Two of the biggest record labels, RCA and Columbia, sponsor record and tape clubs, in which members buy items at reduced prices through the mail directly from the company, avoiding the distributor middleman. Many small record companies sell through the mail as well as through retail outlets, as do specialty mail-order houses who sell only in a certain, usually hard to find, category. For example, *The Lady Slipper Catalogue* carries only hard-to-find recordings by women; they sell to small retail outlets as well as individuals.

BACKGROUND AND DEVELOPMENT

Thomas Edison invented phonograph recording in 1877 using wax cylinders; a few years later, Emile Berliner developed the disk format of recording. These two formats competed for a few years, but by the beginning of the twentieth century, the disk format had won. The earliest commercial recordings were sold in music stores that also sold instruments and sheet music. Classical, jazz, and popular song recordings all sold well during this period. The advent of radio provided the public with free music, and consequently, the recording industry shrank. During the Great Depression of the 1930s, record sales dropped 90 percent from their peak in 1927. Coming to the failing industry's aid, however, were the technological developments of the radio industry, especially microphones, amplifiers, and a new electrical method of recording. In the late 1930s, Jack Kapp of Decca cut the retail price of records from 75 cents to 35 cents, jukeboxes became the rage, and radio began to rely as much on recorded music as live music. In this period, record sales picked up considerably. Soon small neighborhood stores devoted solely to selling records became prominent retail outlets.

The world of marketing changed dramatically in the 1950s, affecting every retail industry. Chain stores expanded and supermarkets replaced corner grocery stores; practices of bulk buying at a discount and mass advertising to sell volume business took hold. New forms of record merchandising grew to compete with, and eventually take over, the small independent record store. Initiated by Sam Goody in New York, some merchants began to sell records at discount prices with the greater volume of sales making up the profit difference. Distributors began to give major retailers discounts for buying in bulk, further fueling the war between the large and the small business. Department and variety stores began to sell a limited selection of records; rack jobbers who each handled many different stores would buy albums at bulk discounted prices and sell them at prices lower than the small retail stores were able to offer. In 1955, Columbia started the first record club, which sold items to members through the mail at discounted prices. This innovation

introduced more competition to the record store industry; consequently, many small dealers were out of business by the end of the decade.

During the 1960s, the rack jobbers and their department store accounts all but completely took over the industry. In 1961, rack sales accounted for only \$47 million in sales while other retailers took in \$305 million; by 1965 the two were almost equal, with rack sales pulling in \$365 million and non-rack sales drawing \$372 million. By 1970, rack sales accounted for 70 percent of the total sales. The rise of large chains in the 1970s, though, and especially the full-line megastore that offered unparalleled selection, brought more business back into the hands of the record stores.

During the 1980s, the new compact disc (CD) format, with its greatly enhanced fidelity, completely revolutionized the industry. While cassette tapes had existed side-by-side with records for over a decade without overtaking the record format, by the early 1990s, companies halted record album production in favor of CDs. The popularity of compact discs showed no signs of abating. The Recording Industry Association noted that almost half of all American households in 1993 had CD players. Other association statistics indicated that shipments of CDs in 1993 increased 21 percent over the year before (to approximately five million total units) while cassette tape shipments dropped more than 7 percent in 1993 (to approximately 3.4 million units).

Because of the greater durability of CDs and the much higher prices (about 50 percent higher than records during the years both were sold), Warehouse Entertainment and other major retail chains began to move into the used record business, joining small independent music outlets that commonly bought and sold used CDs and tapes. This area had been the last bastion of the independent retail store. "Furious because they don't make any money off used CDs," commented critic David Browne in *Entertainment Weekly*, "four major distribution companies—CEMA, Uni, Sony, and WEA—stopped underwriting newspaper advertising for those stores that carry them. That move alone was expected to cost the stores hundreds of thousands of dollars in lost revenue."

It was also noted that royalties were not paid to performers and songwriters on used CD sales. Retail outlets, however, reacted angrily instead of backing down, especially when CEMA refused to allow retailers dealing in used CDs to carry a new record by major recording artist Garth Brooks. Warehouse Entertainment, according to *Billboard*, filed a suit, claiming that the distributors "conspired to unreasonably restrain trade and commerce in used CDs by withholding cooperative advertising dollars from retailers who buy and sell used discs." Independent outlets joined the fray as well, pointing out that many observers have cited artificially high

CD prices charged by the manufacturers as a primary reason for the popularity of used CDs.

The Independent Music Retailers Association, in conjunction with two small independent chains, filed a suit in August 1993, charging among other things that the four distribution companies "violated a federal antitrust statute known as the Robinson-Patman Act, which states that businesses offering promotional allowances must offer the proportionally equivalent terms to all customers," according to *Billboard*. As the number of class action lawsuits grew, the Federal Trade Commission began to investigate. Faced with a storm of legal and business turmoil, the distributors finally dropped the controversial new policies, putting an end to the matter.

During the 1980s and early 1990s, computer technology and cable television created new retail avenues for recordings. Home shopping channels began selling CDs and tapes, as did electronic department stores such as Compuserve. These new retail outlets began to have a small but definite impact on the traditional retail outlets.

While the industry continued to profit, the recession of the early 1990s still had an impact and slowed industry growth. In 1990, record producers raised the prices on both CDs and cassettes, and sales started to slide. The 10 percent growth rate of 1989, as reflected in new store openings, slowed to only 3 percent in 1990; chain acquisition and consolidation almost came to a standstill. The following year saw a shortage of hit tunes, which further depressed the market, and retailers continued to tighten their belts. New store openings decreased further, and stock orders to wholesalers were down 11 percent.

In 1992, despite sluggish sales and the slowest growth in the industry's history, down to 1.04 percent, the larger firms still showed profit, and some investors were still committed to the market. Musicland opened 109 new stores, saw income increase from \$62.3 million to \$69.3 million, and raised \$136 million by selling 17.09 million shares of stock publicly. Blockbuster Entertainment, a video-rental chain, bought several music retail outlets and announced further expansion. Lynch bought the California-based Warehouse chain. Thus, even when sales were slow, the music retail business remained a profitable venture.

The growth of the compact disc industry helped the music industry to reach unit sales worth more than \$10 billion for the first time in 1993. However, dollar and unit volume sales for album-length music cassettes declined for the same period. According to *Television Digest*, the sales increases in 1993 was considered a sign that the industry had managed to meet consumer demand for different music types.

By the mid-1990s large bookstores started retailing recorded music. Borders and Barnes and Noble added

huge music sections to their bookstores while also introducing in-store music booths, where consumers could listen to the records before they bought them.

The mid-1990s was characterized by continued corporate reorganizations through acquisitions, although at a lesser rate. The year 1994 also saw the rise in manufacturers' prices of sound recordings on both CD and cassette formats. According to *Billboard*, this trend was counteracted by retailers who competed aggressively with each other in discount pricing. However, this led to the pruning of retail profits since the increase in sales as a result of lower pricing was not enough to offset the fact that there were just too many outlets selling music.

The financial troubles of the music retail industry shook up the entire sound recording business in 1996. According to *Billboard*, record labels were affected by the financial problems of retailers as well as the slowdown in the sale of catalog albums. To beef up sales, a new marketing concept was adopted in sound recording retail operations. In-store tours by the musical artists themselves was perceived to benefit both the consumers—who were honored by the presence of their favorite recording stars and the retailers—who were able to sell more records to crowds that attended such affairs.

Introduction of online retailing, the reorganization at the music distribution sector and the record-club debate were prominent concepts of the mid- to late-1990s. According to *Market News*, the annual communications industry report forecast that recorded music would be one of the fastest growing sectors of the communications industry with a five-year growth rate of 8.2 percent and gross expenditures of \$14.903 billion by 1998.

In the late 1990s, many different types of establishments sold records, compact discs, and prerecorded tapes. Independent record stores, large, national and international chains, and department and variety stores were included in this sector. Several different types of distributors served the retail outlets, depending on the size and type of stores. Rack jobbers served the department stores, one-stops served the small specialty shops, and major recording company branch distributors and independent distributors served the large chains. Since this industry is essentially devoted to the sale of luxury items, its economic health has depended greatly on the economic health of the nation at large. The stable economy of the late 1990s along with consumer confidence boosted sales in this industry once again, after a dismal performance in the early to mid-1990s.

According to the Recording Industry Association of America (RIAA), in 1997, "more music consumers (86 percent) shopped at retail outlets than in the past eight years. However, the gap continues to narrow between purchases made at traditional record stores versus other

retail stores such as consumer electronics stores and specialty stores (515 versus 34 percent). The percentage of consumers who purchased from tape and record clubs (9 percent) dropped to the lowest level since 1990." Another shopping venue in this industry that became increasingly popular was Internet sales through sites such as Amazon.com. In 1998, approximately 1.1 percent of music buyers used this venue to do their shopping. This percent tripled from 1997 and was forecast to grow substantially into the next millennium.

After being hit hard by lagging sales, consolidation, and bankruptcy in the mid-1990s, music retailers finally recorded positive sales in 1998, the strongest year of the decade. According to RIAA, recorded music sales nearly reached \$14 billion in 1998, with shipments of CDs up 12.5 percent to 847 million in 1998, and dollar value up 15.1 percent to \$11.4 billion. In 1998, music videos were also a hot commodity with an increase of 45.9 percent in shipments, and DVD music video shipments were worth \$12.2 million. Cassettes represented just over \$1 billion in sales, although shipments dropped 8.2 percent to 158.5 million in 1998, while dollar value decreased by 6.8 percent to \$1.4 billion. This gain was attributed to a strong flow of top releases, renewed interest in the music sector, the stable economy and a high consumer confidence level, and advances in technology.

As well as seeing a change in sales and profits, the music retail industry saw major restructuring in the late 1990s. Trans World Entertainment purchased Camelot Music, and Warehouse Entertainment acquired Blockbuster Music. In an effort to reduce debt, many large companies such as Tower Records, National Record Mart, and the Musicland Group were involved in IPOs, bond offerings, and private placements.

Online retailing also played a major role in this industry in the late 1990s. Amazon.com and CDNow encroached into the traditional music store scene, forcing retailers to offer online shopping. According to a survey held by the National Association of Recording Merchandisers, 70 percent of "brick-and-mortar" retail stores had an Internet site. Internet sales also accounted for 1 percent of chain stores' music sales and 3 percent of independent retailers' sales.

Aggressive marketing plans focusing on the consumer also were part of retailers' strategies in the late 1990s. For instance, Musicland launched a campaign to push its Musicland, Sam Goody, On Cue, and Media Play stores into the public eye. These stores advertised heavily in teen magazines, offered promotions on college campuses, and in some locations, presented free in-store concerts. According to Marcia Appel, senior vice-president of advertising for Musicland, "the advertising is not just centered around one new release or 10 products on sale. It

really is being branded to become attached to the customer's heart.'"

CURRENT CONDITIONS

The recorded music industry entered a crisis stage in the early 2000s. Sales continued to fall annually, down from \$14.7 billion in 2000 to \$13.7 billion in 2001. Sales fell again in 2002 by another 9 percent, with an expected 6 percent decline in 2003. With the advent of file swapping, CD singles have been especially hard hit, with sales down nearly 80 percent.

The RIAA has been vigilant in its campaign to blame the dizzying decline in the sale of CDs on piracy and bootlegging music via digital downloads. With the rapid proliferation of recordable CD drives and MP3 technology, the ability to download music to a MP3 player or burn it to a CD has become commonplace. The industry has already spent over \$1 billion combating piracy through court and legislative actions but has struggled to stem the flow of free file swapping.

Other factors have also contributed to declining revenues at music stores. The industry is releasing fewer new titles. In 1999, about 38,900 new titles hit the market. According to the research firm Nielsen SoundScan, by 2001 that figure had dropped by more than 20 percent to 31,734. Although releases increased to 33,443 in 2002, that number is still 14 percent lower than in 1999. Also the music that is being offered has not caught the public's attention. "The music industry's [modus operandi] is to throw things against the wall and see what sticks," Nathan Brackett, a senior editor at Rolling Stone, told *Business Week Online*. "If they're throwing 20 percent less stuff out there, there's less chance something will stick." Prices have increased (7 percent between 1999 and 2001) so that a DVD movie carries a price tag similar to the movie's CD soundtrack, a fact that does not go unnoticed by consumers. With selection decreasing and prices increasing, the result has been declining revenues.

Six retailers—Best Buy, Tower Records, Virgin Entertainment, Warehouse Music, Hastings Entertainment, and Trans World Entertainment—account for 40 percent of all recorded music sales, with discounters such as Wal-Mart and Target also controlling a significant segment of the market. As a mature market, the industry will be required to catch up to the digital age or wait for their impending demise. In an attempt to revamp their relations with consumers, music stores are gearing up to provide more options than the traditional prepackaged CDs by making plans to offer both in-store and on-line digital downloads. However, until the industry gets control over free file swapping, the challenge will be to get music lovers to pay for what they can get for free on the Internet.

INDUSTRY LEADERS

In 1999, Musicland Stores Corporation, MTS Inc., and Warehouse Entertainment dominated the retail music industry. The three were ranked one, two, and three, and together accounted for more than \$3 billion in sales.

The leading music chain in 2003 was Musicland Stores. Based in Minneapolis, Minnesota, the company operated 1,300 Musicland, Sam Goody, On Cue, and Media Play record stores. The company had overall sales revenue of \$1.88 billion. When Jack Eugster took over Musicland stores in 1980, the chain was losing money for its parent corporation, Primerica. Eugster installed a state-of-the-art computer inventory system, applied his merchandising expertise gained from years with Target Stores and The Gap, and turned the company's sales around. In 1988, he assisted Donaldson, Luftkin, & Jenrette in a leveraged buy out of the company and became part owner himself. He added 200 new stores and doubled sales to \$1 billion, making The Musicland Group the country's largest music retailer in 1993. Musicland was sold in January 2001 for \$685 million to Best Buy. In 2002 lagging sales motivated Best Buy to close 160 Musicland stores and place the company for sale.

MTS Inc. operated 120 stores along with franchise operations in the United States and across the world in 2003. The company owned Tower Records, Tower Books, Tower Video, and WOW! Superstores. MTS focused on online growth as well as international operations in an attempt to combat increased competition from Internet retailers and discount chains. Suffering along with the rest of the industry, MTS posted a net loss of \$57.2 million on revenues of \$983 million in 2002.

Another notable company in the industry was Trans World Entertainment Corporation with sales of \$1.3 billion, but a net loss of \$28.5 million in 2002. It purchased Camelot Music Holdings in 1999 and operated more than 900 stores under names such as Camelot Music, Record Town, The Wall, Coconuts, Strawberries, and Spec's Music. Trans World also operated F.Y.E. stores, which offered music, videos, games, and electronics, and also offered products online.

Warehouse Entertainment Inc. became a major music retailer in 1998 when it purchased Blockbuster Music. However, in February 2003 declining sales pushed the company into bankruptcy for the second time in 10 years, leading the company to close approximately half of its 370 stores. In 2002 Warehouse lost \$53.2 million on \$604 million in revenues.

WORKFORCE

According to the National Association of Recording Merchandisers, there were nearly 35,000 workers employed in this industry in 1998. Most retail stores relied

heavily on low-wage clerks for the basis of the workforce, and record stores were no exception. There were nearly three times as many hourly workers compared to salaried employees. Because of the specialized nature of music, most outlets tried to employ people with some musical knowledge, but this was far from universal. The small chain stores selling standards and current popular hits have the least need and ability to hire knowledgeable staff; the best of these stores hire young people with some awareness of current popular culture.

The megastore chains depend on musically aware young people as well and reward hard work and musical knowledge and experience with swift promotions to buyer and management levels. The best of these outlets employ knowledgeable and dependable staff who often have some sort of musical education. Frequently, the companies will hire people with musical knowledge rather than business knowledge and provide their employees with business classes at their national meetings. The small, independent stores hire a predominantly knowledgeable staff, particularly the specialty shops. For example, many stores that sell only classical music are run by and employ musicians and others with college-level music degrees. It is not uncommon for young, struggling rock musicians to work in record stores as they try to get their performing careers started.

AMERICA AND THE WORLD

Music retailers looked to global expansion as trade barriers made it easier to do business abroad in the late 1990s. Tower Records, for example, had successful operations in Japan and the United Kingdom. While North America represented 33.8 percent of global music sales in 1997, Europe accounted for 33.3 percent, Japan had 16.5 percent, and Latin America brought in 6.8 percent of global sales. Latin America was considered the largest emerging market with a 40 percent growth rate. With other parts of the world accounting for large portions of music sales, American-based companies looked for opportunities to expand overseas into the next millennium.

MUSICAL INSTRUMENT STORES

This category covers establishments primarily engaged in the retail sales of musical instruments, sheet music, and similar supplies.

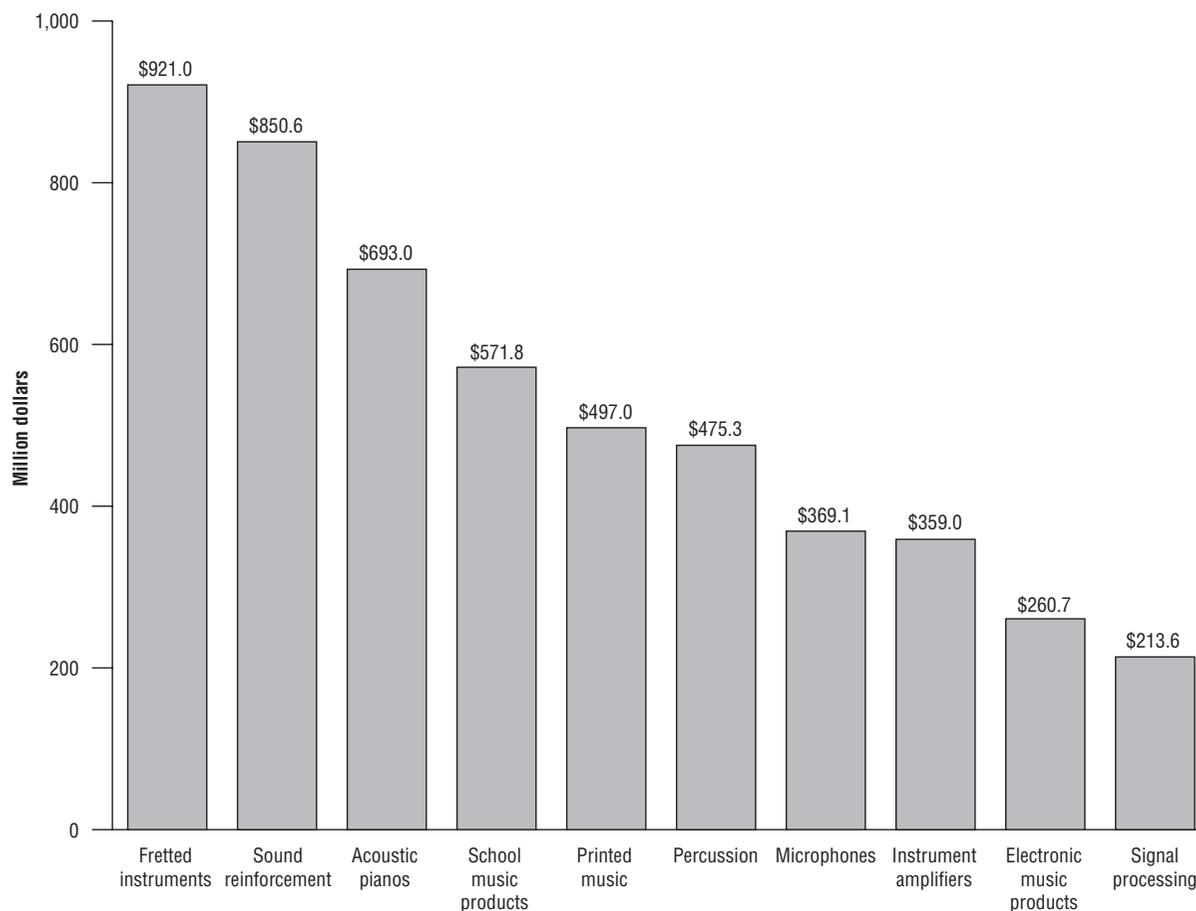

NAICS CODE(S)

451140 (Musical Instrument and Supplies Stores)

In 2001, the U.S. Census Bureau reported 4,358 establishments engaged in the retail sales of musical instruments, sheet music, and similar supplies. Total employees numbered 34,142 people with an annual payroll of \$765.9 million. The total number of establishments increased to 10,443 in 2003, and there were 40,034 people employed within the industry. The annual sales totaled \$4.8 billion, with the average sales per establishment generating about half a million. The majority of

musical instrument stores were concentrated in California with 1,335, Texas with 687, New York with 646, Florida with 580, Pennsylvania with 438, and Illinois with 413. Combined, these firms controlled more than 40 percent of the market.

Musical instrument stores represented the majority of the market, with 7,285 stores comprising more than 69 percent of the overall marketplace. Stores retailing pianos numbered 1,218 and accounted for more than 11 percent of the market. There were a total of 713 stores engaged in the sale of sheet music, 359 stores retailing string instruments, 375 selling organs, 156 selling keyboard instruments, 121 dealing in percussion instruments, 98 retailing band instrument, 93 retailing wind instruments, and 25 selling brass instruments.

According to a study by *Music Trade* magazine, sales in this industry increased at an annual rate of 7 percent during the 1990s. Following a slack market in the

1980s, the industry evolved into a \$6 billion dollar trade by 1999. Electronic instruments, particularly keyboards and electric guitars, generated nearly a quarter of all musical instrument sales.

Musical instrument retailers cater to a wide consumer base, ranging from parents of student musicians to professional performers. In general, the industry is dominated by independent family-run businesses. Some firms in this industry succeed within a limited niche, such as sales to schools and senior citizen groups. Industry analysts predicted several prime areas of growth in retail sales of musical instruments as the 20th century drew to a close. Among the rising markets were sales of student pianos and band instruments, which were expected to increase in accordance with the annual 1.2 percent increase of the number of children between the ages of 5 and 13 in the early part of the new millennium. Additionally, nostalgic-minded baby-boomers displayed a renewed interest in

traditional and acoustic instruments—especially guitars. Demand for electronic instruments was poised for growth also, as home computer sales increased.

The independent retail outlets that dominated the industry faced potential challenges from the aggressive marketing and low pricing of mail-order discount companies during the 1990s. Some stores dealt with these new competitors by discontinuing high-end inventories that overlapped with the mail-order products. Also during that decade, the impact of superstore-type retail outlets for musical instruments began to be felt. Most imposing among the superstores were Guitar Center of Agoura Hills, California; Sam Ash Music Corporation of Long Island, New York; and the Music and Recording Superstores (MARS), headquartered in South Florida. The MARS chain reported \$100 million in revenues from approximately 22 stores in 1998. MARS showrooms are “like candy stores for any kid or adult with even the faintest glimmer of musical interest,” according to Jodi Rodgers in South Florida Business Journal. MARS, established in the late 1990s, grew rapidly and went public in April of 1999. Likewise, Guitar Center experienced a swell of growth after an IPO in 1997. The stock value more than tripled within two years, and Guitar Center, which first opened its doors in Beverly Hills, California in 1964, grossed \$391.7 million in sales for the fiscal year ending in 1999. At that time observers agreed that the retailer had effectively saturated U.S. markets on the Atlantic seaboard. With 1,730 employees and more than three dozen stores across the United States in 1999, Guitar Center was the largest public retailer of musical instruments and the largest among the superstore retailers.

Guitar Center’s sales reached \$335 million in 2002, up from \$290 million for 2001. Guitar Center continued to further its market presence with 126 Guitar Center stores, 108 of which are located in major markets. Guitar Center diversified and branched out to generate additional market share. For example, in 2001 Guitar Center acquired New York-based American Music Group that had sales of approximately \$30 million for 2000. Now, Guitar Center retails band instruments through its American Music division, which operates 19 family music stores that specialize in band instruments for sale or rent. Its *Musician’s Friend* catalog was another way to generate sales for growth. MARS which once held the number two position in sales ended up going out—of—business. Originally, MARS was going to reorganize under Chapter 11 bankruptcy protection on September of 2002, but the company decided to liquidate all its assets instead. At that time, MARS owed musical instrument vendors approximately \$13.6 million. In addition, there was about \$33 million owed to MARS’ prime lender, Congress Financial.

Sam Ash Music Corporation is the second largest music store with more than 40 stores throughout Califor-

nia, Connecticut, Florida, Indiana, Illinois, Nevada, New York, New Jersey, North Carolina, Ohio, Pennsylvania, Tennessee, and Virginia. Sam Ash Music is privately held and generated an estimated \$350 million for 2003. Other music stores include Brook Mays Music Company located in Dallas, Texas. Brook Mays retails band and orchestral instruments throughout 60 stores in seven states. Hermes Music, a private company located in Pharr, Texas retails musical instruments, recording equipment, and accessories while concentrating on the Latino market.

EATING PLACES

This category includes establishments primarily engaged in the retail sale of prepared food and drinks for on-premise or immediate consumption. Caterers and industrial food service establishments are also included in this industry.

NAICS CODE(S)

- 722110 (Full-Service Restaurants)
- 722211 (Limited-Service Restaurants)
- 722212 (Cafeterias)
- 722213 (Snack and Nonalcoholic Beverage Bars)
- 722310 (Foodservice Contractors)
- 722320 (Caterers)
- 711110 (Theater Companies and Dinner Theaters)

INDUSTRY SNAPSHOT

According to the National Restaurant Association, there are over 870,000 restaurants in the United States with sales for 2003 expected to top \$426 billion. This

represents a 4.5 percent increase over 2002, and when adjusted for inflation, sales in 2003, which marks the thirteenth consecutive year of growth, will be 1.8 percent higher than the previous year. From 1970 to 2001, restaurant revenues showed a steady increase, growing at a compound annual rate of 7.5 percent.

Despite being dominated in the advertising media by the mega fast-food chains, such as McDonald's, most restaurants are small operations. More than 70 percent are independent, single unit businesses with fewer than 20 employees, and one out of every three are owned by a sole proprietor or a partnership. According to the National Restaurant Association, in 2000 a full service food-and-drink establishment had average annual revenues of \$650,000, and a fast-food restaurant took in an annual average of \$585,000.

Eating out has become a stable part of the American lifestyle. In 1955 consumers spent approximately 25 percent of their food money at restaurants. By the turn of the century, in a single day an average of 4 out of every 10 people frequented an eating establishment, and the total portion of the American food dollar spent eating out had grown to 45 percent.

ORGANIZATION AND STRUCTURE

The classification for eating places encompasses a wide variety of eating establishments, including five star gourmet restaurants, roadside cafes, fast-food joints, soda fountains, casual dining establishments, pizza parlors, hot dog stands, tea rooms, and oyster bars, to name but a few. The sector for full-service restaurants was the largest in the industry in 1998, with sales of \$112 billion, or 33 percent of the total food service market, according to the National Restaurant Association. One of the strongest areas within this market was casual dining, that is, moderately priced dining houses offering a comprehensive menu at a reasonable price. Chains of casual dining houses, such as Olive Garden and Red Lobster, had combined sales of more than \$3 billion in 1998, up significantly from 1997. This sector of the industry began to experience a slowdown in growth in the late 1990s due to maturity, competition, and consolidation.

Fast-food restaurants constituted the second largest and fastest growing sector of the industry, with projected 1999 sales of \$110.4 billion, or 31 percent of industry sales. Over the preceding two decades this sector's success provided much of the entire industry's growth, and in 1998, about 78 percent of U.S. households used some form of fast food establishment each month.

The biggest companies operating eating places include those operating single concept chains, like McDonald's, and those operating a number of different fast food businesses, such as TRICON Global Restaurants Inc., which runs Pizza Hut, Kentucky Fried Chicken, and Taco

Bell. Previously run by PepsiCo, the company spun off its restaurants division into a separate, publicly traded company—TRICON—in 1997.

Chain-owned restaurants in general have overtaken independently owned outlets in terms of number of units, possibly due to their greater stability and lower failure rate. This trend was likely to continue throughout the year 2000 through mergers and acquisitions, according to the National Restaurant Association's *Food Service Industry 2000* report.

For 1999, projected sales were as follows: eating places \$238 billion; drinking places \$11 billion; managed services \$23 billion; hotel/motel restaurants \$19 billion; and retail, vending, recreation, and mobile projected sales \$30 billion.

BACKGROUND AND DEVELOPMENT

The eating place industry grew from family-run restaurants and diners to giant chain restaurants of the 1990s. With few exceptions, the best-known names in the business operated company-run or franchised chains. This has long been the case with fast-food restaurants but was becoming true in other sectors of the industry as well. The general wisdom seemed to be that if a concept is successful, it should be duplicated.

Perhaps more than any other single factor, the growth of franchising has been responsible for the proliferation of eating place chains. Since the early 1970s, franchised eating places have almost tripled their share of the market, from just 15 percent of industry volume in 1970 to about 43 percent in 1995, when one in four eating establishments, about 110,000, were franchises.

Franchising's popularity stems from its many advantages, from the point of view of both the franchiser and franchisee. The franchiser company is able to expand rapidly without the expense of acquiring land, plant, and equipment. These costs are normally covered by the person buying the franchise, who pays a royalty to the franchiser—usually about 5 percent of sales—and gives a percentage toward advertising costs. In return for this outlay, the franchisee is assured of name recognition, which normally guarantees high sales. Although buying a franchise may increase a businessperson's start-up costs compared with those of an independent restaurateur, the returns render it a worthwhile investment. Franchised restaurants offer an extremely low risk, compared with independent eating establishments. Failure rates within the first year are low. Franchisees also benefit from the training and marketing support of the parent company.

The price to be paid for franchise security is a loss of flexibility. Independent restaurant owners are able to plan their own menus, avoid paying a royalty, and create and run their businesses as they see fit, whereas franchisees

are restricted by the normally rigid and formulaic terms of the franchise agreement.

Though many of the best known fast food and casual dining chains are franchised, including McDonald's, Wendy's Old Fashioned Hamburgers, Burger King, and Pizza Hut, many other successful chains are not. Sales for the largest of the nonfranchised chains, the Red Lobster and Olive Garden casual dining houses, both owned by Darden Restaurants, was nearly \$3 billion in 1995. Of course, even in the case of the heavily franchised chains, such as McDonald's and Wendy's, the parent company owns a considerable share of the outlets.

The exit of packaged food companies from the restaurant business, a trend that reached its peak by early 1997, created more room for franchisers. After Hershey, Sara Lee, and Ralston Purina had already jettisoned their restaurant operations, General Foods did the same in May 1995 when it spun off its Red Lobster, Olive Garden, and China Coast (which later closed) restaurant chains to form the new public company, Darden Restaurants. Similarly, in early 1997, PepsiCo announced that it would spin off its restaurants division—which included Pizza Hut, KFC, and Taco Bell—into a publicly traded company. With PepsiCo's exit, no U.S. packaged food company had a significant presence in the restaurant industry.

As the competition grew more intense in the 1990s, operators became more litigious, going to court in increasing numbers to protect their trademarks and trade dress. The easing of the burden of proof for companies filing trade dress litigation in March 1992 opened the gates for a flood of copycat suits. Defined as the overall appearance that makes a business distinctive, trade dress is becoming more of an issue of contention between competing chains. The Hard Rock Cafe, the Chicago-based Lettuce Entertain You Enterprises, Starbucks Coffee, and the Green Burrito are just a few of the many companies that have brought lawsuits against competitors, charging that their ideas have been plagiarized. Successful suits are extremely profitable and can put the competitor out of business. In 1992, the Houston-based Two Pesos chain was forced to pay \$3.7 million to the Taco Cabana chain of San Antonio after a court found that it had wrongly appropriated aspects of the latter's trade dress.

The restaurant business was healthy in the late 1990s, when more than half of the adult population visited an eating place each day. With a steady economy and high consumer confidence level, restaurant and fast-food sales grew steadily and industry profitability was up. The National Restaurant Association's *1999 Foodservice Industry Forecast* stated that strong economic growth and soaring consumer sentiment, "helped drive stronger-than-expected growth in 1998. In 1998, more than 50 billion meals were consumed in restaurants or in cafeterias."

The buoyancy of the industry can be traced to a number of factors: women's increased role in the workplace has left them with less time to spend preparing food at home; the proliferation of fast-food and takeout eating places has broadened consumer choice and made eating places a convenient alternative to home-cooked food; and food prices have remained low since the early 1990s, enabling the industry to offer competitive prices, although in 1998, menu prices increased 2.5 percent. More aggressive promotion by eating places of their value for money has resulted in a shift of business from food stores to eating places. According to the National Restaurant Association, "statistics indicate that restaurants have become an increasingly important part of the American lifestyle over the past few decades. About 44 percent of the U.S. food dollar is currently spent at restaurants and other foodservice operations, compared with only 25 percent in 1955. Additionally, restaurant industry sales have increased almost eight-fold in the past three decades—from \$42.8 billion in 1970 to a projected \$354 billion in 1999. Meanwhile, the number of U.S. restaurants increased 66 percent from 1972 to 1996—from 492,000 to 815,000 restaurants."

With the overall strength of the industry, competition remained increasingly fierce throughout the late 1990s. Eating places were forced to stake out a strong identity for themselves and to pay closer attention to consumers, who were becoming increasingly demanding. In 1999, convenience was nearly as important to consumers as value. More and more people simply no longer had the time, and/or the desire, to cook meals and clean up afterwards. The National Restaurant Association reported statistics indicating that "people would rather dine out than entertain at home. More than two out of three adults (68 percent) say that going out to a restaurant with family and/or friends not only gives them an opportunity to socialize but is also a better use of their leisure time than cooking and cleaning up, according to 1998 Association research. Furthermore, more than one out of two consumers (56 percent) report that they are not entertaining at home as often as they were two years ago."

Emerging from this focus on convenience was a sort of hybrid of the traditional full-service restaurant and the fast-food outlet—the home-meal replacement segment (also known as "fast-casual"). Pioneered by Boston Chicken Inc.'s Boston Market chain, home-meal replacement offered fare reminiscent of home cooking—and higher in quality than the typical fast food—through a quick-service restaurant operation. Consumers could now take home food closer in quality to that offered by casual dining houses. This segment of the market faced tough competition and lagging sales in the late 1990s. As a result, Boston Chicken declared Chapter 11.

An offshoot of the home-meal replacement segment emerged in the late 1990s. It was a hybrid restaurant/

retail food concept, such as Brinker International's Eatzi's. Also catering to the takeout crowd, these concepts typically look like a market and often offer a wide selection of meal possibilities—some of the gourmet variety—that the customers can combine as they wish and have the onsite chef prepare for takeout. These outlets tend to offer salads, fresh breads, full-service delis, gourmet coffees, and a variety of hot items.

The theme/entertainment restaurant sector was one of the fastest growing areas of the restaurant industry in the late 1990s. In some ways the popularity of such venues was also a matter of convenience, since customers could have their appetites filled for both food and entertainment at the same time. The popular music-oriented Hard Rock Cafe started the trend and was followed by Planet Hollywood (movies), Rainforest Cafe (tropical theme), and Official All-Star Cafe (sports). According to Katherine Paul, in an article published online by Streetnet, "theme-based restaurants serve up side dishes of entertainment and, in many instances, branded merchandise, along with the food."

Meanwhile, the fast-food sector continued to be involved in price wars. McDonald's, Wendy's, and Taco Bell were emphasizing under \$1 menu items. By 1999, however, increased labor, advertising, and beef costs were beginning to force the fast feeders to reevaluate their menus. Many fast-food restaurants began to offer value meals, focusing on the full meal, rather than just one or two items. For instance, McDonald's—offered value meals that are numbered. A customer can order by number and receive a sandwich, French fries, and a drink for a lower price than if these were purchased separately. Consumers also have an option to "super size" the meal. For a nominal fee, the meal could increase in size, an added value for the consumer. The stores also tried to lure consumers with promotional kids' meals. These stores offered popular toys in their meals, spurring intense sales increases during the promotion.

Fast food restaurant growth has slowed due to heated competition. Consolidation, the need for high return on investment, and the reduction of company-owned restaurants have all played a factor in growth development. While the outlook for sales remains strong throughout 2000, new store development is expected to decline.

CURRENT CONDITIONS

Although the restaurant industry has shown overall growth during the past 30 years, the needs and tastes of consumers began to change during the early years of the 2000s, leaving fast food burger chains struggling to maintain their dominant market share. According to market researcher Technomic, as reported by *Restaurant Business* in 2003, burger chains held 37.1 percent of the quick-service market in 1997. By 2002, that had fallen to 35.3 percent. Exacerbating the burger sector's losing

ways is ongoing price wars waged among McDonald's, Burger King, Hardee's, and Wendy's, among others. The widely advertised less-than-a-dollar menu items have the chains beating each other up as profit margins have been worn thin all around.

While traditional burger chains struggle with a saturated market and fat-laden menu image, a new breed of restaurant has made big gains. Termed "fast-casual," these eateries are dominated by bakery and deli-style restaurants that offer fresh-baked breads, a range of specialty sandwiches, and may include coffee or alcoholic beverage offerings. Fast-casual eateries are expanding rapidly, and operations reflect a healthy bottom line. Bakery cafes, such as Panera Bread and Atlanta Bread, generated revenues of \$14 billion in 2001, up from \$13 billion in 2000. Although the trendier bakery shops are leading fast-casual sector, the more traditional sub shops, such as Subway, Quizno's, Schlotzsky's, and Blimpie's, are showing exceptional growth.

In January 2003 *Restaurants and Institutions* predicted that the quick-serve price wars, led by McDonald's one-dollar menu, will continue unabated. While McDonald's tries to crush its competition with price, it suffers from a dated image and market saturation, which have been reflected in declining U.S. revenues. On the other hand, Wendy's, the only burger chain to post an increased market share in 2002, is working on a niche within fast food, namely salads and other healthy menu offerings. Although other burger chains have followed suit, they have not turned the corner on changing their saturated-fats image. Other forecasts in the fast-food sector included an increasing acceptance of payment by credit card, increased number of mergers and acquisitions among the major chains, the additional of new menu items, and a focus on revamping existing facilities.

INDUSTRY LEADERS

The restaurant industry may be highly competitive, but it has a clear leader, the McDonald's Corporation, which recorded total sales of \$15.4 billion in 2002. According to Lebhar-Friedman, at least 96 percent of Americans between the ages of 16 and 65 have eaten at one of 30,000 McDonald's restaurants worldwide. McDonald's spends more than \$1 billion on advertising and promotion every year to make sure that diners worldwide will not forget their logo, the golden arches.

Ray Kroc, the man chiefly responsible for McDonald's success, was a 52-year old malt machine salesman in 1954 when he first visited the hamburger restaurant run by Richard and Maurice McDonald in San Bernardino, California. The highly streamlined operation featured a limited menu of hamburgers, fries, shakes, soft drinks, and apple pie. The absence of any frills and the highly efficient organization of the kitchen accounted for such

savings that the brothers were able to reduce the price of a hamburger from 30 cents to 15 cents. Kroc began franchising the brothers' formula on their behalf, opening his first McDonald's in Des Plaines, Illinois, in April 1955. It proved a runaway success and became the foundation of the McDonald's empire, which grew slowly at first, but later at breakneck speed. In 1961, Kroc bought out the McDonald brothers for \$2.7 million. The following year, he introduced the golden arches as the official corporate logo. McDonald's went public in 1965.

From the outset, the company set itself apart from other franchised restaurants by owning a large proportion of the real estate on which its franchised restaurants are located and holding the leases on virtually all the rest. It selects and develops these sites, for which it later charges the franchisee rent. The upshot is that, although McDonald's invests far more capital per unit in its franchises, its returns are much higher. About 80 percent of McDonald's restaurants are franchised; the remainder are controlled by the parent company. All of the restaurants are serviced by independent suppliers.

McDonald's extraordinary success has been due in no small part to its willingness to be a trendsetter: it was the first fast-food restaurant to offer a breakfast menu (1973); to provide customers with a list of its product ingredients (1986); and to respond to consumers' environmental concerns with the scrapping of its Styrofoam sandwich boxes and the introduction of more environmentally-friendly packaging. It was also first to penetrate the Iron Curtain before the fall of the communist government, opening a restaurant in Moscow in 1990. In the mid-1990s, the company was one of thirty that made up the Dow Jones Industrial Index.

In 2003, McDonald's had more than 30,000 restaurants in more than 120 countries. The company opens a new restaurant every 5 hours of every day, and 8 percent of the American population visits a McDonald's every day. Although national sales growth has slowed from a high of more than 20 percent in the 1970s to just over 10 percent annually, overseas growth remains at more than 20 percent. In an attempt to retain its share of the market, management is giving franchisees more latitude to experiment with decor and menu items. It is also attempting to bolster its position through a "made for you" preparation program which replaced its Deluxe line in 1998.

In terms of sales, Burger King is the second largest restaurant chain in the United States. In 2002, sales were \$1.7 billion. Throughout the 1980s, Burger King, then under the management of Pillsbury, suffered the consequences of high management turnover and a number of failed advertising campaigns. Burger King came under new ownership in January 1989, when it was bought by Grand Metropolitan PLC, a British company. By 1999, Burger King served nearly 1.6 billion Whoppers a year

and had more than 14 million customers daily. The company had 11,500 stores in operation in all 50 states and in 60 other countries.

Three of the nation's top six restaurant chains—Pizza Hut, KFC (formerly Kentucky Fried Chicken), and Taco Bell Corp.—are owned by YUM! Corp. (formerly TRICON Global Restaurants Inc.). Sales in 2002 were \$7.75 billion, and the company operated 33,000 stores in more than 100 countries in 2003. Pizza Hut is the largest pizza chain in the world, and KFC is the world's biggest fried chicken chain, while Taco Bell is the leading Mexican food chain in the United States.

Other major industry players include Wendy's, the nation's third largest chain of hamburger restaurants, with nearly 6,300 units worldwide and sales of \$2.7 billion in 2002; Hardee's, owned by CKE Restaurants, with 2002 sales of \$1.36 billion; and Dominos Pizza, with sales of \$1.28 billion in 2002 from its 7,200 units in the United States and 50 countries. Among non-fast food restaurants, the two Darden Restaurants chains—Red Lobster and Olive Garden—are the largest in the United States. The company posted revenues of \$4.37 billion in 2002.

WORKFORCE

The eating and drinking places industry is the largest employer in the U.S. retail business and provided 11.7 million jobs in 2002. Fifty-eight percent of those employed in this sector are women, 12 percent are African American, and 18 percent are Hispanic. Although 16-to-24 year olds are this industry's main target, in recent years there has been a marked increase in the number of older workers, especially retirees, as operators adjust to a labor shortage. Restaurants are also reacting to the labor shortage by attempting to improve efficiency and productivity and by cutting back on counter service and increasing drive-thrus. According to the National Restaurant Association, finding qualified and motivated employees is an ongoing concern for restaurateurs.

The National Restaurant Association reported that in 1999, "the competition for labor is intense, with restaurant operators competing against one another as well as other retail and service businesses for qualified workers. Top-notch talent can take their pick of offers and frequently change jobs." The Association also noted that "research found that in 1998 executive chefs received a median salary of \$40,000, plus a median bonus of \$4,000; general managers and unit managers earned median salaries of \$48,000 plus a \$7,000 bonus, and \$32,500 plus a \$4,000 bonus, respectively. The research also shows that the industry offers plenty of opportunities for advancement, with three out of five salaried employees having started as hourly workers."

Due to the labor shortage, the late 1990s were also a period of rising wages for workers in the eating place

industry. Many restaurants tried to lure workers by offering competitive wages. In 2001, wages and benefits for full-service restaurants topped out at \$49 billion, while fast-food paid out \$35 billion. In addition to the labor shortage, the industry is also beset by chronic high employee turnover. A survey conducted by the National Restaurant Association concluded that unless more permanent employees came to work in the industry, high worker turnover would continue. A Department of Labor study added that "The problem of labor turnover may be diminished by competitive pressure to reduce costs through greater use of offsite food preparation firms. Labor turnover has also been lowered by firms that offer employees improved training and occupational advancement opportunities. In addition, some firms are increasing wages and benefits to attract workers."

AMERICA AND THE WORLD

Eating establishments are one of North America's most successful exports. McDonald's, the chain with the largest foreign presence, had more than 12,000 outlets distributed throughout more than 117 countries in 1999, accounting for 60 percent of its total worldwide sales. Ninety percent of the new store openings planned for 1999 and 2000 were overseas. Nearly all of the industry leaders have a formidable overseas presence. Restaurants such as Pizza Hut, Kentucky Fried Chicken, Burger King, and Wendy's gained a significant foothold in Western Europe and the emerging eastern European markets during the late 1990s. TRICON had operations in more than 100 countries in 1999, Burger King operated in more than 55 countries, Darden Restaurants had operations in Japan and Canada, and Domino's Pizza is found in more than 60 countries.

According to *Market Share Reporter*, 27 of the 30 top leading international restaurant chains in number of units are American, a clear indicator that the American presence overseas is formidable. The North American Free Trade Agreement increased investment opportunities for U.S. restaurant companies and also increased competition in the industry, as Canadian and Mexican chains began to penetrate the U.S. market.

The majority of restaurant chains in the United States are owned by American citizens, although the number of ethnic restaurants operated by immigrants is increasing. Overseas, the fast-food restaurants with the strongest foreign presence are generally operated by natives of the countries in which they are situated under a franchising agreement, although the parent companies retain ownership of a percentage of the foreign units.

RESEARCH AND TECHNOLOGY

Technological change is sweeping the industry, most profoundly in the area of computerization, but also in the

form of devices to facilitate and speed food preparation and service. According to the National Restaurant Association, "technology is playing an increasingly important role in restaurant operations. Operators are investing in technology to increase efficiency and productivity as well as improve customer service." The association also conducted a survey in which a large number of respondents were planning on increasing technology expenditures from 1998.

The most common dedicated computer systems used in the business in the late 1990s were programmed to transmit information from point-of-order taking to the kitchen and on to a microcomputer used by management. An electronic cash register/point of sale (ECR/POS) system transmitted customer orders to the kitchen where they were either printed out or displayed on a video display unit. The major input device in the system was a keyboard or touch screen unit, part of which was preprogrammed by the manufacturer, part of which could be programmed at the restaurant in line with its specific needs. Hand-held terminals were also in use, enabling waitpersons to key their orders at the table. Display screens were also available that allowed waitpersons to monitor the progress of their orders. Printers in the kitchen issued meal checks. The data was also conveyed to a central microcomputer which used it to keep tabs on operations and to control inventory. A number of independent ECR/POS units could be networked using a powerful microcomputer.

As well as making for smoother restaurant operation, computers produced reports and maintained files for many stores in the late 1990s. For example, says the Department of Labor report: "Menu item files are used to monitor keyboard operations and make changes in items or prices. A labor file can produce numerous reports, including hours worked and different wage rates for each employee who may work at several different kinds of jobs during a pay period." Computers are especially useful in inventory control.

Large restaurant chains have found the new super microcomputers useful for monitoring their various branches. Time-consuming daily or weekly polls of each outlet's business can be replaced by a direct hookup that transmits the information automatically. These innovations save time, increase efficiency, and eliminate errors.

Despite these advances, compared with some other major retailing industries, the eating place sector of the food service industry remains relatively undercomputerized. However, 7 out of 10 table service restaurant operators that have computer access utilize the Internet and use e-mail. Large national chains also have comprehensive Web sites used to communicate with consumers.

Apart from computers, technology is infiltrating the restaurant business in the form of food preparation de-

vices such as microwave ovens, automatic dishwashers, food processors, automatic beverage dispensers, and other automated equipment. A new form of vacuum cooking called "sous vide" is generating a good deal of interest. Although it saves on labor costs and increases efficiency, the substantial investment in special equipment that it requires, as well as the exacting safety standards that need to be observed, was expected to slow its diffusion through the industry at least until the end of the 1990s, according to the U.S. Department of Labor.

Technological advancements were not confined to the kitchen in the late 1990s. A vibrating paging system, for example, which costs about \$5,000 and obviates the need to shout to a waiter when food is ready, was reporting great success in the late 1990s. These were also used to alert customers when their table was available.

Research has also shown that for fast-food restaurants eager to increase the volume and turnover of their drive-thrus trade, double drive-thrus are extremely successful. Having one window for ordering and paying and another for food pickup minimizes the period of stopping during assembly of orders. Fast-food restaurants operating drive-thrus also use wireless, remote control headsets worn by staff to cut back on background noise and reduce errors in order taking and are experimenting with computerized keyboards which allow customers to key in their orders; video systems; and other time saving and efficiency building devices. Restaurants on the West Coast are trying out debit cards, specially coded automatic teller machine cards that are 8 to 15 seconds faster than cash transactions.

SIC 5813

DRINKING PLACES (ALCOHOLIC BEVERAGES)

This category includes establishments primarily engaged in the retail sale of alcoholic drinks, such as beer, ale, wine, and liquor, for consumption on the premises. The sale of food frequently accounts for a substantial portion of the receipts of these establishments.

NAICS CODE(S)

722410 (Drinking places (Alcoholic Beverages))

INDUSTRY SNAPSHOT

In 2001, the drinking establishments primarily engaged in the retail sale of alcoholic drinks numbered 49,973, according to the U.S. Census Bureau. There were 335.2 million people employed within the industry with a shared \$3.5 billion in annual payroll. In 2003, the total number of establishments reached 57,032 establishments employing 370,652 people. The industry generated approximately \$11.7 billion in sales, with the average establishment accounting for \$200,000. States representing the majority of drinking places were Wisconsin with 4,317, Texas with 4,034, New York with 3,980, California with 3,979, Pennsylvania with 3,547, Florida with 2,697, and Michigan with 2,318. Other significant states included Indiana, Iowa, Louisiana, Minnesota, New Jersey, and Washington.

Taverns were the largest sector within the industry, with 21,557 drinking places. Combined, they shared more than 37 percent of the market. Drinking places alone shared about 21 percent of the market. Bars and lounges represented 18.1 percent, cocktail lounges held 11.8 percent, and night clubs had 9.2 percent.

The drinking establishment industry—also known as the bar and tavern industry—dates back to colonial America, which adopted the concept of a roadhouse tavern as a gathering place. The industry, however, is changing rapidly and may not exist in its traditional form by the beginning of the next century. By the late 1980s, some consultants and bar owners were predicting that the corner bar, which sells nothing but alcohol, was heading toward its demise. By way of adaptation, bars and lounges, which serve food and even emphasize the sales of food items over alcoholic beverages have been gaining in popularity relative to establishments that sell beer, wine, and cocktails exclusively.

ORGANIZATION AND STRUCTURE

A profile of the bar and tavern industry in terms of what percentage of the market is represented by larger concerns, such as major hotel lounges versus independently owned taverns, doesn't exist. However, the leading trade association of licensed servers of alcoholic beverages boasted 20,000 members throughout the 1990s.

The small neighborhood bar, the sports bar with menu, the brew pub, and the hotel lounge are generally spread throughout urban and suburban centers in the United States. While they may differentiate themselves in image, ambiance, and type of product served (some, for instance, serve only beer), they often coexist in close proximity to one another. Many have live entertainment, such as music, or associations with celebrities, such as sports bars bearing the name of their athlete-owner.

Most eating and drinking establishments are small, independent operations. In fact, in 1997, more than 70 percent of all establishments employed fewer than 20 employees. Despite the small nature of the industry outfits, drinking places generate more than \$130 billion in business activity such as wages, payments, and sales. Furthermore, sales by on-premise retailers generate more than \$2.5 billion in revenue for state and local government, according to the National Licensed Beverage Association.

BACKGROUND AND DEVELOPMENT

The use of fermented beverages in celebratory rituals and social gatherings has been documented in many parts of the world throughout its history. The public roadhouse was developed by the Romans in the first century A.D. as they built their infrastructure of paved roads. The word pub, in fact, is shortened from "public house," a stopping place for the traveler to rest both himself and his

horse. In the fifth century, Europeans fostered wine-making. In addition, in the tenth century an Arab physician is believed to have discovered the distillation process (for medicinal purposes).

The tavern, or pub, was an important aspect of English culture and was adopted by colonial America. Rum was prevalent at social occasions in early America, as were corn whiskey and hard cider. Tavern patrons were often entertained by performers, including ventriloquists, dancers, and musicians. The pub was also a place where the day's news was spread, as locals listened to travelers passing through from other places. This dissemination of news made the tavern a natural place for the establishment of local post offices.

The tavern owner was considered responsible for contributing to the town's orderliness. Licenses for serving alcoholic beverages dated back to 1672, and they were subject to suspension or revocation for sales to minors, slaves, servants, or intoxicated adults. Throughout the 1600s and 1700s, wine and malt liquors, as well as hard liquor or spirits, were sold. Rum was imported from the West Indies and had begun to eclipse the popularity of hard cider by the early 1700s. The colonies traded fish, tobacco, cotton, and lumber for rum and for molasses, which was then distilled in New England as rum.

England's Molasses Act of 1733 levied a duty on products imported into the colonies. This legislation provided an impetus for independence from England. Numerous historical figures in pre- and post-Revolutionary America that were tavern owners or sons of owners included Samuel Adams, Ethan Allen, William Penn, and Abraham Lincoln.

Prohibition caused the tavern to be replaced by "speakeasies"—illegal establishments where liquor was plentiful to those who provided the correct password. Organized crime gained its foothold in America during this period, as bootlegging flourished and dealers in whiskey and other liquors protected their market with weapons. Following the repeal of the Prohibition Act thirteen years after its passage, the neighborhood tavern reemerged.

Americans were increasingly doubting the healthiness of alcohol consumption in the early and mid-1990s. Medical research linked high alcohol consumption to liver cancer and other degenerative diseases. Smokers who also drink alcohol were found to have 13 times the risk of developing lung cancer as those who neither smoke nor drink. Although some research had found that widespread consumption of wine with dinner in France was responsible for their lower levels of heart disease compared with that of Americans, a 1993 study contradicted that finding. The more recent study concluded that the relative health of the French was due not to their wine consumption, but to their love of vegetables.

The bar and tavern industry has been heavily impacted by the steadily declining consumption of distilled liquor in recent decades. One bar owner in San Francisco described the environment in the late 1980s as “neo-prohibitionist.” In an article in *New York Times* in 1989, Gerry E. Murphy, then executive director of the National Licensed Beverage Association (NLBA), said, “The day of the old bar which just served alcoholic beverages is past.” Indeed, the *U.S. Industrial Outlook* predicted that “Domestic consumption of, and spending for, alcoholic beverages will probably continue to decline, leveling off toward the end of the 1990s.”

In the early to mid-1990s, the eating and drinking places industry as a whole was growing at a steady rate, averaging about five percent increase in overall sales per year. By contrast, sales from bars and taverns (including both alcohol and food receipts) were flat and in some years actually fell. According to the National Restaurant Association (NRA), for example, sales at such establishments fell from \$9.4 billion in 1991 to \$9.3 billion in 1993, rebounded to \$10.9 billion by 1995 but then fell again to \$9.4 billion in 1996 (the latter a drop of nearly 14 percent). The NRA projected 2000 sales of \$11.9 billion, an increase due in large part to the rising popularity of sports bars. This expected increase amounted to a growth of 3.6 percent—a 0.5 percent increase after inflation is accounted for.

Americans’ growing emphasis on healthy eating and healthy living is the primary reason for the slow growth in this category. Self-help programs designed to help people identify and end addiction to alcohol flourished throughout the 1970s and 1980s. Moreover, those who drink alcohol in moderation have become more conscious of caloric measure and the nutritive value of food and drink consumed. In addition, Americans became more disapproving of driving while intoxicated, and groups such as Mothers Against Drunk Drivers (MADD) have gained political and social clout. Rising litigation over the responsibility of drinking establishments for the alcohol consumption of patrons also acted as a force toward lower purchases of alcoholic drinks. The overall effect of this shift in thinking is that the line is blurring between full-service restaurants which serve alcohol and bars and taverns that offer full lunch and dinner menus.

This grim outlook for the alcohol industry as a whole did not portend well for the bar and tavern industry. Many hotel lounges were transformed into combination eating/drinking establishments, or eliminated altogether to be replaced by meeting rooms. Although alcohol items have higher profit margins than food items, food was increasingly being emphasized more than drinks. Renewed interest in wine, martini bars, and sports bars helped stave off a continued decline at the end of the century, stopping the sales slippage with 2000 totals of \$11.9 billion.

While the overall cause in this threat to the industry is the nationwide trend toward healthier living, the signposts of this shift are many. There has been, for the past several decades, a growing acceptance for the nondrinker in social settings. This has occurred in large part because of the widespread recognition of the physical and emotional health problems created by alcohol addiction. The Alcoholics Anonymous program, begun in the early 1900s by Bill Wilson and others, was created to combat the problem of alcoholism through meetings of individuals who identify themselves as having an addiction to alcohol. The number of people who have ended their consumption altogether through this mutual support program is unknown, but is believed to be in the millions. Although people who wished to abstain from alcohol consumption felt social pressure to drink at parties and public gatherings, the stigma associated with “teetotaling” faded until it was almost nonexistent in the 1990s. MADD gained political influence and helped create a stigma surrounding driving an automobile while intoxicated. In addition, several key civil actions brought by victims of auto collisions and their families resulted in increased liability of alcohol servers for intoxicated patrons that leave establishments and cause accidents.

The response of the bar and tavern industry to the liability issue was the education of its workforce about this challenge. A program sponsored by the NLBA called Techniques of Alcohol Management (TAM) certifies bartenders and other alcohol servers in methods of curtailing the problem. The program teaches employees of taverns to identify signs of intoxication in patrons, the effect of food consumption on the rate of intoxication, how to discreetly regulate a customer’s consumption, and the application of state and local laws to the sale of alcoholic beverages. The NLBA reported that over 300,000 bar and tavern employees had participated in the program. A similar program is called Training for Intervention Procedures by Servers of Alcohol (TIPPS).

Several different pieces of federal legislation either hampered the industry or threatened it in the 1990s. President Clinton signed a bill that reduced the business meals and entertainment tax deduction from 80 percent to 50 percent in 1993. The industry immediately began lobbying for repeal of that legislation through separate bills introduced in both the Senate and House of representatives.

A bill under consideration in 1999 included a provision to lower the national blood-alcohol content (BAC) level defining intoxication from .10 to .08. The NLBA opposed this measure on the basis that, of those intoxicated drivers who were killed in auto accidents, 81 percent had a BAC higher than the legal limit of .10. However, several states, including California, had already lowered the BAC to .08 while national legislation was still being considered.

While opposing legislation that was perceived to be harmful to the industry, bar and tavern owners fought back by courting consumers. The rise of sports bars in the 1980s provided an example of industry adaptation to consumer health concerns. In contrast to the dark, smoke-filled bar of past decades, sports bars are lighter, with an updated, high-energy ambiance. The vast majority of such bars, in addition to having televisions for their customers to view, serve full menus of lunch and dinner items. These types of establishment stress a casual atmosphere and efficient but unobtrusive service so that patrons may meet to watch an athletic event and enjoy gathering with friends. Sports bars also target women and families, often tailoring their menu to include light, healthy food in addition to burgers and other American fare. The celebrity element is another prominent characteristic of sports bars. Many are owned by, or named after, athletes, and rely on visits by athletes to publicize and promote the establishment.

Another successful concept of the 1990s has been the brew pub. Although this is a borderline category since many brew pubs derive more than half of their sales from the food they serve, the brew pub—and microbrewer beer generally—has helped to revive both a beer industry on the decline and the drinking places industry itself. According to Michelle Dorfman, writing in *ID: The Voice of Foodservice Distribution*, “brew pubs, by definition, have an on-site brewery and more than 50 percent of the brew product is consumed on-premise.” After gaining initial popularity early in the 1990s, the category has since exploded with more than 500 brew pubs nationwide by late 1996.

Posher alternatives that catered to popular fads such as swing dancing, martini bars became more prevalent and helped rejuvenate the industry. Industry entrepreneurs also embraced the cigar fad of the 1990s, and began to allow their patrons to smoke cigars on-site or created specialty cigar bars that sold a variety of cigars in addition to selling alcoholic beverages. Such innovations were signs that the industry would keep reinventing itself despite all the negative trends.

CURRENT CONDITIONS

While the distilled spirits industry has been lucrative, Federal and state excise taxes play a significant role in the industry. According to the Distilled Spirits Council (DSC) of the United States, “distilled spirits are the most heavily taxed consumer products in the United States.” Not only do the federal and state taxes place a damper on the industry, local taxes also have an effect. The DSC summed it up in its report, “When indirect federal, state, and local taxes and fees are added, the total tax on an average bottle of spirits jumps 51 percent of the purchase price.” This in turn could have a rippling effect throughout the economy by lost jobs, and so forth.

However, the *Food Institute* reported healthy gains for drinking places despite the excise tax concerns for 2003. In fact, there was an increase of 2.9 percent in January of 2003. The United States Department of Commerce reported that alcohol consumption was up 3.9 percent, or \$7,572 million in February of 2004 over the same period a year earlier.

According to Standard & Poor's *Industry Surveys*, the total amount of Federal excise tax collected from the distilled spirits category for 2001 was \$3.9 billion. In 2002, the total amount jumped to \$4 billion. The beer category remained virtually unchanged from \$3.2 billion in 2001, up to \$3.7 billion for 2002. The same held true for the wine category. The Federal excise tax collected for 2001 was \$498.5 million, versus \$513.5 million in 2002.

DRUG STORES AND PROPRIETARY STORES

Establishments in this industry are engaged in the retail sale of prescription drugs, proprietary drugs, and nonprescription medicines and may also carry a number of related lines, such as cosmetics, toiletries, tobacco, and novelty merchandise. These stores are included on the basis of their usual trade designation rather than on the stricter interpretation of the commodities handled. This

industry includes drug stores that also operate a soda fountain or lunch counter.

NAICS CODE(S)

446110 (Pharmacies and Drug Stores)

INDUSTRY SNAPSHOT

In 2001 drug stores posted revenues of \$169.2 billion. Chain drug stores, which account for 51 percent of the industry's over 43,000 stores, took in 73 percent of the income. The industry's top four chains—Walgreen Co., CVS Corp., Rite Aid, and Eckerd—controlled more than 60 percent of the market, up from just 30 percent in 1990.

This industry saw rapid growth throughout the 1990s, encouraging powerful supermarket and mass-merchandise chains to enter traditional drug store markets and forcing the independent drug store industry to compete with these larger companies. In addition, the drug store industry faced narrowing profit margins due to the general push to reduce health care costs in the United States, and as a result, acquisitions and consolidation became prevalent. These factors combined have forced drug stores to concentrate on customer service, expand into niche markets, form partnerships with suppliers and health care providers, and automate operations for increased cost-efficiency.

Drug stores face a future that holds potential for significant growth and harbors unique challenges. The average age of the U.S. consumer is increasing rapidly as the Baby Boomer generation grows older. With an aging population comes increased health care and prescription needs, thus providing a growing customer base for drug stores. However, paper-thin profit margins on prescription drugs, a shortage of pharmacists, and challenges from grocers and discounters may make the road ahead perilous.

ORGANIZATION AND STRUCTURE

As drug stores faced increasing competition from other retailers, chains and independents alike began to vary their store formats in order to differentiate themselves from competitors and strengthen their image as health care providers. As a result, five main store formats emerged within the drug store industry: independents, chain drug stores, mass merchandisers, supermarkets, and mail order.

In 1998, independents grew 10.6 percent over 1997 with \$26.4 billion in prescription sales. In the same year, there were more than 20,644 outlets. According to the National Association of Chain Drug Stores (NACDS), these independent pharmacies filled almost 693 million prescriptions in 1998, an increase of 1.2 percent over 1997. Sales for OTC medications were \$1.3 billion in 1998. Independent drug stores are expected to account for 24.4 percent of prescription sales in 1999.

Chain drug stores averaged 8,958 square feet and offered a wide assortment of goods. Typically, to draw traffic through, the pharmacy was placed in the rear of the store. Some well-known chains that operated conventional drug stores were Walgreen Co., CVS Corporation, Rite Aid Corporation, and Eckerd Corporation. According to the NACDS, chain pharmacies filled 60 percent of all prescriptions, more than four million a day and 1.6 billion per year in 1998. Prescriptions accounted for \$63.3 billion in sales—61.5 percent of sales for chain stores.

Mass merchandisers accounted for 11 percent of all prescription sales in 1998, with \$10.4 billion in sales. The growth rate for this portion of the drug store industry was slowing somewhat, with 5,258 outlets—up from 4,914 in 1997. Prescription sales increased by 16.3 percent in 1998 and accounted for 10.1 percent of total sales. This segment dispensed 272 million prescriptions in 1998, an increase of 7.1 percent from the previous year and accounted for 10 percent of all prescriptions.

This market also includes supermarket pharmacies, which operated 6,963 outlets in 1998. These stores accounted for \$11.4 billion in prescription sales in 1998, an increase of 16.4 percent from 1997. Supermarkets also controlled 11 percent of total prescription sales in this industry. These food stores dispensed 306 million prescriptions in 1998, 10.5 percent of total prescriptions.

OTC sales in supermarkets have also grown. In 1998, sales were \$9.2 billion and projected to increase 7.5 percent in 1999. Mass merchandiser OTC sales were \$9.3 billion and projected to increase 11.1 percent in 1999, independent sales were \$1.3 billion and expected to rise by 3 percent, and traditional chain sales were \$9.7 billion and forecast to be \$10.4 billion in 1999.

Mail order drug stores also play an important role in this industry. In 1998, mail order constituted 13 percent of the prescription and OTC market with more than \$13.4 billion in sales. Mail order dispensed 368 million prescriptions in 1998. A move that started in 1995 and continued to factor into the success of mail order was convincing federal government retirees, who are part of a managed health care program, to order prescriptions through discounted mail order outlets. By using the mail order system, retirees were able to avoid paying the usual 20 percent co-pay. If the retirees decided instead to fill their prescriptions at local drug stores, they were responsible for the co-pay.

The drug store industry relied on four core product categories for a large percentage of total sales in 1998: prescriptions, OTC medications, toiletries, and cosmetics. The chain pharmacy had sales of \$135 billion in 1998 from these segments. Other categories commonly sold in drug stores included tobacco, consumables, stationery,

and housewares. In general, however, drug stores responded to competition by strengthening core product areas in the late 1990s.

Total prescription sales were \$103 billion in 1998, with 2.7 billion prescriptions written. By 1999, that number should increase to 2.97 billion, reflecting growth of 8 percent over 1998. Since 1992, prescriptions have grown by 23 percent. The growth in prescription sales was explained by the fact that prescription rates and prices increased. In 1998, the average cost for a brand name prescription was \$53.51, an increase of 8 percent over 1997. The average cost for generic was \$17.33, an increase of 2 percent over 1997. Some factors that contributed to the increase in prescriptions written were: the aging of the American population; an increase in the percentage of prescriptions reimbursed by third parties, such as insurance companies or government programs; the introduction of new products by pharmaceutical companies; and the availability of generic substitutes for brand-name drugs.

Sales of OTC medications—which included external remedies, cough/cold/flu medicines, and analgesics/digestive—was forecast to increase 8.3 percent to \$32 billion in 1999, or just under 30 percent of drug store industry sales. In 1998, OTCs made up 27 percent of all sales in chain stores, accounting for \$29.5 billion.

Sales of toiletries or health and beauty aids (HBAs) in drug store chains claimed 26 percent of their total sales, or more than \$28.4 billion in 1998. The product mix for a traditional chain drug store in 1997 was as follows: prescriptions, 48.4 percent; OTCs, 12.5; consumables, 8.7; toiletries, 6.2; cosmetics, 3.8; general merchandise, 5.2; photography, 4; and tobacco products, 2.8 percent.

BACKGROUND AND DEVELOPMENT

The drug store industry originated in the mid-1800s, when Americans began using “patent remedies” to treat illnesses. Some early pharmacists operated out of village apothecaries, where they purchased chemicals in bulk and mixed them on the premises to fill prescriptions. Following the Great Depression, pharmaceutical companies grew rapidly and opened sophisticated research facilities. The number of patents issued for drug products increased from fewer than 100 before 1940 to more than 4,000 by the 1950s. Medicines began to be marketed in final-dosage form under a manufacturer’s brand name rather than in bulk as generic ingredients. As a result, the number of drug stores increased, while pharmacists adopted a service-oriented role in dispensing prescriptions.

The drug store industry more than doubled its sales volume during the 1990s, and several factors pointed toward continued growth into the next millennium. For example, the two demographic groups that used the great-

est amount of medication—adults over 65 and children under 10—were the fastest growing segments of the American population in the late 1990s. In fact, the number of people 65 and older increased at twice the rate of the general population, while this age group received an average of 12 prescriptions per person compared to about five for the 20 to 40 age group.

A total of 39,754 traditional drug stores existed in the United States in 1998. There were 19,110 traditional chain drug stores and 20,644 independent stores. The drug store industry as a whole posted a sales volume of \$106.7 billion in 1998. These figures include not only prescriptions and over-the-counter (OTC) drugs sales, but also general merchandise. Prescription sales and OTCs, however, had total sales of \$103 billion in 1998 and made up almost 61.5 percent of all sales in a traditional chain store. Chain drugstores accounted for 40 percent of those sales, while independents took 26 percent of the market. Mass merchandisers and supermarkets claimed 21 percent of the market, and mail order totaled 13 percent. The number of retail prescriptions increased from 2 billion in 1992 to 2.7 billion in 1998.

While this sector of the retail industry continued to see gains, consolidation swept through drug store chains towards the late 1990s, leaving a handful of strong players. CVS acquired Revco and Arbor Drug; Rite Aid purchased Thrifty Payless, Marco, and K&B; and J.C. Penney bought Eckerd Drug, merging it into its Thrift Drug operations. This merger activity was caused by increased competition to offer a variety of merchandise at low costs and the availability of convenience in terms of pharmacy outlets.

The drug store industry also benefited from the trend toward self-medication, and a healthier attitude among consumers in the late 1990s. Drug stores controlled 44 percent of the vitamin market in 1999, and the baby boom generation, which some experts called the most informed in history, often purchased OTC medications, vitamins, and herbal remedies to treat their own symptoms. In addition, the increased availability of generic substitutes for expensive, brand name drugs expanded the overall market for pharmaceutical products.

The continuing success of OTC products prompted regulators to get involved in that segment. According to a March 1999 NACDS press release, “Vice President Al Gore announced a new federal regulation by the Food and Drug Administration designed to make OTC labeling easier for consumers to understand. The new regulation also requires OTC medicine manufacturers to revise product labeling to reflect the importance of consumers consulting with physicians and pharmacists on proper OTC usage.” This action also pointed to the trend of enhanced consumer care in pharmacies and the involvement of pharmacists in consumer purchases. The

NACDS reported that with “fewer hospitalizations leading to more and more procedures being performed on an out-patient basis, as well as the continued discovery of new and more complex drug therapy, there will be an increasing reliance on community pharmacy to educate and monitor patient therapy.”

Another factor that continued to affect the drug store industry into 1999 was the growing emphasis on controlling U.S. health care costs. In 1999, only 8 percent of health care costs were pharmacy related. National health care policies insured more Americans and expanded the market for drugs, but also increased pressure on drug stores to reduce costs and operate more efficiently.

While traditional chain and independent drug stores remained dominant in the late 1990s, supermarkets, mass merchandisers, and warehouse clubs posted gains in prescription sales. Attracted to the industry’s growth, competition from these stores presented significant challenges to drug stores and led to a shakeup among independents and regional chains, evident by the merging or buying out of 35 chains since the early 1990s. Supermarkets continued to hold an important advantage over drug stores in consumer exposure, since the average person visited a supermarket 2.2 times per week compared to once per month for a drug store. Many supermarket chains began competing aggressively for sales of HBAs by cutting prices, increasing advertising, and emphasizing the convenience of one-stop shopping. In addition, supermarket chains opened in-store pharmacies, which they felt increased store traffic and provided a community service. Mass merchandisers such as Wal-Mart, Target, and Kmart entered traditional drug store categories—claiming a 10 percent share of prescriptions in 1998—supported by their superior distribution networks and technology.

Drug stores also faced a growing challenge to their profitability as third party payment accounted for a larger percentage of prescription sales in the late 1990s. Third parties included health maintenance organizations (HMOs), preferred provider organizations (PPOs), unions, government programs (Medicare and Medicaid), and other systems that covered costs by prearranged agreement with health care providers. Prescriptions represented the largest out-of-pocket expense for consumers, so third party payment increased substantially over the past ten years as part of the drive to control health-care costs. This trend affected drug store profitability since third parties typically applied a discount of 20 percent to the average wholesale price of a drug, plus allowed dispensing fees, which covered administrative and labor costs of only \$3.00 per prescription as opposed to the actual cost of \$4.50. Drug stores struggled with the low margin sales and costly paperwork but appreciated the large prescription volume third party systems could provide.

Consumer demands for lower health-care costs also affected drug stores’ ability to raise prices. In the past, prescription prices generally increased at twice the rate of the Consumer Price Index, and drug stores turned this trend to their advantage. Drug stores would often forward-buy inventory of pharmaceutical products at low prices and usually passed along price increases to consumers with little negative effect on sales. In 1998, brand name prescription costs increased 8 percent while generic increased by 2 percent. The average cost for a prescription was \$34.43 in 1998, with 74 percent going to the manufacturer, 3 percent to the wholesaler, and 23 percent of cost being allocated to the retailer. Stores also had to remain price competitive in HBA’s. Many stores focused on “Everyday Low Pricing” and beefed up advertising to lure customers.

Another challenge to the drug store industry was the advent of Internet drug stores. While Internet sales represented only 1 percent of industry sales, that number was forecast to grow along with other retail sectors. These sites, such as DrugEmporium.com, offered prescription and nonprescription drugs, cosmetics, and health and beauty aids. Many offered email access to pharmacists as well. Large drug chains followed suit, and customers could refill prescriptions on store Web sites such as CVS.com. This industry, however, was expected to see advantages from the Internet as well. In a *Drug Store News* editorial, Anthony Cuti, chairman and CEO of Duane Reade, stated that “the bottom line is that personal medical consultations will grow more toward the individual pharmacist and less toward impersonal, less responsive communication vehicles such as the Internet. The Internet, however, will be a great provider of increased general health information that will probably promote a greater number of visits to both physicians and pharmacists to interpret and apply the technical information retrieved from the Internet.”

CURRENT CONDITIONS

The American population is aging. Those 50 years old or older group was expected to surpass 95 million by 2010, compared to 75 million in 2002. In 2002, people aged 65 and over totaled approximately 35 million, or 12.6 percent of the U.S. population. By 2030 that number was expected to double, and by 2050 almost 90 million Americans were projected to be 65 and older, representing 30 percent of the U.S. population. The significant increase in older consumers meant a rapidly growing customer base for drug stores. In 2002, older Americans accounted for more than 30 percent of all prescription medicines by unit and 42 percent of prescription sales. The NACDS reported \$165.2 billion in retail pharmacy sales in 2001, an increase of 17 percent over 2000. In addition, the Centers for Medicare and Medicaid Services predicted that the upward trend would continue with

double-digit annual growth at least through the mid-2000s.

Increased prescription sales would not, however, leave drug stores unchallenged as reimbursement by third party prescription administrators, which had come to dominate the market, was cut drastically. The biggest hit came in Medicaid-funded prescriptions, in which the profit margin might be as low as 2 percent. "The demand is going up and up, and we're keeping pace and delivering services, but we keep on getting squeezed because no one wants to pay for the service," Crystal Wright of the NACDS told *Supermarket News*. One bright spot for pharmacy departments was the impending end to patent protection by a number of widely used drugs. Once the patent protection period expires, generic brands are available, which usually provide a higher profit margin.

Drug stores were not the only ones to recognize the potential prescription explosion, and grocery stores and discounters were eagerly entering the market for prescriptions and other health-care products. According to *Drug Store News*, in 2002 mega-discounter Wal-Mart operated 2,977 pharmacies, compared with Eckerd's 2,641 stores. In addition, at least five supermarket chains reported pharmacy revenues over \$1 billion. Traditional drug stores were starting to give ground to grocers and discounters. According to the NADCS, prescription volume growth slowed for drug stores, increasing by 5.8 percent in 2001, compared to 10.4 percent in 2000. At the same time, discounters and grocers increased prescription counts in 2001 by 5.9 and 7.3 percent, respectively.

To compete with mass merchants and grocery chains, drug stores market themselves as uniquely equipped to service the "quick-trip" shoppers. According to *Chain Drug Review*, the average trip to a drug store takes ten minutes, eight minutes if the customer is not picking up a prescription. Drug stores are also adding food items such as milk, frozen foods, and other staples to bring in time-pressed women and older shoppers who buy for smaller households and may not need to stock up at the grocery store as often but may run low on basic food items.

INDUSTRY LEADERS

As a result of the consolidation in the industry, the drug store sector was dominated by four leaders in the early 2000s. Walgreens, CVS Corp., RiteAid Corp., and Eckerd Corp. accounted for two-thirds of total chain drug store sales. American Drug Stores and Longs Drugs Stores were ranked five and six respectively in the industry.

Walgreens, the number one drug chain, operated approximately 4,000 stores in 43 states and Puerto Rico and posted sales of \$28.7 billion in 2002. The company expanded into new areas, both geographically and with

products. In addition to adding photo-finishing departments to its stores, the company started its own pharmacy benefit management firm, which is actually run through the chain's mail-order business, Healthcare Plus. The store offered an online pharmacy and had 141,000 employees in 2002.

CVS Corp., the number-two drug chain, reported a net income of \$717 million on sales of \$24.2 billion in 2002. The company grew with its purchases of Revco, Arbor, and Soma, an online pharmacy, and had more than 4,100 stores in operation in 2002. Its subsidiary, PharmaCare Management Services, provided managed care drug programs to its customers. CVS had more than 105,000 employees in 2002.

RiteAid Corp., the number three drug chain, had sales of \$15.2 billion in 2002, resulting in a net loss of \$828 million. The company operated more than 3,400 stores in 28 states across the United States and employed 75,000 in 2002. Financial difficulties led the company to curtail its expansion activities and move to reduce its debt load.

Eckerd Corp., the fourth largest drug chain, is a struggling subsidiary of J.C. Penney Corp. Eckerd Corp. posted sales of \$14.6 billion in fiscal 2002, but poor performance led to the closure of 200 of the company's 2,650 stores during 2000. Eckerd offered an online pharmacy for refills and employed 75,000 workers.

WORKFORCE

The drug store industry employed nearly 694,000 people in 2001. The NACDS forecasted that between 1998 and 2005, the number of community pharmacists would increase 6 percent, although there was a 50 percent increase expected in the number of prescriptions dispensed—2.7 billion in 1998 to 4 billion in 2005.

While chain drug stores employed almost 96,000 pharmacists in 2001, the major concern for this industry was the shortage of qualified pharmacists. In February 1999, there were 3,421 jobs available in this sector. Thirteen percent of drug stores were understaffed in 1999. Of 96,000 employed pharmacists, 80,000 worked full time. Over half of those full-time pharmacists were men. According to the U.S. Department of Labor, Bureau of Labor Statistics, the mean annual salary for a pharmacist in 2001 was \$73,060. A pharmacy technician earned a mean annual salary of \$20,530.

RESEARCH AND TECHNOLOGY

Faced with managed care and an aging population with increasing needs for prescriptions, drug stores turned to technology to increase productivity. According to *Drug Store News*, "drug chains are turning increasingly to pharmacy technology to automate the workflow, speed the filing process, and take the guesswork out of

nearly every aspect of prescription dispensing. In the process, they have poured tens of millions of dollars into high-speed pill and tablet counters, new prescription tracking software, robotic devices, work-station terminals and interactive voice response systems (IVR) for phone-in refills.”

IVRs became increasingly popular in the late 1990s. With the growing number of prescriptions, these systems allowed the pharmacy staff to concentrate on filling prescriptions and talking with in-store customers instead of taking orders over the phone. CVS, for example, has implemented these systems throughout the company’s chain stores.

Some new technologies emerging in the late 1990s included: AutoScript III, which integrated robotics, labeling, and pill counting into a touch screen system; QuickScript System, used for automating the entire filling process including labeling, filling, and capping, and streamlined the paperwork and inventory process—it can fill 90 prescriptions per hour; and RX-90 by Condor Corp., which simplified the inventory process.

In addition to these technological advances, many stores instituted a satellite network to allow prescriptions to be filled anywhere in the United States. Drug store chains also began using electronic data interchange (EDI) systems to share information with suppliers. Although relationships between drug stores and suppliers were traditionally somewhat adversarial, intensified competition in the industry led to the formation of alliances.

SIC 5921

LIQUOR STORES

Liquor stores are establishments engaged in the retail sale of packaged alcoholic beverages, including ale, beer, wine, and liquor, for consumption off premises. Stores selling prepared drinks for consumption on premises are classified in **SIC 5813: Drinking Places (Alcoholic Beverages)**.

NAICS CODE(S)

445310 (Beer, Wine and Liquor Stores)

INDUSTRY SNAPSHOT

In 2001, according to the U.S. Census Bureau, there were 28,695 establishments engaged in the retail sale of packaged alcoholic beverages. The industry employed about 136,212 people with an annual payroll of \$2.1 billion. By 2003, the total number of establishments grew to 33,902. Together, they shared \$13.4 billion in annual sales. The total number of employees, however, remained about the same. The average beer, wine, or liquor store generated \$400,000 in sales and employed about four people.

ORGANIZATION AND STRUCTURE

The liquor store industry is made up of mom-and-pop retail outlets, independently run chains, and corporate-owned stores. While the vast majority of stores are small, family-run operations, there are a rapidly growing number are superstores primarily engaged in other kinds of businesses.

Among the industry’s top companies, most remained independently run during the 1990s. Increasingly, however, they changed their retail strategy, consolidating multiple outlets into fewer but bigger warehouse-style stores, thus saving on overhead and payroll while still moving a large inventory. The effect has been hard on smaller neighborhood retail operations comprising the bulk of the industry. As one small retailer observed in the *New York Times* in 1996, “This is a slowly declining industry. The mom-and-pop shops just can’t compete with the superstores and the discounters.” State and na-

tional statistics reinforce the story. In 1970, the New York State Liquor Authority issued 5,070 licenses for new stores. By 1995, 46 percent of the shops had shut down. While the traditional corner liquor store remains a fixture in most American towns, its future can no longer be taken for granted.

BACKGROUND AND DEVELOPMENT

Throughout its history, the retail liquor store industry has been buffeted by changing social and political attitudes toward alcohol, and the sale of alcohol has always been highly regulated. The most severe period of regulation was the Prohibition era (1919 to 1933), during which alcohol consumption was completely outlawed by the federal government. Stores were forced to close en masse, and owners either left the business or went underground.

Liquor sales were legalized again in 1933, when it became clear that Prohibition had worsened bootlegging and facilitated the rise of organized crime. Responsibility for liquor regulation was returned to the states following Prohibition. Since then alcohol has been legally available in almost every part of the country, although a few localities remain "dry." But the nature of governmental regulation has varied markedly from state to state. Some states allow private ownership, while others restrict the sale of alcohol to state-run outlets. Some states permit grocery stores to sell wine and liquor, others do not. Some states tax liquor sales heavily, while others impose little or no taxation. In no state, however, is the production, distribution, and sale of liquor unlicensed or unregulated.

In 1978, many states deregulated liquor prices that had been set by the government. Deregulation allowed supermarkets and convenience stores to enter the business, which increased pressures on traditional corner liquor stores at a time they were already experiencing shaky profit margins. To compete, small retailers lobbied for permission to sell peanuts and other ancillary goods, such as finger foods, corkscrews, gift baskets, and lottery tickets.

State and local governments across the country have tried to address these problems. In 1994 residents of Barrow, Alaska, turned back the clock to Prohibition, voting to ban retail sales of all alcoholic products. A year later statistics showed a 70 percent drop in crime, a plunge in emergency room visits, and the virtual emptying of the town jail's "drunk tank," which usually had a full house, according to a report in the *Wall Street Journal*. Nevertheless, the ban was repealed after the one-year break, giving rise to bitter acrimony among residents (and an almost immediate refilling of the drunk tank). Some local Inupiat Eskimos and others charged opponents of the ban with a racist motivation to destroy native culture. Alcoholism, one state health official said, was the "worst

problem facing native communities." Other Inupiat supported repeal, as did members of the majority community, who argued that the abuse of alcohol was an issue of individual, not social, responsibility. Pro-drink advocates also pointed to an increase in bootlegging during the dry period, as well as an increase in crime and hospital visits in neighboring communities.

Early in 1997 the Distilled Spirits Council (DSC) of the United States, a major trade group, decided to lift its self-imposed ban on television and radio advertising. The ban, included in its 1934 Code of Good Practice for Distilled Spirits Advertising and Marketing, followed the decision of the Seagram's distillery to advertise two of its scotch and bourbon brands. Even before the self-imposed ban was eliminated, nine states jointly petitioned the Federal Communications Commission (FCC) in December 1996 to prohibit such commercials: Hawaii, Iowa, Kansas, Maryland, Michigan, Minnesota, North Dakota, Rhode Island, and Vermont. Alaska had made the same request a month earlier. After hearing arguments about the state's concerns, the FCC announced in 1998 that it would postpone ruling on the petition because few distilled spirits ads were actually appearing. In 1999 the DSC itself responded to the states' petition in a statement issued by its president and chief executive officer, Peter Cressy, who said that the council was "open to considering new provisions that would strengthen all beverage alcohol advertising codes."

The retail liquor store industry experienced an increase in sales from \$21.7 billion in 1990 to \$22.5 billion in 1995 (preinflation figures), but the industry's real income declined 10 percent during the same period. This was on top of a 17 percent drop in real income from 1980 to 1990. Real income began to revive slightly 1996, registering a growth of 2.4 percent. Factors accounting for the industry's sagging numbers included a renewed public hostility over the relationship between alcohol sales and crime, which led to prohibitions on the sales of such alcoholic products as small bottles of strong, fortified wine and single cans of beer. State efforts to curtail the growth of liquor stores, competition from alternative sources of supply, and a nationwide crackdown on alcohol-related driving offenses also contributed to the drop in sales.

Other developments in the 1990s boded well for the industry. In 1996, the Joint Committee of the U.S. Department of Health and Human Services and the Department of Agriculture issued dietary guidelines indicating that a moderate intake of alcohol among adults may be beneficial to health. That same year the American Heart Association issued a scientific advisory noting a 30 percent decrease in coronary artery disease incidence for persons who consume a moderate amount of wine. Researchers at Columbia University released a study in

1999 showing that moderate alcohol consumption can reduce the risk for stroke. Additionally, the liquor industry itself has taken action to improve sales. In 1996 national distillers voted to end their voluntary abstention from advertising liquor on broadcast media. In the first year, after the ban was lifted beverage marketers spent \$609 million at retail for point-of-purchase advertising. By 1998 that figure had doubled. Many liquor stores have reported increased earnings because of vigorous advertising. However, the jury is out as to whether the liquor store industry as a whole will enjoy a resurgence.

Liquor store revenues during the 1990s may have suffered from the publication of studies showing the cause-and-effect relationship between alcohol and crime. A 1996 Brookings Institution report entitled "Broken Bottles: Alcohol, Disorder, and Crime," by John J. DiIulio, Jr., found that 60 percent of convicted homicide offenders drank heavily just prior to committing the crime, the same percentage of those committing other violent felonies. The report, which observed that alcohol "acts as a multiplier of crime," also cited studies showing 30 to 90 percent of convicted rapists were drunk when they raped.

Several studies focused on alcohol abuse among youths, and on the relationship between liquor stores and poverty. A 1996 report by the National Institutes of Health concluded that "Young adults have a higher prevalence of alcohol consumption and binge drinking than any other age group . . . Rates of alcohol abuse and dependence are disproportionately higher among those between the ages of 18 and 29. . . . Young adults are also over represented among alcohol-related traffic fatalities."

In Atlanta a mayoral task force prepared recommendations requiring new retailers to locate at least 1,000 feet—three city blocks—away from other alcohol sellers, and at least 600 feet from libraries, schools, residences, parks, hospitals, and places of worship. Texas liquor storeowners sought to limit the number of permits for retail operations to one for every 1,000 inhabitants. A few cities in the South sought to curtail permits issued for liquor stores located in poor neighborhoods. Some municipalities in other parts of the country chose to regulate liquor store hours, banning sales altogether on certain days. Other communities restricted the amount and type of gaming paraphernalia that could be sold by retail liquor stores.

In New Jersey police officers from the state's Alcohol Beverage Control Division placed themselves in liquor stores in college towns to apprehend youths trying to purchase liquor. By August 1996, the Cops-in-Shops program had arrested 363 people, including 58 adults who had attempted to purchase alcohol for persons under age 21. In 1998, almost 200 people were arrested during June, July, and August alone, most for using fake identifi-

cations. The program ultimately expanded to Atlantic City, Avalon, Wildwood, and Seaside Heights.

Another threat facing the liquor store industry in the 1990s was the emergence of cooperatives that arranged for distributors to deliver hard-to-find microbrews directly to consumers' homes. Beer Across America was the largest such cooperative in the United States, claiming 100,000 members in 1997. But the threat posed by beer cooperatives may be waning. With assets of \$3.4 million and liabilities of \$7.7 million, Beer Across America filed for bankruptcy in 1998. No other business has stepped in to swoop up the insolvent cooperative's members.

Several states also toughened their laws punishing motorists who drive while intoxicated (DWI). By 1999, 17 states and the District of Columbia had lowered to 0.08 percent blood-alcohol content the legal limit at which drivers could be prosecuted for DWI. The remaining 33 states allowed the higher limit of .10 percent. In July 1999, Vice President Al Gore announced that under the Transportation Equity Act for the 21st Century federal grants of more than \$500 million over six years would be made available to all states that had lowered their limit to at least 0.08 percent. A number of localities went further than lowering the legal limit for DWI offenses. New York City enacted a regulation authorizing police to confiscate the motor vehicles of drivers who have been arrested for DWI. By 2003, the lower blood—alcohol level had been adopted by the majority of states.

CURRENT CONDITIONS

According to Impact Databank, an organization that watches over the industry, overall volume is concentrated in a few states. States with the majority of the market share were California, Colorado, Connecticut, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas. Together, they controlled more than 63 percent of the market value. States with the least amount of liquor related stores were Utah with 58, Maine with 48, Vermont with 42, and New Hampshire with 22.

The largest sector, dominating more than 60 percent of the industry, was liquor stores. Hard liquor stores controlled 15.9 percent, while packaged beer accounted for 14.5 percent. The wine sector represented 8.2 percent, and wine and beer stores combined accounted for only 1.5 percent.

Beer consumption was considered the market leader with 85.3 percent share. However, Impact Databank reported liquor sales increased 3.2 percent, while beer fell 0.2 percent.

INDUSTRY LEADERS

Major companies in the liquor store industry included Price Company, of San Diego, California; Kash-

N-Karry Food Stores Inc., of Tampa, Florida; Carr-Gottstein Foods Company, of Anchorage, Alaska; Robert Mondavi Corporation, of Oakville, California; and Eder Brothers Inc., of West Haven, Connecticut. Eder Brothers was the only company whose sole business is the retail sales of alcoholic beverages. The other companies are also in related lines of business.

Of all the top liquor stores in the country, Carr-Gottstein has done the most to expand its business. Formed in 1990, Carr-Gottstein acquired Sea Mart Supermarket and Market Place Discount Food Stores in November 1993. The next year the company acquired Hanson Trading Company, and completed its purchase of Yukon Express Service, a food service supplier. Carr-Gottstein also runs a freight transportation business under the name Delchamps, which operates a liquor store chain in Florida. In April 1999, Safeway Co. purchased Carr-Gottstein for \$330 million. At the time of the merger Carr-Gottstein was the state's largest grocery and liquor retailer with 49 stores.

Most liquor stores are privately held. Even among the top ten, only four are publicly traded: Delchamps; Carr-Gottstein; Cost Plus, of Oakland, California; and Bruno's. Based in Alabama, Bruno's owned more than 200 supermarkets in 1996, under the names Food Fair, Food Max, Food World, Bruno's Food Store, SSS Enterprises, and PS Holding Property. However, in 1999 Bruno's announced that it planned to close or sell 14 stores to put the company in a stronger financial and operational position. The stores included six in Alabama, five in Georgia, and three in Florida. After shedding the 14 units, Bruno's still owned and operated 149 stores in Alabama, Mississippi, Florida, and Georgia.

Among other industry leaders, Warehouse Wines & Liquors, of Stamford, Connecticut, is typical of large liquor retailers utilizing advanced technology for both inventory control and marketing. *Inc.* magazine reported that the firm's computerized inventory management system allows its managers to know "exactly what has been sold as soon as it's gone," thereby eliminating almost all of its out-of-stock problems.

The relative ease of establishing a Web site and the worldwide marketing potential of the Internet has not been lost on liquor retailers. Hundreds of Web sites now sell wine, beer, and other alcoholic beverages over the Internet. Wine Planet has emerged as one of the Internet's most successful liquor retailers. For the September 1999 quarter the company's online sales of alcohol increased by 97 percent over the previous quarter, reaching \$1.41 million. Wine Planet's revenue from online advertising totaled \$98,000 during the same period. Nationwide Internet sales presently account for \$500 million of the \$17 billion U.S. wine industry. But alcohol regulators say that the proliferation of Internet wine and beer retailers has cost states

millions of dollars in lost tax revenues. Some states had even filed lawsuits against the Web site operators to recoup the losses.

WORKFORCE

Some 117,300 people worked in liquor stores in 1996, a drop of four percent from the 122,000 in 1990. A more dramatic picture emerges in a comparison of December employment, traditionally the industry's busiest month. In December 1990 employment reached 127,400. Five years later employment was only 114,600—a decline of more than 11 percent. This drop reflected the steady falloff in the number of liquor retailers across the country. It also coincided with declining industry revenues. Concerns over workplace safety may have contributed to the declining work force as well. The national homicide rate for liquor store employees is the highest for any industry in the country, except taxi drivers.

SIC 5932

USED MERCHANDISE STORES

This category includes establishments primarily engaged in the retail sale of used merchandise, antiques, and secondhand goods, such as clothing and shoes, furniture, books and rare manuscripts, musical instruments, office furniture, phonographs and phonograph records, and store fixtures and equipment. This industry also includes pawnshops. Dealers primarily engaged in selling used motor vehicles, trailers, and boats are classified in the Automotive Dealers and Gasoline Service Stations industries, and those selling used mobile homes are classified in **SIC 5271: Mobile Home Dealers**. Establishments primarily selling used automobile parts and accessories are classified in **SIC 5015: Motor Vehicle Parts, Used**, and scrap and waste dealers are classified in **SIC 5093: Scrap and Waste Materials**. Establishments primarily

engaged in automotive repair are classified under Automotive Repair Shops industries.

NAICS CODE(S)

453310 (Used Merchandise Stores)

INDUSTRY SNAPSHOT

The used merchandise business, a branch of the retail industry, was going strong into the early 2000s. New resale shops were opening rapidly in the United States with industry growth estimated at 5 percent per year. Enjoying recent success, the industry thrived in the status-conscience 1980s, as people constantly upgraded their little-used possessions and consigned or donated their older items. In the 1990s, the ecologically minded turned to recycling, which boosted purchases of recycled or used merchandise. Vintage clothing also became trendy, with more and more people who could easily afford new clothing now purchasing used clothing for style purposes. In the early 2000s, the outlook was similar. In times of economic expansion, more people donate, whereas in times of recession, more people make used purchases. Either way, resale is one of the few recession-proof segments of retail, enjoying success in good times and bad.

ORGANIZATION AND STRUCTURE

In the late 1990s, the vast majority of used merchandise businesses were privately owned and family run. The industry is attractive to small-business people because of its relatively low capital investment and relatively high returns. Consumers like used merchandise stores because they can obtain 50 to 85 percent savings off the cost of new goods; still, the profit margin for the retailer is often higher than that realized with new goods. The cost of purchasing merchandise to sell in such operations is extremely low, and operators typically sell used products for double their cost. Used merchandise sellers buy their inventory from the public, offer goods on consignment, or receive goods for free—or at very low cost—from charities. Both not-for-profit and for-profit used merchandise stores buy their inventory from charities, which collect door-to-door for as little as \$8 per three cubic feet of goods. “Thanks to the low cost of goods, pretax profits are around 10 percent, roughly double Wal-Mart’s,” wrote Lisa Gubernick in *Forbes*.

Women especially were attracted to the used merchandise business, particularly for clothing. Many owned and operated used merchandise stores out of their homes. *Nation’s Business* reporter Sharon Nelton profiled two women who typified the kind of entrepreneur who is attracted to the used merchandise business. Karen Lynch, a former flight attendant, founded Children’s Orchard in 1980. The store specialized in quality used children’s clothing, which it sold for 50 to 80 percent less than new

clothing. The store paid cash for its stock, which had to be clean and in mint condition. By 1996, Lynch’s business had grown to include more than 70 franchises in nine states. Used apparel accounts for two-thirds of the sales and makes up 80 percent of the store’s inventory.

At the other end of the scale was Judy Bradford, who operated I Do—I Do, a used bridal wear consignment store, out of her home. Consignees acted as agents for people wishing to sell used items, displaying used merchandise and splitting the price with the consignor after it had been sold—usually 50/50. The advantage of selling on consignment is that the risk of being left with immovable goods is virtually eliminated. The disadvantage is that consignment stores offer lower profit margins and little control over merchandise, at least where a store relies on donations and drop-offs.

Many used merchandise operations mix their means of sale among resale, consignment, and initial sale. Bradford and Lynch offer new merchandise that complements the shops’ main lines. Offering new merchandise alongside used “serves an important marketing purpose by upgrading the entire store’s image, bringing in customers that might otherwise never go into a secondhand store,” Gubernick commented. When people look at a used clothing store as their own favorite “specialty” shop, it is wise to have a little of everything for sale.

Antique shops comprise another important segment of the used merchandise business. Antique shop owners act as dealers of old and often valuable furniture, ornaments, coins, rare manuscripts, and so on. Sometimes the dealers pay outright for the used merchandise, but others operate on consignment. The number of antique shops grew in the 1980s, mainly at the lower end of the market, with the rise of cottage-industry style antique/junk shops.

Used merchandise stores generally have been marketed by appealing to working-class consumers in need of inexpensive merchandise or by positioning themselves as dealers in rare items prized for their investment value, as is true of antique shops. A third kind of marketing became evident in the 1990s: shops geared toward middle-class but price-conscious buyers. TVI, a company that runs “thrift department stores”, used television advertising to lure customers—an unusual tack for thrift stores.

The industry boomed in the early 1990s, benefiting from the economic recession. More and more middle-class consumers who were short of disposable income and looking to save a buck turned to resale goods. According to the *1997 Economic Census*, an estimated 17,990 used merchandise stores operated in 1996, employing 97,965 people.

More than half the customers at Washington, D.C.-area Goodwill stores earned between \$25,600 and

\$51,200 annually, more than 60 percent had full-time jobs and were women between 22 and 45, according to a 1996 survey by the industry leading Goodwill Industries. More than 62 million people shopped at Goodwill stores each year. In 1996 some Goodwill stores opened "computer shops" in the backs of larger stores, a move estimated to draw in even more customers.

Joan Schindel, owner of a Virginia Play It Again Sam, said the store's typical customer is a professional or middle-class family with a couple of children. A used sporting goods store, Play It Again Sam sells merchandise for at least half what it would cost new. "Because there isn't unbounded optimism in the future, people are more aware of the choices they make," Schindel said. Even people who can afford to buy new products shop in used merchandise stores for the thrill of finding a bargain or because their children quickly wear out or grow out of their clothes.

Throughout the 1990s, the used merchandise industry also benefited from increased environmental consciousness. "People are more conscious in the '90s of recycling and not wasting," Amy Helgren, co-owner of a Chicago children's resale shop told *Newsweek* in 1992. Karen Lynch, owner of Children's Orchard boutiques, noted, "We see the resale business as recycling at its very best."

Because of this and other factors, the number of for-profit resale shops increased an estimated 10 to 15 percent each year during the early to mid-1990s, according to the National Association of Resale and Thrift Stores (NARTS). There were more than 65,000 used merchandise stores in 1996, up from 55,068 in 1992. The greatest number of shops in the 1990s specialized in women's clothes, followed by children's clothes, bridal wear, and men's wear.

Dun's Census of American Business, which categorizes used merchandise stores according to sales volume, reported that approximately 87 percent of the stores surveyed had less than \$250,000 in annual sales. In 1993, 26,955 stores (45 percent) reported annual sales between \$100,000 and \$249,000; 13,799 (23 percent) had less than \$50,000; and 11,574 (19 percent) had between \$50,000 and \$99,000. A very small proportion showed higher sales volume: 3,613 stores (6 percent) had sales between \$250,000 and \$499,000; 1,912 (3 percent) had between \$500,000 and \$999,000; 1,248 (2 percent) had between \$1 and \$5 million; and 131 (0.2 percent) had more than \$5 million.

Once havens for bargain-hunting students, used merchandise stores now appeal to people from all walks of life. Between 1987 and 1995 retail grew 52 percent, whereas the resale industry grew 92 percent. One barometer of the rising popularity of such stores was recorded

by *New York Times* reporter Felicity Barringer, who noted that young Washington, D.C., insiders no longer shunned used clothes. "With the cost of dressing for success rising faster than the cost of housing, secondhand clothes are losing their stigma for a growing crowd of legislative aides, lobbyists, journalists, and consultants." Greta Bonaparte, owner of the Washington, D.C.-based used clothing store A Man for All Seasons, told Barringer: "Attitudes have changed. There's no doubt about it. It's become a kind of in thing, the bargain of it." The mid-1990s brought with it a new style of dressing. The look, "retro," was epitomized by music videos and rock stars dressing in fashions from all ages of the twentieth century. Teenagers latched onto the retro look, and shopping at used clothing stores was one way to achieve it.

CURRENT CONDITIONS

In 2000, U.S. consumers spent an estimated \$17 billion in secondhand stores. Resale shopping became a mainstream activity in the early 2000s. The National Association of Resale and Thrift Shops (NARTS) reported that resale was one of the fastest growing segments of the retail industry with an estimated growth of about 5 percent a year. There were an estimated 15,000 resale shops in the United States by 2003. Re-salers continued to enter specialty markets as well, including furniture, plus-size clothing, bridal items, and sporting goods.

Furniture was one of the leading segments for growth in the used merchandise industry. Some used merchandise retailers expanded existing stores to accommodate furniture, and others opened a separate location specifically for furniture. Specialty apparel was also gaining steam, specifically with an increase in plus-size stores across the United States. Men's and teens clothing were also areas experiencing growth in the apparel category. Sporting goods, computer-related items, and music also were enjoying continued expansion in the resale business.

More traditional retailers, in fact, were getting in on the used merchandise bandwagon in the early 2000s. Warehouse Entertainment, Hastings Entertainment, Trans World, and Tower all began selling used compact discs (CDs) alongside new ones. Online merchant eBay's site, half.com, sold an assortment of new, used, overstocked, and remaindered books, music, video games, electronics, and more. Like Amazon.com, Yahoo introduced a used merchandise section on its Web site. Independent used merchandise Web sites were also proliferating.

The rise in sales of used CDs on the Internet and elsewhere was a sore spot for much of the music industry in the 2000s. With buyers able to buy, listen to, download, burn, and resell CDs, music industry executives

complained that secondary music sales were cutting in to their profits. Others argued that used music represented a very small percentage of music sales in general.

Most sectors of this industry also benefited from the growing popularity of selling over the Internet. Spawned and aided, in part, by the huge success of eBay's Internet business, more antique stores and used booksellers entered the Web. Booksellersolutions.com reported that 40 percent of used/antiquarian booksellers it surveyed had their own Web sites and that 45 percent had a Web presence through home pages on used book listing services, including Abebooks.com. Many others also expanded their businesses by buying and selling on eBay. About 8,000 used and antiquarian booksellers existed in the United States.

Pawnshops were an estimated \$5 billion a year business by 2003. Very popular during the Depression, pawnshops were sometimes the only way for people to get money for food and essentials. Pawnshops loan money on the security of personal property. The item pawned is then offered for sale in the pawnshop. Unsold items may be redeemed by the pawnor for the same price originally given by the pawnbroker. Pawnshops deal in all used merchandise, from household items to musical instruments to jewelry. From the early 1980s to 2000 the number of pawnshops in the United States more than doubled, reaching about 14,000. Again, eBay aided this sector by greatly expanding its consumer market via the Internet. Many pawnshop owners were buying and selling merchandise on eBay daily. Another reason for the success of pawnshops was the somewhat dramatic increase in the number of Americans who were forgoing traditional bank accounts and turning to pawn shops as alternative loan sources in spite of interest rates of up to 240 percent. The downturn in the economy in 2002 and 2003 also aided pawnshops. Another growing segment were flea markets, which had grown into a \$7.5 billion a year business by 2000 and were growing at a rate of more than 100 new flea markets per year.

INDUSTRY LEADERS

The used merchandise industry is dominated by Goodwill Industries International, Inc., a private, not-for-profit company based in Bethesda, Maryland. It operates a chain of secondhand stores and provides vocational training for young people. Founded in 1902, the company employed 60,000 people and generated more than \$1 billion in revenues in 2002.

Goodwill strove to update its image in the 2000s, revamping many of its stores and adding amenities like coffee shops and used bookstores within their facilities. With new, professional remodels, Goodwill also began opening superstores with up to 25,000 sq. ft. of selling space. The average Goodwill store has about 7,500 sq ft.

of selling space. The company operated approximately 1,900 thrift stores. In 2002, revenue from the retail sale of donated goods totaled \$1.13 billion and accounted for 54.7 percent of its total revenue.

One of Goodwill's closest competitors is Cash America International, Inc., the world's largest public, stand-alone pawnshop chain based in Fort Worth, Texas. With 400 stores nationwide, it employed 3,096 people and earned \$387.8 million in 2002. Another major player was the franchise Winmark Corporation, formerly Grow Biz International, based in Minneapolis, Minnesota. Besides selling clothing, musical instruments, and tools, it sells sports equipment through its Play It Again Sports stores. The company had 2002 sales of \$33.4 million and 151 employees.

SIC 5941**SPORTING GOODS STORES AND BICYCLE SHOPS**

This category consists of establishments primarily engaged in the retail sale of sporting goods, sporting equipment, and bicycles, bicycle parts, and accessories. Retail establishments primarily engaged in selling motorized bicycles are classified in **SIC 5571: Motorcycle Dealers**. Those engaged in the retail sale of athletic footwear are classified in **SIC 5661: Shoe Stores**. Establishments primarily engaged in repairing bicycles are classified in **SIC 7699: Repair Shops and Related Services, Not Elsewhere Classified**, while those renting bicycles are classified in **SIC 7999: Amusement and Recreation Services, Not Elsewhere Classified**.

For information on the industry that produces durable goods for athletic competition, exercise, and recreation, see **SIC 3949: Sporting Goods Equipment**.

NAICS CODE(S)

451110 (Sporting Goods Stores)

INDUSTRY SNAPSHOT

One of the most striking features characterizing the industry in the late 1990s and early 2000s was the consumer shift from smaller, local sporting goods stores to so-called “big-box” retailers, or sporting-goods superstores bringing together an exceptionally wide product line under one roof. Combined with the explosive growth in e-commerce sales of sporting and recreational goods, this development gave the industry a complete facelift.

The U.S. Census Bureau reported sales in this industry of \$27.99 billion in 2002, continuing a trend of modest growth since the mid-1990s. There were approximately 57,100 retail sporting-goods and bicycle shops in the United States, with the vast majority of them employing fewer than 10 people. The industry as a whole employed some 270,400 workers in 2002.

ORGANIZATION AND STRUCTURE

The types of firms listed in this classification include department and discount stores, franchise chains, specialty shops (bicycles and athletic equipment), mail-order businesses, and e-commerce businesses.

Bicycles are sold in department stores, specialty bike shops, and discount, variety, and hardware stores. The typical American bicycle shop served a customer base of approximately 9,000 persons. Approximately 40 percent of the bicycle shops in the nation were single proprietorships and were primarily “home-owned” facilities. A

small percentage of bike shops were business partnerships. Only about 25 percent of U.S. bike shops were as large as corporations in terms of average sales, according to a U.S. Department of Commerce industry profile.

Bicycle shops stocked four major classifications of bicycles: single-speed cruiser bicycles (the average price was \$100 to \$250); contemporary utility bicycles (\$100 to \$300); lightweight 10- to 18-speed bicycles (from \$300 to more than \$2,000); and specialty bicycles, such as mountain bikes, sports models, touring bicycles, folding bicycles, and all-terrain bicycles (\$300 to \$3,000).

BACKGROUND AND DEVELOPMENT

Through the 1970s, the sporting goods industry was dominated by hunting and fishing equipment, and hardware stores competed with sporting goods outlets for business. By the late 1970s and early 1980s, however, several factors began to transform the industry. The nation as a whole grew increasingly health- and fitness conscious, sparking a boom in sales of exercise gear as well as apparel. In addition, the booming participation of women in sports of all kinds opened up whole new markets that only barely existed before. And expanding variety and specialization in equipment for all sports necessitated space for the vast selections now pushed by manufacturers. While adults between the ages of 25 and 44 constituted the mainstay of purchasers, industry leaders recognized a need to focus their marketing strategies on the inclusion of both younger as well as older consumer groups. Combined, these factors vastly transformed the industry’s base, toward large retail outlets featuring several departments catering to different sports and activities.

As the fitness industry sparked consumer appeal for exercise equipment, accessories, and athletic wear, trends gradually shifted from sporting goods stores, which were typically sole proprietorships and small “pro shops,” to franchises and eventually sporting goods chains. Bicycle shops even began changing their names to “bicycling and fitness” shops and expanded their product mixes to include exercise bicycles, treadmills, climbers, and weight machines to capitalize on the craze. These types of stores appealed to a growing number of consumers who were exercising in their own homes.

Consumers started turning to discount chains and stores because they knew what equipment to purchase. When the technology was new, customers were more in need of experts to explain the products and their benefits before making a major purchase. As consumers used more types of exercise equipment and became more knowledgeable about fitness, however, they grew much more familiar with the types of equipment they needed. Consequently, store managers were changing their store displays to enable customers to “test drive” a product

before taking it home. Such hands-on displays often proved helpful in alleviating customers' anxiety about assembly. Seeing the assembled product in the store could convince them that it was easy to set up at home.

Although the fitness craze leveled off in the late 1980s, traditional recreational activities such as golf, team sports, fishing, and camping all picked up the slack. Outdoor sports and recreational activities such as camping and fishing led industry growth in the late 1980s and early 1990s.

Sales of American-made bicycles also remained relatively flat in the late 1980s. This was due in part to delivery delays that kept popular models out of shops. The European mountain-bike boom drained American supplies and left many dealers in the United States with unfilled orders. All in all, bicycle shops reported spotty sales on some popular bikes in 1990. East Coast bicycle shop dealers reported flat sales in 1990, but their counterparts on the West Coast reported an 8 percent sales increase.

Firearms, ranging from handguns to hunting rifles to assault weapons, had long been available from sporting goods stores with virtually no guidelines. In 1993 and 1994, however, that changed. The Brady Bill, a piece of legislation championed by the Clinton administration that mandated a five-day waiting period before a consumer could purchase a gun, was ratified into law over the objections of the National Rifle Association and others. A ban on the manufacture and sale of 19 types of assault weapons also passed in May 1994. MCI Communications Corp. developed an automated system that enabled the registration approval process to be completed within the mandatory 10-day waiting period. The former, and less expedient, postal process required up to 20 days for completion.

The early 1990s were prosperous for privately owned Herman's Sporting Goods Inc. as it posted \$570 million in yearly sales. The effective marketing strategy by Sports Authority of providing the consumer with a wide selection of in-stock merchandise and low prices, however, reduced Herman's sales by more than \$230 million. This paralyzing situation caused the 117-store, octogenarian chain to file for Chapter 11 protection in April 1996, ushering in the modern period of domination by Sports Authority.

CURRENT CONDITIONS

Sporting goods stores, traditionally a fragmented market, spent the 1990s and early 2000s in a massive wave of consolidation. Big-box chains grew to dominate the market and swallowed up smaller, less efficient competitors. These larger firms enjoyed greater leverage with suppliers and manufacturers, resulting in lower prices and higher margins, not to mention assistance in promotional activities and inventory management. The most

notable such consolidation was the merger in 2002 of the two industry leaders, Sports Authority and Galt Sports, making Sports Authority the industry's first and only national chain.

The encroachment of big-box retailers with greater economies of scale has seriously damaged the specialty retailers, particularly in categories such as exercise equipment, where big-box stores reign supreme. Particularly as technology has improved and the difference between introductory models and high-end models has grown hazy, the more value-added service provided by specialty retailers failed to overcome the overall price and service advantages big-boxes offered. According to the National Sporting Goods Association, between 2000 and 2001, the share of treadmill sales at specialty retailers fell from 14 percent to only 5 percent, while the share claimed by mass merchants grew from 67 percent to 76 percent.

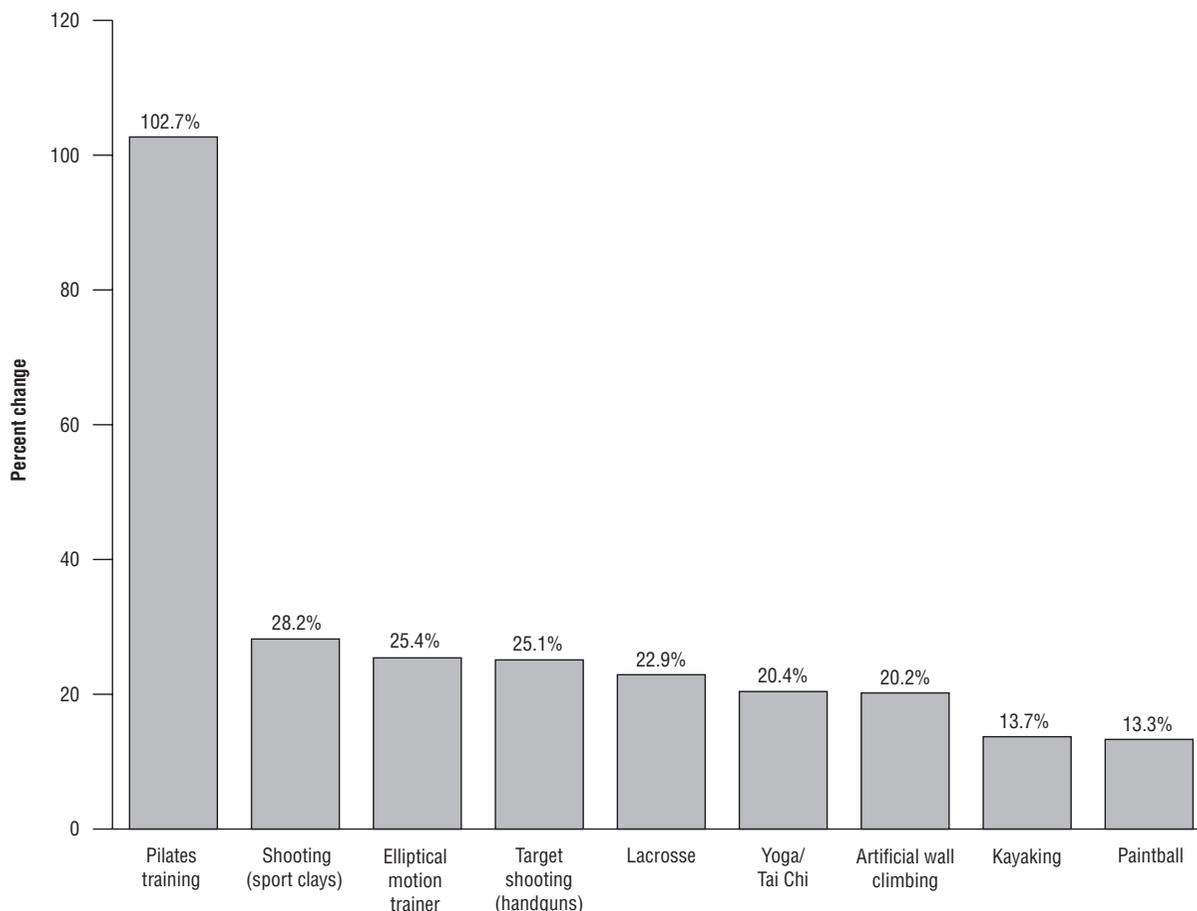

Industry sales were led by exercise equipment, which registered sales of \$3.78 billion in 2002, according to Sporting Goods Manufacturers Association International. Treadmills account for about 60 percent of this category, which also includes stair machines, elliptical cross-trainers, and exercise bikes. Golf equipment took second place, with sales of \$2.6 billion. Outdoor sports, including fishing and hunting, raked in \$1.7 billion; water sports posted sales of \$425 million; and billiards and bowling reached combined sales of \$472 million. Among specific sport categories, a handful registered significant gains in 2002. Snowboards, for example, enjoyed sales growth of 12 percent to \$168 million; hockey equipment and ice skates jumped 6.5 percent to \$245 million; and paintball equipment grew 10.4 percent to \$370 million.

Following the shakeout of many of the late 1990s' biggest e-commerce stars, a crop of new and established e-tailers moved aggressively into the sporting goods market to grab some of the untapped online share. General e-tailers such as SportsLine.com and Sportsrus.com joined specialty online stores like Golfballs.com and Baseball Warehouse in rebuilding the market for online sporting goods sales. In 2003, moreover, these firms were joined by e-commerce giant Amazon.com, which opened a Sporting Goods section on its Web site.

Bicycles represented a highly competitive \$6 billion sector. Longtime market leader Schwinn, a subsidiary of Pacific Cycle, filed for bankruptcy in 2001. By the middle of the decade, the company concentrated its efforts on less expensive children's bicycles, primarily for sale at mass retailers like Wal-Mart. In its place, longtime industry players such as Huffy sparred with foreign upstarts, like China-based Giant, which forced their way to the leading spots in the U.S. bicycle market. In retaliation, U.S. manufacturers, including Huffy and Cannondale, tried to break into foreign markets.

Fastest-Growing Categories in Sporting Goods Stores, 2002–2003

Percent change from 2002 to 2003

SOURCE: Sporting Goods Manufacturers Association International, 2004

Sales of mountain bikes skyrocketed through the 1990s, but sales leveled off by the mid-2000s. Meanwhile, the casual and recreational cyclists represented the fastest-growing sector of the bicycle market. Intense industry competition and the spread of innovative high-end racing technology forced prices downwards in the market for specialty, mountain, road, and racing bicycles. The line between high-end bikes and their moderately priced counterparts blurred significantly through the 1990s and early 2000s.

INDUSTRY LEADERS

Sports Authority clearly dominated the sporting goods market. Its merger with Gart Sports in 2003 pushed it even further into the industry's leadership position and vastly expanded its operations, adding 12 states and 180 stores to its formidable network. Company founder Jack Smith was a former executive at Herman's World of Sports, the industry leader that was eventually pushed out of the market by

Smith's upstart firm. Sports Authority boasted 389 outlets across 45 states in 2003, operating under Sports Authority, Gart Sports, Oshman's, and Sport Mart monikers, with plans to phase in Sports Authority name at all these stores. The firm maintained a payroll of 7,760 employees in 2003, when it raked in sales of \$1.43 billion, up slightly over 2001 but still far below the 2001 peak of \$1.5 billion. Sports Authority planned to continue opening new stores and expanding into new territory through the mid-2000s.

With headquarters in El Segundo, California, Big 5 Sporting Goods Corporation was a leader in the western United States, with over 290 stores in 10 states selling a wide range of products for each major industry category. With 7,123 employees, Big 5 enjoyed a sales increase of 6.3 percent to \$709.7 million in 2003.

Dick's Sporting Goods Inc. was another major industry player, based in Pittsburgh. The firm sold industry apparel and footwear in addition to a wide range of team

sport, exercise, and outdoor equipment at over 160 stores in 27 states throughout the eastern United States.

Recreational Equipment Inc. specialized in outdoor equipment for mountain climbing, hiking, skiing, kayaking, bicycling, and camping. Based in Kent, Washington, Recreational Equipment operated as a cooperative, with over 2 million members jointly running some 70 stores in 24 states.

Gander Mountain Company, of Minneapolis, was another specialist in the outdoor recreational category, with 65 stores throughout the Midwestern United States. Sales jumped 13.7 percent in 2003 to reach \$357 million. Waterford, Michigan-based Dunham's Athleisure Corporation was another major presence in the Midwest, with 100 stores selling major brand sporting equipment. Sports Chalet Inc. employed 2,275 workers at some 30 stores in Southern California, with revenues of \$238 million in 2003.

RESEARCH AND TECHNOLOGY

Sporting goods of the twenty-first century are highly streamlined and are made with lightweight, but durable, metals and plastics. Developments in materials manufacturing made these sleek and colorful designs possible. Technological advances also gave rise to all-terrain bicycles, mountain bikes, high-tech athletic shoes, all-in-one weight machines, aerobic stair steppers, and computerized treadmills, stair climbers, and stationary bicycles. Similarly, sporting goods retailers were using sophisticated multimedia techniques to enhance store environments and make sports involvement more appealing to men, women, and children.

SIC 5942

BOOK STORES

This category includes establishments primarily engaged in the retail sale of new books and magazines. Establishments primarily engaged in the retail sale of used books are classified in **SIC 5932: Used Merchandise Stores**.

NAICS CODE(S)

451211 (Book Stores)

INDUSTRY SNAPSHOT

As did the entire U.S. economy, booksellers struggled during the first years of the twenty-first century. After experiencing healthy growth during the 1990s, in 2000 trade book revenues fell 3.7 percent to \$6.54 billion. Sales decreased again in 2001, falling to \$6.37 billion, with the industry being particularly hard hit during the fourth quarter Christmas season, which came on the heels of the terrorist attacks of September 11. Revenues rebounded by nearly 9 percent during 2002, but the industry continued to face numerous obstacles in a challenging economy. While the big chains continually shuffled resources to get the most out of their assets, thousands of independent booksellers struggled to hold back the onslaught of the bookstore giants, led by Amazon.com, Borders, and Barnes and Noble.

ORGANIZATION AND STRUCTURE

The retail bookstore industry was dominated by several large chains, including Borders Group, Inc.; Barnes and Noble, Inc.; and Crown Books Corporation. The rest of the market was shared by about 10,000 independent bookstores. Chain stores, many of which opened during the 1970s, were generally located in shopping malls and usually carried between 15,000 and 20,000 of the most popular titles targeted for a broad consumer market. Independent bookstores often carried a greater variety of titles, between 30,000 and 40,000 per store. With 900,000 books in print, independent bookstores often specialized, offering a wider variety of titles than the chain stores for niche markets such as religion, science and technology, hobbies, or children's books.

In the 1990s, chain store operators began opening dozens of "superstores." These large freestanding bookstores carried between 50,000 and 150,000 titles, offered substantial discounts, and provided a variety of customer amenities such as reading rooms and coffee bars. Superstores prompted speculation that independent booksellers would be driven out of business. However, other industry analysts noted that there were similar dire predictions in the 1970s during the rapid growth of mall-

based chain stores. While chain stores did siphon business from the independent bookstores, they also greatly expanded the total market. In fact, market research showed that the presence of a superstore increased the local market for books by 50 to 60 percent.

Another type of bookstore also began appearing in the early 1990s. These were multimedia stores that carried books, audiotapes, videotapes, and computer programs. While other bookstores had sections devoted to electronic information media, multimedia stores mixed different media by category rather than by format, placing the printed works of Shakespeare alongside videocassettes of his plays. WGBH LearningSmith stores in Massachusetts were leaders in the area of multimedia bookstores. The company licensed the use of “WGBH” from the award-winning public television station in Boston.

Virtual bookstores also gained popularity in the mid-1990s, thanks to the possibility of online commerce offered by the Internet and World Wide Web. Of these, Amazon.com, was by far the most popular and most successful, offering more than one million titles.

BACKGROUND AND DEVELOPMENT

The first bookstores appeared in the American colonies as early as 1640, with Boston becoming a pre-Revolutionary War center for both book publishing and selling. By the time Benjamin Harris, who published the first newspaper in the colonies, opened a bookstore in 1686, there were already seven other booksellers in Boston. By 1700, there were as many as 30 booksellers in the town, which then had a population of about 10,000. Although a fire swept through the bookseller district in 1711, destroying all the bookstores but one, within a few years there were more bookstores in Boston than ever.

In addition to importing books from England, most early booksellers also published them. For example, Hezekiah Usher, who may have opened the first bookstore in Boston in 1642, published *Spiritual Milk for Boston Babes in Either England*, the famous catechism by Puritan minister John Cotton, in 1656. Bookseller and newspaper editor Benjamin Harris published the first edition of the *New England Primer*. In fact, book selling as a profession independent of publishing did not begin to emerge until about 1800.

Early bookstores were also more like variety stores than bookstores in the modern sense. For example, Andrew Bradford offered his customers merchandise ranging from feathers to pickled sturgeon. Thomas Fleet, a publisher of children’s books in Boston, sold slaves from his bookstore. Moreover, colonial bookstores often carried a remarkable variety of books. In 1766, Boston shop owner John Mein published a catalogue listing more than 1,700 titles. Religion and philosophy dominated the early

book trade. The widespread availability of books by John Locke and other philosophers who wrote about natural rights helped set the stage for the American Revolution and booksellers were often among the intellectual leaders of the colonies. However, novels were also popular, including many with highly suggestive titles such as *Married Libertine* and *Suspicious Lovers*. *Memoirs of a Woman of Pleasure*, originally published in England in 1748 and better known as *Fanny Hill*, also was available in many bookstores.

The first post-Revolutionary War advancement in book selling came in the 1840s, when an American, Richard Hoe, invented the rotary press. The first Hoe presses were able to print 8,000 sheets an hour, which was later increased to 20,000. This technology made possible a mass market for books. It also hastened the differentiation between publisher and bookseller and greatly increased competition. The technology led to the creation of the paperback industry. The first paperbacks were pirated reprints of English novels printed as supplements to newspapers. Eventually they were sold as separate publications.

Bookstores flourished between 1845 and the beginning of the Civil War. However, book selling began to change dramatically about the time the war ended. In the late 1860s, most large publishers were operating their own bookstores in competition with independent booksellers. In addition, publishers began offering volume discounts to large dry goods stores that opened book departments. Volume discounts eventually cut bookstores out of the textbook trade altogether and would remain an issue of contention between publishers and bookstores up early 2000s, especially with the development of chain stores in the 1970s.

Perhaps even more significantly, in the years following the Civil War publishers’ agents began crossing the country selling books door-to-door by subscription, taking prepublication orders for delivery direct to the customers. Publishers often sold books direct for less than they sold them to bookstores and even offered to pay for postage. In 1872, *Publishers Weekly* warned that “The retail book trade cannot live against the competition of manufacturers and either the competition or the retailers must cease to be.” John Wanamaker, whose legendary Philadelphia department store was able to undercut bookstores, flatly declared “book selling is a decaying business.”

Book Sellers vs. Publishers. The first attempt to organize American booksellers occurred in 1802, when 50 publishers and booksellers met in Philadelphia to form the American Company of Booksellers; that association lasted only four years. In 1872, publishers and booksellers again got together and formed the American Book Trade Association (ABTA). This time they agreed to

limit wholesale discounts to no more than 20 percent. However, the public viewed the ABTA as a cartel organized to keep prices high, and newspapers attacked the plan vehemently. Many publishers also failed to live up to the agreement, and the ABTA only lasted five years. In 1890, the publishers formed their own association aimed at forcing bookstores to sell books at a retail price set by the publisher. The publishers agreed that they would continue offering discounts, but they also agreed to blackball stores that violated the "net price" system.

In 1900, six booksellers announced plans to form the American Booksellers Association (ABA) to lobby on behalf of bookstores. The ABA, which held its first convention in 1901, wholeheartedly endorsed the publishers' net price system, since it would eliminate price-cutting by department stores and so-called "book butchers," who bought quantities of discontinued or surplus books and sold them at a fraction of what other bookstores charged. However, in 1890, Congress passed the Sherman Antitrust Act, designed to prevent unfair restraint of trade. In 1902, Macy's Department Store in New York filed suit under the Sherman Antitrust Act against the American Publishers Association and the American Booksellers Association. Eleven years later, in 1913, the U.S. Supreme Court declared the publishers' actions illegal and let stand \$140,000 in damages awarded to Macy's by a lower court.

A near heroic figure in the case, from the department store's perspective, was E. L. Kinnear. Kinnear was Macy's book buyer who managed to keep the store's book department stocked while the suit was heard, despite being blacklisted by the publishers. She used surrogates as far west as Denver to buy books and secretly ship them to Macy's. Macy's would continue to be a thorn in the side of New York book sellers, according to a *Publishers Weekly* retrospective: "During the '30s, the great crusade of the retailers was against price-cutting. The department stores were the chief discounters and books were high on the list of loss leaders. Macy's especially was the hated enemy."

The American Publishers Association disbanded in 1914, following the Supreme Court decision. However, the ABA survived and remained concerned with price stability. *Publishers Weekly* noted that while the Supreme Court made it clear that the publishers had acted illegally, the case also made clear "that unwarranted 'cut prices' are a stupendous merchandizing blunder, if not immoral or illegal." For a while, fair trade laws passed by several states in the early twentieth century allowed manufacturers to establish minimum retail prices on trademarked products, achieving the same results the publishers had wanted. The Miller-Tydings Act, passed in 1937, legitimized these state laws by setting aside federal antitrust laws. However, the consumer interest groups eventually

won out, and most of the fair trade laws were repealed between 1950 and 1970. Congress eliminated the last of them in 1975.

Book Clubs. The first book clubs, formed in the 1920s, immediately became the target of opposition from retail bookstores. The Literary Guild and the Book-of-the-Month Club were both denounced at the ABA's convention in 1927. By the 1940s, book clubs had become such a concern that the ABA complained to the Federal Trade Commission (FTC) about violations of fair trade laws then in effect. The ABA also complained that publishers were leasing printing plates to the book clubs for low-cost reprints of popular books but refusing the same privilege to members of the ABA. In 1951, the FTC charged several publishing houses with unfair trade practices. The most significant outcome of the case was that publishers were not allowed to require bookstores to adhere to minimum retail prices if book clubs were not bound by the same requirement.

During the 1980s, book club sales did not keep pace with the burgeoning retail bookstore industry. While total book sales grew about 8 percent per year in the 1980s, and retail bookstores nearly doubled, book club sales grew about half as fast. With the increase in bookstore competition, readers often received discounts equal to or greater than the discounts offered by book clubs and did not have to wait for delivery.

By the early 1990s, book club sales were decreasing, and clubs were beginning to change their marketing tactics to emulate successful mail-order clothing outlets. This included greater market segmentation and direct-mail advertising, deeper discounts, and faster service through 24-hour telephone ordering. The Literary Guild was experimenting with a "900" telephone number. Callers to the 24-hour Home Previewline could listen to one or several recordings by popular authors who either discussed their works or read selections. Callers could then order the books they wanted.

Perhaps the most significant change was that many book clubs were abandoning negative-option selling, in which members would receive monthly club selections unless they mailed in an order card saying no. In 1993, *The Wall Street Journal* reported that the Book-of-the-Month Club planned to begin a new club drawn from millions of former members who quit because of the negative option. More than half of all Book-of-the-Month Club members quit every year.

Chain Stores. The Walden Book Co., which had operated rental libraries, opened its first retail bookstore in Pittsburgh in 1962. Four years later, the Dayton Hudson Corp., a department store conglomerate, opened the first B. Dalton Bookseller store in suburban Minneapolis, in the nation's first multi-level enclosed shopping mall.

Waldenbooks and B. Dalton Bookseller, which became the two largest bookstore chains in the United States, transformed the book selling industry. Prior to Waldenbooks and B. Dalton Bookseller, bookstores tended to be small, crowded, and situated in out-of-the-way locations. Waldenbooks and B. Dalton Bookseller bookstores positioned themselves in high-traffic malls and created colorful displays that invited the general public to browse. John Pope, then advertising director for B. Dalton, told *Saturday Review* in 1979, "What we've done is taken the awesomeness out of the book-buying experience." John Dessauer, author of the annual *Book Industry Trends*, was less complimentary, especially about the selection of titles: "I think of the chains as doing for reading what the fast-food operations have done for eating. You can preach to the chain stores about cultural obligations, but with their economics, they really can't afford to mess with pate de foie gras."

The chain stores, led by Waldenbooks and B. Dalton with hundreds of outlets each, were so successful that by the early 1970s, some industry analysts were predicting the end of independent bookstores. They also predicted that the chain stores would have a harmful effect on publishing. Victor Navasky, writing in the *New York Times Book Review*, warned that volume-buying chain stores would force publishers to abandon books of limited appeal and focus solely on mass-market best sellers.

ABA executive director G. Roysce Smith countered such complaints in *Publishers Weekly*, arguing that as long as there were readers for books, somebody would publish them and some bookstore would sell them. The literary, social, or political value of a book would determine its success, he claimed, not the chain stores. Although many independent bookstores closed during the 1970s, often due to chain store competition, Smith also noted that the total market for books was expanding. So even while the market share for chain stores was increasing, there was still a growing market for independent bookstores. Book sections in department stores, especially those located in malls with chain-owned bookstores, suffered more than independent bookstores.

The same fears reappeared in the late 1970s with the growth of discount stores. Crown Books, founded in 1977, was one of the first and most aggressive discounters, selling best sellers for as much as 40 percent off the publisher's suggested retail price. "How to deal with a discounter" was a popular topic at ABA conferences in the 1980s. But by 1988 even discounters were seen as good for business, as the ABA acknowledged the value that competition brought to the bookseller industry. In the organization's report for the Bowker Annual, Allan Marshall, then director of professional development and education, wrote that "sellers of books at retail are enjoying an increasing market share as more and more people are

either returning to or discovering for the first time the joys of shopping in bookstores, having originally been introduced to the concept of book ownership through book clubs, direct mail, or discounters."

Censorship. Bookstores were often at the center of controversy regarding censorship, obscenity laws, and the First Amendment guarantee of free speech, which to booksellers also meant the right of adults to read uncensored material. Periodically, especially in the 1920s, 1950s, and 1970s, police departments raided bookstores, arresting clerks and storeowners and confiscating books they felt violated obscenity laws or were otherwise bad for the community, including books on religion and politics. Community organizations also tried to force bookstores to quit selling books or magazines they found objectionable through boycotts, picketing, and occasional violence.

The first federal obscenity law was the Tariff Act of 1842, which made it illegal to bring "indecent and obscene" material into the country. The Comstock Law, passed in 1873, made it illegal to use the U.S. Post Office to distribute obscene materials or information about birth control and abortion. In 1957, the Supreme Court ruled that the First Amendment does not protect pornographic material. In 1964, the Supreme Court specifically ruled that Henry Miller's *Tropic of Cancer*, written in 1934 and perhaps the most censored book in American history, was not obscene. In *Miller v. California* in 1973, the Supreme Court ruled that whether something was obscene depended on "local community standards."

The first official notice the ABA took of censorship was conciliatory. Despite the politically motivated book raids of the 1920s, which resulted in the arrest of many booksellers, in 1923 the ABA passed a resolution deploring the sale of "unclean" books. In 1925, the ABA issued a statement opposing publication and distribution of "salacious" books. The ABA sponsored a discussion on censorship at its convention in 1930 but did not change its official position opposing publication and, therefore, approving censorship of "obscene" books.

In the 1950s, however, there was another rash of book bannings inspired by the investigations of the House Committee on Un-American Activities, and the anticommunist crusade led by Senator Joseph R. McCarthy. Libraries and bookstores were forced to remove books such as John Steinbeck's classic *The Grapes of Wrath*, which was seen as a communist polemic.

The Supreme Court's "local community standards" ruling in 1973 set off another round of police raids and prosecutions for selling obscene books. At its convention that year, the ABA protested the ruling and issued a statement in support of the President's Commission on Obscenity and Pornography, which in 1970 had recom-

mended the repeal of laws restricting the sale of obscene or pornographic materials to adults. In 1973, the ABA also helped form the Media Coalition, an organization of publishers, booksellers, and motion picture producers that circulated information on censorship laws and activities. In *Bookselling in America and the World*, Chandler B. Grannis wrote that joining the Media Coalition marked the ABA's full commitment against censorship.

In the 1980s and early 1990s, the ABA became more proactive in its opposition to censorship. Beginning in the early 1980s, the ABA co-sponsored an annual Banned Books Week to draw attention to the many books that different groups were trying to ban or remove from library shelves. The group also filed suit against "minor's access" laws that would force bookstores to remove books from shelves or store displays. Through the Media Coalition, the ABA opposed efforts to declare pornography a form of sexual discrimination.

In 1986, the ABA publicly opposed the nomination of Robert Bork to the Supreme Court because it believed his views on the First Amendment would be detrimental to bookselling. Ironically, some bookstores were accused of engaging in censorship themselves for refusing to stock *The Tempting of America*, written by Bork.

In 1989, when Iran's Ayatollah Ruhollah Khomeini called for the assassination of author Salman Rushdie, several bookstores, including Waldenbooks, B. Dalton Bookseller, and Barnes and Noble, pulled copies of his controversial book, *The Satanic Verses*, from their shelves. However, other bookstores used the incident to call attention to the ongoing struggle against censorship by promoting the book, and the ABA took out ads protesting Iran's attempt at intimidation. The chain stores reversed their policies within a few days, in part because of a consumer demand for the book. Two bookstores in the United States were firebombed apparently because of the book, but there were no injuries.

In 1990, the ABA took out full-page ads in major newspapers nationwide to protest censorship of all forms, from the banning of *Little Red Riding Hood* by a California school system because it was deemed too violent to anti-pornography groups that were trying to force bookstores to stop selling *Playboy* magazine.

In the mid-1990s, superstores continued to dominate the market, with Borders Group, Inc. the undisputed leader. The market was changing, however, with a new form of competitor rapidly gaining market share—the online bookstore.

Of these, Amazon.com claimed to be not only the largest online bookstore, but the "Earth's biggest bookstore." The company offered 2.5 million titles in its Web-based store in early 1997. With infinite shelf space and no retail rent, overhead could remain low resulting in lower

prices to consumers. Conceived by former hedge-fund manager, Jeff Bezos, Amazon.com offered online chats with authors and reader reviews in addition to a superb list of titles. A new service—MatchMaker—was announced in early 1997. Using sophisticated collaborative filtering technology the service would recommend books that customers were likely to enjoy. The Amazon.com model of "sell-source-ship" meant little inventory to buy or track and no returns to publishers. Instead the company ordered products after receiving customer orders.

The surge in online sales forced drastic changes in the industry. In 1996, *Encyclopedia Britannica* turned to direct mail, television advertising, and its own Web site. In turn, the company completely eliminated its sales force of 550 people. In November 1998 Barnes and Noble acquired Ingram Book Group, a major book distributor, to better serve its online customers. This only exasperated independent booksellers who were fearful that already large chains were getting better deals from publishers and distributors than the smaller stores. In March 1998, the ABA and 26 independent booksellers filed suit against Barnes and Noble and Borders saying the chains received favorable terms and secret discounts not available to all in the industry. The trial was set for 2001.

Independent booksellers were fighting the encroachment of superstore chains and online services. A group of independent booksellers in California protested to the state government in December 1999 that the online services should be collecting sales tax. Not charging sales tax gave the online seller an advantage over brick-and-mortar stores. The group said the law states tax could be collected if the company has a physical presence in the state. They argued that Borders and Barnes and Noble both had stores in California and that Amazon.com had affiliate programs with companies in the state.

Some independent booksellers were turning to the Internet to supplement their sales. Some found it challenging because it was hard to get up and running and some did not have the staff to maintain a site. Online sales accounted for only 3 percent of book sales in 1998, but that number grew rapidly over the next years. Some smaller bookstores, especially those specializing in a narrow field, were getting out of storefront operations altogether and opening up on the Internet.

CURRENT CONDITIONS

According to the *American Association of Publishers*, in 2002 total book sales reached \$26.9 billion, a 5.5 percent increase over the previous year. Trade books, which include adult and juvenile hardbacks and paperbacks, generated \$6.93 billion, up 8.8 percent from 2001. Adult trade hardback revenues rose nearly 12 percent from the previous year to \$2.94 billion. Adult trade paperback sales increased more than 12 percent over the

previous year to \$2.16 billion. Juvenile hardbound revenues reached \$957 million, up 3 percent, and juvenile hardbound sales fell just over 1 percent to \$876 million.

Perhaps the biggest change to the retail bookstore industry in the first decade of the twenty-first century was the proliferation of booksellers' presence on the Internet. According to the U.S. Census Bureau's *Statistical Abstract of the United States*, in 2000, 49 percent of all book purchases were completed via the Internet. Super-store experts Borders and Barnes and Noble had worked extensively to integrate their brick-and-mortar operations with their online presence. Customers might return an online purchase to a store location. Likewise, some stores had options for customers to place an order online in the store.

These nationwide "brick-and-click" companies had the independent sellers lobbying state governments for consistent sales tax assessment. Independent book dealers must charge sales tax on any sales conducted in the state within which their businesses reside. Likewise, the ABA argues, chain bookstores should be required to collect sales taxes on any sales originating in states where they have a physical presence. However, the big chains, namely Borders and Barnes and Noble, create separate business entities to conduct online operations, separated from their superstores, so that state taxes are only collected in the state in which their Internet operations exist. The ABA wanted state governments to recognize brick-and-mortar operations in conjunction with online operations, thus requiring the big chains to charge sales taxes for online sales to any state in which they operate a brick-and-mortar store. To do otherwise, argued the ABA, unfairly puts independent booksellers at competitive disadvantage. The ABA's claim was bolstered in January 2003 when a group of national retailers, including Wal-Mart, agreed to begin charging sales taxes for all online sales.

INDUSTRY LEADERS

Barnes and Noble is the largest bookseller in the United States. In 2003 the company operated 620 Barnes and Noble stores in 49 states, an additional 350 stores under the names B. Dalton, Doubleday, and Scribner's bookstores, and barnesandnoble.com. The company posted a net income of \$100 million on \$5.3 billion in sales in fiscal 2002. Its superstores accounted for approximately 80 percent of the sales. Underperforming B. Dalton closed 66 stores from June 1998 through June 1999. The company is credited with introducing the superstore concept (which Borders embraced) and has also established a significant online presence in an alliance with America Online. Barnes and Noble was founded in 1873 by Charles Barnes and began as a used book business. William Barnes, Charles' son, took over as president of the business in 1902, later selling the firm to C.

W. Follett. Leonard Riggio paid \$1.2 million for Barnes and Noble in 1971; with the acquisition of Marboro Books in 1979, the company entered the mail order and publishing business.

Once the largest bookstore operator in the United States, Borders has been second to Barnes and Noble since 1992. Borders Group operates more than 1,200 retail stores across the country under the names Waldenbooks, Borders, and Planet Music (CDs), including 435 Borders superstores. In 1993, Kmart Corporation was the nation's second largest bookseller, owning two of the largest bookstore chains, Walden Book Company, Inc. and Borders, Inc. In early 1994 Kmart combined Borders and Walden into the Borders-Waldenbooks Group. As part of the restructuring, Walden closed 187 underperforming outlets. The downsizing at Walden was in marked contrast to Borders, which experienced rapid expansion and went public after a 1995 buy back of stock by the original Border brothers from Kmart, consolidating its three divisions in Ann Arbor, Michigan. Changes related to the spin-off led to a \$211 million loss in 1996. Borders Group continues to focus on its superstores, which average 30,000 square feet. The company posted sales of \$3.5 billion in 2002, resulting in a net income of \$111.7 million.

Walden Book began as a small rental library in Bridgeport, Connecticut, in 1933 by Larry W. Hoyt, who leased space in a department store. He rented books for three cents per day. By 1948, the company was operating 250 rental libraries and had begun to sell books as well. In 1962, the company opened its first retail bookstore in Pittsburgh. It was named The Walden Bookstore, a reference to Walden Pond, the lake near Concord, Massachusetts, where author Henry David Thoreau lived from 1845 to 1847. The company opened 50 more Walden Bookstores in less than seven years.

In 1969, Walden Book was purchased by Carter Hawley Hale Stores, Inc., parent company to several leading department stores. The store names were changed to Waldenbooks nationwide in 1972, and in 1981, Walden Book became the first company to operate retail bookstores in all 50 states. The company also opened a central warehouse, the first in the industry, and linked all 750 of its stores to a nationwide computer system that tracked sales and inventory. In 1984, Walden Book was purchased by Kmart, then the second largest retailer in the United States. Walden Book acquired Brentano's, a chain of upscale bookstores, the same year. The first Waldenbooks and More superstore opened in Levittown, New York, in 1985. Walden Book opened the first Waldensoftware and Waldenkids stores in 1987.

Borders, which started the industry's return to large, comfortable, well-stocked bookstores with knowledgeable workers, was founded in 1971 by brothers Louis and

Tom Borders in Ann Arbor, Michigan. By 1976, they had developed a computerized inventory and ordering system that made their Borders Book Shop one of the most profitable and best-run bookstores in the country. While the industry average for unsold books returned to their publishers was about 40 percent in 1990, Borders returned just 8 percent, despite offering 5 to 10 times as many titles as the average mall bookstore. Borders also sponsored book signings, poetry readings, literary discussions, and storytelling sessions.

In 1985, Borders expanded to Birmingham, Michigan, and Indianapolis, Indiana. When it was purchased by Kmart in October 1992, Borders was operating 19 superstores. Kmart opened three more Borders Book Shops in 1992 and shifted responsibility for its nine Basset Bookstores from Walden Book to Borders. The Basset stores were to become Borders Book Shops in 1993. In 1992, Borders also added espresso bars and larger children's book sections to several stores and opened the first two Borders Books and Music stores, which offered 70,000 musical selections and 9,000 videotape titles in addition to books. The stores targeted the musical tastes of book buyers in the 35 to 54 age group. Kmart opened one new Borders Book Shop and 13 more Borders Books and Music superstores in 1993. Plans were for the new stores to have at least 22,000 square feet of floor space, compared to about 15,000 square feet in the older stores. In July 1995, two labor unions (IWW and UFCW) attempted to organize workers at Borders locations. By the end of the year two Borders stores unionized, but union drives at other bookstores failed.

Chairman Herbert H. Haft and his family owned a controlling interest in Crown Book Corporation, which was founded in 1977. The leading discount bookstore chain, Crown Books sells bestsellers for as much as 40 percent off the publisher's suggested retail price. In 1993, the company operated 247 Crown Bookstores, each of which carried 3,000 to 4,000 titles. In 1990, the company opened its first Super Crown Bookstore, which offered about 30,000 titles; in 1993 there were 32 Super Crown Bookstores. In 1992, the publicly owned company had approximately 2,300 employees and \$232 million in sales. In the mid-1990s power struggles in the Haft family created problems within the business. Herbert ousted his son Robert and replaced him with his other son, Ronald. Robert sued and won a jury award of \$34 million. Ronald stepped down in 1995, leaving the company in the hands of CEO Steve Stevens.

In mid-1998 Crown Books declared bankruptcy, filing Chapter 11, citing downward sales and losses that continued to mount. Crown broke free of bankruptcy protection in November 1999, with 92 stores in Washington, Chicago, San Francisco, and Los Angeles, down from a high of 179 stores. The company was projecting sales of \$190

million for 1999. The company said it would remain a deep discount bookseller, pointing out that their prices were lower than online sellers when shipping costs were taken into account. In the spring of 2000, the company was expected to announce plans for online retailing, new stores, and the remodeling of old stores.

WORKFORCE

According to the U.S. Census Bureau's *Statistical Abstract of the United States*, book stores employed 142,000 people, with an annual payroll of \$1.7 billion.

SIC 5943

STATIONERY STORES

This industry consists of establishments primarily engaged in the retail sale of stationery, such as paper products (including printing and engraving), postcards, school and office forms, legal forms, and supplies. Those establishments primarily engaged in selling office forms and supplies are discussed in **SIC 5112: Wholesale Trade**, and those primarily engaged in the retail sale of greeting cards are discussed in **SIC 5947: Gift, Novelty, and Souvenir Shops**.

NAICS CODE(S)

453210 (Office Supplies and Stationary Stores)

INDUSTRY SNAPSHOT

According to the U.S. Census Bureau, there were 8,787 establishments engaged in the retail sale of stationery in 2001, employing approximately 127,922 people with an annual payroll of \$2.7 billion. By 2003, there were approximately 12,377 establishments generating \$19 billion in sales. Average sales per establishment were \$2.3 million. The number of employees climbed slightly to 132,781. The largest segment was office forms and supplies with 7,856 businesses, accounting for more than 63 percent of the overall market. Stationery stores numbered 3,060 businesses, and accounted for more than 24 percent of the market. School supplies numbered 888 businesses, and writing supplies numbered 489. States with the most establishments were California with 1,683, New York with 1,107, and Texas with 1,046. Combined, they employed 34,163 people, and controlled 31 percent of the market.

Sales in the retail stationery industry were somewhat erratic in the 1990s. The total sales volume was stagnant or declining slightly in the early 1990s. However, the industry recovered and grew slightly in the mid-1990s and continued to grow in the later part of the decade.

Industry sales rose significantly in the late 1990s; sales of office supply superstore chains Staples, Office Depot, and Office Max together had estimated sales of \$13.2 billion in 1997. Staples reported sales of \$7.1 billion for 1998, while Office Depot's sales reached \$8.9 billion. Office-Max, the smallest of the three superstores, had sales of \$4.3 billion in 1998. These superstores nonetheless are discussed in this category since they sell the same goods as smaller stationery stores and have a dramatic impact on those stores. While office superstores have become immensely popular, discounters, supermarkets, and drug stores all have seen significant growth in stationery sales.

Office products have become the central component of many stationery stores. This change also has affected the kinds of stationery stores that control the market. Many smaller, independent dealers have been merged or acquired, while several large retailers have grown even larger. An indication of the depth of the shift is that the trade association formerly known as the National Stationers Association is currently known as the National Office Products Association (NOPA).

ORGANIZATION AND STRUCTURE

According to the U.S. Bureau of the Census, establishments that sell to the general public are classified as retail traders, even if the material they sell is not used in a household. Establishments that sell exclusively to businesses, institutional and industrial establishments are classified in wholesale trade. Most retail stationery stores categorized in this industry have fixed addresses, advertise to attract buyers, and buy merchandise in addition to selling it. Commodity classifications are assigned according to the primary source of an establishment's receipts. In the case of the stationery store industry, this means that a stationery store may sell office supplies but must derive most of its receipts from stationery sales.

The supply chain to stationery stores begins with manufacturers that produce office supplies. These firms sell some products directly to retail dealers, and other products are sold first to a wholesaler and then to a dealer. A growing number of manufacturers have begun to follow the practice of selling their merchandise directly to dealers. Warehouse clubs (such as Sam's Club), superstores (such as Office Depot), and discount stores (such as Kmart) buy almost exclusively from manufacturers.

BACKGROUND AND DEVELOPMENT

In 1775, pioneer papermakers of the now-legendary Crane family produced the paper used for the first currency of the young colonies. That paper was engraved by Paul Revere. The Crane family drew on the European tradition of making paper from cotton fibers and sold its products at the finest stores. Crane stationery and papers are sold at Tiffany's and fine department stores, but as

businesses grew in the nineteenth century, more typical mass-market quality papers were developed. Early stationers sold business stationery as well as other products that could be used in an office.

During the twentieth century, business supplies shifted from typing paper, envelopes, and writing utensils to electronic products. Each of these products had replaceable parts: inkwells and cartridges for pens, ribbons for typewriters, and later, computer supplies such as printer ribbons, diskettes, and computer-appropriate paper and labels. The stationery stores responded by expanding and changing their inventories to supply all of the needs of the new business world.

The stationery store industry underwent a dramatic change in the 1980s and 1990s. As computers began to revolutionize the business world in the late 1970s, suppliers to businesses changed as well. Stationers have had to shift their focus away from stationery products toward the ever-growing demand for office products. Greeting cards, which are not part of this industry, are still sold in many stationery stores. Likewise, large office products, such as office furniture and computer equipment, are often carried by stationery stores but are not covered in this industry.

In the 1980s, new channels for stationery and office products emerged. These included superstores such as Staples and Office Depot, warehouse clubs such as Sam's Club, and mass-market stores such as Wal-Mart. Sales of stationery products and office products through these outlets were expanding in the 1990s. No other mass-market retail channels have come close to office superstores and discount stores in stationery sales.

Perhaps the biggest development in this industry in the mid-1990s was the proposed acquisition by Staples Inc. of Office Depot Inc., a combination of two of the largest U.S. office supplies superstore chains. Announced in September 1996, the proposed merger was seen by stock market analysts as a positive development for both the companies and the industry, largely because it would help to avoid "destructive" price competition as the superstore market becomes saturated with stores.

Stock market analysts had expected the merger to be a very positive development, both for Staples and its principal competitor, OfficeMax. By combining resources and management, the merged company was expected to save more than \$400 million in costs over three years.

This merger was blocked by the U.S. Federal Trade Commission (FTC). The FTC charged that the proposed merger would result in less competition and higher prices. The FTC previously had raised serious objections to the merger but Staples responded to the FTC's objections by agreeing to sell 63 Office Depot and Staples

stores to OfficeMax Inc. for \$108.8 million. The group of stores included some of the two chains' most profitable stores. Despite Staples' vow to fight the FTC challenge, the merger effort was eventually aborted in 1997.

Besides the growth of office product superstores and the consolidation of smaller stationery store chains, one trend that both small and large establishments in this industry were watching in the 1990s was the increase in the number of home offices. For stationery stores, this meant that more consumers would purchase items individually rather than for entire staffs. Special needs of the home office user include convenient hours and locations, good return policies, broad selection, and products offered in small quantities.

In addition to the growing number of home businesses, stationery stores were affected by consumers' increasing environmental concerns. After the Federal Resource Conservation and Recovery Act was implemented, Stuart Hall was among the first recycled paper products sold in stationery stores. However, many consumers did not want to compromise on price or quality, and some environmentally friendly paper products were more expensive than those made from virgin material. Consequently, the growth of recycled paper in the market has been slower than expected.

CURRENT CONDITIONS

The overall industry is extending its market presence via online sales. Industry leader, Staples generated \$2.1 billion in Internet sales for 2003, which was a 31 percent increase. The overall Internet related sales account for over half of Staples worldwide sales, and an additional \$15.9 percent of total sales. Office Depot Inc. experienced the same results with online sales of \$2.6 billion for 2003. This was an increase of 25 percent, over 2002. In addition, total Internet sales accounted for about 21 percent of overall sales, up slightly from 18.3 percent in 2002.

Unlike the proposed merger of Staples Inc., and Office Depot, Inc. that had been blocked by the FTC back in 1996, the merger between Boise Cascade Office Products and Office Max placed them in an improved competitive environment. Boise Cascade Office Products located in Itasca, Illinois acquired OfficeMax in 2003. Combined, they would generate approximately \$7 billion in annual sales that would provide them with a slighter competitive advantage over rivals Staples, and Office Depot. The industry leader, Staples generated \$13.2 billion in sales. Office Depot was close behind with \$11.4 billion in sales. OfficeMax, in a distant third, generated \$4.77 billion.

For the future, many sources predicted that independent dealers would be fewer in number and the surviving units would likely combine into new associations and

groups. National distribution networks and more partnering relationships between manufacturers, wholesalers and dealers were expected to introduce more efficiencies to the stationery distribution system.

At one time, stationery retailers marketed their products to all of their prospective customers in the same way. However, the multitude of customers and their diversity of needs has forced dealers to develop sophisticated sales strategies that enable them to sell parts of their inventories to specifically targeted consumers. They have had to develop sophisticated and focused marketing plans, recognizing that people who buy stationery and office supplies can choose among catalog dealers, warehouse clubs, commercial stationers, superstores, and retail stationers.

INDUSTRY LEADERS

The stationery and office products retail business is divided into two dramatically different segments: the office supply superstore segment and the smaller stationery stores. The industry has three leaders, Staples, Office Depot, and OfficeMax.

While Staples is considered to be the leader among the office superstores, Office Depot is larger and had greater sales than both Staples and OfficeMax in 1998. Staples has the youngest store base in the industry and has implemented a strategy of building smaller stores and saturating a market aggressively.

The growth of these retail superstores has been dramatic. Office Depot opened 100 stores in 1998 and planned to expand its store count by 15 percent annually through 2003. Staples plans to open 170 stores in 2000, which would eclipse Office Depot's proposed number by almost 20.

These superstores carried office supplies and products at prices that often were far below those of their competitors. They carried brand-name products and serviced small and medium-sized businesses with stores conveniently located in both suburban and urban areas. Most of the stores have high-volume operations and carry top stationery brands.

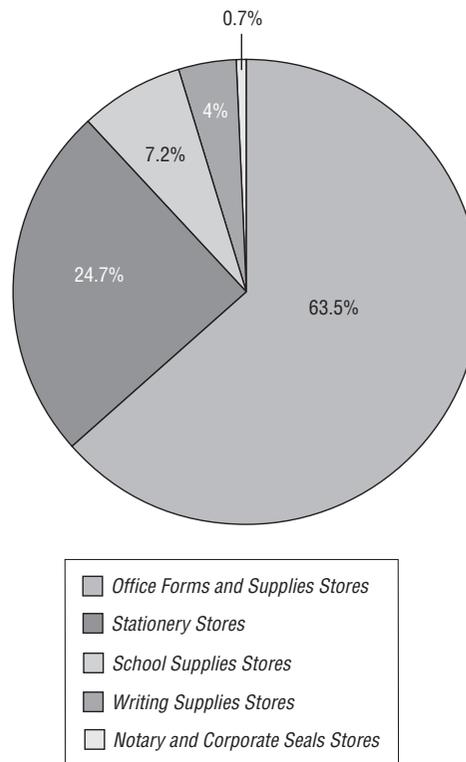

Among the chains of smaller stationery stores, leaders include Fay's Inc., Liverpool, Ohio; Franklin Quest Co., Salt Lake City, Utah; School Specialty Inc., Greenville, Wisconsin; B.T. Miller, Arlington, Texas; and J.L. Hammett Co., Braintree, Massachusetts.

WORKFORCE

Among the smaller stationery stores, about 49 percent of the employees were cashiers; 8 percent were marketing and sales worker supervisors; 7 percent were store clerks; 6 percent were general managers; and the remaining 22 percent were spread across a number of job categories.

Top Types of Stores in the Stationery Industry

By percent of total number of stores

SOURCE: D & B Sales & Marketing Solutions, 2003

AMERICA AND THE WORLD

The American stationery and office supplies industry was one of the world's largest. With the introduction of superstores and competitive pricing, the U.S. industry saw further recognition of its leadership in the international market. Distributors of office supplies began doing more business abroad in the early to mid-1990s, while prices for technologically advanced items in the U.S. market dropped significantly. Staples has tapped into the overseas market; in 1999 the company boasted 63 stores in the United Kingdom, 45 in Germany, 21 in the Netherlands, and 6 in Portugal. In early 1999 Office Depot had a total of 87 locations in Mexico, France, Israel, Poland, Columbia, Japan, Hungary, and Thailand. As of late 1999, OfficeMax did not operate any stores in Europe.

RESEARCH AND TECHNOLOGY

Modern technology has had a profound influence on the products sold by stationery and office supplies stores. Dealers in office supplies used to sell calculators and electric staplers, while office machines dealers sold copiers, word processors, fax machines, and computers. However, the distinction has blurred in the 1990s. For

instance, technological expertise and after-care service requirements became a must for computerized equipment. Calculator prices declined to the point that they became replacement items like typewriter ribbons. Typewriters themselves were almost completely replaced by word processors and computers. As more information was conveyed electronically from one terminal to another, more steps involving paper were eliminated. Again, the effect on the stationery store industry was a loss in net sales.

SIC 5944

JEWELRY STORES

This industry consists of establishments primarily engaged in the retail sale of jewelry, such as diamonds and other precious stones mounted in precious metals and sold as rings, pins, or bracelets; sterling and plated silverware; and watches and clocks. Establishments primarily engaged in the retail sale of costume jewelry are classified in **SIC 5632: Women's Accessory and Specialty Stores**.

NAICS CODE(S)

448310 (Jewelry Stores)

There were approximately 49,542 establishments engaged in the retail sale of jewelry in 2003. The total number of people employed in this industry was about 199,366. The annual sales generated amounted to \$26.9

billion. States with the highest number of establishments were California with 7,023, Texas with 5,145, New York with 4,149, Florida with 3,991, Pennsylvania with 1,813, New Jersey with 1,723, Illinois with 1,629, Ohio with 1,452, North Carolina with 1,308, and Michigan with 1,252. In all, there were 32,704 jewelry stores with total sales of \$13.8 billion. Jewelry, precious stones and precious metals had 14,363 stores and generated \$12.4 billion in sales.

The retail fine jewelry industry is divided into two types of enterprises: chain stores and independents, with chain stores predominant. The early 1990s ushered in a recessionary era of poor sales and bankruptcies, but the industry had regained valuable footing by mid-decade. By the end of the decade, U.S. annual fine jewelry and watch sales totaled \$52.1 billion. A strong economy and low unemployment had served to boost the sale of luxury goods, including jewelry, as the industry headed into 2000. However, since the jewelry industry is cyclical in nature, retailers know that if the economy turns down and consumer discretionary spending slows, they will be hit first.

For retailers, 1999 proved to be a stellar year for sales of watches and related products, and this trend was expected to continue. Watch sales were predicted to rise due in part to the influence of fashion designers who in the late 1990s made watches a status symbol. Technology was also expected to fuel sales with the advent of watches that connect to the Internet.

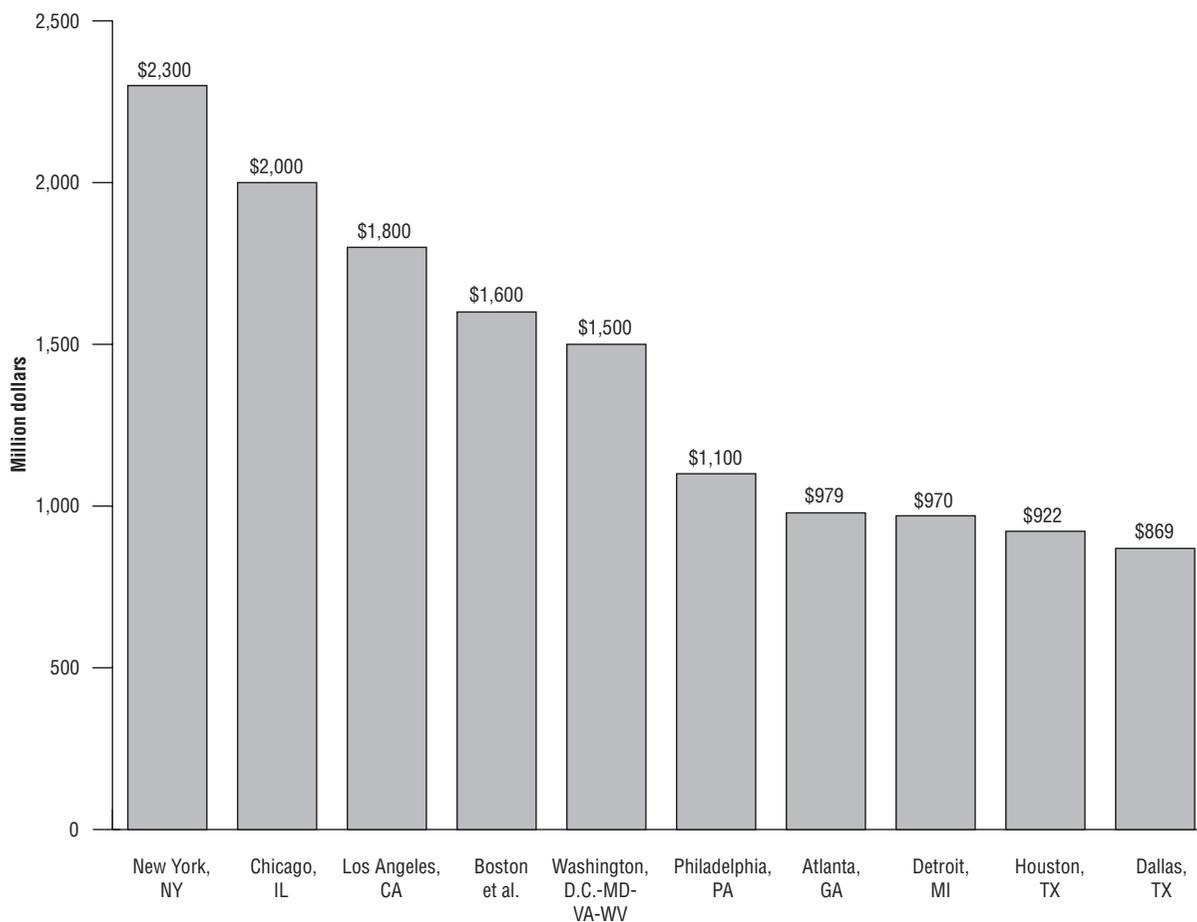

In the independent jewelry retail business, participants have fought a tough battle to maintain their identity in the competitive jewelry business of the 1990s. One such tactic has been the introduction of in-house credit cards, engineered by retailers and their banks. Such lines of credit boost sales and often provide the customer with a much lower interest rate and better terms.

According to *Jewelers' Circular Keystone*, as well as the U.S. Census Bureau, almost 25 percent of the specialty retail purchases were still made in December. Specialty retail jewelers accounted for \$26 billion in sales in 2003. Diamond jewelry accounts for nearly 50 percent of the specialty retailers sales. The jewelry industry is highly fragmented with no single operation controlling more than 6 percent of the overall market. Over the past few years consumers demand had shifted to designer jewelry. The trend was depicted among 66.4 percent of jewelers in 2002 and 2003.

According to statistics offered by Claritas Inc., Chicago will lead in jewelry and watch sales, totaling about \$2.5 billion, into 2007. The average consumer will spend about \$500 per year on fine jewelry. The projected jewelry sales were expected to rise to \$61.8 billion by 2007, from \$52.1 billion in 2002. Although Wal-Mart gener-

Top Jewelry and Watch Markets in the United States

By sales, in millions of dollars

SOURCE: Jewelers' Circular Keystone, 2004

ated the highest amount of overall jewelry sales, Zale's remained the dominant specialty retailer.

Cities with the largest market share of jewelry sales were New York with \$2.3 billion in 2002, Chicago with \$2 billion, Los Angeles with \$1.8 billion, Boston with \$1.6 billion, and Washington D.C., with \$1.5 billion.

Among the chains, the retail jewelry industry is led by some well-known names: Zale Corp., Sterling Inc., and Tiffany and Co. Founded in 1924, the Irving, Texas-based Zale Corp., which holds the number-one spot in the industry, posted sales of \$1.25 billion in 1997 and in 1999 increased sales by 14 percent to \$1.43 billion. That same year it posted a net income of \$80.9 million, up from \$31.5 million in 1995. Zale has 1,345 outlets in the United States and Canada and controls about 5 percent of the nation's \$40 billion jewelry industry. Stores operate under the names Zales Outlets; Peoples Jewelers; Zales Jewelers, which carries lower-priced items; Gordon's

Jewelers, which carries mid-priced items plus regional fashion jewelry; and Bailey, Banks & Biddle, which carries the upscale product lines.

Zale's hegemony was all the more impressive given that it had emerged from bankruptcy in 1993. With a new chair, Robert DiNicola, the company was showing a revitalized strategy by the mid-1990s. DiNicola lowered prices on best-selling items considerably, which increased sales. Another strategy was to "make Zales the McDonald's of the jewelry business," wrote Amy Feldman in *Forbes*, "with national ads and standardized goods." Due to changing markets, Zale's increased spending on advertising (particularly television), incorporated a toll-free number in its newspaper inserts and direct mail catalogs, and expanded into the mail order catalog business late in 1996. By the late 1990s, it was selling merchandise direct on its Web site at www.zales.com. In 1999, DiNicola, who was credited with turning

the company around, stepped down as the chief executive turning over the reins to the president and chief operating officer, Beryl Raff.

Meanwhile, what has become perhaps the most famous name in the history of American jewelry stores, Tiffany, opened two new stores in the United States and posted record sales for the 1996 holiday season. A new marketing strategy that aimed to lure Americans of a wider strata of income levels into Tiffany stores seemed to work well. The Fifth Avenue-headquartered firm's net sales for fiscal 1998 hit \$1.17 million.

As retail jewelers entered the twenty-first century, they faced heavy competition from mass merchants, such as home shopping channels, mail-order firms, and discounters. These mass merchants, which were not even in existence 30 years ago, have snatched up 25 percent of the estimated total \$40 billion U.S. annual fine jewelry and watch sales market. Jewelers are not worried, however, believing it easier to turn a sale with the product in hand.

Another change in the industry was Internet sales. Online sales, which now make up less than 1 percent of total retail sales, are projected to increase exponentially well into the next century. Jewelers will have to get online to be competitive, but several, including Zale and Tiffany, already offer direct online sales. Specialty retailers have also included the distribution of store catalogs in order to generate sales.

Some retail jewelers may soon be offering synthetic diamonds at a fraction of the cost of the natural diamond. Apollo Diamond Inc. located in Boston, Massachusetts, and Gemesis Corp. of Sarasota, Florida have manufactured synthetic diamonds within a laboratory setting versus deep down in the earth. There has been tremendous response to the new technology. An online poll conducted by *CNBC*, revealed about 71 percent of consumers would also be willing to purchase the synthetic diamond opposed to the natural diamond. Apollo has in fact began selling its yellow synthetic diamonds throughout various retailers. The popularity for colored stones remained strong, and Gemesis was working on different shades, expecting to offer them sometime in the later part of 2004.

SIC 5945

HOBBY, TOY, AND GAME SHOPS

This industry consists of establishments primarily engaged in the retail sale of toys, games, and hobby and craft kits and supplies. Establishments primarily engaged in selling artists' supplies or collectors' items, such as coins, stamps, and autographs, are classified in **SIC 5999: Miscellaneous Retail Stores, Not Elsewhere Classified**.

NAICS CODE(S)

451120 (Hobby, Toy, and Game Shops)

INDUSTRY SNAPSHOT

In 2001, the U.S. Census Bureau reported 10,783 establishments primarily engaged in the wholesale distribution of games, toys, hobby goods and supplies, dolls, craft kits, children's vehicles, fireworks, and playing cards. On June 1, 2001, the International Council of Toy Conferences announced that toy sales worldwide reached \$69.5 billion for 2000. According to the Toy Industries Association (TIA), total U.S. toy sales for 2002 were \$25 billion. TIA also noted that was a 1.7 percent increase over 2001 toy sales. Stores ranged from independent shops to national chains, which sold toys and hobby supplies exclusively. Other types of stores carrying toys as part of their retail offerings include discounters, department stores, warehouse clubs, home supply stores, catalog houses, and drug stores.

Hobby, toy, and game shops represent the largest market with 8,288 establishments. Together, they shared more than 26 percent of the market. Arts and crafts supplies numbered 8,107, comprising more than 26 percent of the market. Toys and games had 4,936 retail stores and accounted for about 16 percent of the marketplace. Hobbies followed with 2,000; hobby and craft supplies had 1,872; models, toy and hobby had 1,645; dolls and accessories shared 1,442; ceramics supplies had 1,324; children's toys and games had 754; games includ-

ing chess, backgammon, and other durable games had 462; and kite stores had 188.

ORGANIZATION AND STRUCTURE

Manufacturers of toys and games sell their products either to wholesalers, or directly to retailers, although some manufacturers sell to both retailers and wholesalers. Retailers with multiple outlets require efficient delivery systems from their manufacturers. Toy manufacturers with outdated systems have thus found it difficult to convince large retailers to carry their products.

In the hobby and craft industry, manufacturers sell products through independent sales representatives or through their own salespeople. Wholesalers and distributors often play the role of middleman. Pre-packaged craft kits are increasingly sold in non-traditional outlets. Independent craft and toy retailers now compete with nationwide chains of specialty stores as well as with large discount stores carrying craft products. HIA estimated that nearly 20,000 stores could be considered toy and hobby outlets if sewing and other craft-related fields were included.

By the mid-1990s, the top five retailers were Toys ‘‘R’’ Us, Inc., Kay-Bee Toy and Hobby Shops, Inc., Wal-Mart Stores, Inc., Kmart Corporation, and Target Stores Inc. In 1999, these stores accounted for 52 percent of toy sales in the United States. Many industry observers, however, believe that specialty toy stores can still thrive in this marketplace. Those emphasizing convenience, top-notch service, and quality products are most likely to succeed.

BACKGROUND AND DEVELOPMENT

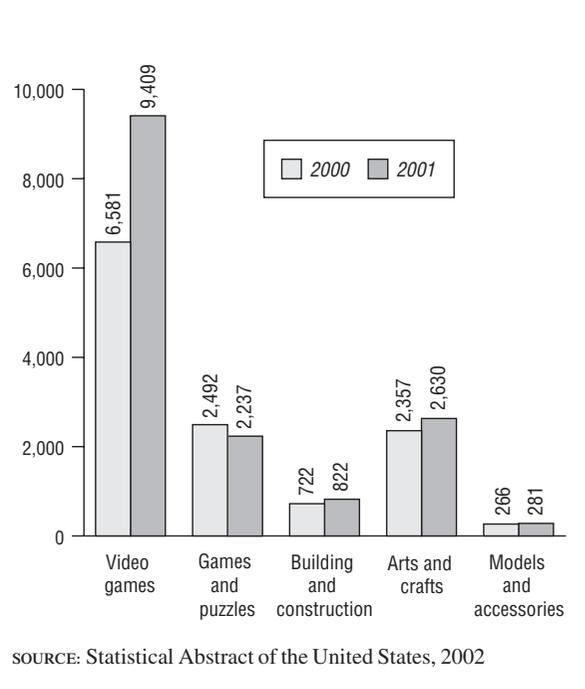

With the opening of the first Toys ‘‘R’’ Us in the 1950s, retailing of toys in the United States changed forever. The vast retail chain began as a bicycle shop, was transformed into a juvenile furniture store, and finally became a toy store. Additional Toys ‘‘R’’ Us stores were soon opened; these outlets emphasized deep discounts and wide selections.

Another key factor in the growth of the retail sale of toys was the increase in the use of television advertising. In the late 1950s and early 1960s, television promotions reached into many homes where toy purchasing decisions were made.

In the 1970s many parents expressed concern about toy safety. Several consumer groups began to lobby on behalf of toy safety, as well as in search of manufacturers and retailers who would support limitations on television advertising. The National Advertising Division of the Council of Better Business Bureaus was established in 1974. It included the Children’s Advertising Review Unit (CARU), which promoted responsible children’s advertising.

Top Types of Hobbies, Toys, and Games, 2000–2001

By retail sales, in millions of dollars

Many toy manufacturers helped toy stores sell items by licensing products that were perceived as popular, or ‘‘hot toys.’’ One emerging trend was the production of licensed promotional items by the retailers themselves, though this practice was limited to larger retailers who could make the investment of time, money, and space in their stores.

The late 1970s and early 1980s also saw the introduction of electronic games and toys. While retailers were enthusiastic about the tendency of buyers to purchase these items year-round, they suffered from a glut of products left on their shelves. These unsold items became so costly for some retailers that losses forced them to close in the late 1980s. This led to the consolidations that occurred in the 1990s.

In the competitive toy store industry, the latest technological advances have always been sought. Scientific progress has for many years been mirrored in toy development and sales. Independent retailers of toys, mindful of maintaining good relationships with their manufacturers, try to get early shipments of these new toys.

Video games changed the face of toy stores in the 1970s and 1980s. That craze was followed in the 1990s by excitement in toy stores over advanced software, such as computer games that incorporate CD-ROM technology.

Electronic Learning Aids, or ELAs, accounted for large sales increases in many toy stores in the early

1990s. Unlike video games, the electronic toys appeal to parents as well as children. They are age-specific and can be used even by very young children. Some ELAs require no more technology than batteries. Some, however, require purchase or rental of CD players, televisions, or VCRs. Milt Schulman wrote in *Playthings* that industry executives expect to see interactive technology increase its presence in toy stores. “These new, interactive toys will challenge retailers to take innovative merchandising approaches that help explain what these advanced toys are capable of doing.”

New technology also helped toy retailers keep track of their inventories and increased sales. Even smaller toy retailers were moving from manual inventory tracking to computerized systems that hinged on the point-of-sale computer register.

The Internet has also helped bolster the retail toy industry. While sites offering books, movies, and music grew by 17 percent in 1998, toy sites grew by 86 percent. This trend served as a signpost for a bright immediate future for the industry. Amazon.com, Inc, an online shopping company that generated sales of \$1.6 billion in 1998, entered the toy-retailing market in the late 1990s and was expected to have a large impact on the industry. According to the U.S. Census Bureau, consumers spent \$2.9 billion online for toys in 2000. That increased to \$3.2 billion in 2001, and to \$3.7 billion for 2002. Overall, there were a total of 22.3 million consumers who purchased toys online in 2002.

Toy Retailers. Manufacturers’ shipments of toys, not including video games, increased from \$11.4 billion in 1992 to \$14.4 billion in 1996, and reached \$29.9 billion in 1999. Retail sales rose from \$17 billion to \$24 billion in the same period. The retail industry as a whole is looking healthier following a difficult recession in the late 1980s and early 1990s. This recovery, coupled with the continued popularity of discount chains such as Wal-Mart, Kmart, and Target, had strong effects on the toy store industry. Some of the toys sold at small independent stores were available at a lower cost on the discounters’ shelves because of the inventory advantages such large chains enjoy. Meanwhile, catalog houses, which have made inroads in a number of areas of retailing, have yet to establish themselves as a significant force in the toy retail sector. Toy and hobby catalog purchases still account for only a small share of the total toy market.

Retailers also examined the effect of the increasing numbers of mothers in the workforce, as well as the increasing buying power of the children themselves. Children not only influence their parents in the choice of school items and toys, but, outfitted with greater amounts of disposable income than ever before, also comprise a significant target market by themselves.

Another measurable asset to the toy industry was the sale of video games. David Miller, president of TMA, noted that the success of video games showed that a steep price was not a barrier to the profitable sale of any particular toy. Much of the burden of selling these toys fell on the retailers, whose marketing efforts showed parents and other buyers that the play value of these items was high enough to justify the price. These video games did not fit neatly into retail stores and their existing toy categories. A combination of home entertainment and toy, the video game needed its own space on the retail floor; those retailers who realized this found tremendous profits in video games.

Hobby and Craft Retailers. Retail sales of hobby and craft items increased in the early 1990s as well. In the crafts sector in 1996, general crafts made up 31 percent of purchases (\$2.95 billion), while florals and naturals made up 16 percent (\$1.53 billion). Frames accounted for 9 percent (\$.91 billion), needlecrafts made up 6 percent (\$.59 billion), and art materials accounted for 10 percent (\$.96). The remainder of sales was in the area of sewing and notions (\$2.73 billion). Michaels Stores were the leaders and generated \$3,091 million in sales for 2004.

Statistics in the early 1990s showed that consumers preferred to buy their model kits from hobby and toy stores rather than discount stores because of the service they received from the former. Moreover, hobby retailers cite low prices as another factor in their ability to withstand the competition from discounters and catalog sales.

Jockeying With Toy Manufacturers. The Kmart Corporation made an unusual request of toy manufacturers in the summer of 1993—to sell toys on consignment. This meant that the toys would be considered inventory of the manufacturer until their arrival at Kmart stores. Kmart did not want to pay for toys until they went to stores even if they sat in distribution centers for long periods of time. The practical result of this request would be that a poorly selling toy would be the responsibility of the manufacturer. Some large toy manufacturers have refused to comply with Kmart’s request, mindful that other retailers were watching Kmart’s bid with interest. Other manufacturers, though, have less leverage and are heavily dependent on Kmart to get their products into the marketplace.

This bid came as Kmart, Toys ‘R’ Us, and Wal-Mart, the three largest toy retailers in the United States, sought to convince manufacturers to assume a greater risk in the toy business. The retailers urged a system wherein toys would be replaced immediately by the manufacturers as stocks were depleted. Manufacturers, concerned about the potential for excess inventory such a system would create, have balked at this as well.

In 1998, the Toy Manufacturers of America (TMA)—a trade organization founded in 1916—

that, due to holiday shopping, approximately two-thirds of toy industry sales occurred in the fourth quarter. Christmas 1999 found shoppers pursuing such products as “Pokemon” and “Star Wars” action figures.

In response to the increasing dominance of large toy chains, specialty toy store owners formed the American Specialty Toy Retailers Association (ASTRA) in 1992. ASTRA created a forum for store owners to exchange ideas, and attempted to create a unified voice that would enable the industry to promote the sale of educational and high-quality toys. Specialty stores were estimated to have about five percent of a \$14 billion market in the 1990s.

INDUSTRY LEADERS

Industry leaders in 2001 included Wal-Mart, which had a 28.4 percent share of the market; Toys “R” Us, which had a 22.79 percent share of the market; KB Toys 6.76 percent; K Mart, 6.75 percent; Target 6.74 percent; Game Shop 3.79 percent; Electronic Boutique 2.93 percent; Best Buy 2.53 percent; Circuit City 1.18 percent; Mattel 1.14 percent; FAO 1.12 percent; Meijer 1.11 percent; and other toy wholesalers represented 15.10 percent. Other significant toy retailers included Ames and J.C. Penney with just over one percent market share each.

Wal-Mart Stores, Inc., the leading retailer in the world, operates approximately 3,600 Wal-Marts and Sam’s Clubs throughout North America, South America, Asia, and Europe. Primarily through wide-scale expansion, the company was able to increase its share of the toy market to become the leading retailer in the industry in 2003.

Toys “R” Us, the world’s largest toy retailer, had sales of \$28 billion in fiscal year 2003. It operated discount toy stores in the United States, the United Kingdom, Canada, France, Japan, Spain, and other countries. Kay-Bee Toy Stores, the second-largest toy retailer in America—Kmart, Wal-Mart, and Target are general merchandise discount retailers—operates more than 1,300 toy stores. A division of Consolidated Stores, the company placed most of its stores in shopping malls. Besides these chains, there are an estimated 3,000 specialty toy stores in the United States. Toys “R” Us CEO, John Eyler was fighting back against the price discounters Wal—Mart, and Target Corp. The company was in the progress of reorganizing and preparing for the 2004 holiday season. In an interview, Eyler revealed, “We have developed pricing strategies, lowered out expense structure, and done a number of things that allow us to reinvest in lower prices.” Among other toy retailers that felt the strain from the mass merchandisers were Kay-Bee Toys, FAQ Schwarz, Inc., Zany Brainy, and the Right Start who all filed for Chapter 11 bankruptcy protection following by the 2003 holiday season.

WORKFORCE

An estimated 137,147 people were employed in the U.S. toy industry in 2001. Almost 49 percent of the workforce in this industry were salespersons. The rest of the workforce was split among various other jobs such as cashier, stock clerks, executives, and shipping and receiving clerks. Every field within this industry was expected to grow going into the next century, some by as much as 40 percent, and some by only seven percent. In 2003, the workforce climbed to 159,930 and average number of employees per store numbered five.

AMERICA AND THE WORLD

The United States has the largest market for toys in the world. Other successful toy markets include Japan, Germany, France, and the United Kingdom, and global toy sales amounted to \$67.8 billion in 1998. Domestic toy manufacturers in 1998 were riding a crest of increased exports that began in the mid-1980s, with exports totaling \$1.0 billion. Imports have risen just as steadily, bringing that total to \$14.3 billion. Many American toy stores have tried to capitalize on the changing face of the world. Toys “R” Us was one of the first U.S. retail stores to open in Japan. In the early 1990s the company projected that sales there could reach \$1.5 billion by the year 2000. It planned to open ten stores each year beginning in 1993. When Toys “R” Us began to expand into Australia, it met with heavy competition from Australia’s own retailer, Coles Myer. In the mid-1990s, Coles Myer planned to open large stores called World 4 Kids (W4K) that would go head to head with Toys “R” Us in each market.

A growing concern for consumers is the conditions under which toys, and other personal products, were produced. William J. Holstein, in a *U.S. News and World Report* article entitled “Santa’s Sweatshop,” points out that many of the most popular toys are made in sweatshops around the world by overworked, and in many cases, underpaid workers, toiling in unhealthy conditions. The toys mentioned ranged from F.A.O. Schwarz’s Bernie St. Bernard to Mattel’s Barbie, to a range of Disney products. Holstein also points out that a “Made in America” label is no longer a guarantee of non-sweatshop production, particularly in the garment industry.

SIC 5946

CAMERA AND PHOTOGRAPHIC SUPPLY STORES

This industry consists of establishments primarily engaged in the retail sale of cameras, film, and other photographic supplies and equipment. Establishments engaged primarily in the retail sale of video equipment are categorized in **SIC 5731: Radio, Television, and Consumer Electronics Stores**; those primarily engaged in photo finishing recovered in **SIC 7384: Photo finishing Laboratories**.

NAICS CODE(S)

443130 (Camera and Photographic Supply Stores)

The retail photographic supply industry has historically been a competitive one. Only six percent of households in the United States purchase cameras and photography supplies at camera specialty stores, with the vast majority purchasing through discount, drug, and supermarket stores. There were 1,149 camera and photographic supply stores throughout the United States. The combined stores represent more than 31 percent of the market, and \$414.8 million in sales. There were another 2,083 specialty stores that retail specifically cameras. Combined they accounted for more than 56 percent of the market, and averaged \$841.5 million in annual sales. Photographic supply stores accounted for 443 stores,

more than 12 percent of the market, and \$300.6 million in sales.

The industry has several major associations. In the 1940s, the Photo Finishers Association of America (founded in 1924) expanded to include photographic dealers and was renamed the Master Photo Dealers' and Finishers' Association. At that time, photographic dealers became more closely aligned with photographic equipment manufacturers and photofinishers. In 1974, recognizing that marketing was central to photo retailing as well as photo finishing, the association became the Photo Marketing Association International (PMAI).

The industry thrives on new technology. Many consumers only shop at photographic supply stores when there is a new lens, camera, or film type that they have heard about and are eager to try. Retailers are eager to remain on the cutting edge of photographic technology and to sell the latest equipment. They also service repeat customers who buy add-ons as well as replacement items such as filters and film. Photo CD technology was hot, as were sales of single-use, disposable cameras. The industry benefited from the Advanced Photo System (APS), a 24mm system acting as a bridge between digital and standard photographic techniques, using high-quality emulsion for its film and a new small hand held camera. By the turn of the century, sales of digital cameras also rose substantially and prices began to fall.

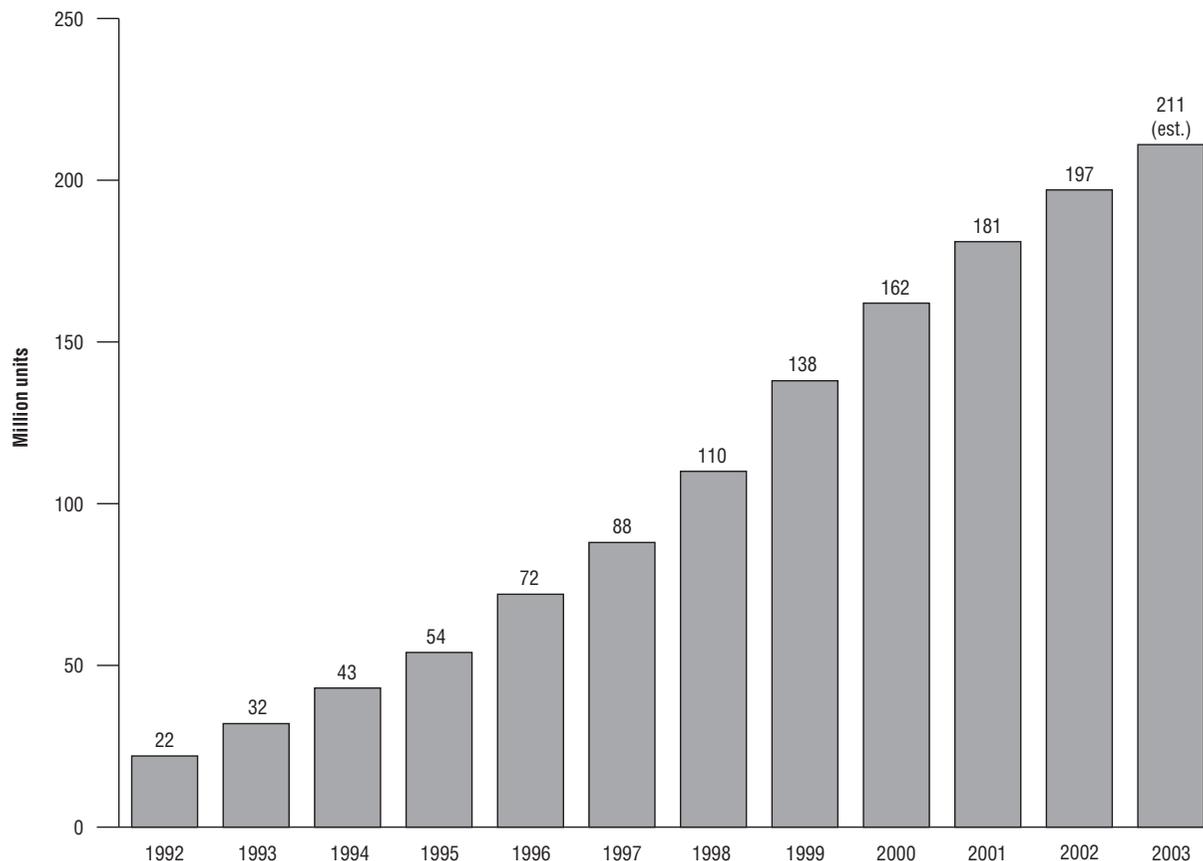

A marketing strategy gaining popularity at the end of the twentieth century was co-branding. A number of the larger film and camera makers agreed to sell their products to specialty stores at substantial discounts. In return, the stores agreed to showcase that manufacturer's products. Eastman-Kodak planned to have more than 500 co-branded sites by 2005.

The photographic equipment and supplies industry was slowed after September 11, 2001, since families were not traveling as much. According to *Value Line*, Eastman Kodak's 2003 sales dropped 23 percent in 2003. Digital cameras were expected to out perform film cameras by a total of 5 million. Some analysts believe that consumers are moving away from the basic cameras, but the single—use cameras have not lost their popularity. In fact, consumers purchased some 197 million in 2002. The projected number for 2003 was 211 million.

Most of the leading companies in this retail industry are privately owned. Some of the more successful camera and photographic equipment stores include Kits Cameras, Inc. of Kent, Washington; Inkley's, Inc. of Salt Lake City, Utah; Samy's Camera, Inc. of Los Angeles; Southwest Camera of Houston, Texas; and Comgraphics of El Paso, Texas. These retailers, as well as others in the industry, have benefited from the efforts of domestic and

Disposable camera sales, 1992–2003

In millions of units

SOURCE: PMA Marketing Research, 2004

foreign camera and film manufacturers to secure a share of the U.S. consumer marketplace.

Ritz Camera, the industry's largest participant, generated \$650 million in sales for 1998. Employing 6,500 people in 1,000 stores in 47 states, Ritz offered cameras and photographic supplies. Ritz stores also operated under the name "Camera Shop." Wolf Camera of Alpharetta, Georgia, generated an estimated \$500 million in sales for 1998—nearly doubling the previous year's sales.

SIC 5947**GIFT, NOVELTY, AND SOUVENIR SHOPS**

This industry consists of establishments primarily engaged in the retail sale of combined lines of gifts and novelty merchandise, souvenirs, greeting cards, holiday decorations, and miscellaneous small art goods.

NAICS CODE(S)

453220 (Gift, Novelty and Souvenir Stores)

Charles Gordon, writing in the Canadian news magazine *Maclean's*, stated "We live in a souvenir society, a

world in which everything we do, everywhere we go, has to be commemorated.” This attitude has encouraged the growth of gift, novelty, and souvenir shops, which have expanded from limited operations in airports and near tourist destinations into a multimillion dollar industry of its own, with specialty stores opening up in shopping malls and retail centers around the country. Many different kinds of stores, including discounters, drug stores, and supermarkets, sold gifts and novelties. However, specialty retail shops marketing exclusively in gifts and souvenirs had become a distinct billion dollar industry by the mid-1990s.

The Walt Disney Company was the leader in the field of specialty shops. Consumer product revenues were \$3 billion in 1999, a 5 percent drop from 1998, due to declines in worldwide merchandise licensing and sales from the Disney Stores. Declines were partially offset by increases at Disney Interactive (Disney’s software and publishing operations). While this downward trend reflects a move toward online merchandising, Disney pledged in 2000 to invest up to \$750,000 in revamping its 715 retail stores worldwide in an effort to reverse the profit slump.

Other leaders in this field included Spencer Gifts Inc., Cracker Barrel, Marriott Hotel Shops, Matthews Inc., Spains Gifts, Museum Shop, and South of the Border Shops. These stores were located in shopping centers, near tourist destinations such as monuments or resorts, or even in museums, zoos, hotels, and airports.

Seasonal and temporary carts, kiosks, and stores gained prominence in the novelty shop industry, ballooning into a \$10 billion business in the late 1990s. Virtually every enclosed mall had a temporary retail program; this allowed major retailers to explore new concepts, artists to peddle handmade items, and entrepreneurs to capitalize on hot trends.

Retail outlets that specialize in the sale of greeting cards are also classified in this industry. Not classified with other stationery products, greeting cards are a cornerstone of the gift and souvenir shop retail industry. The greeting card industry diversified considerably since its beginnings in the 19th century. Mass-produced Christmas cards were first sold in England by Sir Henry Cole in the 1840s, and Louis Prang introduced such cards to the United States not long afterwards. Some of these lines of cards were sold through stationery stores, but other lines were a better match for contemporary gift and novelty shops. Souvenir stores in tourist destinations often carried greeting cards that targeted travelers.

Greeting cards are commonly purchased for a variety of special events, from birthdays to weddings to holidays. The perennial popularity of such items provided retail outlets with a steady source of income throughout the

year, regardless of economic factors that might have devastating effects on other industries.

Hallmark Cards Inc. remained the undisputed leader in the retail sales of greeting cards by virtue of its huge presence in both the manufacturing and retailing of greeting cards. The long-time card manufacturer opened the first of its many retail outlets in the 1950s, establishing a dominant position in the industry. The other two market-share leaders were American Greetings and Gibson Greetings. American Greetings, the largest publicly held greeting card company, acquired Gibson Greetings in early 2000.

Hallmark and American Greetings were in steep competition with some relative newcomers to the industry, as gift and souvenir shops that specialized in the sale of greeting cards faced a vastly changing market. Distributors of gifts and novelties increasingly utilized large warehouse clubs and superstores that carried many product lines at reduced prices. Also, many card manufacturers sold their products through discount stores and grocery stores such as Wal-Mart and Kmart. In some cases, smaller gift and novelty stores were forced to restructure their businesses radically to compete. Buying patterns shifted; in the 1970s and 1980s the card market began moving away from card shops toward one-stop shopping establishments, such as discounters, grocery stores, and drugstores. While half of all cards purchased 20 years ago were sold at specialty shops, that figure shrank rapidly through the 1990s.

Hallmark and American Greetings both began to sell over the Internet. Their sites allowed customers either to design and personalize their own cards or to order traditional cards, all from their home computer. Customers can also send electronic greetings as e-mail messages. This online trend saw tremendous growth in the late 1990s. The number of Hallmark e-cards sent on a daily basis in November 1999 increased more than 600 percent over November 1998. *Discount Store News* noted the danger of this technological revolution: “The increasing use of e-mail poses a long-term threat to category profits by offering consumers an alternative that is often free, and in some respects superior to paper cards.” A survey conducted by American Greetings revealed that 95 percent of e-mail users prefer to keep in touch with friends and relatives electronically, and about 75 percent of these people receive and send cards online. Companies such as Blue Mountain Arts and Egreetings.com became very popular card sites on the Internet, offering free electronic greetings with animation and sound.

The Greeting Card Association in the late 1990s estimated the greeting card business to be a \$7.1 billion industry. Growth in recent decades was attributed to societal trends, as greeting cards took the place of letter writing in the modern world, and niche marketing was successful due to society’s diversity.

leather goods stores specialized in either leather apparel or gift items. Many of these stores were found in discount malls and airports.

The industry is served by the National Luggage Dealers Association. Founded in 1925, this trade association continues to represent retailers of luggage and leather goods around the country. The association’s primary function is to produce promotional material and relevant industry information for its members. Through the efforts of both this organization and the leather producers, the retail luggage and leather goods industry is well organized on a national level, staying in constant contact with the leather producers and manufacturers.

Retailers maintain close relationships with the leather producers to gain a better understanding of customers’ desires. Often, the producers hire fashion experts to advise retailers in future fashion trends in leather. The leather producers also provide promotional material and samples to retailers well before the leather articles are available to the public.

As they entered the late 1990s, luggage and leather goods stores faced a challenging business environment. Although people traditionally viewed fine leather as a luxury, the 1990’s consumer placed a premium on value. Therefore, in an effort to remain competitive, industry leaders focused on providing customers with good values without compromising quality. Some businesses used strict cost control and streamlining as a means to this end, while others relied on competitive leather sourcing from China, India, and Brazil since these countries supplied quality leather goods at low cost. In the late 1990s, 53 percent of the leather and leather products sold in the United States were imported. Since labor costs represented a high proportion of total production cost for leather goods, it was more cost-effective to import leather goods from developing countries with lower wage rates.

Like most retail segments, luggage and leather goods retailers use technology and automation to improve efficiency. Retailers also needed to attend to customer demands and desires because U.S. consumers in the 1990s shunned hard-side luggage, preferring lighter and less expensive soft-side goods.

Changes in the regulations concerning the use of carry-on baggage in air travel provided yet another challenge to the luggage industry in the late 1990s. Anne DeCicco, President of The Luggage and Leather Goods Manufacturers of America, stated, “Luggage producers must be certain to accurately and truthfully label products within the parameters of the new carry-on baggage environment that has resulted from the Federal Aviation Administration’s 1998 Advisory Circular on Carry-on Baggage and from changes the domestic airlines have implemented in their respective carry-on programs. Luggage

LUGGAGE AND LEATHER GOODS STORES

This category includes establishments primarily engaged in the retail sale of luggage, trunks, and leather goods.

NAICS CODE(S)

448320 (Luggage and Leather Goods Stores)

There are 1,977 luggage and leather goods stores in the United States, according to U.S. Census Bureau statistics. Luggage and leather goods stores employed more than 12,000 persons and generated net sales of \$1.3 billion in the late 1990s. As specialty retailers, all of these businesses carried narrow product lines but many offered deep selection within those lines. Often, luggage and

gage manufacturers that use terms such as approved carry-on bag or approved by the FAA or that use incorrect sizes can be charged with fraudulent or misleading advertising by the Federal Trade Commission.” How this will impact industry practice is one area of interest that will certainly be carried into the new millennium.

SEWING, NEEDLEWORK, AND PIECE GOODS STORES

This category includes establishments primarily engaged in the retail sale of sewing supplies, fabrics, patterns, yarn, and other needlework accessories.

NAICS CODE(S)

451130 (Sewing, Needlework, and Piece Goods Stores)

INDUSTRY SNAPSHOT

Although this industry was dominated by a few large national chains, hundreds of small shops were scattered throughout the country. Because many of these small businesses were privately owned, the size of the industry was difficult to determine. In 1999, the two largest companies in this sector, Jo-Ann Stores, Inc. and Hancock Fabrics, Inc., generated approximately \$1.76 billion in sales—one-fourth of industry totals.

An increase in the popularity of arts and crafts and a surge in home decorating prompted renewed growth in the sewing, needlework, and piece goods industry during the 1990s. Although the industry demonstrated enviable vitality, competition was intense. The attractive growth rate encouraged new entrants to the industry and convinced discount retailers to devote more resources to craft items. Retailers in this industry also competed with some hobby retailers classified in **SIC 5945: Hobby, Toys, and Game Shops**, that carried craft supplies such as yarn and fabric.

As the industry emerged from the mid-1990s, the business environment was changing. Small shops were

experiencing increasing competitive pressure from the larger craft/fabric super stores. Consumers, moreover, were attracted to the enormous variety offered by such stores. Consequently, several smaller chains were acquired by bigger firms during this period. Consolidation was typical as many large fabric chains closed small shops and operated fewer but more expansive stores.

In the late 1990s, many firms reported increased profits with fewer but larger outlets. Significantly expanded inventories and retailers' emphasis on home decorating fabrics added a much-needed boost to the lackluster sales figures of earlier years. In 1997, the 6,590 establishments in this industry totaled \$6.6 billion in sales and employed 45,351 people.

ORGANIZATION AND STRUCTURE

Since all the stores in this industry carried limited product lines, albeit deep selection within those product lines, they were classified as specialty retailers. Within the broad category of specialty retailers, the sewing, needlework, and piece goods industry was populated by two different retail formats. In the sewing and fabric category, large “super stores” were the norm. The needlework stores, on the other hand, were usually small boutique-like shops.

Although these two types of stores often carried similar products, they had different competitive priorities. While the large fabric retail chains, such as Hancock Fabrics and Jo-Ann Stores, carried large inventories of varying quality, the small independent shops focused on providing high quality products and services. Rather than competing on the basis of price, they pursued customer satisfaction strategies with low turnover rates and more sales expertise than the large chain stores. The small stores, moreover, usually carried products related to only one or two segments of the industry, such as quilting or knitting. The local stores, therefore, exuded distinctive competence in service and quality, while the national chains emphasized selection and price.

Like most retail industries, the popularity of discount retailers changed the competitive structure of the sewing, needlework, and piece goods industry. By the early 1990s, department stores, once the industry's primary competitors, had virtually eliminated their fabric and craft departments. In their place, however, emerged discount retailers such as Wal-Mart.

In the sewing, needlework, and piece goods industry, the influence of off-price retailers was particularly strong because the arts and crafts trend of the 1990s encouraged discounters to augment their craft departments. Shifts in consumer preferences, moreover, favored discounters. A 1996 Hobby Industry Association (HIA) nationwide consumer study revealed that the key consumer motives in the craft industry were price, merchandise selection, con-

venient store location, and merchandise quality, in that order. Consequently, the well-stocked discounters found themselves with an advantage over niche-oriented shops with limited selections.

By the mid 1990s, however, consumer needs and the popularity of discount retailers encouraged the national chains to reevaluate store size and location. Hundreds of stores in this industry were moved out of malls and into strip shopping centers. The new locations, which were usually 10,000 to 12,000 square feet in size, were more accessible and expansive than the traditional mall-based stores. The dizzying pace of store conversions lasted nearly a decade.

These structural and organizational changes were not unique to this industry, however. These developments were typical of the retail industry overall. Competitive pressure in the sewing, needlework, and piece goods industry was, however, unusually strong.

BACKGROUND AND DEVELOPMENT

Many of the businesses in this industry opened in the 1940s and early 1950s as basic fabric outlets. Carrying garment-oriented sewing supplies, these stores catered to the post-World War II mother who sewed a large percentage of her family's clothing. Throughout the 1950s and into the early 1960s, businesses in the home-sewing industry prospered. Some businesses, such as Fabri-Centers of America (now Jo-Ann Stores), were able to grow from small local enterprises into national chains by acquiring or merging with other fabric retailers. In the late 1960s, however, the home-sewing market began to decline.

Two factors influenced the demise of home sewing: the increase in affordable "off the rack" clothing, and an increase in the number of working mothers. In the first case, the influx of inexpensive clothing, especially from Southeast Asia, virtually eliminated the cost savings associated with sewing. This cost factor, coupled with the fact that a working mother barely had time to cook and clean, made sewing a costly alternative to buying clothes. As demand for home-sewing related fabrics and notions declined, fabric retailers were forced to search for new product lines.

Fortunately for these retailers, the decline of home sewing was succeeded by a series of fads in other sewing and needlework segments. Entering the 1970s, the yarn and needlework crafts fared better than garment sewing. These types of crafts, such as knitting, typically involved less time than sewing and were convenient for time-pressed women. One critical difference between garment sewing and needlework was that sewing required a person to sit at a sewing machine, while crafts such as knitting or needlepoint were portable. Working mothers could work on these portable needlework projects while commuting or during their lunch hours. Many large fabric

retailers diversified into yarn crafts in response to growing demand.

The popularity of these types of crafts, especially knitting, caused a boom period in the number of small yarn shops during the 1970s. These knit shops carried full lines of yarn, knitting and crocheting supplies, and usually offered classes. Unlike the large fabric retailers that stocked average-quality acrylic yarn, the small knit shops sold a wide variety of expensive natural fibers such as mohair and cotton. While fabric chain stores targeted price-conscious customers, small shops catered to the quality-oriented consumer. This customer segmentation continued throughout the 1980s and into the 1990s.

The industry continued to evolve as different sewing and needlework segments gained and lost popularity. Successive waves of craft trends dictated store inventories. In the late 1980s, for example, quilting became popular, immediately followed by fabric painting. The 1990s saw a revival of cross stitch and embroidery popularity. Though the colors changed year after year, the different crafts required the same raw materials like fabric, yarn, and notions.

CURRENT CONDITIONS

As the sewing, needlework, and piece goods industry emerged from the mid 1990s, earnings had begun to show signs of recovery from a slump earlier in the decade. Competition among the larger chains was somewhat reduced through massive store closures and the recessionary period of the early 1990s. Conditions improved as retailers' expanded craft inventories. An increase in consumer demand for home decorator fabrics and supplies also contributed to the rise in sales. By this time, many of the large chains finished consolidating stores and the industry outlook began to brighten.

Fueled by continued growth in crafts, the industry saw a surge in home decorating as well. The Hobby Industry Association's nationwide consumer study for 1996 revealed that in 84 percent of U.S. households, one or more persons participated in crafts or hobbies. Moreover, the average number of different craft activities engaged in was 4.5 among the households surveyed.

The explosion in the number of customers meant rising profits for companies in this business. During 1999, Hancock Fabrics, Inc. reported a sales increase of 2.7 percent over the previous year. Jo-Ann Stores, Inc.'s sales were up 11.2 percent from 1998.

Retailers in the industry responded to the increased demand for craft supplies by building bigger stores and by increasing selection. By the late 1990s, Hancock Fabrics had about 460 stores in 40 states, while Jo-Ann Stores operated approximately 1,050 stores in 49 states. These stores were mainly located in strip shopping centers.

In addition to expanding inventories, retailers in the sewing, needlework, and piece goods industry changed the type of goods and services they offered during the mid 1990s. Fabric retailers reduced the apparel-type fabrics in favor of decorator fabrics and quilting supplies, while many yarn shops stocked more needlecraft kits than in previous years. Most notably, however, classes and in-store consultations, once the hallmark of small stores, were offered by most retailers. The addition of these services reduced the competitive advantage enjoyed by the small shops and increased the popularity of craft specialty chains.

Evidence of competitive pressure in the sewing, needlework and piece goods business could be seen as the industry entered the post-1995 period. The proliferation of new and bigger stores coupled with competition from discounters created a difficult operating environment. Retailers responded by using promotional pricing tactics, television advertising, and more creative direct-mail circulars and catalogs.

Jo-Ann Stores partnered with Martha Stewart Living Omnimedia in 1999 to bring a line of 89 home decorating fabrics to its stores nationwide. The partnership was seen by Jo-Ann Stores to signify an important growth opportunity for them. Chairman, president and CEO of Jo-Ann Stores Alan Rosskamm was quoted in the *Akron Beacon Journal* as saying: "The new collection reflects our strategy to develop partnerships with highly respected, nationally known entities to further build our brand identity."

INDUSTRY LEADERS

The sewing, needlework and piece goods industry was dominated by two companies: Hancock Fabrics and Jo-Ann Stores (formerly Fabri-Centers of America).

With 1999 sales of \$1.38 billion, Jo-Ann Stores was the leading company in the industry. The company was started in 1943 as a single fabric store in Cleveland, Ohio and was incorporated in 1951 as Cleveland Fabric Shops, Inc. The name Fabri-Centers of America was adopted in 1968.

Fabri-Centers grew by acquiring fabric and craft stores throughout the country. These acquisitions included Sewing Shops, Inc., a ten-store chain in Washington, DC; Giltberg's Fabrics of northern Florida, Alabama, and Georgia; New York Fabrics of San Francisco; and Missouri-based Cloth-World. The company continued to operate stores in selected markets under the name New York Fabrics, though most stores used the name Jo-Ann Fabrics. Fabri-Centers acquired the 261-store House of Fabrics chain in 1998, and officially became Jo-Ann Stores to more closely align its corporate identity with that of its retail locations.

Fabri-Centers of America adopted its strategy of super store conversion in 1988, after years of ceding sales

and market share to large discounters. By 1996, nearly all of Fabri-Centers 916 stores had been converted to super stores, and the total retail space had nearly doubled, from 3.2 million square feet in 1988 to more than 7.4 million in 1996. According to Jo-Ann Stores, these super stores produced higher revenues and profit margins than the mall-based stores and were entrusted with the future of the company.

Jo-Ann Stores operates all of its stores under either the name Jo-Ann Fabrics and Crafts or Jo-Ann etc. The Jo-Ann etc. stores are fabric, craft supply, and home decorating megastores where customers are offered demonstrations, classes, and specialized customer service. The Jo-Ann etc. stores debuted in 1996.

Following Jo-Ann Stores was Hancock Fabrics, the Michigan-based fabric specialty store. Formerly a division of Lucky Stores, Hancock Fabrics became independent in 1987. By the late 1990s, the company operated almost 500 stores averaging 14,000 square feet. Hancock Fabrics' 1999 sales totaled \$381.6 million.

Although they dominated industry sales, leaders in the sewing, needlework, and piece goods business were not lacking for competition, as many stores in different retail categories offered similar products. One extremely successful competitor classified in **SIC 5945: Hobby, Toys, and Game Shops** was Michaels Stores, Inc., a hobby and craft retailer that enjoyed tremendous growth in the 1990s.

Faced with this competitive pressure and the threat of new entrants, industry leaders worked hard to maintain market share. As they entered the new millennium, businesses in the sewing, needlework, and piece goods industry were searching for new ways to gain a competitive edge. Super store conversion, increased customer service, more creative marketing, and expanded inventories were high on the agenda for these companies.

CATALOG AND MAIL-ORDER HOUSES

The catalog and mail-order house industry, or non-store retail industry, is comprised of establishments primarily engaged in the retail sale of products through television, catalog, and direct mail. Such organizations include companies that sell book club memberships, magazines, and retail consumer and business products. These establishments deliver products and services through the mail. This classification does not encompass direct-mail advertising firms or stores that are operated by catalog companies for the purpose of on-site retail sales.

NAICS CODE(S)

454110 (Electronic Shopping and Mail-Order Houses)

INDUSTRY SNAPSHOT

According to the U.S. Census Bureau’s *Statistical Abstract of the United States*, there were 11,800 electronic shopping and mail order houses in the operation in 2000. The industry generated approximately \$68.1 billion in revenues, up significantly from just \$19.3 billion in 1990. The industry experienced great growth during the 1980s when mail-order selling activity leaped more than 300 percent. From 1990 to 1996, mail order sales grew at a rate of more than 9.9 percent per year, about 1.7 times the average growth of general merchandise, apparel, and furniture store sales.

The catalog industry saw renewed opportunity with the growth of Internet shopping in the late 1990s. While some new Internet sales companies seemed to pose a threat to established nonstore retailers, the industry soon reacted by adopting the new technology. As of 1999, an estimated 90 percent of catalog sellers who were members of the Direct Marketing Association were online in some way, and 60 percent of them were selling over the Internet. Catalog retailers’ Internet sales represented a high growth area in the late 1990s, with some major companies reporting the doubling and tripling of online sales growth annually. Sales were slowed in the fourth quarter of 2001 following the September 11 terrorist attacks, when the entire U.S. economy plunged into recession. Although business rebounded during 2002, war with Iraq in 2003 kept a damper on the economy.

Catalog and direct-mail sellers also saw some blurring of the lines in the industry at the beginning of the twenty-first century, as retailers launched catalogs, catalog sellers opened stores, and many merchants explored the option of selling via the Internet. The industry also went through a period of consolidation through a host of mergers and acquisitions. And a new line of business opened as some direct marketers found they could sell management expertise to newer companies, especially Internet merchants who lacked the know-how to distribute products smoothly.

ORGANIZATION AND STRUCTURE

The catalog and mail-order house industry encompasses companies that sell products through all “non-store” retail channels, including radio, television, and computers. Although larger retailers, such as J.C. Penney, typically maintain an inventory warehouse, most industry participants keep little, if any, inventory on hand. When a customer orders a product, the retailer contacts a wholesale company that ships the product to the retailer or directly to the customer.

Because they refrain from traditional retail purchasing, manufacturing, and inventory management activities, many nonstore retailers are essentially marketing companies. Some catalog companies, for instance, sim-

ply assemble a group of complimentary products manufactured by other companies and try to market those items in a catalog to the customers they think would be most interested in them. Similarly, many direct mail and broadcast media retailers essentially act as middlemen, selling products that are manufactured and stored by wholesalers.

The three major categories of nonstore retailing include business, consumer, and charitable sales. Throughout the 1990s, consumer sales accounted for approximately 50 percent of industry revenues, while business and charitable sales each garnered about 25 percent of the market. About 60 percent of consumer nonstore sales were products, while the remaining 40 percent were services. Of nonstore consumer product sales, more than 80 percent were derived from specialty items that were not commonly available in stores. The remaining approximately 20 percent came from sales of general merchandise. Of nonstore sales of consumer services, about 40 percent of revenues were garnered from financial services.

One tremendous advantage that companies in this industry enjoy, however—whether they secure sales via catalogs, direct mail, the Internet, or television home shopping—is the elimination or severe curtailment of two expenses that have a tremendous impact on the bottom line of traditional retailers: rent and sales workforce. Another advantage is that even small to mid-size companies can use mail order to grow the business and/or give current business a larger presence in the market without expanding overhead costs.

The primary disadvantage of mail and broadcast retailing is high advertising costs. The cost of producing and delivering catalogs, fulfilling orders, and servicing customers often leaves retailers with slim profit margins, or losses, if the response to a promotion is poor. The cost of mailing a simple letter and brochure typically ranges from 40 to 65 cents per piece, and the retailer often expects only .5 percent to 3 percent of the recipients to actually purchase a product. In fact, a 2 percent response rate is considered highly successful in the mail-order business. Although response to a catalog is often higher, usually between 3 percent and 6 percent, production costs often exceed \$3 per catalog. Mean response rates from catalogs peaked at 8 percent in 1996, and the drop to 5 percent by 1998 was seen as a possible portent of slowing in the industry.

Nonstore Consumers. Nonstore retail industry consumers differ from store customers in several ways, which affects the method companies use to reach the target market. Catalog shoppers, for instance, are better educated, are more likely to work in professional and managerial capacities, earn more money, are more con-

servative and traditional, and are more comfortable with modern technology and financial instruments. Catalog shoppers are also more likely to be women—58 percent to 42 percent, versus an even percentage of store shoppers. A greater percentage of nonstore customers are also divorced and middle-aged. For example, 25 percent of catalog shoppers are 35 to 44 years old, versus only 17 percent of store customers.

Many demographic differences bode well for nonstore merchandisers. Dual-income households, for example, are more likely to shop through catalogs. As a result, more than 50 percent of households that regularly shopped through mail-order earned \$30,000 to \$99,000, versus 38 percent in that range that never shopped by mail. Catalog shoppers are also more likely to listen to media advertisements and typically expose themselves to more news and financial media. Catalog patrons also spend more money on grocery items (\$65 per week versus \$55 per week for non-catalog patrons), and are more likely to develop brand loyalty.

BACKGROUND AND DEVELOPMENT

The history of mail-order is said to go back to the 1490s, just after Gutenberg's invention of movable type. The first known catalog dates from 1498 when Aldus Manutius of Venice offered 15 books by Greek and Latin authors for sale. Mail-order operations have existed in the United States since colonial days. In fact, Benjamin Franklin is believed to have initiated the industry with the first direct-mail offer ever presented to the public. Not until the latter part of the nineteenth century, however, did mail order assume a significant role in the economy. The main impetus for merchandisers to offer products through the mail was the inaccessibility of the massive rural consumer market. Companies knew that they could benefit by getting product information to farmers, who represented the majority of the population.

Although a few firms successfully promoted products to the rural population through catalogs and mail, Richard Sears achieved the most notable success. In 1886 Sears began selling watches in the mail. Eventually, the Sears Roebuck, & Co. catalog became a staple of American life, delivering access for millions of Americans to general merchandise that was locally unavailable.

During the late 1800s and early 1900s, several developments contributed to the emergence of a nonstore retail industry. Most importantly, the construction of a continental rail network provided a vital distribution channel for East Coast mail-order houses. In addition, the U.S. postal service began offering special rate structures for mail-order businesses that encouraged the dissemination of advertising papers and catalogs. Furthermore, in 1913 the postal service developed the parcel post system. These factors provided a relatively inexpensive alterna-

tive to products sold by controversial middlemen, who often garnered huge profit margins from the sale and delivery of goods to rural customers.

Three of the largest mail-order houses that gained prominence in the early 1900s were: Sears; Montgomery Ward and Company, founded in 1872; and Spiegel, Inc. These companies, like others of that era, generated huge profits by offering general merchandise at low prices. They often made their own products and benefited from large-scale advertising and high-quantity sales.

Although mail-order houses continued to experience sales growth throughout the mid-1900s, particularly during the post-war economic boom of the 1950s and 1960s, the role of catalog and mail-order sales in the U.S. economy was changing. As the population shifted from primarily agricultural to predominantly urban and suburban, the importance of delivering general merchandise to remote consumers waned. Instead, mail-order companies began emphasizing shopping convenience and access to specialty products.

Despite industry growth, nonstore shopping still represented less than 1 percent of all retail sales by 1960. Even by 1967, U.S. mail-order sales had only reached \$2.4 billion. During the 1970s, moreover, mail-order houses realized only modest gains in combined sales.

The 1980s. A variety of developments in the 1980s combined to result in explosive growth in the catalog and mail-order house industry. Technological advances, demographic changes, and more efficient financial markets were the predominant forces behind this phenomenal growth.

Technological advances that catapulted many competitors to success in the 1980s included computers and software, which increased marketing efficiency and improved customer service. The computer systems that became popular in the early 1980s allowed companies to manage and manipulate large amounts of consumer data. As a result, companies were able to cull from a customer list only the best prospects for a particular product or catalog, thereby reducing unnecessary marketing expenditures. Furthermore, by storing customer information in databases, companies were able to efficiently market new products to existing customers.

Computers were also used to track and manage inventory. When a customer ordered a product, the mail-order house could electronically alert its warehouse, or its supplier, and ship the product quickly. Similar information management systems allowed merchandisers to integrate money-saving, just-in-time inventory control, and customer service systems. Furthermore, inexpensive desktop computer systems allowed small, specialty nonstore retailers to compete more easily with larger firms on a national scale.

In addition to computer technology, the nonstore retail industry benefited in the 1980s from pivotal demographic changes affecting American buying patterns. One of the most important changes was a rise in the percentage of working women and dual-income households. Between 1980 and 1990, the percentage of women involved in the labor force climbed from 42 percent to 46 percent, or from 107 million to about 125 million. Because dual-income households did more shopping by mail, this change increased nonstore merchandising revenues. A rise in the number of elderly Americans, who were also more likely to shop through the mail, prompted industry growth as well.

Another factor boosting mail-order growth in the 1980s was the development and public acceptance of new methods of paying for and financing products purchased through the mail. Credit cards allowed both retailers and consumers a safe and efficient means of paying for mail-order items. By the mid-1980s, more than 600 million credit cards were held by Americans. The proliferation of toll-free "1-800" (and after 1996, "1-888") numbers also generated a large increase in sales. Many catalog companies reported increases of more than 60 percent in sales as a direct result of utilizing toll-free order numbers.

The effect of these and other advances was a 300 percent increase in nonstore retail sales between 1980 and 1990. Indeed, from just \$72 billion in 1980, sales in mail-order houses skyrocketed to \$211 billion by 1990, representing average annual growth rate of more than 11 percent. By the end of the decade, catalog and mail-order shipments were responsible for about 10 percent of all merchandise sales, more than 3 percent of retail sales, and 1 percent of consumer services sales. Furthermore, trade in the industry represented nearly 2 percent of U.S. gross domestic product.

However, U.S. mail-order sales growth declined in the early 1990s as a sluggish economy suppressed revenues in all retail sectors. By 1992, industry participants faced heightened price competition that reduced profit margins. In addition, many analysts believed that the catalog and mail-order industry was maturing and had passed its stage of high profits and dynamic growth. Several trends supported this theory: the industry was becoming more consolidated; sales growth was leveling off; advertising costs were escalating; and failure rates were up. A major cause of higher advertising costs was media saturation. Because consumers were being bombarded by increasingly larger amounts of mail-order advertising, response rates for promotions, on average, were declining. The average consumer received more than 21 pieces of mail per week in 1995. Households that regularly purchased items through the mail, however, often received much more.

In addition to declining sales growth and slimmer profit margins, catalog and mail-order houses were battling state and federal regulatory efforts that sought to

eliminate an important industry advantage—the absence of sales taxes on products sold to out-of-state consumers. Companies narrowly averted disaster in 1992 when the Supreme Court ruled that states could not force mail-order retailers to collect or remit state sales taxes unless they were physically present within the state. An opposite decision would have cost the industry at least \$3 billion, in addition to lost sales. Many states continued to seek methods of taxing out-of-state sales, however.

In response to the relatively inclement business environment of the early 1990s, catalog and mail-order houses scrambled to increase sales and profit margins. Companies emphasized customer satisfaction by gathering data on preferences and wants, and then carefully tailoring products and promotions accordingly. Companies also eliminated large, general audience catalogs and relied instead on specialty niche promotions. In 1992, for instance, Fingerhut Companies Inc. joined forces with Montgomery Ward and Co. to develop a set of 10 specialty catalogs.

Part of the customer satisfaction strategy included the integration of advanced database management techniques. By gathering and storing consumer information on a computer database, retailers were able to determine what, when, and how to market to each of their customers. For many companies, database marketing became an exact science that allowed them to maximize the efficiency of every advertising dollar. Indeed, many companies offered products to potentially new customers at a loss so that they could gather information on the consumer and generate profits from follow-up sales.

In the mid-1990s, the business-to-business division of Dell Computer Corporation spent more than \$1 million to clean up its database, using a comprehensive telemarketing campaign to add more than 150 fields of information to its database; at the same time, the company eliminated more than 50 percent of its existing list. As a result of this \$1-million expenditure, Dell doubled the response rate from its remaining customers, and by reducing printing and postage costs realized an approximate \$4 million in annual savings.

Firms also beefed up inventory control systems in the early 1990s. Just-in-time management techniques, whereby warehousemen kept minimum stock on hand and relied on prompt delivery by suppliers, became standard for most successful large mail-order houses. Value pricing, too, became an important strategy for many firms. By improving the quality of merchandise, increasing service, and reducing prices, many successful competitors were able to overcome reduced margins by increasing market share and sales volume and taking advantage of follow-up sales opportunities.

In addition to internal efforts, a flurry of mergers and acquisitions characterized the industry in the early 1990s,

as companies sought the benefits of economies of scale and greater access to investment capital. Aaron's Furniture Warehouse, Donnelly Marketing, Burpee, Ticketron, and Conde Nast were just a few of the companies that were absorbed by other mail-order houses. One of the largest mergers involved the sales of Murdoch Magazines to K-III holdings for \$650 million.

The Rise of Electronic Retailing. Although the Home Shopping Network was founded in the late 1970s, this retail medium was stagnant for a number of years. Dismissed “as a downscale medium whose average viewer was a far cry from the urban and suburban sophisticates that merchants hanker after,” as *Business Week* observed, electronic retailing was given little attention by major retail companies. The arrival of former FOX Network executive Barry Diller as a part owner of QVC, however, lent the concept an increased credibility.

At the same time, retailers increasingly recognized that, given the moribund performance of many of the stores, electronic retailing had its charms. As an analyst at UBS Securities observed in *Business Week*, electronic home shopping is “a low-cost distribution system. You don't need thousands of stores, and you don't need thousands of pieces of inventory in each location.”

The Direct Marketing Association reported that in 1995, 77 percent of the U.S. population had viewed direct response television in an infomercial, a direct response television spot, or a home shopping program. More than 22 million adults had watched home shopping programs, and approximately 8 million bought merchandise from a television offer. One of the fastest growing areas of television sales was the infomercial (an in-depth promotion of a product, replicating a television show), which increased from \$350 million in 1988 to \$1 billion in 1994.

The next big event in the history of nonstore shopping was the arrival of the Internet. Though some commerce had been tried over the Internet earlier, on-line shopping became a recognized presence on the American scene in 1997. The success of some early on-line ventures, such as 1-800 Flowers and Amazon.com, led to a plethora of on-line sales sites. Many of these were small start-up ventures without the marketing sophistication of brand identity of either traditional retailers or catalog vendors. But by 1999 the majority of catalog houses had some presence on the Internet, and many traditional retailers also published online catalogs. Major sellers on the Internet were books, computer products, recorded music, gifts, and financial services.

In the late 1990s, the catalog and mail-order industry was both growing and changing. The doldrums of the early 1990s ended, and sales grew at levels hovering around 8 percent annually at the end of the decade. Though earlier

analysts had thought the mail-order industry was saturated, by the late 1990s it seemed that the traditional retailing industry was saturated too, and catalogs were an easy way to expand. The president of the Direct Marketing Association, H. Robert Wientzen, explained in a September 22, 1999 *New York Times* article, “[T]here aren’t a whole lot of places left to put stores.” So for example Federated Department Stores bought venerable direct-marketer Fingerhut in 1999, and Fingerhut then ran the catalog and online divisions of Federated’s stores. Staples, a giant chain of office supply stores, acquired the catalog office supply vendor Quill in 1998, and Office Depot, another sprawling retail office supply chain, also acquired a catalog vendor, Viking. Yet this trend worked in reverse at the same time, as catalog marketers decided to open stores in the late 1990s. L.L. Bean, which had had only one retail store in its almost 90-year history, announced in 1999 that it would begin to open a chain of stores. These mergers and changes showed the catalog and mail-order industry was still volatile at the end of the 1990s. In many cases, this volatility meant lower profits. Many major direct marketers had flat or declining sales as they struggled to adjust business strategies. For example, in 1998 sales remained level or shrank for Lillian Vernon, J.C. Penney, and Land’s End, all industry leaders.

Catalog and mail-order sales as a whole expanded in the late 1990s, but the area of the most explosive growth was Internet sales. Some major catalog retailers reported rapid expansion of their Internet sales, even if overall sales were flat. Online sales for J. Crew, a major apparel catalog, quadrupled in 1998, reaching \$20 million. Total sales for J. Crew were \$816 million, so Internet sales represented only a small percentage. But Internet sales at the company continued to rise over the next year. Though Land’s End, another apparel catalog company, reported a steep drop in earnings in 1998, its Internet sales nevertheless grew from only \$18 million in 1997 to \$61 million a year later. The stagnating company planned to move more aggressively into Internet selling, while abandoning some of its retail stores. But Internet selling seemed unlikely to replace catalog selling in the industry as a whole. According to a survey of major catalog retailers in the *New York Times*, direct-mail advertising and large catalog mailings were still considered the best way to reach new customers in 1999.

Some of the highest growth mail-order companies in the late 1990s were computer retailers. Dell had sales of \$18 billion in 1998, an increase of 33 percent over the previous year. CDW did almost as well, with an increase of 26 percent in 1998, leading to sales of \$1.7 billion. Gateway was another stellar computer retailer, with \$7.5 billion in sales and revenues increasing 16 percent.

Another new development in the industry in the late 1990s was the introduction of the hybrid magazine/cata-

log. These “magalogs” or “catazines” were mostly given away as store promotions. Leading retailers Abercrombie & Fitch, Nordstrom, and Neiman Marcus were early on the magalog scene. J.C. Penney created *Noise*, a free magazine for teens, in 1999. These publications were a skillful blend of feature articles and photos that touted store brands without explicitly saying so. The appeal of this kind of catalog seemed to be that it stood out from other mailings. As the number of catalogs mailed increased in the late 1990s, the hybrid version was hoped to be more arresting than the run-of-the-mill direct mail offering.

CURRENT CONDITIONS

The catalog industry had a rough start to the twenty-first century after a decade of exceptional growth. According to *Catalog Age’s*, “Benchmark Report on Critical Issues & Trends” survey, 24 percent of the survey’s respondents reported missing profit goals by more than 10 percent for 2001. Additionally, 29 percent missed the mark by 1 to 10 percent, meaning well over 50 percent of the industry did not make their profitability goals. Whereas downtrends in 2001 can be blamed on the aftermath of the terrorist attacks that had devastating effects on the fourth quarter, the industry did not rebound completely in 2002, and sales once again fell off in the fourth quarter of 2002.

One of the most important concerns for catalog retailers is the rising cost of catalog distribution and shipping merchandise. Postage and paper costs as well as United Postal Service and FedEx charges are variables that can and have had a negative effect on the cost-effectiveness of catalog campaigns. As a result, some companies are employing money-saving measures such as cutting down on cold-call mailings (sending out unrequested catalogs), reducing page count of the catalogs, substituting a catalog drop with a postcard or e-mail that promotes special offers, and reducing the number of specialty catalogs targeted at specific customer segments. Despite the difficulties caused by a recessionary economy, the catalog and e-commerce sectors are expected to continue to expand as the U.S. population continues to increase its Internet use to purchase products.

According to the U.S. Census Bureau in 2000, the latest statistics available, electronic shopping and catalog houses accounted for 19.1 percent of all retail activity in the United States, with sales valued at \$21.4 billion. Book and magazine revenues sold via e-commerce totaled \$2.1 billion, or 49 percent of all sales. Computer software sold via the Internet totaled 31 percent of all software revenues. Online sales of toys and music/videos each held slightly under one third of their category market shares. E-commerce sales of consumer electronics and appliances also garnered 31 percent of the category’s total revenues. Online computer hardware sales totaled \$6.1

billion, 23 percent of all computer sales, and 28 percent of all e-commerce revenues.

INDUSTRY LEADERS

The largest catalog retailer in the United States in the late 1990s was J.C. Penney, the department store chain. The catalog has always figured heavily in its retail mix, but that was not the sole source of the company's business. Fingerhut Companies, Inc., of Minnetonka, Minnesota, moved up from being the ninth largest mail-order firm in the country in 1995 to being the second largest firm in 1999. Fingerhut sold more than 15,000 different products, including various housewares, electronics, and domestic items, to a customer database of more than 13 million people. In 1999 Federated Department Stores, a conglomerate that owned several department store chains including Bloomingdales and Macy's, bought the company. After the acquisition, Fingerhut found a new niche for itself handling the catalog and online sales of some of Federated's divisions. In 1999 it inked a contract with the world's largest retailer, Wal-Mart, to manage its Internet sales. In July 2002, Federated sold Fingerhut to FAC Acquisition.

Provell Inc. (formerly Damark International) was another consistent leader in the catalog and mail order industry in the 1990s, but it struggled in the 2000s. The company's 2001 sales stood at \$138 million, resulting in a net loss of \$79.3 million. Damark ran a massive catalog operation, mailing out some 150 million catalogs annually. It offered computers, home office equipment, sporting goods, electronics, and other consumer goods at discount prices. Damark also ran direct mail shopping clubs. In the late 1990s it had nine such clubs with approximately 1.7 million members. Club members paid roughly \$60 a year to join and were then able to buy the company's discounted entertainment, travel, health and fitness and restaurant services.

One of the fastest growth mail-order companies in the late 1990s was Dell Computer Corporation. It was one of the largest catalog operations by revenue in the late 1990s and early 2000s, and led the world in direct mail sales of personal computers, software, and peripheral equipment. Being a computer corporation, it was natural for Dell to move heavily into Internet sales. Dell reported a net income of \$2.1 billion on revenues of \$35.4 billion in 2002.

The phenomenon of the late 1990s nonstore retailing world was Amazon.com. It was arguably the company that made Internet shopping a comfortable option for American consumers. By the close of 1998, more than 6 million customers had purchased books, music, or videos from its online store. It branched out from its position as a virtual bookstore to become a virtual shopping mall. Amazon.com did this by acquiring the online auction house

e-bay and stakes in a host of other online vendors including drugstore.com, HomeGrocer.com, and Pets.com. The *Wall Street Journal* named Amazon.com as its best one-year performer in 1999. Despite its overall success Amazon posted a net loss of \$149.1 million on \$3.9 billion in revenues for 2002.

WORKFORCE

Employment in the catalog and mail-order house industry was expected to grow faster than employment in most other U.S. retail sectors in the early 2000s. Advances in automation and information systems, however, could curtail job growth as companies eliminate labor-intensive positions. Despite expected growth, the catalog and mail-order industry offered relatively meager employment opportunities in relation to businesses with similar sales volumes. The greatest job growth was expected to occur among computer programmers and information systems professionals, who were needed to integrate and streamline customer, inventory, and financial information. Most computer positions required little prior training, allowing opportunities for many entry-level information specialists.

Jobs in sales, photography, layout, and design were likely to increase between 50 percent and 65 percent. Labor and blue-collar positions were forecast to expand as well—by about 50 percent. Positions in management, finance, and information systems were also expected to realize growth rates of 50 percent to 60 percent by 2005.

According to the U.S. Department of Labor, Bureau of Labor Statistics, in 2001 the industrial category of nonstore retail employed nearly 380,000 workers. Of this total, 41 percent of jobs were related to office and administrative support duties. Customer service representatives totaled 42,670, or 11 percent of all jobs, and had a mean annual salary of \$21,490. Other major in-category positions included order clerks, shipping and receiving clerks, stock clerks, and order filers. Sales positions accounted for 19 percent of the industry's jobs, with 70,710 jobs. Mean annual salary for sales-related jobs was \$25,520.

AMERICA AND THE WORLD

The U.S. catalog and mail-order industry is the largest and most advanced in the world. There are two basic reasons for this industry's continual growth: a large population and a relatively high-income level. Although other countries may be more densely populated, they lack a large enough number of people who have the income to buy.

Mail-order retailers in the United States benefit from several other advantages. Most importantly, U.S. retailers enjoy access to the largest industrialized, relatively homogenous market in the world. As a result, multiple economies of scale exist for domestic merchandisers. An

entire U.S. mailing list industry has emerged, for example, allowing retailers to efficiently attack specific market niches.

Another very important advantage for the U.S. mail-order industry is relatively low postal rates. U.S. bulk and first-class postal rates are the lowest in the world—much lower, in fact, than rates in most of Asia, Europe, and South America. Postal rates in much of Europe, for instance, are twice as high as U.S. rates, making it difficult for companies to successfully promote products through the mail. Higher shipping charges further dilute profit potential in overseas markets.

In addition to these factors, most foreign mail-order markets are characterized by relatively limited media availability; much tighter government regulation of advertising content and product approval requirements; a lack of public understanding and acceptance of mail order; language and cultural barriers; low credit card penetration; and a lack of toll-free numbers. Furthermore, in some European countries many types of mail promotion are banned for environmental and social reasons. The European Community mail-order industry also suffers from a lack of uniform postal and business standards. Some of these mitigating factors were disappearing in the late 1990s, and the growth of the Internet also served to break down geographical barriers.

Cross-Border Sales. Foreign sales by domestic catalog and mail-order houses have traditionally been limited by language and cost barriers. Despite the inefficiency of nonstore retailing in many overseas markets, however, several U.S. and foreign firms have successfully penetrated other markets. Cross-border sales between the United States and European Community (EC), particularly steadily increased throughout the 1990s, spurred in part by increasingly uniform EC markets.

The most exportable mail order products in the 1990s, in order of revenue size, were information, education, and collectible products. In addition, several U.S. firms successfully marketed specialty American products in some Asian countries. Some of the most successful offshore U.S. mail-order enterprises included Hanna Anderson, Austad's, Eddie Bauer, L.L. Bean, Black Box, Inmac, Myron Manufacturing, and Recreational Equipment Incorporated (REI).

RESEARCH AND TECHNOLOGY

The most successful catalog and mail-order houses increasingly moved computer systems toward client/server architecture with relational databases and distributed processing. Information databases would eventually allow companies to produce highly specific catalogs and marketing materials tailored to smaller groups, or even individuals. A company might be able to print a set of

catalogs, for instance, each of which contained a different product mix and marketing message. Just-in-time inventory practices would assume a primary role in helping companies to maintain profit margins through lower fixed costs and better customer service.

New advertising media increasingly complements traditional broadcast, print, and telephone channels. The burgeoning multimedia environment will eventually integrate video, telecommunications, optical disk technology, and personal computers. Advertisers will be forced to adjust marketing techniques as consumers gain more control in choosing which ads and media they internalize. Advancements in recycled paper, printing technology, and ink would likely help the industry move toward reduced waste and lower production costs. At the same time, the proliferation of specialty cable television channels that reach more homogenous niche markets is expected to increase the efficiency of broadcast advertising.

The importance of new Internet technology was amply demonstrated by the catalog and mail order industry as it embraced online selling in the late 1990s. Some innovations included Catalog City, a Web site consumers could visit to request any of 17,000 catalogs. Partially owned by Bear Creek Corporation, parent of the mail-order fruit and gift firm Harry and David Orchards, Catalog City allowed small vendors without much Internet expertise to have a presence on the Web. Internet shopping also offered new opportunities for interaction between the consumer and the catalog. For example Land's End offered a "virtual fitting room" where women could construct a three-dimensional model of themselves on screen to find clothes that flattered their build.

AUTOMATIC MERCHANDISING MACHINE OPERATORS

This industry consists of establishments primarily engaged in the retail sale of products by means of automatic merchandising units, also referred to as vending machines. This industry does not include the operation of coin-operated service machines, such as music machines, amusement and game machines, and lockers and scales. Insurance policies sold through vending machines are classified in **SIC 6300: Insurance Carriers** or **SIC 6400: Insurance Agents, Brokers, and Service**. Establishments primarily engaged in operating music machines, amusement and game machines, lockers and scales, and most other coin-operated service machines, are classified in services, Division I.

NAICS CODE(S)

454210 (Vending Machine Operators)

The U.S. government issued the first vending machine patent in 1886, and in 1888 the Thomas Adams Company installed similar machines on the train platforms in New York City to sell gum. Less than 100 years later, the vending machine phenomenon had permeated American culture, becoming more commonplace than the corner mailbox. The number of vending machine operators declined during the 1980s, as larger companies—

including food service and beverage suppliers—bought out smaller companies. Yet more than 8,000 vending machine operators maintained services in the United States in the late 1990s, and the industry dispensed \$30 billion worth of products. By the turn of the century, ingenious entrepreneurs had transformed the machines into veritable mini-malls, vending everything from video games to underwear. Sales in this industry grew by 428 percent between 1995 and 1999.

Establishments in this retail industry typically rent space for their coin-operated machines in office buildings, large stores, subway and train stations, airports, and places of entertainment. At the turn of the twenty-first century, vending machines were located in every mainstream location, from office buildings to grade schools. An estimated 85 percent of vending machine sales involved food or beverage. Other common merchandise sold in vending machines includes toiletries and other personal items. Automatic merchandising machine retailers fill and service the machines regularly with products from a range of manufacturers and food packagers.

Important factors in the operation of these types of non-store retail businesses are vending machine locations, turnover of products at each location, and the quality of service personnel who fill and repair machines. Computerized systems monitor vending machine sales and usage and facilitate maintenance for the operator as well. By the end of the twentieth century, machines equipped with radio transmitters and small antennas allowed machine owners to count the money in the machines and take inventory from remote locations. Remote control systems could also alert operators to malfunctions such as coin jams and other mechanical problems. Larger companies in the industry used highly sophisticated inventory control systems and study market research data in order to optimize product inventory and machine placement. Additionally, the National Automatic Merchandising Association (NAMA), headquartered in Chicago, Illinois, assists vending machine operators by providing access to educational services, information, and technical support.

Innovations in vending machine technology and design developments improved the quality and scope of vending machine services during the 1900s, enabling a wider selection of products to be sold via the machines. Snack food machines were adapted to handle a greater variety of package shapes and sizes, and to support hot and cold food and beverage, including ice cream and freshly brewed Cappuccino. Electronic improvements contributed to the ability of modern machines to provide digital readings and push-button functionality and to accept credit cards, thus enhancing the convenience for consumers. In 1999, industry leader Canteen Service Company of the British Compass Group PLC expanded

its vending machine operation through agreements with popular restaurant chains to sell name brand fast food. Canteen, founded in 1931, operates restaurants as well as automated merchandising apparatus.

SIC 5963

DIRECT SELLING ESTABLISHMENTS

Retail companies that sell merchandise door-to-door, from trucks and wagons or from other temporary locations, make up the direct selling industry. Included are individuals who sell products by these methods and are not employees of the organizations they represent, as well as establishments that are retail sales offices from which employees operate to sell merchandise by house-to-house canvassing.

NAICS CODE(S)

722330 (Mobile Caterers)

454390 (Other Direct Selling Establishments)

Although direct selling has been a staple method of distribution for retailers in the United States since colonial times, the industry has undergone major changes since the 1970s. This industry, which for years included just a few mainstays such as books, household appliances, and cosmetics, now encompasses an enormous variety of products, from household goods to gourmet foods.

For most of its history, the direct selling industry relied on door-to-door sales. Indeed, many organizations built large retail empires based primarily on home sales methods. Avon Products Inc., Tupperware Corp., and AB Electrolux are a few of the organizations traditionally associated with house-to-house canvassing that generated huge profits during the post-World War II economic boom.

Despite past successes, the effectiveness of some forms of direct selling waned in the 1970s and 1980s as new retail channels emerged. As a greater proportion of women entered the work force, salespeople found it increasingly difficult to find prospects at home during the

day. Moreover, because two-income families had less time to shop at stores, they began to purchase more goods through direct mail, catalogs, and the Internet. The increased popularity of consumer goods shows, warehouse stores, television shopping networks, and other selling techniques further reduced direct sales to the remaining one-income families. Finally, increased crime rates caused many potential customers to refuse strangers’ entry into the home, and some municipalities banned door-to-door sales altogether.

Responding to this trend, in 1992 both Avon and Tupperware started marketing their products for the first time through mail-order catalogs and direct mail. AB Electrolux also shifted its focus from door-to-door sales to catalog showrooms and warehouses in the late 1980s.

In 1996, after 60 years of selling door-to-door, Encyclopedia Britannica Inc. laid off its entire sales force in the United States and Canada. Sales had declined from \$650 million in 1990 to \$405 million in 1995, mainly due to the advent of CD-ROM encyclopedias. In June 1996, Collier’s Encyclopedia followed suit. According to Linda Corman of *Sales & Marketing Management*, Britannica’s decision to eliminate door-to-door selling marked the “end of an era in sales,” and noted that it was probably a “harbinger of what lies ahead for the sales profession, as selling and marketing in the information age become more sophisticated, more targeted, and more driven by technology.”

The largest growth area in the direct selling industry in the 1980s and 1990s was the direct selling organization (DSO), also known as network or multilevel marketing (MLM). With MLM, one person becomes a product distributor and then makes a commission on the sales made by other distributors he or she signs up. The first network marketing company, founded in the 1940s, was Nutrilite (now part of Amway), a maker of nutritional supplements. By the mid 1990s, almost every kind of product was being sold through DSOs, including cosmetics, art, time management systems, tires, kitchen tools and appliances, lingerie, long-distance phone services, and computers.

Many DSOs use the party plan, in which the seller invites friends to a party where goods are displayed and sold, or else they build sales through networking. In 1996, Christina Gold, Avon’s chief for North America, told *The New York Times* that since 1994 she had expanded her sales force from 45,000 to 445,000. Explaining that more than one-half the company’s sales are made or arranged at work, Gold stated that “We train people in how to connect at the office and factory. . . . It’s a high touch business.”

According to the Direct Selling Association, worldwide retail sales in U.S. dollars reached approximately \$68 billion in 1995. There were 17 million distributors

worldwide, covering at least 44 countries, with the 6.3 million U.S. distributors producing \$16.5 billion in sales.

By the late 1990s, there were an estimated 364,800 employees in all non-store retailing industries. Most worked slightly more than 30 hours a week for an average wage of \$10.33 per hour.

Direct selling, or doorstep marketing, also was growing overseas by the mid 1990s. In 1995, Brazil became Avon's largest market outside of the United States, with 478,000 sales representatives. Amway, introduced to Brazil in 1991, had increased its number of distributors to 200,000 by 1995. The Direct Selling Association reported that other countries with a strong selling presence included Japan, where sales reached \$30.3 billion; Taiwan, with sales of \$1.7 billion; and Korea, with sales of \$1.3 billion.

Some of the leading direct selling companies by the end of the decade included Amway Corp. (\$6 billion); Avon (\$5.2 billion); and Nikken (\$1 billion).

SIC 5983

FUEL OIL DEALERS

This classification covers companies primarily retailing fuel oil. Companies that primarily sell fuel oil burners are in **SIC 5074: Plumbing and Heating Equipment and Supplies (Hydronics)**; those that install and service fuel oil burners are in **SIC 1711: Plumbing, Heating**

and Air-Conditioning; and those that repair and service fuel oil burners are in **SIC 7699: Repair Shops and Related Services, Not Elsewhere Classified**.

NAICS CODE(S)

454311 (Heating Oil Dealers)

Dun and Bradstreet listed 8,391 establishments doing business under this industrial classification in 1997. Companies in this industry sell motor oil for vehicles and fuel oil for heating buildings, with the largest earnings coming from heating oil sales. Residential customers are the primary consumers of heating oil. In 1999 the U.S. Department of Energy reported that 16 million American homes use a total of 11 billion gallons of heating oil each year, which represents 700 gallons per household. Schools, hospitals, businesses, and industry account for the bulk of non-residential heating oil sales. Similar figures for motor oil consumption are not updated regularly. Retail sales of motor oil in the U.S. reached \$4.2 billion in 1995, the last year statistics were available.

Industry sales of heating oil vary with the season and geographic market. Demand is normally higher in northern states during the winter, causing oil prices to rise. But price is also affected by regional climatic changes. Nearly the entire continental United States experienced a series of mild winters in the late 1990s. In the fairly typical winter of 1996 the average price of heating oil reached \$1.14 per gallon. But two unseasonably warm winters caused a 34-cent per gallon dip in price. By February 1999 heating oil prices had fallen to 66 cents per gallon. Nine months later heating oil distributors were bolstered by forecasts of a bitterly cold winter for the northern states. Industry experts predicted that the average price of heating oil in winter by the turn of the century might hit \$1.06 per gallon.

Fuel oil dealers can also be affected by international conflict and domestic politics. The 1970s energy crisis inflated the price of crude oil (which sets the pace for heating and motor oil prices) and reduced profitability for gasoline and fuel oil dealers. Gasoline prices peaked again in January 1981 shortly before the Iran-Iraq oil embargo. Oil prices collapsed in 1985 and 1986, when Saudi Arabia and Kuwait launched an oil price war in OPEC. In 1993 the industry successfully launched a campaign against President Bill Clinton's proposed 60 cents BTU (British Thermal Unit) tax on heating oil. The tax was eventually lowered to the same level as tax increases on other forms of energy. Both motor and heating oil prices have been affected by the ongoing crisis between the U.S. and Iraq. Dating back to the 1991 Persian Gulf War, fuel oil prices have ebbed and flowed with tensions in the Middle East. In November 1999 Iraq suspended exports, forcing crude oil to its highest level since Operation Desert Storm.

Two of the largest heating oil distributors in the 1990s were Petroleum Heat and Power Company, Inc. and Star Gas Partners L.P., both of Stamford, Connecticut. Petroleum Heat and Power was widely considered the largest heating oil distributor in the United States, with 340,000 customers in the Northeast and Mid-Atlantic states, and \$548.1 million in sales in 1997. Star Gas reported more than 166,000 customers in 1997 and \$161.4 million in sales. In 1999 Star Gas purchased Petroleum Heat for \$368 million. It also purchased Maryland-based Diamond Fuel, New Jersey-based Foreman Hardware Co., Inc., and Ohio-based Mohrfeld Inc. in 1999, adding about 1,800 accounts to their customer base. Another industry leader was Warren Equities Inc. of Providence, Rhode Island. The privately-held company owns Extra-Mont gas station/convenience stores, in addition to selling fuel oil. In 1997 it reported sales of more than \$900,000 and a payroll of 2,100 employees.

By the late 1990s the three best-selling brands of motor oil were Pennzoil, Quaker State, and Valvoline. Pennzoil held 21.8 percent of the market, Quaker State had 15.9 percent, and Valvoline had 14.2 percent. In 1999 Pennzoil Co. acquired Quaker State Co. for about \$1 billion and formed the Pennzoil-Quaker State Co. The merger joined Pennzoil's 1,516 Jiffy Lube centers with Quaker State's 600 Q Lube oil change stores. Pennzoil-Quaker State anticipated having about \$2.7 billion in assets, about \$1 billion in equity, and annual sales of about \$3 billion by the turn of the century.

SIC 5984

LIQUEFIED PETROLEUM GAS (BOTTLED GAS) DEALERS

This industry consists of companies that primarily sell bottled or bulk liquefied petroleum (LP) gas, which is used mainly for heating homes and businesses in rural areas. This classification includes other byproducts of crude oil, such as bottled butane gas, used as an additive in gasoline and for lighters, and bottled propane gas, which is most often used to produce LP gas.

NAICS CODE(S)

454312 (Liquefied Petroleum Gas (Bottled Gas) Dealers)

This industry arose from the industrial revolution, when manufacturers sought plentiful, easily transported fuel. In the twentieth century, dealers of liquefied petroleum and propane and butane gases had customers in commercial, industrial, and residential markets. Industry sales rose with population growth and industrial expansion. However, profitability varied due to changes in demand and production costs, both of which were affected by such factors as economic conditions and the price of crude oil imports used to make these products.

In 1997, the fuel industry employed 98,400 workers, most of whom worked 37 hours a week for an average wage of \$13.26 per hour.

In 1999, the industry leader in this category was AmeriGas Partners, L.P. of King of Prussia, Pennsylvania, with sales of \$872.5 million and 5,026 employees. In addition to selling engine fuels, AmeriGas sold propane to more than 950,000 residential, industrial, agricultural, and commercial users, and possessed a fleet of 3,400 vehicles. The company is a wholly owned subsidiary of UGI Corp.

Second in this industry was Ferrellgas Partners, L.P. of Liberty, Missouri, with 1999 sales of \$624 million and 4,463 employees. Ferrellgas also owned its own delivery fleet, which included 4,000 vehicles, most of which ran on propane gas. Another industry leader was Suburban Propane Partners, L.P. of Whippany, New Jersey, with 1999 sales of \$544 million and 3,179 employees. Suburban Propane was spun off from the British conglomerate, Hanson PLC, which still owns 24 percent of the business. The company operated 350 stations in 44 states, and owned its own storage units, railroad tank cars, and trucking fleet. Cornerstone Propane Partners, L.P., of Watsonville, California, another industry leader, employed 2,396 workers.

Liquefied petroleum gas dealerships were also secondary businesses for companies in related industries, such as dealers in **SIC 2869: Industrial Organic Chemicals** and businesses in **SIC 4925: Mixed, Manufactured, or Liquefied Petroleum Gas Production and/or Distribution**. In 1989, Quantum Chemical Corp., a retailer in industrial organic chemicals and propane gas, made news when it purchased Petrolane, Inc. in a partnership deal with First Boston. According to *Chemicalweek*, the purchase was "in line with the company's strategy to grow its propane business through acquisitions." Though a secondary business for Quantum, the propane operations of the company held about 15 percent of the propane market in 1989.

In the 1990s, demand for liquefied petroleum and other petroleum products grew at roughly 1.5 percent annually. However, demand for commercial and residential use declined while transportation use rose.

SIC 5989**FUEL DEALERS, NOT ELSEWHERE CLASSIFIED**

Establishments in this industry primarily sell coal, wood, and other fuels, not elsewhere classified.

NAICS CODE(S)

454319 (Other Fuel Dealers)

The United States produced 1.1 billion tons of coal in 1998, with 940 million tons going for domestic use and the remainder being exported. Over 87 percent of U.S. coal was sold to utilities in 1998. Approximately 3 percent was sold to the industrial, residential, commercial, and transportation sectors. Americans were projected to consume 580 million cubic meters of wood and wood products by the turn of the century. Most U.S. fuel wood is sold to electric companies. But this could change if the U.S. becomes a leading exporter of fuel wood in the next millennium. In 1998 the U.S. imported \$9.4 billion dollars more of forest products than it exported. U.S. wood exports have dropped 20 percent since 1994, while foreign wood imports have increased 33 percent. At the same time, developing countries burn nearly 2 million tons of wood fuel each day. Wood fuel supplies are up to 95 percent of domestic energy in these countries and also contributes to commercial and industrial needs.

Companies in this industry are affected mainly by production levels of the products they sell and by customers' use of competing fuel sources, such as petroleum and natural gas. Coal was the leading source of fuel used in America until the 1920s, when the growing popularity of automobiles and developments in the aviation industry introduced new fuels. Meanwhile, the coal industry over-expanded, which led to intense competition among coalmines and a decline in coal prices, both wholesale and retail. By the 1940s, the coal industry lost one of its largest markets after railroads converted to diesel-powered systems. Coal consumption rose again in the 1970s and 1980s due to the oil crisis, which prompted

new coal-processing technologies. At the start of the 1990s coal production rose 4 percent annually with increasing demand from electrical utilities.

In 1997 Dun and Bradstreet listed 1,287 establishments doing business under this industrial classification. Leaders in the industry ranged from big companies with large payrolls to smaller companies that still generated significant revenue. Do-All Gas Company of Benson, North Carolina, reported \$790,000 in miscellaneous fuel products sales during 1997, while employing less than 20 workers. Clonch Industries, Inc. of Belva, West Virginia generated \$3.7 million in wood-related sales in 1997, while employing 50 workers. Southern Appalachian Coal Sales, Inc. of Knoxville, Tennessee, reported more than \$23 million in revenue during 1997, and a staff of several thousand employees.

SIC 5992**FLORISTS**

This category covers establishments primarily engaged in the retail sale of cut flowers and growing plants. Establishments primarily engaged in the retail sale of seeds, bulbs, and nursery stock are classified in **SIC 5261: Retail Nurseries, Law and Garden Supply Stores**. Greenhouses and nurseries primarily engaged in growing seeds, bulbs, flowers, and nursery stock are classified in **SIC 0181: Agriculture**. Establishments primarily engaged in the retail sale of artificial flowers are classified in **SIC 5999: Miscellaneous Retail Stores, Not Elsewhere Classified**.

NAICS CODE(S)

453110 (Florists)

INDUSTRY SNAPSHOT

According to the American Floral Endowment Consumer Tracking Study, conducted between June 1998 and

May 1999, projected 1999 retail sales of floriculture items would reach \$15 billion. Retail florist shops still dominated the industry, numbering 27,341 and averaging annual sales of \$209,182 per shop. However, these traditional outlets faced increasing competition from floral departments in supermarkets, which numbered 23,000 at the time of the study, and 10,857 retail nurseries and lawn and garden supply stores. The industry imported about 60 percent of the cut flowers sold in the United States, with 64 percent of these imports originating from Colombia. Ecuador held a distant second with 12 percent of cut flowers imported to the United States. California controlled the domestic growing of cut flowers, with 65 percent of the market; Florida came in a distant second, growing a mere 7 percent of cut flowers.

The traditional image of men buying women cut flowers for a date does not correlate with consumer sales trends tracked by the study, which tracked only personal consumer purchases, not business purchases. The study revealed that cut flower sales accounted for only 28 percent of florists' business; outdoor bedding and garden plants accounted for almost half (49 percent) of their sales; and flowering or green houseplants accounted for almost a quarter (23 percent) of sales. Also, women predominantly purchased flowers. Women made 81 percent of overall floral sales, though men caught up some in cut flower sales with one third of purchases. What's more, individuals purchased flowers for themselves a majority (64 percent) of the time, leaving only 36 percent of purchases as gifts. Cut flower sales turned this statistic on its head, though, with only 31 percent of purchases for the self, compared with 69 percent as gifts. Finally, calendar events accounted for only 15 percent of overall floral sales; Mother's Day accounted for 23 percent and Valentine's Day for 16 percent of these sales. The majority of floral sales (85 percent) marked no calendar occasion; only 4 percent of these purchases commemorated love or an anniversary, with exactly half of these sales marking no special occasion and 21 percent of these purchases for home decoration.

ORGANIZATION AND STRUCTURE

Florists either design arrangements per customer request or sell and design arrangements according to standard designs. Their job also entails floral decoration of buildings, cost and price consulting, and training others in floriculture. Most traditional retail florists are affiliated with national wire services that handle long-distance orders by telephone. The receiving florist gets a commission from the sending florist depending on the size of the order. Often, customers are charged an additional service fee by the sending florist.

Wire services play an important role in the industry. According to Bram Cavin, in his book *How to Run a Successful Florist and Plant Store*, the number of wire

orders increased from 4 million in 1947 to 10 million in 1965. FTD, a cooperative of 20,000 florists in the United States and 52,000 florists in 140 countries worldwide, reported 20 million wire orders in 1992. FTD is the only member-owned floral cooperative of its kind. The Society of American Florists estimates the flower-by-wire business accounts for 20 percent of a traditional florists' sales. Most florists belong to one or more of the 11 flower-by-wire services serving the floral industry.

In order to increase service, computers were used to send customers' orders to other towns. Some consumers used toll-free numbers to reach the florist who actually sent the product. Others used various florists, who in turn used various wire services like Florist Transworld Delivery, Teleflora, and AFS to send the flowers. Wire services offering memberships give florists advertising and promotional materials and assistance, as well as training in management, marketing, and point-of-purchase aids.

Standard arrangements were designed to make it easier for the customer to order. Other factors that helped this industry included telephones and credit cards. These allowed direct contact between retailers and growers — unlike the old days of telegrams — and provided a better way to pay, thereby protecting both parties even though they did not know each other.

While technology made it easier for florists to communicate, it also brought in heavy competition. Traditional florists lost market share because of the proliferation of "nonflorists"—supermarkets, discount retailers, department stores, and nurseries—selling the same products. According to *Flowers* magazine, in 1992 traditional florists held 56 percent of the market compared to nonflorists who held 44 percent.

BACKGROUND AND DEVELOPMENT

The Society of American Florists formed in 1884 to represent retail florists and all segments of the industry. Unfortunately, association officials have no records of the first retail floral establishments in the United States. Florist Transworld Delivery (FTD) of Downers Grove, Illinois, was the first floral wire service to standardize order placement among florists nationwide. Originally, 15 florists banded together in 1910 in Rochester, New York, as the Florists' Telegraph Delivery Association to exchange orders for out-of-town deliveries by telegraph. Before the formation of FTD, floral arrangements were shipped out of town via train or mail. FTD was the first to create a standard special bouquet order with its member florists and was also the first such company to publish floral arrangement catalogs to help consumers select the proper arrangements.

A green plant boom in the 1970s, coupled with a big demand for imported cut flowers, prompted a rapid nationwide expansion in the number of florists. The Floral

Index, Inc., a Chicago-based marketing and consulting service reports overall retail sales of floral items were slowing after unprecedented growth between 1982 and 1989. Between 1989 and 1990, growth slowed to less than \$500 million or one-half the rate of previous years. Americans purchased floral products at about \$49.33 per capita in 1992, more than double the amount purchased in 1982, but 3 percent less than in 1991. According to *Flowers* magazine, this figure represents the first decline in per capital sales in 17 years.

Individual floral shop sales also experienced a 3 percent decline from \$185,200 in 1991 to \$180,000 in 1992, based on estimates from some 40,480 shops in the United States. American consumers paid an average of about \$16.15 per unit for their floral items in the early 1990s. Imports of fresh cut flowers such as carnations and roses were forcing prices down, causing some retail flower shops to lose market share to nontraditional shops with low overhead.

Close to 70,000 retail florists and supermarket flower departments sold cut flowers and growing plants in the early 1990s, compared to about 20,000 such shops in the early 1970s. U.S. retail sales of floral products remained steady at about \$13 billion from 1990 to 1993, in part due to a sluggish worldwide economy. In the mid 1990s, the United States had 26,757 florists, which employed about 120,000 workers. In 1996, nonsupervisory workers earned about \$8.76 per hour.

Roses remain the number one selling flower and were grown domestically and imported from 26 countries. Per capita purchases of roses were 4.1 stems per person in 1992, nearly double the amount purchased between 1975 to 1980. Sixty-five percent of all roses sold were red, and the majority, some 64 million, were sold around Valentine's Day. An increase in corporate gift giving was also helping to expand the floral market. Plants and flowers, according to a Gallup poll commissioned by the American Floral Marketing Council in 1990, were the "most convenient gift" and the best "I love you gift." Green plants, while losing market share, continued to be a \$1 to \$2 billion industry segment.

CURRENT CONDITIONS

Growth continued to be divided among retail outlets and traditional florists. Supermarkets not only continued to sell flowers, but many were expanding their floral departments. According to a survey conducted by *Supermarket News*, 9 percent of the surveyed operators planned to expand their floral departments and over 15 percent planned to add full service floral departments. According to *Supermarket News*, the expansion was fueled by higher profit margins.

Increasing competition between the traditional and nontraditional florists spurred uses of new technology

such as flowers-via-computer and toll-free numbers to make floral item purchases more accessible to the public. Advertising campaigns were also focusing on non-occasion uses for flowers and plants. In the late 1990s, television commercials promoting gifts of flowers were becoming very common. The Internet played a substantial role in setting a new trend at the turn of the century. Many traditional florists were resorting to the Internet to sell flowers, and others only sold flowers via Web sites.

INDUSTRY LEADERS

As the largest flowers-by-wire cooperative, FTD was the industry leader in the early 1990s. With its recognizable winged Mercury—messenger of the gods—logo in a yellow and black circle, FTD was estimated to have 60 to 70 percent of the flowers-by-wire market. The company made florists accessible by placing ordering outlets in gas stations, car dealerships, fast-food franchises, and even pizza parlors. It also distinguished itself from other floral wire services with its 100 percent satisfaction guarantee. FTD members pay 7 percent of the value of their transactions in return for advertising support from FTD.

In May 1999 FTD announced increased sales for the third quarter (as well as for the first nine months) of its fiscal year. Third quarter net sales increased by \$10.2 million or 21.1 percent, to \$58.5 million from \$48.3 million in the third quarter of fiscal 1998. Net sales for the first nine months of fiscal 1999 increased by \$22.7 million or 16.8 percent, to \$157.6 million from \$134.9 million for the first nine months of fiscal 1998. The explosion in e-commerce pushed sales up dramatically, as FTD not only hosted its own World Wide Web site, but also inked an agreement with CompuServe in July 1998 making FTD the exclusive floral sales organization on this computer network.

The March 1999 acquisition of Florafax International, Inc., by Gerald Stevens, Inc., exemplified the diversity of the floral industry in the Late 1990s. Gerald Stevens was already a geographically diverse company, with 94 stores in 13 U.S. markets: 62 free-standing retail shops and 32 supermarket locations. Florafax represented the fourth-largest wire service in the floral industry, serving all 50 states by 5,300 member-florists. Gerald Stevens acquired the Florafax subsidiary National Flora, a company that generated more than 500,000 floral-product orders in 1998, increasing its net revenues by 24 percent over 1997, to \$13 million. At the same time, Gerald Stevens acquired Internet Services, LP, parent of the oldest e-commerce company in the industry, FlowerLink, which experienced order increases of 60 percent for the first six weeks of 1999 as compared to the same six-week period in 1998.

Clearly, the Internet represented the biggest opportunity for growth in the floral industry, just as e-commerce was bolstering most every other business segment.

1-800-FLOWERS.com announced impressive growth in its first quarter of 2000, with online revenues increasing by 88.1 percent to \$11.8 million and telephonic revenues increasing 9.5 percent to \$37.6 million; total revenue climbed 22.1 percent to a record \$58.1 million. What's more impressive is the fact that these increases occurred in the slowest quarter of the fiscal year for the floral industry, the summer, with fewer calendar events prompting consumers to purchase flowers.

AMERICA AND THE WORLD

Foreign countries are stepping up their efforts to gain more of the U.S. market by flooding the market with exports and establishing retail stores, thus driving prices down. In the early 1990s, imports of Latin-American roses accounted for 40 percent of the roses sold in the United States, compared to 2 percent sold in 1971. American rose specialists protest that this will only devalue the rose and have launched campaigns emphasizing the rose as a strictly American product. More than \$325 million worth of fresh cut flowers had been imported from overseas producers at the end of 1991, compared with less than \$5 million in 1971.

SIC 5993

TOBACCO STANDS AND STORES

This entry includes establishments primarily engaged in the retail sale of cigarettes, cigars, tobacco, and smokers' supplies.

NAICS CODE(S)

453991 (Tobacco Stores)

In 1998 a reported 5,204 tobacco stores operated in the United States, with sales totaling \$460,757 according

to *Smokeshop* in the "1999 Industry Report." Eighty-eight percent of sales came from tobacco-related merchandise.

Tobacco specialty stores, often called "smoke-shops," were traditionally located in malls or downtown business districts. The mall shops were often part of a chain, while the downtown shops tended to be independents that also sold other items such as magazines and newspapers. Historically, tobacco manufacturers subsidize some of these endeavors in an effort to ensure a constant retail outlet for their products. The largest domestic concentration of smokeshops appears in the southern United States, with 1,516 establishments reported. Although the total number of establishments declined by 23 percent in the late 1990s, the states of Montana, South Dakota, Wisconsin, Oklahoma, and the District of Columbia reported an increase in the number of shops. Across the United States, the number of shops declined at a rate of 8 to 1, with the most significant decline in the western states with 35 percent reduction in stores. Total sales dropped by 14 percent, although employment in smokeshops increased from an average of five employees per store in 1997, to 7.4 employees in 1998, with 43 percent of smokeshops offering employee fringe benefits.

The number of tobacco stands decreased steadily in the United States during the latter half of the twentieth century. Declines were attributed to a change in life-style for many Americans as businesses moved out of the downtown areas where support for smokeshops was high. With less pedestrian traffic, the smokeshops suffered a loss of clientele. Many of the smokeshops that were located in malls in the 1970s slowly disappeared in the 1980s as rents climbed too high for small businesses to endure. Additionally, the steady decrease in consumption of most tobacco products, due in part to the dissemination of information about the dangers of tobacco use, factored into the decline. Meanwhile, an increasingly wide array of stores added smoking supplies to their inventories. Distributors reported that many of the specialty tobacco shops lost sales to other less specialized retail outlets, including drug stores, grocery stores, and convenience stores. Discount department stores and supermarkets became popular second-tier distributors, even for pipe tobacco. The overall convenience and the lower prices offered at these outlets increased their attraction for consumers as an alternative to smokeshops.

At the end of the 1990s, pharmacies discontinued sales of tobacco products in response to negative public sentiment towards the tobacco industry, and convenience stores began to pose serious competition to tobacco specialty shops. In 1997, a particularly large number of non-specialty retail outlets joined the trend and backed away from the tobacco business in response to efforts by the U.S. government to regulate the tobacco industry. The FDA—

backed by President Bill Clinton—passed several regulations, among them a mandate that retailers verify the age of cigarette buyers at the risk of steep fines for those retailers in violation of the law. Remarkably, the anti-tobacco onslaught contributed in part to a limited revival of smokeshop businesses. In anticipation of these stricter regulations, new cigarette outlet stores — small smokeshops selling low-priced products at high volume—opened for business nationwide. In fact, the number of cigarette outlet stores in the United States jumped 36 percent, to about 3,600, between March of 1995 and April of 1996. In 1998, 67 percent of tobacco shops listed themselves as tobacco-only retailers. Analysts predicted a growing trend if government regulators prevailed, and if supermarkets, drugstores, and convenience stores continued to abandon the tobacco consumer.

By the late 1990s, the largest form of retail tobacco consumption came from increased sales of premium cigars—cigars that sell for \$2 or more. These accounted for 39.7 percent of tobacco sales at smokeshops. The escalating popularity of premium cigars prompted many department stores, such as Saks Fifth Avenue and Macy's, to add cigar accessory shops in order to profit from the modern fashion trend. So popular were the cigars that, even as President Clinton signed bills hindering cigarette advertisements during the 1990s, he refused to abandon his own habit of enjoying an occasional smoke. Restaurants and liquor stores across the country added fine cigars to their retail mix, further reducing the clientele at traditional smokeshops. Statistics from the Cigar Association of America, reprinted in *Market Share Reporter* in 1999, revealed that only 16 percent of cigar sales transpired at cigar stores in 1998. During that time, smokeshops in rural sites remained stable, yet urban sites declined by 10 percent. Of existing establishments in 1998, 95 percent were independent, 75 percent existed at only a single location, and 9 percent of businesses operated three or more stores.

Among the largest businesses listing tobacco stands and stores as their primary business were Burley Tobacco Growers Cooperative Association and A. Fader and Sons. Other businesses in this industry included Nazareth's Fine Cigars of Beverly Hills, California; Smoke and Snuff Shops, of Clearwater, Florida; and Smoker's Den, of Bennington, Vermont.

SIC 5994

NEWS DEALERS AND NEWSSTANDS

This category covers establishments primarily engaged in the retail sale of newspapers, magazines, and other periodicals. Home delivery of newspapers by other than printers or publishers is classified in **SIC 5963: Direct Selling Establishments**.

NAICS CODE(S)

451212 (News Dealers and Newsstands)

INDUSTRY SNAPSHOT

Newsstands and news dealers occupy a nostalgic corner of modern urban history in the United States. A majority of such businesses are located in heavily populated areas, and are owned and operated by a single proprietor. The 1997 Economic Census reported 2,313 active news dealers and newsstand establishments. Sales figures for the same year were \$853 million, with 9,770 people employed in this field.

Some news dealers and newsstands are seasonal and shut down in winter months. The small kiosks often lack insulation, and space heaters may not provide enough warmth during the most frigid weeks of the northeastern seaboard. Most, though, stay open throughout the year. As mentioned, most of the businesses classified in this industry are small single-proprietor establishments. However, larger chain and franchise operations are becoming more common. According to industry watchers, the number of street-based news dealers and newsstands has been steadily dwindling over the past several dec-

ades. The industry is dominated by enterprises with five or fewer employees.

ORGANIZATION AND STRUCTURE

A typical newsstand derives its profits from volume sales of newspapers and magazines. Ancillary items such as cigarettes and chewing gum also play an important part in its financial success. A typical day for a newsstand operator or dealer begins in the pre-dawn hours of the morning, when a distribution service drops off bundles of periodicals that come out on that particular day of the week. Newspaper trucks deliver the morning dailies, and may return later with a p.m. edition. Each delivery requires employees to audit and verify the shipment invoice, remove the unsold prior editions from display, and stock either all of the new delivery or store part of it until needed later. Historically, Monday was the busiest day for both deliveries and sales with the arrival of weekly magazines. However, in the 1990s *People* magazine started delivering on Friday, and the resulting increase in sales prompted many other weekly publications to follow suit.

Morning patrons generally limited their purchase to a single newspaper or periodical. Later lunch-hour and afternoon customers lingered over the magazine racks and often made impulse purchases. Many larger newsstands also acted as local bookstores, stocking popular paperbacks and sometimes even hardcover editions. A typical newsstand drew its sales primarily from the sales of daily newspapers, but in cities such as New York or Los Angeles, with many citizens transplanted from other areas of the country or globe, foreign newspapers and magazines were also big sellers. There, the *International Herald Tribune*, the *Times of London*, as well as European weeklies such as *Paris Match* and the German magazine *Stern*, sold well.

In the late twentieth century, the industry shifted toward more standard business practices as a result of corporate ownership. For example, cash registers appeared at newsstands even though most customers on their way to a job or commuter train did not want to be held up for the few seconds longer these machines require.

A news dealer or newsstand typically made a small profit from every item their establishment sold. A dealer would typically receive a maximum of 20 percent for each daily newspaper sold. Magazines had a higher profit margin because the intense competition between magazine titles and publishing houses resulted in courting the retailer. In addition to the 20 percent sellers received from the sale of each magazine, they would often obtain an additional 10 percent in the form of a retail display allowance. This premium came most often from larger magazine publishing corporations, such as Conde Nast or Time-Warner, as an incentive to keep their magazine

titles prominently displayed near the transaction counter. Additional incentives could be paid to the news dealer for positioning a certain magazine overhead above the counter or for allowing poster displays of current issues. Such premiums could become a large part of revenue for major newsstands in New York City, where competition for display space was fierce. The monthly fees could sometimes reach into the thousands of dollars.

BACKGROUND AND DEVELOPMENT

For much of its history, the newsstand industry has been operated by new immigrants, especially in the decades following World War II. European families originally dominated the business, while Arabic and Asian entrepreneurs entered the field in the 1980s and 1990s. In New York City alone, 1,325 newsstands were in business in 1950, a figure that can be compared with the 2,313 newsstands operating in the entire United States in 1997. By then, New York City was home to only 330 street vendors of newspapers and magazines.

While street newsstands continued to be a presence in large metropolitan areas, other forms of newsstands emerged in the late 1990s. One development was the emergence of “superstores” devoted almost entirely to periodicals. Because these stores had more space than a traditional street stand, they could offer a larger selection of titles to their customers — up to 4,000 in some cases. Some firms have also experimented with opening newsstands in shopping malls, areas with the high pedestrian traffic that traditional street vendors have relied on for their business.

CURRENT CONDITIONS

The number of news dealers and newsstands has increased only slightly since 1992, when 2,260 newsstands were in operation. The industry is increasingly dominated by larger multi-unit organizations such as Eastern Lobby Shops. These corporate entities have brought modern business methods to what were mom-and-pop type establishments — cash registers were implemented in order to keep an eye on sales, and computer-aided stock tracking helped keep sufficient copies on the racks. Yet in major urban areas like New York City and Chicago, small one-person operations could still be found on many major thoroughfares.

In the late twentieth century, street dealers became increasingly restricted by laws regulating all urban street vendors, while a rise in crime has also played a decisive role in their dwindling numbers. A lone owner-operator, having worked up to an 18-hour day, makes an easy robbery target at closing time when he or she heads to the bank with the day’s receipts. Small newsstands, like all other stationary objects in a large city, have also been the target of graffiti.

Street newsstands have also faced community pressure to clean up both their appearance and their merchandise in some large cities. In New York City, the mayor's office has pushed for regulations that would limit the amount of adults-only material that dealers could sell or display. The mayor's office has also proposed that dealers' license fees be proportional to the value of the property their stands occupy. Under this proposal one dealer's annual fee would increase from \$538 to \$3,750.

In Philadelphia, which has around 300 street news dealers, a 1999 regulation required that stands be built from durable materials instead of wood. The city developed a standardized stand for this purpose. Some vendors opposed the change, though, because of the \$10,000 they would have to pay for the new stands.

Several marketing changes had also put pressure on newsstands and news dealers by the late 1990s. These pressures stemmed from publishers' and distributors' practices and from new outlets for periodicals. While the number of magazine titles published increased at a rate of nearly ten per week in 1998, this larger selection did not bring an increase in single-copy sales. The Audit Bureau of Circulation reported combined sales of approximately 367 million magazines per issue, but only 18 percent were purchased as single copies instead of by subscription. Furthermore, only 3 percent of the single copy sales occurred at newsstands.

There are many reasons for newsstands' small share of this market. Circulation departments began aggressively pursuing subscription customers, rather than single-copy readers who purchased magazines at newsstands, because retail sellers could return unsold copies for a refund. Other outlets for periodicals have also cut into newsstands' sales. Mass-market bookstores have proliferated, offering extensive magazine sections in an enclosed space for perusing the numerous titles. The rise in cafes and coffee houses in urban areas also had a negative effect on newsstand sales. Many such enterprises began selling magazines and newspapers to attract customers who wanted to sit and read for a while over a cup of coffee. Publishers also began targeting specialty stores as retail outlets for magazines — placing *Vegetarian Times* at health-food store check-out counters or *Rolling Stone* in record stores. Technological innovation has also cut into a market that had long been a staple of newsstands: the out-of-town newspaper. With many newspapers available on the Internet, customers have become less inclined to visit a newsstand for a publication that is at least a day old when they can get the news from afar more immediately on their computers.

INDUSTRY LEADERS

Although most newsstands are singly-owned establishments, a few companies have a fairly large presence

in the industry. Hudson News Company has a large presence in the New York City area. While primarily a magazine distributor, the company also owned and franchised several newsstands and had total sales of \$508 million in 1998. Healy News Store, Inc., of Wakefield, Rhode Island, is a small firm that managed to earn \$1.2 million in sales with only nine employees in 1998. A company with more of a national presence is Eastern Lobby Shops, which has 120 newsstands around the country.

SIC 5995

OPTICAL GOODS STORES

This entry includes establishments primarily engaged in the retail sale of prescription eyeglasses and contact lenses for individuals. Establishments primarily engaged in the retail sale of binoculars, telescopes, and

opera glasses are classified in **SIC 5999: Miscellaneous Retail Stores, Not Elsewhere Classified.**

NAICS CODE(S)

339115 (Ophthalmic Goods Manufacturing)

446130 (Optical Goods Stores)

INDUSTRY SNAPSHOT

U.S. retail eyewear stores generated \$15.8 billion in sales during 1998, a 2.6 increase over 1997. Independent opticians (vendors of eye wear prescribed by ophthalmologists or optometrists), optometrists (graduates of optometry school who are trained to detect eye diseases, but not to treat them), and ophthalmologists (medical doctors who can treat eye diseases, prescribe medication, and perform surgery) accounted for two-thirds of that total. National chains like Pearle Vision, Inc. and Lens Crafters accounted for the rest. Industry observers expect annual earnings to hit \$19.5 billion by the early twenty-first century. In 1999 Dun and Bradstreet listed more than 18,000 U.S. establishments under this industrial classification, with more than 65,000 employees on their payrolls.

BACKGROUND AND DEVELOPMENT

The eyeglasses and contact lens retailing industry has been increasingly crowded, as opticians, optometrists, and ophthalmologists compete for the same market. Ophthalmologists and optometrists examine eyes and write eyewear prescriptions. Traditionally, both ophthalmologists and optometrists have offered to fill the eyeglass and contact lens prescriptions they write. But independent opticians can also fill these prescriptions. In the late 1960s optical stores and some small regional chains began offering eye exams along with glasses and contacts. Retail giants began to spring up, and an industry that was once considered strictly a "health-care" field became a competitive retail market.

Two 1978 legal decisions further opened the door for retail competitors. In one decision the Federal Trade Commission (FTC) ruled that optometrists and ophthalmologists must give patients their prescriptions, making it possible to shop around for glasses rather than rely exclusively on the doctor who wrote the prescription. In the second decision the FTC unanimously approved a rule preempting state law and prohibiting states and professional organizations from banning advertisements for eyeglasses, contact lenses, and eye examinations. Four years later the FTC issued an order prohibiting the American Medical Association from placing a ban on advertising by its member physicians. The Association appealed to the United States Court of Appeals for the Second Circuit, which approved enforcement of the Commission's order. *American Medical Association v. FTC*, 638 F.2d 443 (2d Cir. 1980), *aff'd*, 456 U.S. 966 (1982).

These rulings transformed eyeglasses into a marketable consumer product. Retailers began advertising fast turnarounds, low prices, and convenient hours and locations. They promoted eyeglasses and contacts as fashion wear and convinced the public of the need for more than one pair — in part by offering special deals when two were purchased. Retailers introduced lighter and thinner lenses and more attractive frames, which stimulated sales. Retailers began offering contact lenses in a variety of colors, and many consumers bought several pairs because they liked the idea of changing their eye color. In recent years, the emergence of less-expensive daily "disposable" contacts has opened further marketing opportunities.

CURRENT CONDITIONS

At least 150 million people — or more than half of all Americans — require vision correction, and the incidence increases with age. Nearly two-thirds of all women in the U.S. wear corrective eyewear. About 26 million Americans wear contact lenses. The industry's growth rate has slowed through the 1990s from steady annual increases of around 10 percent to yearly gains as low as 4 percent, but sales are expected to rise as the population continues to age. In the late 1990s corrective laser eye surgery provided competition to optical goods retailers. At a cost of between \$1,800 and \$2,500 per eye, laser surgery provided a permanent solution to impaired vision for approximately 1 million Americans each year.

In the 1980s emerging retail eyewear chains grabbed a third of the market from optometrists, ophthalmologists, and independent optical goods establishments — which previously had dominated the entire market — but their total share has since remained constant. Cole Vision Corp., was the nation's largest eyewear retailer in 1998, with approximately \$1 billion in sales, 2002 stores, and a 7 percent market share. Based in Ohio, Cole Vision expanded its business in 1996 by purchasing Pearle Vision, Inc., for \$165 million.

In 1998 National Vision Associates, Ltd., moved to second place among national retail eyewear chains, when it purchased New West Eyeworks, Inc. and Frame-n-Lens Optical. The acquisitions gave the Georgia-based eyewear chain 919 stores in 45 U.S. states and Mexico. The next year National Vision Associates changed its name to Vista Eyecare, and looked into expanding its business further. Company executives predicted revenues in excess of \$1 billion by the turn of the century. With only 858 stores, Lens Crafters led all U.S. retail eyewear chains in sales during 1998, reporting more than \$1.1 billion in earnings. The Ohio-based company reported more good news for the first three quarters of 1999, when sales increased 14 percent to \$965.3 million. Founded by Procter & Gamble Co. executives 17 years ago as a profoundly team-driven company, Lens Crafters has al-

ways been family-friendly. In 1999 Lens Crafters parent company, Luxottica SpA, the Italian eyeglass frame company, purchased Bausch & Lomb's sunglass business for \$640 million.

SIC 5999

MISCELLANEOUS RETAIL STORES, NOT ELSEWHERE CLASSIFIED

This category includes establishments primarily engaged in the retail trade of specialized lines of merchandise that are not included elsewhere, including art and architecture supplies; autographs, sets of coins, and related supplies; finished monuments and gravestones; cake decorating supplies; baby carriages; cosmetics; awnings and banners; candles; fireworks; rough gemstones and rock and stone specimens; home swimming pools (not installed); hearing aids; and trophy shops. It also includes ice dealers; hot tub and whirlpool bath dealers; orthopedic and artificial limbs stores; pet shops; rubber stamps stores; art dealers; auction rooms; typewriter stores; religious goods (other than books); telephone stores; and tent shops.

NAICS CODE(S)

446120 (Cosmetics, Beauty Supplies, and Perfume Stores)

446199 (All Other Health and Personal Care Stores)

453910 (Pet and Pet Supplies Stores)

453920 (Art Dealers)

443111 (Household Appliance Stores)

443112 (Radio, Television and Other Electronics Stores)

448310 (Jewelry Stores)

453998 (All Other Miscellaneous Store Retailers (except Tobacco Stores))

The industry also includes establishments primarily engaged in selling a general line of their own or con-

signed merchandise at retail on an auction basis. Establishments primarily engaged in auctioning tangible personal property of others on a contract or fee basis are classified in **SIC 7389: Business Services, Not Elsewhere Classified**.

As part of the more than \$2 trillion retailing business in the United States, these businesses are wide-ranging in size of operation and revenue generated. While many of the enterprises in this category can be classified as small business, their impact on the U.S. economy is substantial, accounting for as much as 30 percent of the gross domestic product. These businesses sell everything from light bulbs to sunscreen to mailing supplies to cat toys. The products are not always glamorous, but for many, they are necessities.

Depending on the segment of retailing being examined, the profit margin for these businesses hovers around the 2 percent range nationwide. In the late 1990s, some enterprises in this classification (e.g., typewriter stores, ice dealers) no longer enjoyed the same prominence or level of enterprise that they did 20 or more years ago. On the contrary, other enterprises like religious goods stores and pet stores have enjoyed healthy activity, even during difficult times.

The growth of discount stores and price clubs that carry a wide variety of durable and nondurable goods (e.g., Wal-Mart and its sibling operation Sam's Club) have seen an increase in popularity. Wal-Mart is by far the best known of these stores; with 910,000 employees in 3,600 stores and 1999 sales of \$138 billion, it is larger than Sears, Kmart, and JC Penney combined, according to the Hoovers' Business Information Service.

It is difficult to predict future trends for this segment of the economy, given all of the variables involved and the "scrambling" of merchandise among the businesses. Although various individual businesses may have posted double-digit sales increases in the late 1990s, retailing as a whole posted less impressive numbers. Indeed, economic predictions are hard to make, but it is a fact that, in the mid- to late 1990s, thousands of retail companies sought protection from creditors in bankruptcy courts. Reports of bankruptcies, voluntary consolidations and hostile takeovers still occupy a regular place in business news columns.

One effect of retailing failures is the growth of liquidator-type stores. A liquidator will either purchase a store's inventory or run a going-out-of-business sale when a merchandiser cuts back its operation or closes down. In the late 1990s, liquidators moved billions of dollars' worth of inventory: Boston-based Gordon Brothers Group LLC alone estimates that it moves \$2 billion of merchandise annually. Besides Gordon Brothers, the Schottenstein Bernstein Capital Group is another big

name in the liquidation business. These companies have worked with Jamesway, Woodward & Lothrop, along with selected Kmart, Edison Brothers, and Petrie Stores.

Home-based shopping in the form of catalog offerings (e.g., Spiegel and Fingerhut) and broadcast-based presentations (like QVC and the Home Shopping Network) are also part of this diverse retailing segment, although their sales have slowed in the 1990s.

This general slowdown might be attributed to another trend that will surely have a long-term impact on retailing: the Internet. In less than five years, the Internet and the rise of electronic commerce has become an important, if not integral, part of many people's lives; and, often, it is these people who possess the most buying power. It is difficult to find businesses that have no presence on the Internet: moving companies, restaurants, and bakeries all seem to have their own Web sites. Sites that began with one specific product now sell a variety of items; Amazon.com, which started as a book dealer but now sells a variety of retail goods over the Internet, is the best known example.

Still, the Internet is subject to hype, and many of the companies that try to establish a presence on the web will fold, or sell out to competitors. Moreover, there are still a number of glitches in computerized retailing. The 1999 Christmas season was supposed to revolutionize how people bought gifts. Although more people shopped online than ever before, they also found themselves having to contend with overloaded Web sites that could not

handle the volume. Besides, the products purchased online need to be delivered offline — and that step has to be done by ground or air transportation. Despite advances in security systems, a number of people are still leery about submitting their credit card information while online, and, consequently, many people search for the product they want on the Internet and then order it by telephone. This is expected to change as the technology becomes more trustworthy in the eyes of consumers. "Once secure transactions become more prominent, the Web will be for people of this century what the Sears Roebuck catalog was for consumers in the last century," according to Robert Marczak, an Internet marketing specialist and president of Marczak Business Services of Sharon Springs, New York.

FINANCE, INSURANCE, & REAL ESTATE

SIC 6011

FEDERAL RESERVE BANKS

This classification includes the Federal Reserve banks and their branches, which serve as regional reserve and rediscount institutions for their member banks.

NAICS CODE(S)

521110 (Monetary Authorities-Central Banks)

INDUSTRY SNAPSHOT

While U.S. banks were experiencing greater autonomy as restrictions were relaxed in the late 1990s, the U.S. banking structure was still heavily regulated by the U.S. Federal Reserve System. The Fed, as it is popularly called, also greatly influences the U.S. financial markets and monetary supply, to which banks must continuously react. At the end of 2001, there were 3,058 member banks of the Federal Reserve System, with 49,102 branches. This number included 38 percent of all commercial banks and 74 percent of all banking offices. The total net income of the Federal Reserve banks was \$31.87 billion in 2001, compared to \$33.94 billion in 2000. Most of this income was derived from the interest earned on federal government securities, which the Fed acquires on the open market. The banks spent \$1.8 billion on operations.

Banking institutions can be regulated by as many as four major, independent federal agencies as well as state agencies. Historically, there have been two distinct types of financial institutions in the United States: commercial banks and savings banks. Commercial banks are depository institutions with investment and broad lending powers for short- or intermediate-term purposes. Savings banks include thrift institutions, which hold passive deposits and investments in long-term real estate mort-

gages, and credit unions, which are owned by the members and provide short-term personal loans. Either of these types of financial institutions may be state or federally chartered.

The Federal Reserve banks enforce Federal Reserve Board regulations, clear and collect checks for depository institutions, extend credit to depository institutions, and act as the fiscal agent of the United States. In addition to the Federal Reserve, the banking industry is regulated by several other agencies. The Federal Deposit Insurance Corporation (FDIC) insures deposits in commercial banks and thrifts and also regulates these institutions. The Office of Thrift Supervision has a role in overseeing thrift institutions. The Office of the Comptroller of the Currency supervises national banks. Finally, each state has a banking office to regulate state-chartered banks.

Banks and savings institutions chartered under state law are subject to the laws and regulations of that state, as are nationally chartered institutions, where the state provisions are not preempted by federal laws. The resulting combination of federal and state regulation and charters has created an interrelated system under which most state banks are subject to some federal supervision, and state laws are often applicable to national banks.

The Federal Reserve is the primary federal supervisor and regulator of all U.S. banks and of state-chartered banks that are members of the Federal Reserve System. In its supervision of the general operations of these financial institutions, the Federal Reserve seeks to promote the soundness of these institutions and ensure their compliance with relevant laws and regulations. The Federal Reserve is also responsible for reviewing the participation of these institutions in electronic data processing, fiduciary activities, government and municipal securities dealing and brokering, and securities underwriting.

The Federal Reserve greatly influences the amount of money circulating through the country's financial system. By purchasing and selling Treasury bills, the Federal Reserve causes fluctuations of the rates charged to banks for short-term loans to other banks. These open-market transactions can also raise or lower interest rates throughout the economy, since higher rates force banks to set a higher bar for lending practices, thus leading them to favor more expensive funds. In addition, the Federal Reserve can alter the interest rates charged to member banks for loans involving government securities. These discount rates more or less monitor the pulse of the U.S. bond market. Conversely, the Federal Reserve can create printed money with which to purchase securities, increasing its reserve supply and lowering interest rates. In the early 2000s, the Fed cut interest rates several times in an effort to bolster a faltering economy. The September 11, 2001, terrorist attacks, which dealt a blow to the U.S. economy, prompted the Fed to reduce the federal funds rate further.

ORGANIZATION AND STRUCTURE

The Federal Reserve banks are an integral part of the Federal Reserve System and were created under Section 4 of the Federal Reserve Act.

The Federal Reserve System is composed of four parts: a board of governors, known as the Federal Reserve Board, which is an independent government agency; the Federal Open Market Committee (FOMC); the Federal Advisory Committee (FAC); and 12 Federal Reserve banks, each with its own board of directors, which are independent instruments of the government.

The Federal Reserve Board. The Federal Reserve Board is made up of seven members appointed for 14-year terms. The president names the chairman and vice-chairman to four-year terms. The Federal Reserve Board supervises and examines the Federal Reserve banks; state-chartered member banks, bank holding companies, and nationally chartered commercial banks; international operations of domestic banking organizations; and the U.S. operations of foreign banks. The Federal Reserve Board also has the authority to act on bank mergers involving member banks and to review changes in control over state-chartered banks and bank holding companies.

The Federal Reserve Board implements U.S. monetary policy. The board seeks to maintain low unemployment, price stability, and economic growth. The board exercises this authority through open market operations, the review and determination of discount rates, and the prescription of specific reserve requirements of financial institutions.

The supervisory role of the board includes prescribing rules and regulations governing advances and dis-

counts by Federal Reserve banks to member banks; open market purchases by Federal Reserve banks; acceptance by member banks of drafts or bills of exchange; legal reserve requirements; purchase of warrants by Reserve banks; accounting and disclosure requirements of member banks; extension of securities credit by lenders other than banks, brokers, and dealers; eligibility requirements for membership in the Federal Reserve System; issuance and cancellation of stocks of Federal Reserve banks; collection of checks and other items by Federal Reserve banks; regulation of foreign banks operating in the United States; loans to executive officers of member banks; regulation of interlocking relationships under the Clayton Antitrust Act of 1914; prescription of minimum security devices and procedures for member banks; regulation of interest on time and savings deposits; relationships with securities dealers; extension of credit for margin purchases; bank service arrangements; loan guarantees for defense procurement; regulation of bank holding companies; and the regulation of a variety of consumer-related functions.

The above does not exhaust the range of supervisory powers assigned to the Federal Reserve Board. It is also active in the regulation of mergers, consolidations, or acquisitions of assets by state member banks, a responsibility it shares with the FDIC, the Comptroller of the Currency, and the attorney general. The board is empowered to fix for each Federal Reserve District the percentage of individual bank capital and surplus that may be represented by security loans. The board may take punitive action toward member banks and Reserve Bank employees for the violation of regulations or laws relating to the bank or engaging in unsound practices.

The board's supervisory powers also include the oversight of the implementation of the international credit guidelines under the Voluntary Credit Restraint Program, permitting Federal Reserve banks to rediscount paper for one another at rates approved by the board, allowing Federal Reserve banks to make four-month advances to adequately secured member banks and to make loans to groups of five or more banks that are inadequately secured, and requiring the writing off of worthless assets from the books of the Federal Reserve.

Finally, the board's powers include the operation of the Interdistrict Settlement Fund (a bookkeeping system used for Federal Reserve interdistrict transactions), the examination of Federal Reserve banks and member banks, the production of various reports on the Federal Reserve banks and member banks, suspension of reserve requirements for 15 days (renewable), imposition of penalties for deficiencies of reserves of member banks, supervision and regulation of the issuance and retirement of Federal Reserve notes, and the appointment of the three Class C directors of each Federal Reserve bank, as well

as selection of the chairman and vice-chairman from these directors.

The Federal Open Market Committee. The Federal Open Market Committee (FOMC) consists of seven Federal Reserve Board members and five Federal Reserve bank representatives. The FOMC sets monetary policy by selling government securities to influence the credit supply and interest rates. The FOMC has centralized direction and control of the open market operations of the Federal Reserve System.

The FOMC was organized under the Banking Act of 1935. Each Federal Reserve bank is required to participate in the FOMC's operations and may not engage in market operations on their own without the committee's approval. Policy directives of the FOMC are issued to the Federal Reserve Bank of New York for the execution of transactions on the open market. The individual Federal Reserve banks are authorized to engage in open market transactions in foreign exchange, subject to the direction and regulation of the FOMC.

The Federal Advisory Council. The Federal Advisory Council (FAC) consists of one member from each Federal Reserve District. The FAC meets regularly with the Federal Reserve Board to discuss general business conditions and make recommendations regarding the Federal Reserve System. The FAC has a purely advisory and consultative function.

The Federal Reserve Banks. The 12 Federal Reserve banks are located in the Federal Reserve Districts and include numerous branches and regional check processing centers. The 12 district banks are located in Boston, New York, Philadelphia, Richmond, Atlanta, Cleveland, Chicago, St. Louis, Dallas, Minneapolis, Kansas City, and San Francisco. Each of the 12 banks has its own distinct organization and serves its own district. The minimum capital for each district bank is \$4 million in subscribed capital; most of the banks hold significantly more capital than this amount.

Each of the Federal Reserve banks is overseen by nine directors divided into three lettered classes: A, B, and C. Class A and B directors are elected by the member banks of the district, while Class C directors are appointed by the Federal Reserve Board of Governors. The Class A directors are intended to represent the member commercial banks and are usually bankers by trade. The Class B and Class C directors are intended to represent the public. Directors may not be members of Congress, while Class B and C directors may not be employees of any banks, and Class C directors may not be stockholders of any bank. All directors are expected to exercise discretion and to avoid participation in partisan political activities. These directors are elected for three-year terms on a staggered basis. The Class A and B

directors are elected by mail by the member banks of the district. The banks of the district are divided into three categories, based on capitalization, and each category may nominate three directors for each class.

One of the Class C directors, armed with significant banking experience, is appointed by the Board of Governors as the chairman of the Federal Reserve Bank and as the Federal Reserve agent. A second Class C director is appointed vice-chairman, and the final Class C director presides at meetings of the bank's board of directors. The Federal Reserve agent may appoint experienced assistants, with the approval of the Board of Governors, to assist the agent in the performance of his duties and to act in his place during absence or disability.

Despite the fact that the member banks are the sole stockholders and elect two-thirds of the investors, policy control lies with the Board of Governors. The district banks are required to participate in the programs of the FOMC. Discount rates set by the district bank directors are subject to the review and acceptance of the Board of Governors, which makes the final determination as to reserve requirements and has broad control of operational matters through its regulations.

The responsibilities of the Federal Reserve banks include: enforcing Federal Reserve Board regulations, clearing and collecting checks for depository institutions, extending credit to depository institutions, and acting as the fiscal agent of the United States.

Federal Reserve banks are actively involved in the enforcement of Federal Reserve Board Regulations. The breadth of these regulations is comprehensive, spanning the full authority of the Federal Reserve System. One example of the Federal Reserve's enforcement efforts at the beginning of the twenty-first century gained significant media attention. In the early 1990s the Federal Reserve banks became involved in the investigation of the Bank of Credit and Commerce International (BCCI) and other institutions and individuals that aided BCCI in illegally gaining control of shares of U.S. banking organizations. Amid the booming economy of the late 1990s, an upswing in risky lending activity among commercial banking institutions forced the Fed to step up evaluation procedures, working to help banks establish internal risk grades by which to weigh potential lending options.

The district banks are responsible for providing an efficient system of collecting out-of-town cash items such as checks. Each district bank acts as a regional clearinghouse for the depository institutions in its district. The Board of Governors acts as the national manager for clearing debit and credit balances among the Federal Reserve banks through the Interdistrict Settlement Account.

Regional Check Processing Centers (RCPC), located in Boston, New York, Philadelphia, Cleveland, Rich-

mond, Atlanta, Chicago, St. Louis, and Minneapolis, are responsible for collecting checks overnight. These RCPCs are operated by the Federal Reserve banks to expedite check collection. The RCPCs sort, clear, and deliver checks deposited by commercial depository institutions.

The Federal Reserve banks offer credit to depository institutions by accepting eligible paper for rediscount or by offering secured loans to the institution with eligible paper or government securities as collateral. The depository institution may choose to receive the proceeds in Federal Reserve notes or other forms of currency to meet deposit withdrawals or as credit to its reserve account. These institutions may also return excess currency to the Federal Reserve Bank for credit to its reserve account. To maintain the stability of this arrangement, the Federal Reserve Bank must meet collateral requirements for Federal Reserve notes. These notes must be fully secured by gold certificates, special drawing rights, eligible paper, or U.S. government obligations, tendered to the Federal Reserve agent at the district Federal Reserve Bank.

The Federal Reserve banks act as the fiscal agent of the United States, supplying currency and coin to over 9,700 institutions. Each of the 12 Federal Reserve banks carries an account for the U.S. Treasurer and undertakes transfers of treasury balances, handles issuance and redemption of U.S. government obligations, and performs other functions for the federal government. The banks are also responsible for the replenishment of currency to the member banks and the issuance of new currency to replace worn and mutilated bills and coins.

The Federal Reserve banks maintain 25 branches, 37 automated clearinghouses, 46 regional check processing centers, and 9 check clearing offices in the major commercial centers of the United States. The largest is the New York bank, employing 3,826 individuals. The branch offices perform many of the functions of the district banks for their territories. Each branch is directly supervised by a board of either five or seven directors, the majority of whom are appointed by the district bank and the remainder by the Board of Governors. These directors are subject to the regulations of the Board of Governors and the general supervision of its district bank.

National banks are required to become members of the Federal Reserve System. State-chartered banks may become members if they wish. In the early 1990s slightly less than half of all banks in the United States belonged to the Federal Reserve System. Those banks with membership, however, held nearly three-quarters of the country's total deposits.

Each member bank is required to hold stock in its district's Federal Reserve bank in an amount equal to 3 percent of the bank's capital and surplus. Access to Fed-

eral Reserve credit facilities and to Federal Reserve services, including check clearing and transfer of funds, is open to both member and nonmember institutions.

Last, the Federal Reserve brings all of the nation's diverse financial activities into a tight statistical relationship with each other via the flow of funds (FoF) system. This system identifies, tracks, and monitors the influences on financial markets of nonfinancial activities. The FoF system divides the economy into basic sectors (households, governments, nonfinancial businesses, financial businesses, and all foreign activity) in order to make sure that all the sectors' transactions balance with each other. In so doing, the FoF system tracks the proliferation of financial claims and the size of capital stock throughout the economy.

BACKGROUND AND DEVELOPMENT

The history of banking in the United States is characterized by a tension between a reluctance to give the federal government control over monetary policy and the concept of Federalism. Alexander Hamilton secured the establishment of a strong central bank in order to give stability to the fledgling republic's currency. The First United States Bank was authorized to stabilize United States currency for a period of 20 years. However, a bill to renew its charter was defeated by one vote in both the House and Senate in 1811. The ensuing chaos led to the establishment of the Second Bank of the United States in 1816. In 1836 the charter of this second bank was not renewed, and financial chaos followed once again.

The National Banking Act of 1863, coupled with the National Banking Act of 1864, established the contemporary banking system through the authorization of national bank charters and the creation of the Office of the Comptroller of the Currency. This action was a major improvement to the ad hoc system that was in place between 1836 and 1863. However, this system was still inadequate for the growing country's economy.

The Federal Reserve Act of 1913 created the Federal Reserve System. This act created the Federal Reserve Board, an independent government agency, and 12 regional banks. On 2 April 1914, exactly 100 days after President Woodrow Wilson signed the Federal Reserve bill into law, the Organization Committee released its report naming the cities of Boston, New York, Philadelphia, Richmond, Atlanta, Cleveland, Chicago, St. Louis, Dallas, Minneapolis, Kansas City, and San Francisco as locations for the Federal Reserve banks. On 16 November 1914, the 12 Federal Reserve banks opened for business.

During World War I, the Federal Reserve banks extended loans to the member banks to help them buy U.S. securities. Although this move aided the treasury, it also aggravated price inflation. The Federal Reserve's

tightening of credit to halt gold outflows in the aftermath of the war exacerbated the economic recession of 1920 and 1921. This experience helped formulate the Federal Reserve's later policy of raising the discount rate to curtail credit in periods of expansion and lowering it to stimulate economic growth.

The system was faced with even greater challenges during the depression era (from 1929 to approximately 1939). As panicking depositors withdrew currency from member banks in response to the number of bank failures, the volume of Federal Reserve discounts declined. The depletion of commercial bank reserves led to reductions in new lending, which further aggravated the depression. In response to this crisis, the Federal Reserve was later given greater regulatory powers, including the power to regulate margins in stock purchases and the power to vary reserve requirements of member banks.

In World War II the Federal Reserve was also involved in helping the treasury borrow at low interest rates. The Federal Reserve banks purchased around \$20 billion dollars of U.S. securities and provided member banks with additional reserves, so that they could also buy treasury securities. Despite rigorous price controls and aggressive sales of savings bonds, inflation increased sharply in the late 1940s. The Federal Reserve Board was criticized sharply for not using open market operations more aggressively to curb inflation.

To increase lending, the member banks sold treasury securities during the Korean War, forcing the Federal Reserve banks to buy these securities to keep the prices stable. The increased inflation, financed by credit, presented a new set of problems for the Federal Reserve. In response, the Federal Reserve Board asserted its independence and reached an accord with the Treasury in 1951, agreeing that Federal Reserve policy should not be subordinated to treasury financing.

After 1951 the policies of the Federal Reserve were more focused on domestic economic stabilization than funding the Treasury. In the early to mid-1960s, the Reserve's focus was on price stability and the restriction of monetary growth; in the late 1960s the emphasis was on full employment and growth of output. The late 1960s also marked the beginning of the concern with international trade deficits and the outflow of gold, the latter culminating in the repeal of the gold-reserve requirements for the Federal Reserve by Congress in 1968 and the end of the Gold Standard under the Nixon administration on 15 August 1971.

The events of the 1970s were difficult for the Federal Reserve. The discount rate tripled, the federal debt more than doubled, gasoline prices increased ominously, and inflation was seemingly out of control. Congress began looking for ways to limit the independence of the Federal

Reserve or, at minimum, force it to reveal its policies and goals in specific terms. The bank was also becoming bogged down in the sheer number of transactions that it had to complete, including check collection and shifting deposits. Pressure was mounting to make significant changes to the Federal Reserve as well as to the overall financial structure of the United States.

In 1980 Congress passed the Financial Institutions Deregulation and Monetary Control Act. This act was to have a significant impact on the Federal Reserve. It required all depository institutions that maintain transaction accounts or nonpersonal time accounts to maintain reserves with the Federal Reserve to the extent necessary for the conduct of monetary policy. It opened the facilities of the Federal Reserve to all banks, including savings and loan associations and credit unions. Finally, it required the Federal Reserve to charge fees for its services to banks in order to cover the costs, including taxes and interest, incurred by the Reserve for providing these services. The implementation of this new legislation was difficult and costly. By 1984 however, the goal of breaking even on services had been achieved.

The Federal Reserve's role in bank regulation was changed by the Federal Deposit Insurance Corporation Act of 1991. This act came in the aftermath of the savings and loan crisis of the late 1980s, when the viability of the banking system was in question. This legislation significantly modified the Federal Reserve Act in response to these uncertainties.

The Federal Reserve also assumed greater responsibility for consumer protection in the 1990s. The Division of Consumer and Community Affairs addressed concerns about fair lending practices in urban areas, access to credit by minorities and low-income households, possible discrimination in mortgage lending, and the need to match its consumer regulations to industry developments. In 1995 the Board joined in issuing revised interagency regulations under the Community Reinvestment Act that included the publication of two proposals. The new rules emphasized performance in lending; they will help promote consistency in assessments and reduce compliance burdens for many banks. In fair lending, the Board adopted streamlined procedures for referring discrimination complaints to the Department of Justice. In 1995 the Board also completed its first full year of operating a specialized fair-lending school for Federal Reserve examiners. The two-week school covers an extensive range of conceptual topics and practical, hands-on class work. A total of 109 examiners attended the 3 sessions offered during the initial year.

By the early 1990s the Truth in Lending Act, the Fair Credit Billing Act, and the Equal Credit Opportunities Act involved the Federal Reserve in the protection of individuals' rights in obtaining consumer credit. The Fair

Credit Reporting Act, the Consumer Leasing Act, the Real Estate Settlement Procedures Act, and the Home Mortgage Disclosure Act involved the Federal Reserve in requiring and monitoring the disclosure of crucial financial information to consumers involved in credit transactions. The Electronic Funds Transfer Act provided a basic framework regarding the rights, responsibilities, and liabilities of consumers who used electronic funds transfer as well as those of the institutions granting them. Finally, the Federal Trade Commission Improvement Act authorized the Board of Governors to identify and implement legislation to prohibit unfair or deceptive bank practices.

Perhaps the most profound event affecting the Federal Reserve during the late 1990s was the passage in 1999 of the Gramm-Leach-Bliley Act, which repealed the Glass-Steagall Act and thus began to dismantle the distinction between commercial and investment banks. The legislation was expected to overhaul the entire financial services landscape. Lobbyists for the financial industry had campaigned for over 20 years to bring down the depression-era law. Overall, the legislation lifted a broad range of restrictions on the spectrum of financial institutions' activities, allowing them to offer insurance products and to run travel agencies and a host of other previously prohibited business activities. Among other features, the Glass-Steagall Act prohibited commercial banks from dabbling in the stock market. The Gramm bill knocks down that law and allows banks to directly underwrite municipal revenue bonds.

The Federal Reserve's responsibilities under Gramm-Leach-Bliley center on the risk management and capitalization of holding companies. By dismantling provisions of the Bank Holding Company Act of 1956, barriers between banks, securities firms, insurance companies, and other institutions are crumbling, leading to extensive merger activity. The resulting firms are forming financial holding companies, thereby preserving the regulatory muscle of the Federal Reserve, which will determine the validity of those holding companies on the basis of their capitalization. Requirements include a relatively high level of capital relative to risk-based assets and a satisfactory rating under the Community Reinvestment Act.

Analysts noted, however, that while the Gramm bill was certainly a landmark piece of legislation, banks' nonbanking activities had been extensive for years. The Bank Holding Company Act was filled with loopholes, particularly Regulations K and Y, which allowed banks to invest in nonbanking institutions through small business investment companies (SBICs). Nonetheless, the Gramm bill was expected to lead to unprecedented consolidation in the financial services industries.

In the mid- and late 1990s, the Federal Reserve was keeping a sharp watch out for inflationary pressures. Dur-

ing the economic expansion of these years, the Fed held off raising interests for two years until early 1997, when it instituted the first of what was expected to be a series of rate increases to ward off inflation. The Fed's action to cool a booming economy temporarily upset the stock market and resulted in political criticism from those who believed the Fed's tight control would weaken the employment outlook. Afterwards, the Fed implemented a series of adjustments, including four rate increases in 1999 and early 2000.

While the United States enjoyed unprecedented economic growth during the late 1990s, the rising number of weak or potentially weak loans at some institutions alarmed the Fed, which issued a guidance to banks warning them against the relaxation of credit discipline, including the over-reliance on the borrower's promise to pay. The Fed attributed the development to overconfidence in clients' portfolios. The Federal Reserve hoped to stave off a trend toward laxity before its potentially ill consequences rippled through the financial markets.

In foreign affairs, the early 1990s saw the Federal Reserve begin to implement the Foreign Bank Supervision Enhancement Act of 1991. In conjunction with this act, the Federal Reserve Bank began to strengthen its supervisory role with respect to the operation of foreign banks in the United States. By the end of the decade, the Fed was working on a series of information-exchange agreements with the financial supervisory authorities in countries around the world, with the purpose of opening information channels regarding the banking activities of the respective nations. With the continued international face of finance, such agreements were set to allow U.S. banks to make further inroads into foreign markets and vice versa.

CURRENT CONDITIONS

By the end of 2001, more than 550 U.S. bank holding companies had taken advantage of the Gramm-Leach-Bliley Act and transformed themselves into financial holding companies (FHCs). A handful of U.S. securities firms and one leading insurance player had also converted to FHC status by then. The total assets of FHCs totaled \$6.1 trillion, which accounted for roughly 80 percent of the assets of domestic bank holding companies. The larger FHCs typically used the Gramm-Leach-Bliley Act to diversify into securities and insurance underwriting as well as merchant banking. Many of the smaller FHCs created insurance brokerages.

The unprecedented growth of the U.S. economy in the late 1990s had come to an abrupt halt by the end of 2000. Therefore, the September 11 terrorist attacks in 2001 undermined an already weak economy. According to U.S. Board of Governors of the Federal Reserve System 2001 Annual Report, "The most pressing concern of

the Federal Reserve in the first few days following the attacks was to help shore up the infrastructure of financial markets and to provide massive quantities of liquidity to limit potential disruptions to the function of those markets.” To this end, Federal Reserve banks extended the hours of their funds and securities transfer systems. The Federal Reserve Bank of New York even relaxed certain restrictions related to securities lending. As a result, securities lending reached unprecedented levels in the weeks following the attacks. To encourage consumer spending, the Fed cut interest rates several times throughout the remainder of the year.

Along with reducing the federal funds rate and working to facilitate liquidity, the terrorist attacks also prompted the Fed to initiate new security measures to ensure that Federal Reserve banks are able to maintain operation in the event of disaster. At the same time, Federal Reserve banks have also begun working to reduce costs in three areas of operations: accounting, human resources, and information technology.

AMERICA AND THE WORLD

In the early 2000s there was heavy interaction between Federal Reserve policies and international economic developments. The Fed engages in foreign-exchange transactions, which involves the purchase of foreign currencies and maintaining them in reserve. The exchange value of the dollar relative to foreign currencies is a primary instrument by which the Federal Reserve engineers U.S. monetary policy. By raising interest rates in the United States, the dollar rises in value relative to foreign currencies, thereby raising the cost of U.S. goods on the world market and decreasing exports. The reverse, of course, is true when the Fed lowers interest rates. Furthermore, after the Asian financial crisis and Russian bond default in 1998 sent shockwaves through financial markets, the Federal Reserve focused its international efforts on tallying the extent of U.S. banks’ exposure to volatile economies.

Since the early 1970s, the Federal Reserve and other central banks have developed a reciprocal, or swap, network by which central banks may access each other’s currencies. In this way, central banks can intervene to prop their local currencies. The New York Federal Reserve Bank handles swap transactions, transferring dollars to a foreign central bank in exchange for that country’s currency, at the same time agreeing to reverse the transaction a few months later.

The concept of central banking was developed in response to the recurrent British financial crises of the nineteenth century. Modern market economies are subject to frequent economic fluctuations. The causes of these fluctuations are diverse; however, there is general agreement that the ability of banks to create money may

exacerbate them. This situation raises the need for an independent monetary authority able to view economic and financial developments objectively and to exert control over the activities of the banks.

Central banks have four major functions: the maintenance of a sound commercial bank structure; the management of international trade and financial relationships; ensuring the adequacy of banking capacity and services for the community; and, finally, acting as financial advisor to and taking responsibility for the financial affairs of the government.

To maintain a sound commercial banking structure, central banks are often called upon to offer support to financial institutions in times of crisis and to avoid such crises. The Federal Reserve System examines the books of commercial banks and sponsors various educational programs. In some developing countries such as India and Pakistan, the central banks continually scrutinize commercial bank operations. The Bank of England plays a crucial role in the United Kingdom’s banking system, ensuring that banks have a steady supply of cash, even during periods of credit restrictions.

Central banks also manage the international financial relationships of their country as well as the foreign exchange activities of that country. This role often requires coordination and cooperation with other central banks and international financial institutions, such as the International Monetary Fund (IMF) and certain regional, yet supranational organizations.

Another responsibility of a central bank is the assurance of the availability of banking services. In rural areas of India and Norway, the central banks have been active in ensuring that the banking needs of these areas are met. In France, this concern has led to the expansion of the central bank’s activities to France’s territories. Central banks are also active in assuring that the quality of banking services is adequate. In India and Pakistan, as in the United States, the central banks inspect and audit bank operations. In other countries, such as France and South Africa, this function is delegated to a separate authority.

Finally, central banks are often called on to act as the government’s financial agent and advisor. The Bank of England developed into a central bank from its original role as the banker to the government. The Federal Reserve, as well as the Bank of France and the German Bundesbank, has historically been involved in granting credit to the government on a direct or indirect basis. However, many banks are severely restricted in engaging in these activities.

In 2003 many of the world’s central banks were nationalized. These banks had taken a role as public institutions that exist to serve the community as a whole. Most of these banks, however, do garner significant pro-

fits. The European Central Bank, the Bank of Korea, the Bank of England, and others were raising key interest rates at that time. But in areas where the spectacular financial performance the U.S. has enjoyed was lacking, such as continental Europe, such moves were widely viewed as an attempt to prop local currencies and make assets more attractive.

RESEARCH AND TECHNOLOGY

The Federal Reserve Bank has been aggressive in implementing new technology. In 1999 the Fed revised Regulation CC to allow broader validity for check images as substitutes for physical checks. The ruling opens greater opportunities in electronic checking, a technology that was somewhat restricted by Regulation CC's vague passages regarding the handling of returned items. The revised ruling clarifies that images are in fact an acceptable replacement for paper, wherever the two parties, or a consortium of parties, agree to it.

In 1991 the Philadelphia Federal Reserve adopted the DISC Global Payment System for transferring and receiving Federal Reserve payment instructions. This system provided customer initiation, service delivery, and payment processing in a single product, operating a comprehensive electronic wholesale banking system on the same platform.

In 2001 the Fedline personal computer software was upgraded to offer greater flexibility in electronic transaction services. The upgraded software offered improvements that allow banks to make electronic bids for treasury securities, treasury security transfers, and automated clearinghouse and wire transfer transactions and currency orders.

In addition to decreased processing time and improved service, the Federal Reserve also cut costs through the implementation of new technologies. One of the most important of these cost-saving methods was the consolidation of 12 general purpose data processing centers into three regional operations: Dallas, Richmond, and the New York Bank's East Rutherford, New Jersey, facility.

Finally, the Federal Reserve has implemented measures to shore up the Banks' security systems, particularly in the growing area of electronic funds transfer. To ensure the \$1.5 trillion in funds transferred daily through the Federal Reserves's bank network, the Fed has implemented the Triple DES (data encryption standard) method. Ready for application in June 2002 as an official government standard was the Advanced Encryption Standard (AES), which uses 256-bit key lengths to encode electronic data, compared with DES's 56-bit key lengths.

CENTRAL RESERVE DEPOSITORY INSTITUTIONS, NOT ELSEWHERE CLASSIFIED

This classification includes central reserve depository institutions, other than federal reserve banks, primarily engaged in providing credit to and holding deposits and reserves for their member commercial banks, thrift and loan associations, credit unions, insurance companies, and other federally-insured financial institutions who hold at least 10 percent of their assets in residential mortgage loans.

NAICS CODE(S)

522320 (Financial Transactions Processing, Reserve, and Clearing House Activities)

The Federal Home Loan Bank System (FHLB System) was established by Congress in 1932 with the passage of the Federal Home Loan Bank Act. The FHLB System's intended role was to provide readily available, low-cost funds to federally insured savings institutions.

As it was originally constituted, the FHLB System acted as regulator and supervisor of federally chartered savings institutions and federally insured state-chartered savings institutions.

Coming on the heels of the savings and loan debacle of the 1980s was the creation of The Financial Institutions Reform, Recovery and Enforcement Act of 1989 (FIRREA) and the dissolution of the Federal Home Loan Bank Board (FHLBB).

FIRREA eliminated the FHLBB and transferred those powers to the Federal Housing Finance Board (FHFB). Thrift institutions that were members of the FHLB System continued, as before, to be regulated by the Office of Thrift Supervision, which is part of the U.S. Treasury.

FIRREA simultaneously expanded member eligibility in the FHLB System to include commercial banks, credit unions, thrift and loan associations, and other federally-insured financial institutions.

Since the dismantling of the FHLBB, the 12 regional governing banks in the system now act as wholesale banks only, providing their shareholders with an important link to the U.S. capital markets. By the late 1990s, more than 7,200 member banks composed the FHLB System.

It is the banks' mission is to provide access to housing for all Americans and to improve the quality of credit by raising funds for their lender institutions/shareholders through the Office of Finance which, in turn, issues and services debt for the banks — the FHLB System is one of the three largest issuers of debt in the world. The system's consolidated debt rating is the highest rating available from Standard and Poor's and Moody's rating services. The United States Government is neither responsible for nor guarantees these obligations.

The FHFB has regulatory authority and supervisory oversight responsibility for the 12 FHLB banks and the Office of Finance. According to its Web site, the finance board "ensures the safety and soundness of the Bank System, establishes policy for the Community Investment Cash Advances programs (including the Affordable Housing and Community Investment programs), oversees the Banks' financial performance and operations and evaluates their attainment of public policy mission as a government-sponsored enterprise (GSE)."

The FHLB System is regulated by the FHFB, an independent agency of the executive branch responsible for ensuring that the banks carry out their housing finance mission, remain adequately capitalized, raise funds in capital markets and be fiscally solvent. The finance board also establishes policies and regulations governing the operations of the banks.

The FHFB is comprised of a five-director board, one of whom is the secretary of housing and urban development. The four other directors are appointed by the president and are subject to senate confirmation. The FHFB's directors are chosen from a pool of people who have extensive experience in housing and community development finance or with a commitment to representing consumer or community interest in services, credit needs, housing, or consumer protection.

The FHFB is supported by assessments from the 12 FHLB banks. The banks finance their own operations through investments, the sale of collateralized obligations, and by charging for credit products and services they provide to member institutions. No tax dollars or other appropriations are used to support the operations of the FHFB or the bank system.

SIC 6021

NATIONAL COMMERCIAL BANKS

This classification includes commercial bank and trust companies (accepting deposits) chartered under the National Bank Act. Trust companies engaged in fiduciary business but not regularly engaged in deposit banking are classified in **SIC 6091: Nondeposit Trust Facilities**.

NAICS CODE(S)

522110 (Commercial Banking)

522210 (Credit Card Issuing)

523991 (Trust, Fiduciary, and Custody Activities)

INDUSTRY SNAPSHOT

The U.S. commercial banking industry remained healthy in the early 2000s, despite a sluggish economy. The frenetic pace of industry consolidation that had characterized the 1990s began to slow, partly because the number of players had dropped so considerably. Indicative of the massive consolidation of financial services in the United States, there were 8,129 commercial banks in operation at the start of 2002, dramatically down from 18,769 at the end of 1975. The number of mergers and acquisitions that took place in 2001 fell to 376, compared to 475 in 2000. At the same time, the number of new banks established in 2001 dropped to 149, compared to 217 in 2000. Similarly, the number of mergers and acquisitions between bank holding companies (BHCs) fell from 180 to 155 over the same time period.

Commercial banks held about \$6.4 trillion in assets in 2001, registering an increase of 5.2 percent from 2000. That year, the 10 largest commercial banks in the United States held 40 percent of total domestic bank assets, and the top 50 U.S. BHCs held nearly 78 percent of domestic banking and nonbanking assets.

Commercial banking was among the first industries to develop in the United States. Subject to a convoluted set of regulations at the state and federal levels, the banking industry is broad in scope and complex in nature. Modern commercial banks provide both individual and corporate customers with an increasing number of financial services. Recent innovations in this industry include the introduction of credit cards, accounting services for corporate firms, factoring, leasing, trade in Eurodollars, lock box banking, and security investment. Banks are constantly seeking to improve service to customers by expanding the quality and number of their services.

Commercial banks perform at least eight major functions in the U.S. economy. First, banks facilitate the elastic credit system that is necessary for economic progress and steady growth. Second, they allow the efficient transfer of money between firms and individuals. Third, they encourage the pooling of savings, making these savings available for lending. Fourth, banks extend credit to credit-worthy borrowers, increasing production and capital investment. Fifth, banks facilitate the financing of foreign trade by converting various currencies. Sixth, they act as trust administrators and advisors. Seventh, they aid in the safekeeping of valuables. Finally, banks have recently been allowed to engage in brokering activities, buying and selling securities for customers.

Several banks in the early 2000s continued to take advantage of the Gramm-Leach-Bliley Act—landmark legislation passed in late 1999 that opened the door to deals between banks and other financial institutions, such as securities brokers and insurance companies. The number of BHCs that have transformed themselves into financial holding companies grew from 552 in 2000 to 672 in 2001.

Despite the increasingly relaxed regulatory climate, the banking industry is one of the most regulated parts of the U.S. financial system. The industry operates under the supervision of three regulatory agencies: the Federal Reserve System, the Office of the Comptroller of the Currency (OCC), and the Federal Deposit Insurance Corporation (FDIC). The Federal Reserve System, created in 1913, is the central bank of the United States and is responsible for monetary policy. Its operations are carried out by its 12 regional banks. The OCC has wide discretionary authority, which it uses in routine examinations of all national banks' books to identify unsafe or unsound banking practices. This agency is the most involved with national bank regulation. The OCC has the

authority to take any actions necessary to correct the conditions resulting from violations of law or sound and safe banking practices. Finally, the FDIC was created to reduce the risk of making deposits by insuring the deposits of member banks, both national and state.

ORGANIZATION AND STRUCTURE

The National Bank Act of 1863 created the basis for the first national U.S. banking system and continues to serve as the basic banking law for American national banks. The act was originally created to provide a uniform national currency backed by U.S. Government bonds that would replace the various currencies issued by state banks and other forms of exchange that were then in use. The original plan for the national banking system was outlined by Salmon Chase, the secretary of the treasury, in 1861.

National banks are chartered and supervised by the Comptroller of the Currency of the United States. The charters issued by the comptroller are of indefinite duration. Upon the submission of an application, a national bank examiner in the region where the proposed national bank will be located initiates an investigation of the bank, focusing on the character and experience of the organizers, existing banking facilities, and prospects for success. A national bank must meet certain capitalization requirements depending upon its location and cannot begin operation until it has paid-in surplus equal to 20 percent of its capital. The examiner puts the capital and paid-in surplus of each bank to an "adequacy" test that subjects each potential bank to criteria based on established minimal capitalization levels and analysis of local conditions. If the application is accepted, the Comptroller of the Currency issues the necessary documentation to the bank and, eventually, a certificate to commence business.

All national banks are required to be members of the Federal Reserve bank of their district and to invest in the capital stock of the bank as required by the Federal Reserve Act of 1913, which requires that 6 percent of the national bank's capital and surplus must be pledged and 3 percent deposited as payment. National banks are further required to be insured by the Federal Deposit Insurance Corporation (FDIC).

National banks have 20 enumerated, general powers, which are effective upon the execution and filing of the articles of association and the organization certificate. Such powers include the obvious—receiving and loaning money—as well as the obscure—providing travel services for customers. National banks are granted general corporate powers, which include making contracts, suing and being sued, electing and appointing directors, and prescribing bylaws. They are also allowed to establish branch offices in the United States and abroad, under

specified conditions. They conduct a range of activities involving real estate, U.S. government securities, the establishment of trusts, and other financial activities. Such broadly construed powers enable national banks to engage in far more than strictly commercial banking.

Commercial banks may be classified as either unit or branch banks. In the United States, unlike other countries, banks of both types exist. Historically, however, unit banking has been the most common. Under unit banking, services are provided by a single office or institution. The system of unit banking is the product of an earlier American social and economic structure in which a single local bank could serve the needs of a relatively small and insular town. As communication became more efficient and the economic environment became more complex and interdependent, however, branch banking became dominant in many areas of the country. Branch banking is a system under which a single banking firm operates at two or more locations. There are different degrees of branch banking across the country. In general, the more densely populated areas, such as the East and West Coasts, have adopted branch banking, while more sparsely populated areas have maintained unit banking.

BACKGROUND AND DEVELOPMENT

The first incorporated commercial bank in North America was opened in Philadelphia on 7 January 1782, one week after the Continental Congress had granted a perpetual charter to the Bank of North America. This bank was intended to be a pillar of American credit that would play a significant role in the financial management of the fledgling republic. The number of banks in the United States grew exponentially in the early nineteenth century. By 1816 there were 246 banks in the United States and, by 1840, there were three times as many as there had been in 1820. Between 1840 and 1860, this number again doubled, to 1,500.

By the outbreak of the Civil War, both the North and the South had well-developed banking, but the systems were decentralized. Before the war, banking policy was controlled by the individual states. But the war strengthened the central government and began a new era in banking. In 1863 the government crafted legislation giving the federal government powers to regulate banking. For the first time, the nation had a uniform bank currency controlled by a central authority. This step marked the beginning of what is called the "dual banking system," which consists of banks chartered by the states and other banks chartered by the federal government.

The existence of a strong federal banking structure after the Civil War underlay the explosion of productive capability that characterized the United States in the late nineteenth century. Yet, while a dependable money supply aided economic expansion, it also prompted distrust

of those controlling the flow of money. By the end of the nineteenth century, reformers looked to further banking legislation to smooth economic turmoil. In 1913 the Federal Reserve Act created the system of Federal Reserve banks. The Federal Reserve Act was created to bring stability to commerce and industry, prevent financial panics, make commercial credit available, and discourage speculating by banks. Although this legislation was initially opposed by bankers, the Federal Reserve has since developed into a cornerstone of the current banking system.

Despite improved supervision and economic prosperity, nearly one quarter of the banks operating in the mid-1920s had closed by the end of the decade. Between 1921 and 1929, more than 5,700 banks closed, far exceeding the total for the previous 56 years. After the stock market crash in 1929, banks continued to close at an alarming rate. The rampant failure of banks led to the implementation of a deposit insurance program created by the Banking Act of 1933, or the Glass-Steagall Act. One important part of this legislation was the establishment of the Federal Deposit Insurance Corporation (FDIC), which guaranteed the deposits of investors up to a certain limit. The Glass-Steagall Act also created the distinction between commercial and investment banking. Commercial banks were prohibited from underwriting securities, engaging in the stock market, and a host of other activities that legislators felt had contributed to the financial crisis. Commercial banks were to focus on accepting deposits and providing commercial loans. The act also built on long-standing distrust in the United States of centralized monetary institutions by regulating and restricting bank branching.

After 1945 U.S. banks began to expand their operations to encompass a wide range of financial services. In the 1960s banks began to represent themselves as "full-service banks," indicating their involvement in a growing range of financial activities, as regulatory constraints were relaxed. This trend toward deregulation continued throughout the second half of the twentieth century. After 1965 banks began to expand into foreign markets, while foreign banks also began to gain footholds in the United States.

Commercial banking assumed an increasingly international posture through the late twentieth century. In 1965, 13 U.S. banks maintained operations abroad, controlling \$10 billion in assets; by 1980 the number had grown to 159, holding assets of \$340 billion. However, U.S. creditors began to realize in the early 1980s that they had overextended themselves in emerging markets, as foreign borrowers failed to service their debts, resulting in massive losses. Not until the early 1990s were commercial banks confident about lending in such markets again. U.S. bank assets held \$861 billion in foreign assets

in 1998, while 82 banks maintained foreign branch offices, down significantly from the 162 in 1985. This decline was primarily reflective of the intense consolidation of U.S. commercial banking; the number of branches in foreign markets was at a record high of 935 in 1998.

In February 1993, during the first few months of the Clinton administration, the General Accounting Office (GAO) announced that despite the extensive bureaucracy, the federal government did a poor job of examining the books of banks and thrifts. The Comptroller of the Currency, Charles Bowsher, indicated he felt that the regulatory agencies did not adequately ensure that unsafe banking practices were uncovered. Although these sentiments were not uncommon, many felt that there was no reliable evidence about what was happening in the banking industry.

The Treasury Department suggested that the fundamental changes needed in the banking industry required thorough reconsideration of the foundations of the financial system, including the scope and operation of the federal deposit insurance system, the nature of bank supervision and regulation, and bank and nonbank affiliations. Four broad principles to guide the reform process were proposed by the Treasury Department, which suggested that banks should: preserve deposit insurance for small depositors, but protect taxpayers by exposing large depositors to some risk; create a system of incentives and sanctions that encourages higher levels of capital; allow banks to engage in a broader range of business activities and to operate nationwide; and make the regulatory structure more efficient to strengthen the banking system.

By 1994 banking institutions had become far less restricted by geographical boundaries. That year the Riegle-Neal Interstate Banking and Branching Efficiency Act eliminated most of the remaining regulatory barriers impeding interstate banking activity. The act unleashed a massive reorganization of banking structures. Previously, banks maintained separate subsidiaries in states other than those in which they were headquartered. With the passage of Riegle-Neal, banks could organize all their operations under one institution with separate branches across state lines, enabling more streamlined networks and diversification of product lines. In the first six months after the bill's passage, the number of interstate branches of U.S. commercial banks more than doubled.

With the continued relaxation of the U.S. financial regulation climate, the reach of large national commercial banks expanded rapidly, moving across state and national borders and swallowing smaller banks that found it increasingly difficult to remain profitable in the face of competition from their more leveraged competitors. The fiercely competitive market forced banking institutions to offer a greater range of services and to "out-local" the national banks, "out-national" the local banks, or both.

By 1998 roughly 25 percent of all commercial banking assets were controlled by institutions with operations in more than one state; only a small handful of banks were engaged over state lines in 1980. The control of assets likewise gravitated toward the largest national banks. The largest 100 commercial banks maintained about 70 percent of domestic banking assets in 1998, up from 50 percent in 1980. Small community banks, however, were not among the primary victims of this consolidation, managing to hold their own in their own localized markets, where they could market their service to and shared interests with the community.

The financial industry prepared for a complete transformation entering the 2000s, as the passage of the Gramm-Leach-Bliley Act, also known as the Financial Services Modernization Act, repealed the Glass-Steagall Act, capping a 20-year effort by lobbyists. The new law allowed banks to engage in a range of activities prohibited since the Great Depression. By establishing financial holding companies, banks could establish brokerages, insurance operations, and other financial service offerings in addition to their traditional banking activities all under one institution. The ruling sparked additional merger activity, especially across financial sectors. Bank of America, for instance, took advantage of the opening to become the first bank to reorganize its insurance operations from an operating subsidiary to a financial subsidiary, relocating it to the bank's headquarters. To establish a financial holding company, national banks were required to meet the following criteria: they must be considered well capitalized, determined by a ratio of at least 10 percent total capital to risk-adjusted assets, as evaluated by the Federal Reserve; they must receive a satisfactory rating under the Community Reinvestment Act; and aggregate, consolidated assets of all banks' financial subsidiaries must amount to either less than \$50 billion or 45 percent of the banks' total assets, whichever is lower.

While the Gramm-Leach-Bliley Act was certainly a landmark piece of legislation, banks' nonbanking activities had been extensive for years. The Bank Holding Company Act of 1956 was filled with loopholes, particularly Regulations K and Y, which allowed banks to invest in nonbanking institutions through small business investment companies (SBICs). Moreover, in the years leading up to the new law, federal regulators had become so lenient in interpreting legal loopholes that the Glass-Steagall Act, meant specifically to prevent combinations between banks that lend money and Wall Street brokers in the business of offering corporate securities to the public, was nearly meaningless. Nonetheless, the Gramm bill did fuel further consolidation in the financial services industries.

Such changes did little to quiet fears (deemed irrational by many banking executives) that the U.S. banking

system was unsound and might experience a disaster similar to that experienced by the savings-and-loan industry in the mid- and late 1980s. Bank deregulation under the Reagan administration was blamed for the failures of hundreds of savings-and-loans that would cost American taxpayers as much as \$500 million in repayments to depositors. Those seeking lessons from the fiasco tended to suggest that banks needed more rather than less regulation.

Perhaps validating many such fears that the dramatic surge in financial performance masked an unsound foundation was the alarming increase in consumer bankruptcies, which reached a record 1.35 million in 1997, up 20 percent from the year before, even in the midst of the strongest U.S. economy in years. As a result, the Federal Reserve warned banks against the relaxation of credit discipline, including the overreliance on the borrower's promise to pay.

Overall, however, banks did not seem worried by such developments. Commercial and industrial loans expanded 13 percent in 1998, reaching \$847 billion, as bankers remained confident in the sound fundamentals of U.S. companies. Total deposits at commercial banks were also in good shape at \$3.3 trillion, up 11 percent from 1997, while 95 percent of all bank assets in 1998 were held by banks considered well capitalized by the Federal Reserve.

CURRENT CONDITIONS

Commercial bank assets grew 5.2 percent to \$6.4 trillion in 2001. While this growth had slowed from the 8.7 percent increase in 2000, it remained similar to the pace set in 1999. While the sluggish U.S. economy of the early 2000s did increase loan and lease losses, these were "offset in large part by realized gains in investment account securities: these gains developed as banks' portfolios benefited from declining short- and immediate-term market interest rates," according to the June 2002 *Federal Reserve Bulletin*. In response to the September 11, 2001, terrorist attacks, which undermined an already weakened economy, the Federal Reserve continued to reduce interest rates into 2003, and the resulting low interest rates on home mortgages helped to spark a refinancing boom, which bolstered the industry's performance as well.

The FDIC reported that seven U.S. banks liquidated their assets in 2000. This number dropped to four in 2001, and combined net income for U.S. commercial banks grew 8 percent to \$75.3 billion that year. As in 2000, roughly 625 banks posted losses in 2001, accounting for 1.3 percent of total industry assets, compared to 4.7 percent in 2000. This decrease in overall losses reflected the improved performance of a number of banks that had taken one-time write-offs in 2000.

To handle the anticipated growth in loan losses, the result of the floundering economy, banks increased their loan loss provisions by 41 percent in 2000 and by another 45 percent in 2001. As a result, loan loss provisions in the early 2000s accounted for nearly 11.5 percent of total bank revenues, their highest level since the early 1990s.

In 2001 overall loan and lease growth declined to 1.8 percent, compared to a growth rate of roughly 9 percent in 1999 and 2000. The number of commercial and industrial loans fell 6.6 percent in 2001, while commercial real estate loans remained steady. Although slowing from their explosive pace in 2000, residential mortgage loans did grow by 5.6 percent, while home equity loans grew 21 percent.

While consolidation slowed, major deals did continue to take place, including the merger between Chase Manhattan and J. P. Morgan and Company Inc., which created J. P. Morgan Chase and Co., the second largest bank in the United States, in 2001. That year, U.S. Bank and Firststar Bank also completed a merger, creating U.S. Bancorp, the eighth-largest financial services holding company in the United States.

INDUSTRY LEADERS

While the number of national banks is quite large, there are several recognized leaders in terms of size of deposits and range of services. These industry leaders include Citibank, Bank of America Corp., J. P. Morgan Chase and Co., and Bank One Corp.

Pittsford, New York-based Citibank, which continues to operate as the consumer and corporate banking subsidiary of Citigroup Inc., was originally organized in New York in 1812. It was chartered under the National Banking Act in 1865. The bank conducts general banking business, including retail and wholesale operation, and operates an extensive international network covering over 40 countries. Citibank is one of the nation's largest bank issuers of credit cards. Near the turn of the twenty-first century, parent company Citigroup became the first U.S. bank to record total assets of more than \$1 trillion.

J. P. Morgan Chase and Co. operates the second largest U.S. bank. It was formed in 2001 via the merger of investment firm J. P. Morgan and Company Inc. and Chase Manhattan Corp. Chase Manhattan had emerged when Chemical Bank purchased Chase Manhattan in 1996. At the time, the combined entity was the largest commercial bank in the United States with approximately \$300 billion in pro forma assets. With assets of \$694 billion in 2001, J. P. Morgan Chase and Co. secured revenues of \$50.4 billion and employed nearly 96,000 workers.

Bank of America Corp. was formed by the merger of San Francisco, California-based BankAmerica Corp. and

Charlotte, North Carolina-based NationsBank Corp. in 1998. The bank is heavily involved in commercial banking, savings, trusts, safe deposit, and installment credit. It operates more than 4,000 branches across 21 states, as well as several foreign subsidiaries in Europe and Latin America. In 2001 Bank of America was the third largest U.S. bank, with \$660 billion in assets.

Bank One Corp., based in Chicago, was formed via the merger in 1998 between Banc One Company and First Chicago NBD Company. The firm's business includes commercial and retail banking, and various investment activities. Bank One was the top bankcard issuer in 1998, with \$70 billion in outstandings, and is also a leading manager of mutual funds. The company reported total assets of \$274 billion in 2001 and employed 73,500 people.

WORKFORCE

The entire banking industry employed about 1.5 million people in the late 1990s, including 550,000 bank tellers, who earned an average annual salary of \$16,300. However, the year 1998 witnessed a record number of layoffs in the financial sector. The top handful of banks eliminated more than 70,000 positions due to merger activity and the attempt to remain competitive by cutting costs. As banks become increasingly connected to the performance stock and other financial markets, the temptation to downsize a bank's labor force to mitigate sagging stock prices will likely intensify.

AMERICA AND THE WORLD

Despite the intense consolidation, the U.S. banking industry remains highly fragmented when compared with other industrialized nations. However, even among those nations that already rely heavily on central banking institutions, U.S.- style consolidation is the order of the day. The globalization of financial markets is largely responsible for this development, since typically only larger, more leveraged institutions are able to compete in overseas markets. The increasingly liquid global financial markets invite the deregulated industries to tap into new markets abroad.

The most popular entity for international banking among U.S. national banks is the foreign branch office, which maintains full access to its parent bank's capital when making lending decisions, rather than being restricted by its host country to its own balance sheet. In 1998, 82 U.S. commercial banks maintained foreign branch offices, controlling assets of \$704.5 billion. Almost \$350 billion in assets was held by branches based in Europe, though that figure declined somewhat in the late 1990s. The Latin American market experienced the most pronounced growth for this type of foreign entity during the 1990s; at the start of the decade about 250 foreign branches held a total of \$10 billion in assets in

this region, while by 1998 \$32 billion was controlled by 350 branches.

However, in many cases foreign tax laws or other considerations relating to the host country favor the establishment of foreign subsidiaries, legally separate entities that are responsible for, and limited to, their own asset holdings, even though they are wholly or partially owned by the parent bank. Foreign subsidiaries also shield the parent bank from liabilities accrued by the foreign operation. U.S. banks owned 1,133 foreign subsidiaries in 1998, controlling assets of \$717.9 billion. About half of these assets were held in the United Kingdom.

The lending of currency in the host countries' denomination creates what is known as "transfer risk," which measures the exposure of a U.S. banking operation to that country's financial market. Foreign-currency lending is among the most tightly concentrated sector of the U.S. banking industry, with the six largest banks accounting for more about 83 percent of transfer risk. By the late 1990s, the strength of the dollar relative to foreign currencies had begun to slow the demand for such lending, however, as dollar markets opened up in many countries, emerging markets experienced dramatic volatility in their currency valuations.

The Japanese financial system was in the midst of sweeping reform, known as the "Big Bang," in 2000, which is completely overhauling the banking system in an effort to mitigate the country's decade-long economic woes. Most significantly, the reforms are opening Japanese financial markets to foreign players and, like the United States, breaking down restrictions against banks' engagement in other financial activities, such as securities underwriting.

Meanwhile, the European financial markets continue to integrate. In 1999 all European Union members with the exception of the United Kingdom, Sweden, and Denmark officially chained their currencies to the euro, with the United Kingdom expected to jump on board within a few years. The European Union thus constitutes the largest economic area in the world, with banking policy administered by the European Central Bank, which has worked to open its market to more liquid financial flows.

RESEARCH AND TECHNOLOGY

As the banking industry became ever more complex in the mid 1990s, banks around the world began to adopt new technologies and automation. Much of the investment was for Automatic Teller Machines (ATMs), teller workstations, check processing equipment, and related software. Electronic check presentment (ECP), which involves check processing via electronic transfer and which was expected to save the industry some \$2.8 billion in paper costs, was beginning to take firm hold in 1999, as was online banking. With increased emphasis on the

electronic transfer of funds, however, banks were forced to invest heavily in security systems. Security spending for electronic systems was projected to skyrocket from \$1.2 billion in 1996 to \$7.4 billion by 2002, mainly for firewalls and encryption systems.

SIC 6022

STATE COMMERCIAL BANKS

This category includes commercial banks and trust companies (accepting deposits) chartered by one of the states or territories. Trust companies engaged in fiduciary business but not regularly engaged in deposit banking are classified in **SIC 6091: Nondeposit Trust Facilities**.

NAICS CODE(S)

522110 (Commercial Banking)

522210 (Credit Card Issuing)

522190 (Other Depository Intermediation)

523991 (Trust, Fiduciary, and Custody Activities)

INDUSTRY SNAPSHOT

Despite a lackluster economy, the U.S. commercial banking industry remained healthy in the early 2000s. According to the Conference of State Bank Supervisors, total commercial banks' assets grew from \$6.5 trillion in 2000 to \$6.9 trillion in 2001, while assets at state-chartered commercial banks increased from \$3.01 trillion to \$3.08 trillion over the same time period.

The consolidation frenzy of the 1990s had lessened by the early 2000s, at least in part simply because the number of banks had been reduced rather dramatically. At the end of 2002, commercial banks in operation totaled 7,933, compared to 18,769 at the end of 1975. Of those banks, 5,841 were state chartered. In 2001 mergers and acquisitions totaled 376, compared to 475 in 2000. In addition, the number of new banks created in 2001 dropped to 149, compared to 217 in 2000.

As interstate banking restrictions gradually disappeared, the reach of large national commercial banks expanded rapidly, moving across state borders and swallowing smaller banks, which found it increasingly difficult to remain profitable in the face of competition from their more leveraged competitors. By 2002 nearly 70 percent of all commercial banking assets were controlled by the 50 largest bank holding companies, many of which operated in more than one state; only a small handful of banks were engaged over state lines in 1980. The challenge remained for state banks to prove capable of providing a range of new financial services in conjunction with their traditional operations while fending off competition from superregionals and foreign bank branches seeking to take advantage of more open financial markets to encroach on state banks' customer bases.

Despite the increasingly relaxed regulatory climate, U.S. state commercial banks are subject to a range of regulations at the state and federal level. In addition to the federal regulatory bodies that oversee national banks, each state has a system of supervisory bodies charged with the chartering and regulation of state commercial banks. These diverse structures and organizations are responsible for regulating the state's banking industry in a manner that is most appropriate for the financial, economic, and social environment of the state.

Historically, there were advantages to be found for banks in the multiplicity of rules and regulations state to state. At one time, for example, Minnesota was among the few states to allow its banks to sell insurance. Mean-

while, Texas once barred branch banking, so that any bank building had to exist as its own corporation with its own board of directors. While such differences smoothed out to a great extent, thanks to interstate banking deregulation in the 1980s and 1990s, enough perceived differences remained, in the form of tax incentives and loose restrictions, to convince many banks that it was still advantageous to be chartered by a state rather than by the federal government.

ORGANIZATION AND STRUCTURE

Commercial banks, which are organized primarily to conduct general banking business, are most often state or national banks. State banks are organized under a charter granted by the state government, while national banks are organized under charters issued by the Comptroller of the Currency of the United States. Many institutions that are chartered as trusts offer services that are generally considered commercial banking, while many banks also offer trust and savings services. These institutions and operations are also included under the commercial banking category.

The regulation of banks on the state level is delegated to a banking authority in each state. These bodies exercise primary and additional regulatory powers. There are four primary bank regulatory powers: new bank charter approval, new branch or separate facility application approval, cease and desist orders, and officer removal orders. There are also four additional state bank regulatory powers: power to fine, power to order affiliate examinations, power to order special examinations, and power to issue regulations. Such regulatory powers are exercised by either the state's primary banking authority or by the state's banking board, depending upon the structure of the state's system. Most states maintain a banking board consisting of between 5 and 17 members who are generally appointed by the governor for three to six year terms. Some states, however, regulate banking without a banking board.

The specific type of institutions that are regulated by the state banking authorities can also vary. Normally, the state authorities will regulate commercial banks, trust companies, money order companies, loan production offices, and foreign bank branches. The states may also regulate other entities, such as travelers check issuers, currency exchanges, and collection agencies. State banks may voluntarily join the Federal Reserve System, in which case they are required to adhere to the regulations that apply to all national banks, including those that apply to the purchase, sale, underwriting, and holding of investment securities and stock for national banks.

BACKGROUND AND DEVELOPMENT

Among the first institutions created by the administration of President George Washington was the Bank of

the United States. Washington's Secretary of the Treasury, Alexander Hamilton, insisted that a national bank was necessary to give the fledgling democracy stability and legitimacy. Centralized banking remained a politically divisive issue for over 70 years, as those fearful of a powerful federal government attacked the power vested in the bank. President Andrew Jackson made the Second Bank of the United States one of the primary issues in his presidential campaign of 1832, launching what is known as the Bank War, which left the nation with no central banking agency by 1834. Nearly 30 years later, the Federal Banking Act of 1863 brought banking under federal control and created a uniform bank currency controlled by a central authority for the first time in the nation's history.

The existence of a strong federal banking structure after the Civil War underlay the explosion of productive capability that characterized the United States in the late nineteenth century. Yet, while a dependable money supply aided economic expansion, it also prompted distrust of those controlling the flow of money. Important steps were taken during the administrations of Woodrow Wilson (1912 to 1920) and Franklin D. Roosevelt (1932 to 1944) to further curb the power of bankers and provide equal access to and protection from the U.S. banking system. The Federal Reserve Act of 1913 established 12 regional banking districts and made the district banks answerable to regional as well as national concerns, thus addressing the historical dominance of eastern bankers. The creation of the Federal Deposit Insurance Corporation (FDIC) in 1933 ensured Americans that their deposits were safe in accredited banks, thus calming concerns over bank instability caused by the Depression.

The U.S. banking system is thus the product of two centuries of adjustment designed to make banks serve the interests of the widest number of people operating in a capitalist economic system. Banking regulation proceeds downward from the Federal Reserve Bank through a variety of national regulations to state regulations crafted to suit the needs of particular localities. The "dual" banking system created by the actions of independent national and state regulatory agencies has allowed innovation in local banking, while ensuring continuity in banking between the states.

The stock market crash of 1987 came at a bad time for commercial banks. After investing heavily in infrastructure to make them competitive in the investment banking industry, the banks were faced with a much smaller and more competitive market in the wake of the crash. Equally troubling to the banking industry was the failure of hundreds of savings-and-loan institutions. While these institutions were insured, the administration of President Ronald Reagan left them largely unregulated, and taxpayers were left to cover the roughly \$500

million needed to repay depositors. In the aftermath of these two disasters, broad skepticism about the stability of the financial system brought the banking system under closer scrutiny. However, booming profits in the mid-1990s and a looser regulatory environment led to a blurring of the regulatory borders between various branches of the financial services world.

Throughout the 1990s banks were granted greater freedom to focus on other activities, such as investment banking. Following a series of concessions by regulatory bodies, state banks strived to court wealthier clients by delving into the surging hedge fund industry (investment strategies that in general “hedge” against market downturns), acting as management custodians, lenders, and brokers. Furthermore, commercial banks increasingly participated in the lucrative investment-banking sector, a practice forbidden commercial banks since the Great Depression. Thus the industry continued to chip away at the long-standing regulatory climate restricting the range of banks’ activities. By the end of the decade, however, bankers finally achieved the sweeping legislation they were hoping for.

As U.S. banks enjoyed record revenues, the financial industry geared for a long-awaited overhaul as a result of the Gramm-Leach-Bliley Act in November 1999. Also known as the Financial Services Modernization Act, this legislation repealed the Glass-Steagall Act, capping a 20-year effort by lobbyists. The new law allowed banks to engage in a range of activities prohibited since the Great Depression. By establishing financial holding companies, banks could establish brokerages, insurance operations, and other financial service offerings in addition to their traditional banking activities all under one institution. To establish a financial holding company, banks must meet the following criteria: they must be considered well capitalized, determined by a ratio of at least 10 percent total capital to risk-adjusted assets, as evaluated by the Federal Reserve; they must receive a satisfactory rating under the Community Reinvestment Act; and aggregate consolidated assets of all banks’ financial subsidiaries must amount to either less than \$50 billion or 45 percent of the banks’ total assets, whichever is lower.

CURRENT CONDITIONS

In 2002 there were 7,933 commercial banks in the United States, about 73 percent of which were state chartered. While asset growth had slowed in 2001 and 2002, compared to the 8.7 percent increase in 2000, it remained similar to the pace set in 1999. Return on assets for state-chartered banks grew from 1.11 percent in 2001 to 1.14 percent in 2002. However, these figures did remain below the 1.25 return on assets percentage achieved in both 1999 and 2000. But national commercial banks

realized a 1.54 percent return on assets, achieving a level higher than all three previous years. Some analysts believe that this discrepancy was due to the fact that the consolidation of the 1990s had favored the larger, more well-capitalized banking institutions, particularly national and superregional banks, which were able to achieve greater economies of scale than state and local banks.

Both national and state commercial banks in the early 2000s did see increased loan and lease losses, as the U.S. economy continued to weaken. However, these were “offset in large part by realized gains in investment account securities: these gains developed as banks’ portfolios benefited from declining short- and immediate-term market interest rates,” according to the June 2002 *Federal Reserve Bulletin*. The September 11 terrorist attacks in 2001 undermined the economy further, prompting the Federal Reserve to reduce interest rates repeatedly in 2001 and 2002. As a result, home mortgages’ interest rates dropped to near record lows, fueling a refinancing flurry, which also helped to offset losses in other areas.

In 2000, in anticipation of increased loan losses, commercial banks had upped loan loss provisions by 41 percent; when recessionary economic conditions continued into 2001, banks increased those provisions another 45 percent that year. Consequently, by 2002 loan loss provisions had reached their highest level since the early 1990s, accounting for nearly 11.5 percent of total bank revenues.

Loan and lease growth at commercial banks declined to 1.8 percent in 2001, compared to approximately 9 percent in the two preceding years. Banks also closed 6.6 percent fewer commercial and industrial loans in 2001; however, the number of commercial real estate loan closings remained fairly even with the two preceding years. Residential mortgage loans increased by 5.6 percent, and home equity loans jumped 21 percent.

AMERICA AND THE WORLD

In the late 1990s, 33 state banks maintained 188 foreign branches. Branches were the most popular mechanism by which U.S. commercial banks engaged in operations overseas. These entities maintained full access to their parent banks’ capital when making lending decisions, rather than being restricted by their host countries to their own balance sheets.

Foreign banks, while operating under what seem to be very different regulatory frameworks, nevertheless shared a number of regulatory concerns with the American banking system. These included regulation of market entry, capital and liquid adequacy, permissible business activities, foreign currency exposure, concentration of loans and country risk exposure, and bank examination.

These regulatory concerns transcended national boundaries. In contrast to the U.S. "dual" banking system, most countries regulate their banking systems exclusively on the national level. Thus there is generally no equivalent of a state commercial bank outside the United States.

Globally, patterns generally followed the U.S. trend toward relaxed regulation of financial services. Specifically, banks worldwide were being allowed to offer a broader range of financial services, contrary to past practices. The European Union's financial liberalization program was a catalyst, encouraging the liberalization of American and Japanese policies to keep pace with their European competitors. In 1999 all European Union members, with the exception of the United Kingdom, Sweden, and Denmark, officially chained their currencies to the euro, with the United Kingdom expected to jump on board within a few years, as the E.U. worked to open its market to more liquid financial flows. The Japanese financial system, meanwhile, was in the midst of sweeping reform, known as the "Big Bang," in 2000, which was expected to completely overhaul the banking system in an effort to mitigate the country's decade-long economic woes. Most significantly, the reforms would open Japanese financial markets to foreign players and, like the United States, break down restrictions against banks' engagement in other financial activities such as securities underwriting.

RESEARCH AND TECHNOLOGY

Changes in computer technology have radically altered the role of banks in American society. The most profound change was the capability of processing automated transfers of money between banks, companies, and consumers. Electronic funds transfers (EFTs) are computer-based payment systems that substitute electronic and digital transfers for movements of cash and paper checks. EFTs virtually eliminated manual paper handling in payments between institutions. Direct deposit also eliminated some of the paper transfers between institutions and individuals. The trend was toward more and more automation of payments systems.

Similarly, it was estimated that by 2002, 20 percent of all U.S. households would engage in online banking. An expected 15,850 banks would offer online services by 2003. In 2000 over 3,000 banks maintained their own Web sites. There was also an increased use of intranets for staff conference, communication, and data management. The heightened emphasis and dependence on electronic information and funds transfers was expected to lead to an explosion in bank spending on information technology security systems and software, particularly electronic encryption systems, to generate a \$7.4 billion market by the early 2000s.

More visible to the consumer were automated teller machines (ATMs), those ubiquitous computerized terminals from which consumers can access their savings, checking, or credit accounts. The ATM revolution began in 1969, when Chemical Bank in New York City installed one of the first cash dispensers in the country. Some 72,000 ATMs existed in 1990. In 1998, the number had grown to 187,000 ATMs, up 13.3 percent from 1997. ATMs allowed consumers to process account balance inquiries, make cash withdrawals and deposits, and conduct transfers between accounts.

These new technologies have made a number of significant changes to the American market place, including changes in the methods of personal finance and in the process of purchasing consumer goods and services; changes in the structure of financial and retail organizations and their methods of operation; changes in the flow of funds in the marketplace; increased potential for the invasion of personal privacy and new avenues for the occurrence of fraud and theft; and changes in the regulatory and competitive balance among financial institutions. These and other technological changes radically altered the American commercial banking industry in the 1990s and 2000s.

SIC 6029**COMMERCIAL BANKS, NOT ELSEWHERE CLASSIFIED**

This category includes commercial banks (accepting deposits) that do not operate under federal or state charter.

NAICS CODE(S)

522110 (Commercial Banking)

The 1990s have been characterized by dramatic consolidation in the commercial banking industry. The number of commercial banks fell 18 percent between 1993 and 1999, due primarily to mergers and acquisitions. In general, commercial banks are involved in financing the production, distribution, and sale of goods and services by acting as a source of short-term funds for the producer. Funds are acquired by the banks from the deposits of individuals who earn interest on these deposits. The vast majority of these institutions are either national or state banks. National banks are organized under the National Bank Act of 1863 and overseen by federal agencies. State banks are organized under similar state regulations and overseen by state banking authorities. Organizations created under these regulations charter the banks and give them access to depositors' insurance.

Industry leaders in commercial banking include: Citibank of New York; Bank of America National Association of Charlotte, North Carolina; Chase Manhattan Bank of North America; First Union National Bank of Charlotte, North Carolina; Morgan Guaranty Trust Company of New York; Bank One National Association of Chicago; Wells Fargo National Bank of Chicago; and Chemical Bank of New York.

The nation's 8,011 commercial banks maintained assets of \$5.4 trillion in 1999. In a reversal of a trend that had characterized the national commercial banking sector since the mid-1980s, the number of commercial banks losing money has escalated in the late 1990s. While 17.1 percent of banks were losing money in 1985, that figure dropped to 3.6 percent in 1995, largely reflecting the declining number of banks as smaller and less profitable firms were forced out of business or swallowed by larger competitors. In 1998, 5.8 percent of commercial banks were unprofitable, due in part to relaxed lending regulations that allowed many banks to enter into risky loans.

A small minority of commercial banks are private—neither federally nor state chartered. These banks are sometimes owned by a small group of partners who assume unlimited liability, in effect insuring the bank themselves. These banks tend to focus on global custody

and private banking, two growth sectors of banking in the 1990s.

Traditional global custodian services include paying for a security in local currency, minimizing settlement problems; collecting dividends and interest; handling safekeeping and tax reclamation; and taking care of bookkeeping for stock splits and rights issues. As this industry continues to grow at an estimated rate of 30 percent, bankers have had to develop new, high value-added services. These services include analytics, performance measurement, and full master trust reporting.

The repeal of the 1933 Glass Steagall Act with the passage of the Gramm-Leach-Bliley Act in 1999 broke down many of the restrictions on the kinds of activities banks are permitted to engage in. By allowing financial services firms to offer lending, insurance, and brokering services under one company, it was expected that customers would increasingly begin to place all their financial business with a single firm. Thus, banks will be forced to find ways to make quick and efficient inroads into other financial sectors to secure or maintain a sound customer base.

Private banking involves offering banking services to very wealthy customers. These services are generally more personalized and flexible than services offered by other types of commercial banks. Private banks usually set net worth or minimum deposit requirements that vary from \$250,000 to \$2 million.

One reason that banks in the United States are chartered is to impose discipline on the individual banks. In private banks, discipline is imposed by the need for consensus, the unlimited liability of the partners, and the limitation of capital. This structure also has the benefit of allowing the partners, who often serve for many decades, to take a long-term view of their business. Perhaps the most important of these banks is Brown Brothers Harriman, the oldest and largest private bank in the United States, founded in 1818. In 1999, it employed more than 2,000 people nationwide and had total assets of \$2.6 billion, up from \$1.95 billion in 1997.

SIC 6035**SAVINGS INSTITUTIONS, FEDERALLY CHARTERED**

This category includes savings and loan associations operating under federal charter and savings banks operating under federal charter. Both savings and loan associations and savings banks fall under the general term “thrifts.” Thrifts are financial institutions that exist primarily to hold retail deposits and make residential mortgage loans. About half of all residential mortgage debt, or dollars lent to individuals for the purpose of buying a home, is held by thrifts, though this market share has declined with the rise of mortgage bankers and the shrinking of the thrift industry. The thrift industry is the second largest type of financial institution, after commercial banks. This article deals only with federally chartered institutions; **SIC 6036: Savings Institutions, Not Federally Chartered** discusses state chartered institutions.

NAICS CODE(S)

522120 (Savings Institutions)

INDUSTRY SNAPSHOT

As of December 31, 2001, there were roughly 1,500 thrift institutions in the United States, nearly 1,000 fewer than in the early 1990s. These thrifts held roughly \$1.3 trillion in assets (compared to about \$6.9 trillion held by commercial banks) and employed about 255,000 people. Of the 1,019 thrifts regulated in 2001 by the Office of Thrift Supervision, 882 were federally chartered, and 137 were state chartered. This falling number of thrift institutions was the result of regulatory changes that allowed some thrifts to become commercial banks. It also reflected the late-1990s flurry of mergers and acquisitions, a phenomenon that altered the nation’s entire financial services world. The majority of the nation’s thrifts were insured by the Savings Association Insurance Fund (SAIF). The small percentage of thrifts not insured by the SAIF was insured by the Bank Insurance Fund (BIF).

Of the industry’s total \$1.299 trillion in assets on December 31, 2001, \$598 billion, or 46 percent, were in one to four family mortgages. This percentage marked a sharp decline from the 76 percent level for these small mortgages in the early 1990s—another reflection of the growing diversification of the financial services industry. Of thrifts’ other assets, some \$319 billion were held in securities, while \$59 billion were in multifamily residential properties, and \$38 billion were in commercial real estate loans. Although the number of institutions continued to shrink, the industry’s level of assets, deposits, and other measures exploded in the early 2000s, as falling interest rates boosted both new mortgage and refinancing levels.

ORGANIZATION AND STRUCTURE

Some federal savings and loan associations are owned through the issuance of capital stock traded on the stock exchanges, just like any other corporation. Others are mutually owned. Mutually owned savings and loans, or “mutuals,” do not issue stock and are owned by the customers of the institution. Any customer who opens an account at a mutual becomes a part owner of the institution. The type of ownership—stock or mutual—and the type of institution—S&L or savings bank—is specified in the thrift’s charter.

Federal Home Loan Bank System. The Federal Home Loan Bank (FHLB) System is to thrifts what the Federal Reserve is to banks. It provides liquidity to federally chartered savings and loans, which must join it, and to any state chartered institutions that wish to join. Members are affiliated with 1 of the 12 regional FHLBs from which they may borrow. Such borrowing is not long term; a thrift does not go into debt to a FHLB for any extended period of time, only for a short period, often overnight. To fund such borrowing, FHLBs have credit with the U.S. Treasury and issue government agency debt bonds, much the way that the Federal Reserve sells Treasury bills. The 12 regional FHLBs were managed by the Federal Home Loan Bank Board until that board’s abolition in 1989, after which they were managed by the U.S. Department of Treasury.

Regulation: The Office of Thrift Supervision. The many failures in the thrift industry, beginning in the late 1980s, brought the industry under careful scrutiny and regulation. The Office of Thrift Supervision (OTS), an agency within the U.S. Treasury Department, became the chief regulator of the thrift industry with the bailout law of 1989. Since the bailout law, thrifts are tightly regulated, mainly because the deposits of their customers are federally insured. It is to the taxpayer’s advantage that thrifts be profitable. The OTS decides if a thrift is healthy and profitable enough to do normal business. The OTS charters, regulates, and examines the operations of federally chartered savings and loans.

The OTS classifies thrifts by capital levels and profitability. There are four such classifications, each of which corresponds to a particular level of capital: Group I thrifts are healthy institutions, fully capitalized, and profitable; Group II consists of those institutions that do not quite meet the capital guidelines for Group I but are expected to; Group III thrifts have poor earnings and low capital; and Group IV consists of those thrifts whose assets will be transferred to the Resolution Trust Corporation. As of November 1992, 37 percent of all assets of the federally chartered thrift industry were held by Group I thrifts. Thirty-five percent of the industry assets were in Group II, 24 percent in Group III, and only 4 percent in Group IV. This meant that 72 percent of all assets in federally chartered thrifts were in institutions that were

considered either healthy or expected to meet the healthy capital guidelines. By December 1996, the health of the industry had improved even further. The Federal Deposit Insurance Corporation (FDIC) estimated that there were only 35 problem thrifts at that time, compared to 71 just two years earlier, and 480 at the end of 1990.

For a thrift to be in OTS Group I, it must pass the following tests. First, 1.5 percent of assets must be in tangible capital. Tangible capital is stockholder's equity minus investments in activities that were legal before the bailout law but are no longer legal for thrifts to undertake. This condition existed because the thrift industry was in a period of transition in the early 1990s, with tighter regulations being phased in to minimize losses. Second, 3 percent of assets must be in leverage capital. Leverage capital is tangible capital plus the value, as judged by the OTS, of the firm's goodwill and intangible assets. Goodwill is defined as an asset equal to the market value of another institution a thrift purchases minus the value of its liabilities. The 1989 bailout law calls for goodwill to be phased out as part of the capital that a thrift reports. Third, 7.2 percent of a thrift's risk-weighted assets must be in total capital. Risk-weighted assets are obtained by assigning a weight to each kind of asset. For example, the amount of cash and government securities is multiplied by zero, while the amount of higher-risk assets is multiplied by as much as two times the face value of the asset. Total capital includes leverage capital less items being phased out, such as nonresidential construction loans, plus an allowance for general loan loss.

In addition to these capital guidelines, during at least three-fourths of each year, thrifts must invest 65 percent of assets in certain investments. Among these acceptable investments are residential mortgages, car loans, Fannie Mae loans (Fannie Mae is a private company offering "the nation's largest source of financing for home mortgages"), home equity loans, and investment in the Resolution Trust Corporation. The idea behind this last requirement, known as the Qualified Thrift Lender Test, is that none of these acceptable investments is of the high-risk venture capital or commercial real estate variety that became popular areas for thrift investments during the years after the 1980 deregulation.

If a thrift does not comply with the above guidelines for Group I, it must submit a plan to the OTS, stating how it will meet them and comply within 60 days. If this compliance does not happen, the OTS places restrictions on the thrift, such as limiting the growth in the amount of future loans and further limits on the kinds of loans the thrift may make. The delinquent thrift also may not purchase an interest in any other company.

Other Regulators. The Federal Deposit Insurance Corporation (FDIC) is the provider of deposit insurance for

all depository institutions. The FDIC controls the Savings Association Insurance Fund and the Bank Insurance Fund. Therefore, the FDIC has an interest in assuring that thrifts stay profitable so as not to pose a threat to the insurance fund. Whereas the OTS is the chief regulator of thrifts and is concerned with overall operations, with an emphasis on the asset side of the balance sheet, the FDIC regulates deposits at thrifts and conducts investigations to the effect of securing deposits. The FDIC works closely with the Resolution Trust Corporation (RTC) in administering the affairs of failed thrifts. The RTC seizes the assets of Group IV thrifts and attempts to either sell the institutions or liquidate them and pay off depositors with federal insurance money, as provided for in the 1989 bailout law.

The thrift industry is also under the same depository regulations of the Federal Reserve System as all other depository institutions. As of 1993, all depository institutions, including thrifts, had to hold a certain amount of deposits as reserves. As of 2003, the reserve requirement was 3 percent of all savings deposits up to \$42.2 million in deposits and then 10 percent of all savings deposits above \$42.2 million. The Federal Reserve imposes this "reserve requirement" in order to insure that at least some deposits remain in the vaults of depository institutions as a hedge against bank runs.

BACKGROUND AND DEVELOPMENT

Savings and Loans Versus Savings Banks. The nineteenth-century origins of savings and loan associations and savings banks were separate. Savings and loans were first created primarily with the goal of fostering home ownership among members of the association. These "building societies" were originally designed to exist only until all members received a home loan. But inevitably, some societies continued to accept new members and exist in perpetuity. Savings banks, by contrast, were designed to encourage thrift and personal savings and from their origins were intended to be permanent institutions. Yet savings banks also found mortgage lending a sound investment of depositor funds. In this way, savings and loan associations and savings banks came to have similar functions.

The first federal charters for savings and loans were granted in 1933. Savings banks were not federally chartered until 1980. Thus, before 1980 savings and loan associations and savings banks were distinct segments of the thrift industry because all savings banks were state chartered mutuals. Savings and loans focused on residential mortgage lending, which made up more than 75 percent of their assets. Savings banks also were heavily into mortgage lending, but without federal regulation they were able to have much greater shares of assets in other kinds of consumer lending.

Historically, all savings banks were mutually owned and state chartered, thus the name “mutual savings bank.” With the Depository Institutions and Monetary Control Act of 1980, mutual savings banks could easily obtain federal charters and change their ownership to stock form. In 1982, with the Garn-St. Germain Act, federal savings banks could convert to federal savings and loans and vice versa. As the thrift industry entered the 1990s, virtually the only difference between savings and loan associations and savings banks was that the FDIC administered insurance funds; the SAIF and the BIF are kept separate to make it easier to have separate insurance premiums for the two segments of the industry.

Postwar Favoritism. After World War II, savings and loans enjoyed less deposit regulation than commercial banks because housing was a national priority. The Federal Reserve’s Regulation Q prevented commercial banks from paying more than 3 percent on deposits from 1933 to 1962. As such, savings and loans typically offered one-quarter percent higher interest than banks, easily attracting deposits. In 1966, Regulation Q was extended to place a deposit interest ceiling on thrifts as well, but in such a way that thrifts always paid one-quarter to one-half percent higher than commercial banks. The Federal Reserve would periodically make adjustments in the rate ceilings, but the Fed could not cope with the skyrocketing and erratic interest rates of the late 1970s, and an important deregulation law passed in 1980 removed all deposit interest rate ceilings from all depository institutions.

Deregulation. The Depository Institutions Deregulation and Monetary Control Act (DIDMCA) changed the regulatory environment for both banks and thrifts. It deregulated the thrift industry by allowing thrifts to acquire more nonmortgage loans, eliminating interest rate ceilings on both loans and deposits, and eliminating some geographical lending restrictions on thrifts. Prior to this act, federally chartered savings and loans could only make non-mortgage consumer loans if they were for home improvement, mobile homes, education, or if the loans were secured by deposits. DIDMCA allowed savings and loans to make a broad range of consumer loans, just like state chartered savings banks. DIDMCA also allowed savings banks to get federal charters and to convert ownership to stock form, and opened the Federal Reserve’s discount window to all depository institutions, both federally and state chartered, banks and thrifts. This act allowed federally chartered savings banks and savings and loans to switch charters from one to the other and gave both segments of the thrift industry power to make commercial loans. Thrifts responded by trying to become more full-service financial institutions, making commercial real estate loans, buying commercial paper, and making direct commercial loans. It was the mismanagement of many individual thrifts trying to become more like

commercial banks that led to the rash of thrift failures later in the 1980s.

Crisis and Bailout. From 1986 through the early 1990s, hundreds of thrift institutions became insolvent. A comparison of asset holdings of solvent and insolvent thrifts as of December 31, 1987, showed that insolvent thrifts differed from solvent ones in several aspects of asset structure: lower percentage of residential mortgages (31.3 versus 46.3), higher percentage of commercial real estate (14.5 versus 9.9), higher percentage of repossessed real estate (9.9 versus 1.3), and lower levels of cash and government securities (11.5 versus 13.3). Simply put, many thrifts, when presented with their new lending powers under deregulation, experienced poor judgment and made many bad loans.

The regulators of thrifts made the problem worse. The Federal Home Loan Bank Board (FHLBB) was established in 1932 as the chief regulator of thrifts. The FHLBB oversaw the Federal Savings and Loan Insurance Corporation (FSLIC), which insured thrift deposits up to \$100,000 per account. The insurance money for the FSLIC came from premiums paid by member thrifts. But unlike other regulators, the FHLBB was more of an advocate for its members and as such kept the premium very low. So the FSLIC was underfunded, and by the end of 1987, so many thrifts had failed that the FSLIC itself became insolvent. Also, throughout the 1980s the FHLBB allowed the FSLIC to practice creative accounting to hide the depth of member problems. The FHLBB was so under the influence of the industry itself that a whole new regulatory environment was needed.

“The Bailout Law.” The Financial Institutions Reform, Recovery, and Enforcement (FIRRE) Act of 1989 eliminated the FHLBB, an independent agency, and replaced it with the OTS, which would be under direct control of the U.S. Treasury Department. Meanwhile, FIRRE took the insurance fund out of the hands of regulators and put it under the control of the FDIC, in the form of the Savings Association Insurance Fund. The FDIC was considered more sound and to have stricter examination standards than the insolvent FSLIC. FIRRE also strengthened capital-to-asset ratio requirements and phased out forms of intangible assets from the counted capital levels. The act also established the Resolution Trust Corporation to oversee and administer the sale or liquidation of failed thrifts.

Bad loans continued to haunt the thrift industry in the early 1990s, as nearly 2 percent of loans were delinquent in the first quarter of 1992. Twelve percent of construction and land loans were delinquent at this time, demonstrating why such loans were discouraged in the new regulation following the 1989 bailout law. In accordance with the OTS capital guidelines, and as a result of closing troubled thrifts, the industry-wide level of tangible capi-

tal as a percentage of total assets rose through the early 1990s from 3.5 percent in March 1990 to 5.2 percent in March 1992.

Recovery and Profits. Despite the continuance of some bad loans, profits in the thrift industry steadily climbed in the early 1990s. Losses from 1987 to 1990 totaled \$30 billion, but by 1992 profits were up to \$5.14 billion, one of the industry's best years ever. Profits were aided in the early 1990s by the widest interest rate spreads in decades, that is, a wide gap between the rates charged on loans and paid to depositors. In part, the wide spread at thrifts was a reaction to some of the widest gaps ever between the 30-year Treasury bill and the short-term Treasury bills, or T-bills. Long-term T-bill rates are usually higher than short-term rates, but this gap was exceptionally large through the early 1990s. The gap grew from 2.91 percent in March 1991, to 3.33 percent by December 1992.

Also, the wide spreads at thrifts resulted from the Federal Reserve's easing of interest rates in response to a sluggish economy. Thrift profits tend to be higher when interest rates are low. Mortgages are long-term commitments, while deposits are relatively short-term. Therefore, when interest rates rise, thrifts lose profits, with rates to depositors rising, while revenue from fixed-rate mortgages stays level. The high interest rates of the late 1970s were responsible for thrift failures at that time, encouraging the deregulation in the early 1980s, which ultimately and ironically led to the failures of the late 1980s.

Falling rates, likewise, reduce costs of thrift liabilities to depositors, while mortgage revenues fall more slowly, increasing profits. Lower interest rates in the early and mid-1990s made the industry's recovery during this period much easier.

Profits were also aided by a decline in the amount of troubled assets. The ratio of noncurrent assets plus real estate owned to all assets fell from 3.98 percent at the end of 1990 to 1.1 percent at the end of 1996. Moreover, the number of failed or assisted institutions fell to one during 1996 from 223 in 1990. These healthy declines can be attributed to several factors. First, falling mortgage rates combined with an economy no longer in as deep a recession helped consumers pay their mortgages on time. Second, the real estate market in general was improving in the early 1990s; the major slowdown in home sales experienced in 1989 and 1990 was over. Finally, the strict regulation following the 1989 bailout law found many thrifts writing down their bad assets. Many of these write-downs were in commercial and out-of-state loans, the worst sources of thrift troubles in the late 1980s.

Profits were boosted by higher capital-to-asset ratios as well. The ratio of leverage capital to total assets industry-wide grew from 4.06 percent in March 1990 to 7.77 percent at the end of 1996. Thus strengthened net

worth base allowed more thrifts to engage in profitable "equity financing" (funding new loans without taking on any new liabilities in the form of deposits). Equity financing is pure profit, and the amount of equity financing increases with the capital-to-asset ratio.

Types of Loans. There are two kinds of loans that thrifts offer: fixed-rate loans and adjustable-rate mortgages (ARMs). About 30 percent of the thrift industry offers mainly fixed-rate loans, most of which are the traditional 30-year mortgage, though some other time periods are available. About 30 percent of thrifts offer both kinds of loans, and 40 percent of the industry offers mainly ARMs. Many thrifts prefer to offer ARMs because they pose less risk to the institution by not locking into a low rate. ARMs are adjusted either monthly or yearly and may be tied to either the Office of Thrift Supervision's cost-of-funds index for monthly adjustments or to the rate of the one-year Treasury bills for annual adjustments.

The relative preference of consumers for fixed-rate mortgages or ARMs depends, of course, on the prevalent level of interest rates. At low rates, such as in the early 1990s, consumers want to lock in to a low fixed rate, while at high rates, ARMs will be more popular in hopes that rates will fall. Yet the willingness of thrifts to offer one versus the other is the exact opposite; thrifts prefer ARMs when interest rates are low, so that revenues from loans will rise with interest rates. ARMs first became legal for thrifts to use in 1981. Thrifts began to lobby for ARMs in the late 1970s, spurred by the pioneering usage of ARMs in the mid-1970s by some California state chartered institutions.

There are few differences between thrift institutions with respect to what their products look like. The only differences are in the kind of loan or in the interest rates offered for loans or savings and checking accounts. The large number of firms in the industry tends to keep interest rates, both on assets and liabilities, pretty close from one savings institution to another. After all, with so many institutions and so little difference in the kinds of product, thrifts will be very careful to keep their interest rates competitive.

Refinancing. One phenomenon thrifts faced in the early 1990s was refinancing of mortgages. Falling mortgage rates allowed many consumers to lock in to lower fixed rates. The average rate on a 30-year mortgage fell from 10.2 percent in 1990 to 7.5 percent by 1993, a 20-year low. Refinancing lower thrifts' profits in the long term because of the lower fixed rates, but in the short term they contribute to profits, as they did in the early 1990s. Refinancing brings in new business. Refinancing also brings in up-front fees, such as application fees and points.

Charter Flips. The 1982 Garn-St. Germain Act allowed thrifts to change over from savings and loans to savings

banks and vice versa. The number of such charter flips, plus changes from a federal to a state charter, went from zero in 1989 to 29 in 1990, 54 in 1991, and 114 in 1992. Some of these institutions were seeking a name change to avoid the stigma of being called a savings and loan. Others were sought to continue pursuing the commercial banking activities discouraged of thrifts under the 1989 bailout law. State chartered thrifts are exempt from OTS rules regarding capital-to-asset ratios and also need not pass the Qualified Thrift Lender Test, which forces federal thrifts to keep 65 percent of assets in housing-related areas. It is not clear that charter flips are always advantageous, as the downside includes loss of access to the Federal Home Loan Bank system, as well as the administrative costs of the flip.

Takeovers by Banks. A residual phenomenon of the thrift bailout in the early 1990s was the great extent to which the commercial banking and thrift industries were merging through the acquisition of thrifts by banks. The FDIC Improvement Act of 1991 made thrift acquisition easier for banks, and banks were enjoying record high stock prices in the early 1990s. Banks tend to have a stronger balance sheet than thrifts, and bankers already have the skills needed to manage a thrift.

During the mid- to late 1990s, many businesses aggressively pursued the financial services market. Such businesses used the federal thrift charter as a loophole to offer virtually unregulated financial services all over the United States. Such services included trust funds, deposit service, loans, and almost everything that a bank could offer, with the exception of corporate banking and bond trading. Under the federal charter, thrifts were able to offer nearly the same services as commercial banks, but with less regulation.

In 1998 OTS approved 43 charters, and more than 33 percent of these were given to companies not in the banking business, such as State Farm Mutual Automobile Insurance Company. In 1999, OTS was faced with applications for charter from more nonbank companies, such as Ford Motor Company and the Farm Bureau. While an OTS director (Ellen S. Seidman) claimed in *Business Week* (22 March 1999) that the OTS used discretion in granting charters to applicants, industry banking commissioner Catherine A. Ghiglieri of Texas called the trend a “recipe for disaster” and stated that “you have traditional bank products being sold through non-traditional means by people who haven’t been in the business before.”

Although Congressional reform could make it more difficult for nonbanks to obtain thrift charter status, such reform had been unsuccessfully attempted since the 1970s, according to an article in *Business Week* (7 December 1998). In 1998, the House Banking Committee Chairman

(James A. Leach, R-Iowa) led unsuccessful reform to completely eliminate savings and loans. In 1999, Leach concentrated on initiatives that would slow or block nonbanks from purchasing new thrifts. But the new players in the thrift arena made sure that they did not face the same fate of Savings and Loans in the 1980s. The new thrifts focused on loan origination only, followed by a sale of the loan to investors to reduce the risk of holding bad assets.

CURRENT CONDITIONS

The sluggish economy of the early 2000s boosted the number of troubled loans as a percentage of total assets at thrifts; however, this figure remained at less than 1 percent as of early 2002. In fact, as the economy weakened, and interest rates fell, thrifts saw their return on assets grow. In 2001, return on assets reached 1.07 percent, their highest level since the mid-1950s. The thrift industry saw total net income grow 27 percent to an unprecedented high of \$10.2 billion in 2001. According to James E. Gilleran, director of the Office of Thrift Supervision (OTS), in a 2001 OTS press release, this growth was attributable to both “the low interest rate environment and strong earnings from record levels of mortgage refinancing.” With one to four family mortgages accounting for nearly half of the industry’s assets, the reduced interest rates that fueled both new home mortgages and existing mortgage refinancing also bolstered growth among thrifts.

The faltering economy also worked to help reduce the growing number of unprofitable thrifts. Between 1997 and 2000, the percentage of unprofitable thrifts had grown from 4.1 percent to 8.56 percent; however, in 2001 this figure dropped to 8.22 percent. The assets at problem institutions also fell from \$7 billion to \$4 billion.

Despite controversy surrounding efforts by nonfinancial companies to secure thrift charters, these firms continued to apply for thrift charters in the late 1990s and early 2000s. Between 1997 and 2001, insurance companies accounted for 53 percent of all nonbank institutions applying for thrift charters. Securities brokers accounted for 18 percent. The total number of new thrift charters peaked in 1998 at 89 and fell to 17 by 2001.

INDUSTRY LEADERS

In the early 2000s, the thrift industry’s largest player, in terms of both assets and revenues, was Washington Mutual, with \$275 billion in assets and \$17.6 billion in revenues. After acquiring two California thrifts, American Savings Bank and Great Western Bank, Washington Mutual had spent \$30 million in 1998 to launch an advertising campaign that portrayed it as a “big bank with a small town feel” and emphasized personal service. The thrift continued to grow in 2001, purchasing another thrift, Dime Bancorp Inc., for \$5.1 billion and the specialty lending assets of Homeside Lending Inc. for \$1.9 billion.

In a distant second place, Golden West Financial secured revenues of \$4.4 billion in 2001 and assets totaled \$59 billion. Golden State Bancorp Inc., the third largest industry player, posted 2001 revenues of \$4.3 billion and assets of \$54 billion. With revenues of \$2.8 billion and assets of \$37.7 billion, Charter One Financial held the fourth-place position in the early 2000s. In fifth place, Sovereign Bancorp Inc. reported revenues of \$2.6 billion and assets of \$36.8 billion.

WORKFORCE

The Insurance Information Institute, based in New York City, estimated that 255,800 people were employed in savings institutions in the United States in 2001. According to the Bureau of Labor Statistics (BLS), trends in the industry, such as the advent of interstate banking, would impact the workforce in this industry. The need for tellers, for example, was expected to decline through 2010, but rapid turnover would continue to provide job openings in this position because little education is required, and the pay is relatively low. The BLS suggests that interstate banking would diminish the total number of banks but change the job responsibilities in a new type of financial institution that is larger than its counterpart of the past. BLS predicted that the financial industry would cut costs in order to more effectively offer an expanded network of interstate services. Among changes that impact the workforce were the following: the hiring of part-time rather than full-time tellers and the use of customer service representatives who could also perform teller duties and who were housed in all-service locations, such as bank branches in grocery stores. Such a workforce would need to perform more tasks, so thrifts started to train employees using computerized tutorials on the job, right at the thrift branch itself, rather than send employees to a traditional training center.

AMERICA AND THE WORLD

Most industrial countries have financial institutions to provide mortgages and house personal savings similar to the thrift institutions in the United States. Because the thrift institution is segmented locally, with no institutions owning branches outside the state where headquartered until 1992, most business done by thrifts is local. Since thrifts serve a domestic market, serving the local needs of individual savers and borrowers, thrifts do not have the international business that many commercial banks and brokerage houses have. Thrifts do not have to compete in world markets, as do some commercial financial institutions. The major impact of international finance on thrifts is that of interest rates, because the interest rates that affect thrift profitability are highly influenced by world markets. But thrifts are no different in this respect than any financial institution.

RESEARCH AND TECHNOLOGY

As thrifts entered the 1990s, technology played an increasing role in how they did business. Thrifts were becoming more sales oriented in the wake of the bailout crisis, moving away from higher-risk ventures and back to consumer-oriented banking; for this reason, customer relations became a prime area for the application of technology. Thrifts used a variety of media to improve their services, both salesperson-activated and customer-activated. Salespeople could use the latest software to access all kinds of information on the thrift's rates and products. As time constraints on consumers increased, thrifts responded by having loan representatives use automated credit scoring, allowing consumer loans to be approved by telephone in minutes.

Thrifts also introduced technology to reduce risks when making loans. Thrifts hoped to use artificial intelligence systems to assist in various decision-making processes, such as loan applications and deciding which financial services to offer.

ATMs, voice/audio response systems, and "smart cards" became widespread during the 1990s. Smart cards accessed accounts like ATMs, contained a microchip with information about the customer's accounts and could be used as a debit card. In 1990 Connecticut-based People's Bank became the first financial institution to offer a three-way card combining a credit card, telephone calling card, and debit card. By networking the computer systems at a bank and a telephone company, such a card could be used by the consumer to interact with hardware systems at both companies. The consumer could also access interactive video technology to use the thrift as a financial supermarket, getting visual information about different rates, loans, and investment products before speaking with a customer service representative. With the completion of the electronic superhighway, consumers would be able to do this at home for thrifts all across the country, reducing the local saturation of some thrifts.

As the amount of free time available to Americans declined, thrifts responded to the demand for faster service through electronic banking, phone banking, and direct deposit. In addition to a hope of improved service, thrifts looked ahead to cutting costs by using smaller, better-trained staffs supported by high-tech automation. By the late 1990s, other means to cut costs using technology included creating bank branches consisting of ATMs and kiosks. Kiosks added a new dimension to an ATM transaction; the kiosk allowed the bank customer to communicate with bank personnel via remote and interactive video.

SIC 6036

SAVINGS INSTITUTIONS, NOT FEDERALLY CHARTERED

This category includes savings and loan associations operating under state charters and savings banks operating under state charters. Both savings and loan associations and savings banks fall under the general term "thrifts." Thrifts are financial institutions that exist primarily to hold retail deposits and make residential mortgage loans. The thrift industry is the second largest type of financial institution, after commercial banks. Thrifts can be either federally chartered and regulated by the Treasury Department's Office of Thrift Supervision or state-chartered and subject to regulation varying by state. This article discusses state-chartered thrifts and is intended as a supplement to **SIC 6035: Savings Institutions, Federally Chartered**. Much information pertinent to both federally and state chartered institutions is included in that article.

NAICS CODE(S)

522120 (Savings Institutions)

INDUSTRY SNAPSHOT

As of December 31, 2001, there were approximately 1,500 thrift institutions in the United States, compared to nearly 2,800 in 1990. These thrifts held more than \$1.3 trillion in assets compared to about \$6.9 trillion held by commercial banks) and operated from some 12,368 branches. In 2001, Of the 1,019 thrifts regulated by the Office of Thrift Supervision, 882 were federally chartered and 137 were state chartered.

The declining number of thrifts reflects regulatory changes that have prompted some thrifts to become com-

mercial banks. This trend is also the result of a wave of mergers and acquisitions in the late 1990s that transformed the nation's entire financial services world. Most U.S. thrifts are insured by the Savings Association Insurance Fund (SAIF); those not insured by the SAIF are insured by the Bank Insurance Fund (BIF).

One to four family mortgages accounted for 46 percent, or \$598 billion, of the industry's \$1.3 trillion in total assets at the end of 2001. This reflected a marked decrease from the 76 percent these small mortgages accounted for in the early 1990s. The drop was due to the growing diversification of the financial services industry. Securities accounted for some \$319 billion in assets; multifamily residential properties, \$59 billion; and commercial real estate loans, \$38 billion. Despite the waning number of thrift institutions, the industry's level of assets, deposits, and profits exploded in the early 2000s, mainly because falling interest rates sparked record levels of mortgage origination and refinancing loans.

ORGANIZATION AND STRUCTURE

Thrifts can be classified in three ways: by type of ownership (stock or mutual), by type of institution (savings and loan association or savings bank), and by type of charter (state or federal). The type of ownership and institution is specified in each thrift's charter, and distinctions between the different types of ownership and institutions are discussed in **SIC 6035: Savings Institutions, Federally Chartered**. The distinctions between the organization and structure of state-chartered versus federal-chartered thrifts are discussed below.

Depository Insurance. All thrifts, both federal and state, have federal depository insurance. Savings and loan associations are insured by the Savings Association Insurance Fund (SAIF), and savings banks are insured by the Bank Insurance Fund (BIF). Both of these funds are administered by the Federal Deposit Insurance Corporation (FDIC), an independent federal agency, which originally was formed to provide depository insurance for commercial banks but assumed the role of insurance provider for thrifts with the passage of the 1989 bailout law. Savings banks have always been insured by the FDIC; savings and loans were insured by the now defunct Federal Savings and Loan Insurance Corporation (FSLIC) until 1989. The two funds are kept separate to justify higher insurance premiums at the SAIF, though there have been ongoing discussions in Congress regarding their merger, which was proposed to take place in 1999. A more thorough discussion of depository insurance is found in article **SIC 6035: Savings Institutions, Federally Chartered**.

In all states, federal deposit insurance coverage is a necessary condition to obtain and keep a state charter. Those state institutions that opt for federal insurance

must comply with any rules of the particular insurance fund but are not subject to most federal regulatory rules in general, with some important exceptions as explained below. That all state-chartered thrifts had federal insurance, a situation that has existed since the 1980s, did not occur by law. Rather by the 1980s most individual state-sponsored insurance funds had failed.

State Regulation. States can regulate many aspects of state-chartered thrifts. For example, California and Texas have each a separate agency that regulates thrifts. In other states, such as New York, thrifts and commercial banks are regulated by the same agency. Historically, states could regulate the kinds of assets thrifts may acquire; however, the Financial Institutions Reform, Recovery, and Enforcement Act (FIRREA) of 1989 forced state regulation to conform more closely with federal requirements pertaining to asset acquisitions.

States can regulate locations of thrift branches, whether thrifts may have branches in other states, and whether branches may exist for out-of-state thrifts. When a state-chartered thrift becomes insolvent, the state may appoint a conservator or receiver to handle the thrift's assets, though disposition of assets may also be carried out by the Federal Resolution Trust Corporation. (See **SIC 6035: Savings Institutions, Federally Chartered.**)

Since the passage of FIRREA, state-chartered thrifts must meet net worth and capital-to-asset ratio standards identical to federally chartered thrifts. Before the 1989 act, state thrifts did not have to meet any federal standards beyond the few imposed by the FSLIC for those thrifts that chose to obtain deposit insurance there. But some leeway still exists for state-chartered thrifts, as those that do meet the net worth standards are free to invest deposits in assets that federal thrifts may not or in certain assets to a greater extent than federal thrifts are allowed. However, the FDIC has the right to veto any asset acquisition of state thrifts if it determines that the asset may pose too much risk for the insurance fund. After FIRREA went into effect, there were fewer distinctions between the types of ventures that are permissible for state versus federal thrifts.

Office of Thrift Supervision. The Office of Thrift (OTS) System, and its predecessor agency, the Federal Home Loan Bank System, is to thrifts what the Federal Reserve is to banks. OTS provides liquidity to federally chartered savings and loans, which must join it, and to any state-chartered institutions that wish to join.

Reserve Requirement. State-chartered thrifts are also under the same depository regulations of the Federal Reserve System as all other depository institutions (both state and federal and including thrifts) and must hold a certain amount of deposits as reserves. As of 1998 the reserve requirement is 3 percent of all savings deposits up

to \$47.8 million and then 10 percent of all savings deposits above \$47.8 million. The Federal Reserve imposes this "reserve requirement" as a hedge against bank runs.

BACKGROUND AND DEVELOPMENT

Savings and Loans Versus Savings Banks. Both savings and loan associations and savings banks have their origins in the nineteenth century. Savings and loans were first created primarily with the goal of fostering home ownership among members of the association. Savings banks, by contrast, were designed to encourage thrift and personal savings but also found mortgage lending to be a sound investment of depositor funds. In this way, savings and loan associations and savings banks came to have similar functions, and their differences in the twentieth century stemmed from variances in regulation and chartering.

Regulation. Chartering and regulation of savings and loans by individual states was all that existed until the creation of the Federal Home Loan Bank System in 1932. From this time, savings and loans could obtain a federal charter and could have either stock or mutual ownership, but savings banks were only state chartered and mutually owned until 1980. After 1932 state savings and loans willing to pay the premiums could receive federal insurance from the Federal Savings and Loan Insurance Corporation (FSLIC). Aside from FSLIC standards, these state thrifts were exempt from federal regulations. Since state-chartered savings and loans historically held a smaller portion of the industry's assets than federal ones, dual regulation sometimes served as a testing ground for new concepts. Because particular states in the 1970s allowed adjustable rate mortgages (ARMs), notably California and Wisconsin, ARMs became popular enough to convince Congress to allow federal thrifts to offer them. State regulations were for the most part little different from federal ones, perhaps slightly more liberal, until federal deregulation in the early 1980s provided inspiration for many states to allow massive experimentation by thrifts with minimal regulation.

Deregulation. The Depository Institutions Deregulation and Monetary Control Act (DIDMCA) of 1980 and the Garn-St. Germain Act of 1982 deregulated federally chartered thrifts. However, these acts had a profound effect on state-chartered thrifts as well. Because federal thrifts were then able to pay higher deposit rates and could invest those deposits in a much wider variety of consumer and commercial loans, state governments had the incentive to deregulate their own thrift industries. In an effort to allow their state-chartered thrifts to remain competitive with the newly deregulated federal thrifts, several states made regulations much more lenient than even the newly eased federal regulations, with Texas and California leading in leniency followed by Florida and

Arizona. In California, the state with the largest number of state-chartered thrifts, the Nolan Bill became law at the beginning of 1983, which allowed almost anyone to own a savings and loan, with unlimited deposits and no rules pertaining to how those deposits may be invested. All of these deposits, for a very small premium, were insured by the FSLIC. Other states passed laws almost as lenient.

It would be an oversimplification to say that deregulation caused savings institutions to fail. Deregulation was a response to the inflation-induced insolvencies of the 1970s, and in the early years of the 1980s, it appeared as if deregulation was helping the industry recover from the previous decade's slump. Yet the facts show that failures of thrifts were more widespread at the state level than at the federal in the mid-1980s, so it can be said that the industry, especially at the state level, grew too fast, accumulating vast quantities of federally insured deposits, which were badly invested without regulation. Deregulation caused a huge increase in new thrift start-ups, mostly at the state level. From 1982 through 1986, some 139 new state charters were granted with only 67 new federal charters. Compared to the new federal thrifts, the new state thrifts had a higher variance of returns on assets, riskier asset portfolios, and were more likely to pay higher than competitive rates on deposits in order to grow more quickly.

Shrinkage of the State-Chartered Segment. From 1980 to 1986 state-chartered savings and loans declined from 50 percent of all savings and loans to 46 percent and then down to only 42 percent by 1989. The share of all savings and loan assets held by state-chartered institutions from 1980 to 1986 fell from 44 percent to 36 percent and then down to only 26 percent by 1989, the level it continued roughly to hold in the mid-1990s. Most of this shift away from state to federal charters happened in the last part of the 1980s because of the realization in the mid-1980s that state-chartered thrifts were more likely to be insolvent. The FIRREA of 1989 reduced the advantages of holding a state charter, leading to more charter flips in the 1990s. Savings banks could not obtain federal charters until 1980, and since the crisis of failures and insurance insolvency did not affect savings banks as harshly, only a handful of savings banks made the switch. Tax law changes in 1996 made it more cost effective for commercial banks to acquire thrifts, and in 1997, a record 77 savings institutions were acquired.

Both state and federal thrifts began recovering in the early 1990s. Lower interest rates and loan refinancing had positive effects on both state and federal thrifts. These issues are all discussed in the **Current Conditions** section of **SIC 6035: Savings Institutions, Federally Chartered**. At the turn of the twenty-first century there were over 7,000 state-chartered banks with at least 70 percent having assets under \$100 million. As of the

early 2000s most state banks were still small community banks.

Charter Flipping. The rapid switching of state thrifts to federal charters in the mid-1980s resulted from the extra problems of state thrifts. Yet by the early 1990s, some federal thrifts were healthy enough to make the opposite switch. These thrifts tended to be among the healthier and better-capitalized institutions. These healthier thrifts found it possible and advantageous to pursue the few regulatory perks of a state charter that still existed post-FIRREA. Having met the federal capital-to-assets requirements, these institutions found it advantageous to switch to state charters so that they could invest in a broader variety of assets. By the late 1990s Congress was considering legislation to deregulate the governance of financial services that may be offered by all depository institutions in the areas of securities, insurance, real estate, and similar nonbanking services. President Clinton signed the Gramm-Leach-Bliley Act into law on November 12, 1999. The act was predicted to accelerate combinations among banks, brokerages, and insurance companies.

During the mid- to late 1990s many thrifts converted their charters to commercial bank charters. Between 1990 and 1997, some 135 thrifts made this change. This number is astoundingly high considering that only eight thrifts made this change during all of the 1980s, largely due to favorable tax legislation enacted in August of 1996. Also in 1996 there was legislation easing restrictions that allowed commercial banks to qualify for a thrift charter if they wished. This legislation included increasing the amount of credit card loans and student loans a thrift could hold. From 1996 to 1998, some 14 commercial banks converted to savings institutions.

By 2000, there were also an increasing number of community banks, both commercial and thrift. While the total number of community banks in the United States was decreasing due to consolidation, new community banks were proliferating. Independent Community Bankers of America reported in 1999 that the highest number of new or "de novo" community banks formed in nearly a decade, with 205 new charters reported during the year. The last record was in 1989 when 192 new banks were formed.

CURRENT CONDITIONS

Since the mid-1980s, the state-chartered portion of the thrift industry has been characterized by a greater rate of insolvencies. Because they were governed by fewer regulatory safeguards than federal thrifts, state thrifts were able to make risky investments with depositors' funds. Throughout the 1990s and early 2000s, the industry saw increasing defection to federal charters among savings and loans, with similar but less widespread char-

ter flipping among savings banks. Between 1990 and 2001, the number of OTS-regulated state-chartered thrifts declined from 850 to 137. The total assets of these state-chartered thrifts declined from \$173.3 billion to \$24.6 billion over the same period.

In the early 2000s, a weak economy boosted the number of troubled loans as a percentage of total assets at both federally-chartered and state-chartered thrifts; however, this figure was below 1 percent as of early 2002. In fact, as the recession deepened, interest rates plunged, and return on assets for thrifts began to climb, reaching 1.07 percent, their highest level since the mid-1950s, in 2001. Net income for the industry as a whole grew 27 percent to a record \$10.2 billion in 2001 as lower interest rates fueled record mortgage refinancing levels, as well as increased new mortgage loan originations. Because one to four family mortgages accounted for 50 percent of the thrift industry's assets, the rock bottom interest rates that bolstered both new home mortgages and existing mortgage refinancing also fueled growth for thrifts.

Despite controversy surrounding efforts by nonfinancial companies to secure thrift charters, these firms continued to apply for thrift charters in the late 1990s and early 2000s. Between 1997 and 2001, insurance companies accounted for 53 percent of all nonbank institutions applying for thrift charters. Securities brokers accounted for 18 percent. The total number of new thrift charters peaked in 1998 at 89 and fell to 17 by 2001.

CREDIT UNIONS, FEDERALLY CHARTERED

This industry classification includes cooperative thrift and loan associations (accepting deposits) organized under Federal charter to finance credit needs of their members.

NAICS CODE(S)

522130 (Credit Unions)

INDUSTRY SNAPSHOT

Credit unions spent the late 1990s and early 2000s diversifying their range of services in order to attract new members and maintain current ones amid intensifying competition from commercial banks. By the start of the twenty-first century, the 1999 repeal of the Depression-era Glass-Steagall Act had fostered the development of "financial supermarkets," as banks expanded into and merged with insurance operations and securities brokerages. Because customers in the early 2000s were increasingly conducting most or all of their financial business with a single firm, credit unions faced the complicated pressure of promoting their unique benefits while simultaneously assuming more characteristics of commercial banks.

A credit union is a collective, cooperative financial institution created and owned by its members for their own benefit. Credit unions collect members' savings and make loans to members from these accumulated savings. Unlike commercial banks, credit unions are non-profit organizations. The formation of credit unions was encouraged by a broad cooperative movement in the early years of the industrial revolution that focused on providing affordable financial services to people of modest means.

Membership in a credit union is limited to individuals or groups who are members of the organization (employer, association, residence, etc.) specified in its charter. These membership criteria are collectively known as the common bond provisions. Individuals qualified under these provisions may submit an application and, if approved, become members with voting rights similar to those of shareholders in public corporations. In 2001, about 79 million members belonged to 10,000 credit unions nationwide. Assets that year grew 14 percent to reach \$501.4 billion.

The system of credit unions in the United States is quite extensive. In 2001, some 6,118 credit unions were chartered under federal law, with membership ranks totaling 43.8 million and assets of \$270.1 billion. State-chartered credit unions totaled 3,866 with 35.5 million members and \$231.2 billion in assets.

ORGANIZATION AND STRUCTURE

Credit unions are organized according to a general philosophy called the Rochdalian Principles. This doctrine emphasizes self-help, a mutual form of organization, and “one-man, one-vote” democratic rule.

The credit union industry is supported by the Credit Union National Association (CUNA), the professional society for credit union executives, which collects, processes, and disseminates information on credit unions and engages in advocacy and publicity for the industry as a whole.

A number of bodies are charged with ensuring the financial soundness of the nation’s credit unions, including at least one state regulator and an array of local regulators in each state. The National Credit Union Administration (NCUA), created in 1970, oversees the system of federally chartered credit unions. It has six major functions:

- to promote self-help security through privately owned and democratically controlled federal credit unions
- to stimulate systematic savings to provide capital and cash reserves for credit union members
- to make credit available to individuals with modest means for reasonable purposes
- to help stabilize the U.S. economy by promoting sound thrift, savings, and personal financial management practices
- to study the financial problems of individuals with modest means to determine the benefits of cooperative savings and loans and to publish the results
- to insure the accounts of members of all federally chartered credit unions and those of state credit unions that apply for insurance and are qualified.

These goals are achieved through four primary means: chartering, supervising, and examining credit unions, as well as providing an insurance system for federal and state use.

Credit unions encourage savings on the part of their members. The board of the credit union then creates guidelines for loaning these accumulated savings back to the credit union’s members. These board members are elected by the credit union’s members at an annual meeting that is similar to a shareholders meeting. Each member has one vote regardless of the number of shares owned. This board then elects the credit union’s officers

from its own membership and also appoints a supervisory committee. The board, officers, and supervisory committee usually serve on a volunteer basis.

Any net earnings realized are distributed to the members in the form of dividends. In 1996 more than \$8 billion was paid in dividends by federal credit unions nationwide. The average annual rate was 3.5 percent.

BACKGROUND AND DEVELOPMENT

Credit unions first began operating in Germany in 1848 and were promoted by Hermann Schulze-Delitzsche and Friedrich Wilhelm Raiffeisen. The idea spread to Italy and then to North America by 1900. Credit unions were first popularized in the United States in Boston by a local merchant named Edward E. Filene.

The Federal Credit Union Act of 1934 established federally chartered credit unions in the United States. Initially, the administration of the act was the responsibility of the Farm Credit Administration. In 1942 Executive Order 9148 transferred the administration of the act to the Federal Deposit Insurance Corporation (FDIC). In 1948 Congress gave all responsibilities for credit unions to the Bureau of Federal Credit Unions, which was part of the Federal Security Agency. This bureau became a department of the Social Security Administration. Finally, the oversight of credit unions was charged to a new independent agency of the executive branch, the National Credit Union Administration (NCUA), in March 1970, just as the number of credit unions peaked at 23,900 nationwide.

In 1980 the Depository Institutions Deregulation and Monetary Control Act brought all depository institutions under the control of the Board of Governors of the Federal Reserve System. This act created the Depository Institutions Deregulation Committee (DIDC), which included the chairman of the NCUA Board as one of its members. The mission of the DIDC was the elimination of limitations on dividend rates and interest paid by deposit institutions.

The Monetary Control Act of 1980 allowed depository institutions to offer negotiable order withdrawal (NOW) accounts for individuals and certain non-profit organizations. Credit unions were authorized to charge a maximum of 15 percent annually on loans, and the NCUA was authorized to increase this rate for a period not to exceed 18 months. Federally insured credit unions were authorized to offer share draft accounts. Federal deposit insurance was raised to \$100,000 per account for all depository institutions.

Through the 1980s, the Interstate Banking and Branching Act and other moves toward deregulation led to large-scale encroachment of commercial banks on credit unions’ business. Credit unions responded by consolidating in order to pool resources and offer more ser-

vices. The median U.S. credit union's membership grew by 45 percent in the 1990s, while asset-holdings increased 105 percent. The number of credit unions with less than \$5 million in assets, meanwhile, fell 53 percent in the 1990s, as those with over \$200 million in assets increased by 93 percent.

While credit unions fended off intensifying competition from commercial banks, the expansion of the variety of services credit unions offered mirrored their expanding size. The 285 credit-union mergers in 1999 represented an increase of 33 percent from 1998; most of those credit unions absorbed maintained less than \$5 million in assets. The NCUA further reported that 1999 also delivered near-record low numbers of liquidations (15) and failures (23), of which the majority also involved credit unions with under \$5 million in assets.

Many credit unions, meanwhile, had opened several branches and began offering automated teller machines (ATM) and other sophisticated customer services. According to the NCUA, 45 percent of all credit unions offered credit cards in late 1999; 47 percent offered ATM cards; 40 percent provided first mortgages; and 30 percent maintained debit-card programs. The late 1990s also saw credit unions begin to offer online services, including loan applications and approval and check imaging.

In keeping with the relaxed regulatory environment throughout the financial services industries, the federal government prepared a relief package in 1999 for federally chartered credit unions that exhibited financial soundness and healthy business practices, a description that applied to perhaps half of all federally chartered credit unions. The package mandated fewer regulatory examinations and permitted heightened discretion in credit union investment activities.

CURRENT CONDITIONS

While at a slower pace than in the late 1990s, consolidation among credit unions continued into the early 2000s. As a result, the number of credit unions declined from 10,316 in 2000 to 9,984 in 2001, while assets rose from \$438.2 billion to \$501.4 billion, an increase of \$63 billion, or 14 percent. In 2002, the number of credit unions with less than \$5 million in assets fell by 11 percent, while the number of credit unions with more than \$500 million in assets grew 23.5 percent. Along with fostering larger credit unions, consolidation also allowed credit unions to achieve great economies of scale, which helped pushed total net income for the industry up 10.8 percent during the same time period. The sluggish economy of the early 2000s, which prompted many members to opt for savings and money market accounts over higher risk investments like mutual funds, also helped bolster the industry's performance. Between 2000 and 2001, the number of failed credit unions declined from 29 to 22.

As credit unions moved to expand the services offered to their customers, some conflicts arose, particularly among those institutions that offered financial planning and brokerage services. Some of the concerns included: the tension between increased service portfolio and the possible loss of credit union savings; the fear of taxation; and member-trust issues. Resolving these conflicts remained one of the primary challenges facing the industry in the early 2000s as the line between credit unions and other financial service institutions dissolved following the passage of the Gramm-Leach-Bliley Act, also called the Financial Services Modernization Act, in November 1999. By the start of the twenty-first century, the major difference between credit unions offering these services and commercial banks in the same field was the former's emphasis on service as opposed to profit.

The CUNA has responded to competition from the increasing power of commercial banks with a national public relations campaign, in which all 10,000 CUNA members have participated, to promote credit unions as favoring "people over profits." The campaign features a logo with hands linked together in the form of a star to emphasize the participatory environment of credit unions, underscored by the slogan: "Where people are worth more than money." Members are able to download logos and information regarding this campaign from the CUNA Web site.

INDUSTRY LEADERS

Federal credit unions vary in size from the very large, with assets in the billions and employees numbering in the thousands, to smaller institutions with only a few employees. The size of a credit union depends on the size of the organization that it represents. Not surprisingly, the largest credit unions represent federal government workers, state employees, or the employees of large corporations.

In 2001, the largest credit union in the United States was the Navy Federal Credit Union in Merrifield, Virginia, which represents U.S. Navy employees and personnel. Chartered in 1947, it controlled more than \$15 billion in assets in 2001. Other leading federal credit unions were the State Employees' Federal Credit Union, with assets of \$8.1 billion; the Pentagon Federal Credit Union of Alexandria, Virginia, chartered in 1935, with \$4.2 billion in assets; the Boeing Employees Credit Union, with assets of \$3.95 billion; and the United Air Lines Employees Credit Union in Chicago, also chartered in 1935, which held \$3.6 billion in assets in 2001.

WORKFORCE

One distinctive feature of the employees of credit unions is that they are often also employees of the organization that they represent. Many credit unions depend

upon the volunteer efforts of these workers to remain in operation. Credit unions employ from four to 3,700 workers. Nationally, credit unions employ an average of 45 workers per \$100 million in assets, though that number was expected to decrease with consolidation. Between 1992 and 2001, U.S. credit union employment grew 47 percent, from 138,300 to 203,300 workers.

AMERICA AND THE WORLD

Cooperative savings banks are common financial institutions around the globe. These institutions were created to address the credit needs of workers who were ignored by commercial banks during the industrial revolution. The World Council of Credit Unions, Inc. (WCOCU) reported that the international credit union movement was growing steadily, despite strong competition from commercial banks as they focused increasing attention on consumer services. The United States is by far the leader in credit-union membership. Financial industries in Europe and other industrialized economies tend to be far more centralized than in the United States. Nonetheless, the WCOCU reported that the movement grew about 5 percent in 1998, reaching total membership of ranks of about 101 million, with 37,620 participating credit unions. The total assets of these institutions equaled \$451.4 billion.

Germany. The concept of cooperative banking originated in Germany during the mid-nineteenth century under the guidance of Friedrich Raiffeisen and Hermann Schulze-Delitzsche. In the early 2000s its system was one of the most sophisticated in the world. The cooperative banks tended to merge into larger institutions and increase their branch office network. These banks tended to make loans to agricultural customers, small and medium sized companies, and local cooperative societies.

France. The cooperative banking system is highly developed in France. Some of France's largest financial institutions, including Credit Agricole, Credit Mutuel, and Banques Populaires, are co-operative banks. These banks are capable of offering services similar to those offered by commercial banks.

Eastern Europe. In all of the East European countries there is one major institution to handle the banking system for the population as a whole. In general, with the exception of Poland, cooperative banks have been unimportant in Eastern Europe. Major changes can be expected in this region as these countries make the transition to market-based economies.

Japan. There are three types of cooperative banks in Japan, each stringently regulated by the Japanese authorities: Sogo banks, which conduct business for small and medium sized factories, wholesalers, and retail stores; Shoko Kumiai Chuo Ginko banks, which facilitate the

finance of cooperatives of small and medium sized enterprises; and Norin Chukin banks, which service agriculture and forestry.

The Developing World. Savings banks in the newly industrialized countries (NICs) have experienced a number of unique problems. For example, the habit of saving may not be as established as it is in developed nations. Some banks have developed nontraditional means to overcome these problems. Caixa Economica Federal in Brazil operates the state lottery as well as the national soccer pool, channeling the revenues into socially positive projects.

In general, cooperative banks in developing countries face four similar challenges: poor infrastructure, difficulty in mobilizing funds, inadequate resources, and a shortage of qualified managers. Despite these challenges, cooperative banks have made some progress in these areas over the last three decades.

SIC 6062

CREDIT UNIONS, NOT FEDERALLY CHARTERED

This industry classification includes cooperative thrift and loan associations (accepting deposits) organized under other than a Federal charter to finance credit needs of their members.

NAICS CODE(S)

522130 (Credit Unions)

A credit union is a collective, cooperative financial institution created by its members for the benefit of these members. These members share a bond of employment or affiliation, which the credit union is designed to serve. In 1997, there were 11,629 credit unions in the United States, of which about 4,100 held assets in excess of \$10 million. According to industry data, credit unions serve 70 million Americans, but hold less than 2 percent of each member's total financial assets. Credit union loans to consumers were mainly in the auto and credit card sectors.

Credit unions are owned by their members. Typically, these institutions collect the savings of their members and make loans to members from these accumulated savings. Unlike other financial institutions, such as commercial banks, credit unions are non-profit organizations that focus on serving their members. The primary objective of a credit union is not profit maximization, as no individual can claim any residual profit. Instead, credit unions attempt to maximize the economic and social interest of its members. The formation of credit unions was encouraged by a broad cooperative movement in the early years of the industrial revolution.

Membership in a credit union is limited to individuals or groups who are members of the organization (employer, association, residence, etc.) specified in the charter. These credit union membership criteria are collectively known as the common bond provision. An individual who is qualified under these provisions may submit an application and, if approved, becomes a member with voting rights similar to those of a shareholder in a public corporation.

The common bond provisions of credit unions have a number of operational benefits. These include lower information costs, lower collective loan default risk, operating subsidies, and mitigation of the borrower versus saver conflict. It has been argued, however, that the deregulation that took place in the late 1980s will erode some of these benefits. Indeed, in February 1997, the U.S. Supreme Court agreed to hear a case that tested whether credit unions could serve multi-occupational memberships without violating common bond requirements. The attempt by some credit unions to broaden their membership base beyond a single occupation stems from a search for greater liquidity in an increasingly competitive financial marketplace.

State credit unions are chartered under the state's credit union provision. In general, these laws are similar to the federal law, premised on the Federal Credit Union Act. The federal act was largely based on the preceding state provisions.

Leading state credit unions include the Food Lion Credit Association, headquartered in Salisbury, North

Carolina; and State Employee's Credit Union, based in Raleigh, North Carolina. Other large state credit unions include the Golden 1 Credit Union of Sacramento, California; Granite State Credit Union in Manchester, New Hampshire; Patelco Credit Union of San Francisco, California; and Delta Employees Credit Union of Atlanta, Georgia.

Credit unions, by nature, tend to be small. In 1997, there were 1,990 with less than 5 employees, 1,296 with 5 to 9 employees, and only 57 with over 100 employees.

SIC 6081**BRANCHES AND AGENCIES OF FOREIGN BANKS**

This industry category includes establishments operating as branches or agencies of foreign banks that specialize in commercial loans, especially in trade finance. They typically fund themselves via large-denomination interbank deposits, rather than through smaller denomination retail deposits. Federally licensed agencies of foreign banks may not accept deposits. Federal branches may accept deposits; however, if they choose to accept deposits in denominations of \$100,000 or less, federal deposit insurance is required. Establishments that are owned by foreign banks but primarily engaged in accepting retail deposits from the general public in the United States are classified as commercial banks.

NAICS CODE(S)

522293 (International Trade Financing)

522110 (Commercial Banking)

522298 (All Other Nondepository Credit Intermediation)

INDUSTRY SNAPSHOT

Historically, banks that were chartered in a particular country conducted most of their business in that domestic market. The long period of prosperity in the 1960s and early 1970s, however, led to substantial increases in global operations of industrial and commercial compa-

nies. This, in turn, caused an increase in international banking activity, because banks tend to follow their customers. Since the early 1980s, however, financial institutions in the United States and in other nations have rapidly expanded their overseas offices.

There was little growth in U.S. offices of foreign banks in the early 1990s, but growth increased in the mid-1990s. By 1997, foreign banks had assets totaling \$1.12 trillion in the United States, with U.S. offices of Japanese banks holding the largest aggregate assets of all foreign banks operating in the United States and Germany a close second. Growth decreased or remained flat in 1998 and 1999. By the end of June 2002, there were 196 foreign banks from 55 countries with a banking presence in the United States. Those banks had total banking assets of nearly \$1.34 trillion.

ORGANIZATION AND STRUCTURE

Foreign banks operate in the United States through five types of banking offices: branches, agencies, investment companies, “edge” or “agreement” corporations, and commercial banks.

Foreign Branches. Historically, foreign banks have opened limited branches in more than one state with relative ease, and nearly half of the foreign banks with U.S. offices have established multistate banking facilities. To enter the U.S. financial markets, most foreign banks initially opened offices in New York City; the institutions then opened offices in other parts of the country, particularly in places where a bank’s home-country customers had trade or financial relationships. The International Banking Act (IBA) and the Foreign Bank Supervision Act of 1991 govern the establishment of branches at the federal level (licensed by the Comptroller of the Currency) in any state that does not prohibit such a branch. Foreign banks may also obtain branching licenses from certain states. These states usually require the foreign banks to have their deposits insured by the Federal Deposit Insurance Corporation (FDIC). State law also generally requires the foreign bank’s home country to offer reciprocity to U.S. banks seeking to branch into that nation. The IBA grandfathers existing multistate branching networks of foreign banks; however, establishing branches in more than one state is prohibited. State banking regulators supervise almost 95 percent of all the U.S. assets of foreign banks. In 1996, New York accounted for more than 58 percent of all foreign branch and agency assets in the United States. California accounted for about 27 percent, with the remaining foreign assets scattered primarily in Florida, Louisiana, Maryland, and Illinois.

Foreign Agencies. A more limited type of banking than that provided by a branch may be engaged in by a foreign bank through an agency. For the most part, agencies and branches offer similar services and enjoy similar powers;

however, agencies are not permitted to accept domestic deposits. They can accept credit balances of customers in connection with international activities. Although agencies may not accept domestic deposits, they have more flexibility than branches because they are not subject to reserve requirements or to loan limits for a single borrower. Federal agencies would be subject to loan limits for a single borrower, and they would be required to keep on deposit with a member bank investment securities and deposits equal to the amount of capital that would be required if the agency were being established as a national bank at that location.

Unlike the other types of U.S. offices, which are separate institutions, agencies and branches are integral parts of their parent banks. Both agencies and branches may conduct full-scale lending operations. Agencies and branches generally are wholesale banking offices; that is, their customers are chiefly banks and other nonbank businesses rather than individuals, and they compete primarily with large U.S. banks. By year-end 1996, agencies and branches of foreign banks held almost 83 percent of all assets held by foreign banks in the United States. Nearly half of the credit extended by the agencies and branches was in the form of business loans, with about one-quarter of these loans representing lending to non-U.S. residents.

U.S. Investment Companies. New York State permits the organization of investment companies by foreign banks. Investment companies, like agencies, may not accept domestic deposits but can hold customers’ credit balances. They are subject to neither reserve requirements nor limits on loans to a single borrower and operate essentially as commercial finance companies.

Edge or Agreement Corporations. The International Banking Act (IBA) allowed foreign banks to own, with the prior approval of the Board of Governors of the Federal Reserve System, a majority of the stock of an edge corporation. Furthermore, the IBA repealed the stipulation that edge corporation directors be U.S. citizens. Edge corporations are similar to agencies in that they may not accept domestic deposits but may hold credit balances pursuant to international business. They are chartered by the Board of Governors of the Federal Reserve System and may be domiciled anywhere in the United States. Additionally, a bank may establish more than one edge corporation in more than one state. Agreement corporations are state-chartered corporations that have entered an agreement with the Federal Reserve Board to limit their activities to those of an edge corporation.

Commercial Banks. In contrast to agencies and branches, many commercial bank subsidiaries are retail banks whose customers include many individuals and smaller businesses. Unlike agencies and branches, these

banks are engaged in consumer and real estate lending in about the same proportions as domestically owned commercial banks. In California and New York in particular, foreign banks have acquired subsidiary commercial banks with large retail branch networks. Large U.S. banks acquired by banks from other industrial countries in the late 1970s and early 1980s include Bank of California, Harris Trust and Savings Bank, LaSalle National Bank, Marine Midland Bank, National Bank of North America, and Union Bank. Chicago-based LaSalle, for example, is a subsidiary of the Dutch ABN AMRO Bank N.V., one of the world's top 20 banks. In 1996, ABN AMRO Bank had 1,800 locations in more than 60 countries. In the early 1990s, a number of banks from developing countries also sought to acquire or establish banks in the United States.

The Bank Holding Company Act (BHCA) regulates the foreign ownership of a United States bank. Any company—including partnerships, but excluding individuals—that owns 25 percent of a U.S. bank is considered a bank holding company and must apply, pursuant to the terms in Section 3 of the BHCA, for permission from the Federal Reserve System to acquire that bank. The tests required by the BHCA relate to competition and the public interest. These requirements are less likely to present problems for a foreign bank holding company, because an application to acquire a U.S. bank is not likely to have an anticompetitive effect unless the holding company already owns another U.S. bank or is in a consortium or joint venture with U.S. banks, or unless the bank to be acquired is active in international banking.

Other Alternatives. There are several other ways in which foreign banks or individuals can participate in a less direct way in U.S. banking markets. For example, they can purchase less than a controlling interest in a U.S. bank merely as an investment. Another way for interested parties to participate is through a correspondent relationship, whereby a U.S. bank will perform various services for the foreign institution. A final approach available to foreign banks and individuals is the representative office. A representative office is merely an office of a representative of the foreign bank. Technically, such an office cannot engage in banking and is supposed to be used only for making contacts and promoting the parent bank. As such, no regulatory approval is needed under present law to establish such an office, although under the IBA all such offices must be registered with the Secretary of the State. These offices are frequently used as forerunners to either a branch or an agency after the representative has surveyed the landscape and cultivated a client base.

BACKGROUND AND DEVELOPMENT

Foreign banks typically establish offices in the United States for several reasons: to conduct trade financ-

ing activities, to service U.S. activities of home-country operations, to participate in the U.S. interbank market, to manage the dollar assets and liabilities of their parent organizations, to engage in foreign exchange trading, and in some cases to develop a retail banking business. A number of the larger foreign banking institutions have used the contacts and expertise developed through their initial presence in the United States to compete for the business of large U.S. companies. By the 1980s, however, many of these banks had already captured their most natural U.S. business from large national and international companies, and they found establishing a credit business with medium-sized U.S. companies more difficult. As a result, a number of U.S. offices of foreign banks have become actively engaged in new areas of banking and finance, such as merger-related lending, or have begun to place more emphasis on specialized financial areas in which they have expertise.

The activities of U.S. offices of foreign banks grew dramatically in the 1970s, as they tried to establish a foothold in the U.S. market through aggressive price competition. The industry's growth slowed during the early 1980s, but it began to pick up during the latter part of the decade. During the early 1990s, the industry was subjected to increased regulation and supervision. The extraordinary growth in the presence of foreign banks in the United States since the early 1970s, however, has complicated the review and supervision procedures of U.S. regulators. This bureaucratic confusion has contributed to the underlying problem of the international banking industry—the lack of a consolidated supervisory process. However, The Riegle-Neal Interstate Banking and Branching Efficiency Act, signed into law by President Clinton on September 29, 1994, was structured to transform the U.S. banking system, particularly in regards to interstate bank activity and mergers. The act allowed a foreign bank, subject to certain regulatory approvals, to establish de novo branches in states outside the foreign bank's "home state" if a U.S. bank headquartered in the same home state could establish such branches.

By the end of 1996, there were more than 870 foreign banks in the United States with aggregate assets in excess of \$994 billion, or 21 percent of total U.S. banking assets. Foreign banks had 493 branch and agency offices, 99 U.S. bank subsidiaries, and 11 Edge Act and Agreement corporations. Indeed, banking transactions have become increasingly global, setting the stage for even greater transnational financial activities in the late 1990s. In 1996, the commercial and industrial loans made by foreign-owned U.S. banks amounted to \$461 billion—around 34 percent of all business loans to U.S. borrowers. By comparison, selected assets and liabilities of domestically owned commercial banks and U.S. offices of foreign banks having less than 25 percent foreign ownership

totaled more than \$3,804 trillion in 1996 with a total of \$2,390 trillion in loans. This figure includes assets and liabilities on the books of International Banking Facilities.

Total deposits in 1996 by U.S. offices of foreign banks were \$529 billion, representing nearly 17 percent of all deposits made in the United States. Domestically owned commercial banks, U.S. agencies and branches of foreign banks, and commercial banks and New York investment companies with more than 25 percent foreign bank ownership (but not edge or agreement corporations) had a total of \$4,795 trillion in assets in 1996. Loans for this group totaled nearly \$2,851 trillion. Of these, the total assets of U.S. offices of Japanese banks were almost \$362 billion in 1996 with total business loans at nearly \$127 billion and deposits near \$198 billion. This significant cross-border presence of banks, however, has the disturbing potential to increase the risk of bank failure and reduce the soundness of the international banking system. Major branches and agencies of foreign banks in the United States included French American Banking Corp., Israel Discount Bank Ltd., and Nippon Credit Bank of Los Angeles.

This surge in foreign banking has been accompanied by a variety of questions and concerns on the part of the public, legislators, regulators, and U.S. bankers. Many of these concerns have been addressed by the passage of the International Banking Act of 1978 (IBA), which tightened federal and state control over foreign bank operations in the United States. International bank scandals, most notably the closure of the worldwide operations of the Bank of Credit and Commerce International (BCCI), illustrate the disastrous effects of deficient supervision of the international banking system. The Federal Reserve responded to the corruption with the promulgation of the Foreign Bank Supervision Act of 1991 (FBSEA). The FBSEA greatly expanded the supervisory authority contained in the International Banking Act of 1978 and placed the bulk of this authority in the hands of the Federal Reserve Board. As a result of this act, the entry of foreign banks in the United States slowed down considerably in the early 1990s. In 1992, for example, no foreign bank opened a new branch, agency, or representative office anywhere in the United States. This was attributed to administrative delays in processing the applications required to be submitted to the Board of Governors of the Federal Reserve System for such offices.

As far as Federal Deposit Insurance Corporation (FDIC) deposit insurance was concerned, most federal branches and agencies of foreign banks were not covered. As a result, uninsured U.S. federal branches and agencies were not permitted to accept retail deposits under \$100,000. An exemption existed for certain minimal (so-called de minimis) deposits up to 5 percent of branch

deposits. The Riegle-Act required the Office of the Comptroller of the Currency (OCC) and the FDIC to reduce that exempted amount from 5 percent to 1 percent of branch deposits. In other words, it could accept retail deposits under \$100,000 limited to 1 percent of the daily average of deposits of the last 30 days of the most recent quarter. In 1995, the OCC made a proposal for a transition period of up to 5 years to phase out deposits held in the existing 5 percent de minimis accounts.

Another objective of the Riegle-Neal Act was to ensure the competitive equality of foreign and domestic banks, as well as credit availability to various sectors of the U.S. economy, including trade finance. The OCC proposed adopting the exemptions cited in the act, with some modifications and additions. As a result, uninsured federal branches would be allowed to accept deposits under \$100,000 from individuals who are neither U.S. citizens or residents; foreign individuals employed by a foreign bank, business, or government, or a recognized international organization; foreign businesses and large U.S. businesses; U.S. and foreign governmental units and international organizations; persons to whom the branch or the foreign bank has extended credit or provided other nondeposit services in the past year, or has agreed to provide credit or nondeposit services in the next year; persons who deposit funds in connection with transmitting funds; and persons who may deposit funds with edge corporations, such as persons engaged in certain international business activities.

The OCC's proposed rule also clarified the permissible activities for agencies of foreign banks. For instance, the proposed rule would implement the provision for the Riegle-Neal Act that addressed the ability of a federal branch or agency of a foreign bank to manage the activities of the bank's offshore offices. The act permitted a federal branch or agency to manage the same offshore activities permissible for U.S. banks to manage offshore.

Legal/Regulatory Framework for U.S. Operations of Foreign Banks. Bank regulation in the United States can be viewed on three levels. The first level involves examination and supervision of individual banking institutions and rules designed to ensure that each banking organization is being operated in a sound manner. The second level of regulation is concerned with competitive conditions and expansion within the banking industry. Its focus is on maintaining not only soundly operated banks but also a competitive banking system that balances economic efficiency with certain political and economic goals. These goals are reflected in legislation governing bank mergers and acquisitions, intrastate and interstate expansion of banking organizations, and monetary control. The third level of regulation involves ownership and other relationships between organizations and other financial, commercial, industrial, and service enterprises operating in the

United States. Although this level of regulation includes elements of bank safety and soundness and competitive concerns, its primary focus is on broader policy objectives such as maintaining a separation between banking and commerce. This type of regulation is embodied in the Bank Holding Company Act (BHCA), the Glass-Steagall Act, and the Riegle-Neal Act.

Examination and Supervision. State and federally chartered banks that are subsidiaries of foreign banks are supervised and examined by appropriate federal and state banking authorities and are treated the same as other state or federally chartered banks in virtually all respects. The examination and supervision of U.S. agencies and branches of foreign banks, however, differs in many respects from that of subsidiary banks, because these offices are not separately incorporated legal entities but rather are integral parts of their foreign parent banks. As a result, examination and supervision of a U.S. agency or branch of a foreign bank is generally aimed at ensuring that the office is operated in a safe and sound manner and that local depositors and creditors are protected in the event of any problem with the parent banking institution. Because an agency or branch must rely on the resources of its parent bank for support, lending limits and similar prudential controls applied to branches and agencies are generally based on the capital and surplus resources of the foreign parent bank.

Since the passage of the Riegle-Neal Act, the Institute of International Bankers—a New York association that represents foreign bankers—recommended that the act permit international banks to change their home state more than once, clarify the procedures under which international banks could acquire additional branches or agencies outside of their home states, permit the “upgrade” of existing limited branches and agencies to wholesale branches where permitted under state law, and clarify that a branch or agency can act as an agent for an affiliated depository institution to the same extent that U.S. banks can perform that role.

Regulation of U.S. Banking Activities of Foreign Banks. To open an agency or branch in New York City, for example, a foreign bank must obtain approval from both the New York State banking authorities and the Comptroller of the Currency. Similar conditions apply in other states, although some states permit only agencies, some permit only branches, and some permit neither. Although the IBA gives foreign banks the option of establishing federal agencies or branches, the act also defers to the states by allowing state comptrollers to approve the establishment of a branch or agency by a foreign bank according to state law. If a state does not prohibit foreign bank agencies or branches, but merely sets conditions for their establishment (such as requiring that the state banks have reciprocal privileges in the

foreign bank’s home country), the comptroller may approve the establishment of a federal branch or agency in that state without regard to such requirements. Thus, as long as there is not an outright prohibition in state law, the foreign bank has the dual-banking system option of proceeding under the more favorable regulatory climate.

Before the IBA was passed, foreign banks were free to establish deposit-taking operations in more than one state as long as state laws permitted such operations. Because Congress determined that this gave foreign banks a competitive advantage over domestic banks, the IBA subjected foreign banks to interstate banking prohibitions on deposit taking designed to parallel those applied to U.S. banks. However, Congress also provided foreign banks with liberal grandfather treatment and permitted the establishment of limited interstate branches. These branches may only accept deposits that are incidental to international or foreign banking activities.

As a result of the IBA enactment, foreign banks are required to designate a home state and may only change their home state designation one time, subject to certain conditions. A foreign bank may not establish outside its home state a branch that takes domestic deposits and may not acquire more than 5 percent of the voting shares of a domestic bank outside its home state if such an acquisition would be prohibited under Section 3(d) of the Bank Holding Company Act (BHCA). The interstate banking restrictions of the IBA do not apply to state or federally licensed agencies, limited branches, or investment company subsidiaries of foreign banks, because these operations do not accept domestic deposits. Section 3(d) of the BHCA generally prohibits the Federal Reserve Board from approving interstate bank acquisitions by bank holding companies unless such acquisitions are permitted by the law of the state in which the acquired bank is located. Although state laws are increasingly being amended to permit bank holding company acquisitions across state lines on a regional and even national basis, foreign banks are not always able to take full advantage of these opportunities.

A foreign bank seeking to expand in the United States by establishing a de novo subsidiary, branches in states outside the foreign bank’s “home state,” or by acquiring an existing bank may do so under the Riegle-Neal Act. Like any other bank holding company, a foreign bank’s acquisitions must be consistent with interstate banking restrictions, with restrictions on nonbanking activities, and with competitive safety and soundness, among other public interest criteria.

In addition to placing restrictions on the geographic expansion of deposit-taking activities of foreign banks, Congress also decided to subject such activities to Federal Reserve Board requirements. The purpose was to promote competitive equality between domestic and for-

eign banking institutions in the United States and to ensure that the effectiveness of monetary policy would not be impaired by the existence of a rapidly growing segment of the banking industry not subject to federal requirements. Subsequent to the enactment of the IBA, Congress extended federal reserve requirements to all depository institutions in the United States in the Monetary Control Act of 1980.

The Foreign Bank Supervision Act of 1991. Although the Federal Reserve Board possessed some form of supervisory authority over foreign banks since the 1978 adoption of the International Banking Act, it had never before been authorized to approve the opening of foreign bank branches, agencies, or representative offices. The enactment of the IBA gave foreign banks the option, similar to that enjoyed by domestic banks, to establish a banking office in the United States by obtaining either a federal license from the Office of the Comptroller of the Currency or a license from the appropriate state regulator. The Foreign Bank Supervision Act of 1991 provided the mechanism for consolidated supervision over such a dual banking structure. The Federal Reserve was given this umbrella supervisory authority. The following issues are the main areas of supervisory concern: the entry of foreign banking institutions into the American market; the application of regulations to foreign banks; and the extent of supervision and examination.

The regulation is applicable whenever a foreign bank seeks to establish an office in the United States. This criterion applies to the first U.S. office opened by a foreign bank, as well as any additional branch, agency, or representative office set up by a foreign bank having a previous U.S. presence. In addition, the regulation requires the submission of an application whenever an existing office is upgraded in status or relocated to another state. In certain limited circumstances, however, an application need not be filed. These situations include the establishment of a branch, agency, commercial lending company, or representative office merely as a by-product of one foreign bank's acquisition of another, without any merger or organic change occurring in the organization.

Another significant mandatory requirement for approval is that a foreign bank applicant must be engaged directly in banking in its home country and be subject to supervision by the appropriate authorities in that country. Because of this requirement, the Federal Reserve Board has been compelled to study in detail the initial application it receives from each country with respect to the adequacy of the country's supervision. The board has indicated that a determination of the adequacy of a particular supervisory scheme will be based on a variety of factors, including whether the home country supervisor performs the following duties: verifying the existence of procedures for monitoring and controlling worldwide

risks and operations, obtaining consolidated information on a periodic basis, obtaining information concerning transactions among affiliates, analyzing periodic consolidated financial reports, and evaluating prudential standards on a worldwide basis.

Yet another requirement is that foreign banks must furnish the Federal Reserve Board with such information as the board deems necessary for the application. Additionally, the board has the prerogative to assess whether an applicant has provided it with adequate assurances that it will continue to make available additional information that the board deems necessary. The board is concerned that the prospect of foreign secrecy laws may hamper its supervisory efforts. Therefore, an applicant is required to disclose in its application any laws that may inhibit the board's access to pertinent information.

In evaluating branch and agency applications, the regulation provides the board with the power to assess the following additional issues that are similar to those previously considered by most states: whether home country authorities have consented to the new office; the financial and managerial resources of the applicant, including its experiences and capabilities with respect to international banking; and whether the foreign bank and its U.S. affiliates are in compliance with applicable U.S. laws. The regulation also identifies other relevant factors that the board may consider. The regulation notes that the size of the applicant should not be the sole factor determining approval and states that the board is permitted to consider the needs of the community, the applicant's history and relative size in its home country, and whether the regulator in the applicant's home country shares information with U.S. supervisors.

Regulation of Nonbanking Activities of Foreign Banks. A foreign bank that has a controlling interest in a U.S. bank, whether state or federally chartered, is a bank holding company under U.S. law and is subject to both the banking and nonbanking prohibitions of the BHCA with regard to its activities in the United States. Foreign banks that have established branches, agencies, or investment company subsidiaries in the United States but do not control a domestic bank are not considered bank holding companies. However, they are still subject, under the IBA, to the nonbanking prohibitions of the BHCA and are thereby subject to the regulation by the Federal Reserve Board with regard to their nonbanking activities and investments in the United States.

In an attempt to eliminate unfair competitive advantages in the industry, federal and state agencies require that foreign banks with a branch, agency, commercial bank, or investment company subsidiary in the United States comply with the same binding legislation that applies to domestic holding companies attempting to diver-

sify into nonbanking activities. However, many foreign banks enjoy grandfather privileges with respect to activities or investments in the United States that the banks had initiated before enactment of the IBA. For example, some European banks have grandfathered investment banking subsidiaries in the United States that would otherwise be prohibited under the BHCA.

Moreover, when the IBA was being considered for ratification, Congress was also faced with the problem that many foreign banks were linked through stock ownership in their home or other foreign markets with foreign nonbanking companies that were expanding into the United States. Strict application of BHCA rules in such situations would have either required foreign banks with U.S. banking operations to divest themselves of many non-U.S. stock holdings or blocked investment in the United States by foreign companies in which foreign banks have substantial ownership interests.

Congress decided that neither of these options was in the political or economic interests of the United States and thus granted certain exemptions in the IBA. In general, foreign banks that are principally engaged in the banking business outside the United States are permitted to maintain both their banking operations in the United States and certain investments in foreign nonbanking enterprises that also conduct activities in the United States. The exemption permits foreign banking organizations to own a foreign nonbank company that engages in the same commercial nonbanking activities in the United States that it conducts abroad. Financial nonbanking activities in the United States require prior approval by the Federal Reserve Board and are generally permitted only to the extent that U.S. bank holding companies are allowed to engage in the activities. Legislative proposals before Congress in 1996, however, raised the issue of international banks' ability to expand into new securities and other activities comparable to what U.S. banking organizations are allowed to do even if they do not maintain FDIC insurance.

Policy Issues Affecting Future Entry and Expansion.

Despite enactment of the IBA in 1978 and the FBSA in 1991, the role of foreign banks in the U.S. banking system continues to be a subject of much attention and debate. Three issues in particular could have a significant impact on future foreign bank entry and expansion in the United States.

In late 1983, for example, legislation was proposed in the U.S. Senate that would have required the comptroller to consider the home country's reciprocating policies regarding U.S. banks before approving the establishment of a federal agency or branch. This proposal reflected a judgment that, at least in some countries, U.S. banks were not being given equal competitive opportunities with

local banks and that reciprocity would be a useful means for opening banking markets abroad to U.S. banks. Although limited in scope and ultimately never enacted, the bill became the focus of considerable debate as to whether reciprocity should be a consideration in U.S. policy toward foreign bank entry and expansion.

Reciprocity is typically used to refer to efforts to assure a precise balancing of the treatment countries accord to each other as trading partners. For example, under a policy of reciprocity, if a foreign bank country limited the presence of U.S. banks to agencies, banks from that country would be able to establish only agencies in the United States. Such "mirror image" reciprocity has been consistently opposed by the U.S. government on the grounds that it would be almost impossible to administer in the United States, would remove flexibility, and would interfere with the role of the United States as a major international financial center. Instead, to attack the problem of discrimination against U.S. banks abroad, the U.S. government has used both bilateral and multinational channels to promote greater liberalization and equality of competitive opportunities in banking markets abroad. The Riegle-Neal Interstate Banking and Branching Efficiency Act was intended to transform the American banking system and remold it to be more in line with those of other industrialized nations.

In addition to establishing the various prudential standards for international lending, the International Lending Supervision Act of 1983 (ILSA) required U.S. bank regulatory authorities to establish minimum capital ratios for U.S. banking institutions. The establishment of such ratios focused increased attention on perceived disparities between U.S. and foreign bank capital requirements, with the larger U.S. banks claiming that many foreign banks enjoy competitive advantages due to lower capital ratios. The Federal Reserve Board addressed these concerns in Section 3 of the BHCA. This section requires the board to ensure that foreign banks establishing banking operations in the United States meet the same general standards of strength, experience, and reputation required of domestic banking organizations. Foreign banks are also expected to serve on a continuing basis as a source of strength to their banking operations in the United States. In this regard, the board has initiated consultations with foreign bank supervisors and has begun work on developing more fully the concept of functional equivalency of capital ratios for banks of different countries. The overall goal is to achieve broader international comparability of capital standards; this emphasis suggests that U.S. authorities may increasingly try to assess the capital adequacy of foreign banks according to functionally equivalent international standards.

Interstate banking in the United States has been growing rapidly as a result of the enactment of laws by a

number of states that permit acquisitions of in-state banks by bank holding companies in other states. However, many of these state laws permit interstate acquisitions only among states with regional or historical ties. For example, laws in many northeastern states restrict acquisitions to bank holding companies headquartered in those states. Under the principle of national treatment embodied in the IBA, it would seem that a foreign bank might be treated as if it were a local bank headquartered in the state the foreign bank has chosen as its home state. For example, a Canadian bank with Connecticut as its home state could be treated as a Connecticut bank for purposes of regional interstate banking statutes. Delaware stands out as a particularly progressive state in this regard. In 1999, Governor Tom Carper signed a bill to let foreign banks establish Delaware as their home state, giving banks another economic incentive to open shop in a state that already has an extremely favorable tax environment. However, in some states, regional interstate banking laws have either expressly or implicitly excluded foreign banks or their U.S. bank subsidiaries from taking advantage of regional acquisition opportunities.

Foreign banks have expressed the view that such state laws deny them equal competitive opportunities and are thus inconsistent with national treatment. Prior to the passage of the Riegle-Neal Act, Congress largely deferred to the states in the area of interstate banking and would not address this issue of possible discrimination against foreign banks. With the Riegle-Neal Act, however, a bank holding company in one state became able to acquire a bank in another state after September 29, 1995, without regard to the law of the other state. Under the more recent act, the only significant restriction a state could impose was to restrict the acquisition of a bank that has not been in existence for a specified period of time (up to five years). The purpose of this requirement was to preserve the value of existing banks by discouraging the start-up of new banks merely for the purpose of facilitating entry into a state.

Although foreign banks still enjoyed considerable flexibility in the United States in the early 1990s, a regulatory framework at the federal level began taking shape. That framework eliminated certain advantages foreign banks possessed relative to domestic banks, but also opened the possibility of operating through edge corporations, obtaining funds from the Federal Reserve System, and obtaining deposit insurance. International banks could change their home state more than once and acquire additional branches or agencies outside of their home state.

CURRENT CONDITIONS

There were 196 foreign banks representing 55 countries in the United States by 2002. Those banks had total banking assets of \$1.34 trillion and total banking and

nonbanking assets of more than \$3.3 trillion. Offices of foreign banks in the United States had total deposits in excess of \$664 billion and \$471.1 billion in total loans in 2002, including \$237.8 billion in business loans. Foreign banks accounted for 27 percent of U.S. commercial and industrial loans at the end of June 2002.

In March 2002, the Office of the Comptroller of the Currency (OCC) announced plans to lower the capital requirements for the U.S. branches of well-run foreign banks. In effect, since 1960 the current law required foreign banks to reserve 5 percent of their liabilities in trust accounts at other banks. Under the new law, the formula for qualifying banks would be adjusted and would exclude liabilities booked on a federal branch's international banking facility, a department of the bank only able to accept deposits and extend credits to foreign individuals, companies, and similar institutions. The adjustment would apply to 37 of the 52 federal branches the OCC supervises and free up \$1.6 billion. The OCC determined qualifying branches by assessing the financial condition of the branch, the parent bank's financial condition, and the political and financial stability of the country in which the parent bank is located. Qualifying branches would be able to withdraw excess deposits, held to mitigate against losses, without prior approval from the OCC. A \$1 million reserve minimum would, however, still be in effect regardless of the fact that it may be more than 5 percent of a branch's liabilities. First instituted in New York, the newly relaxed federal requirements may make the United States more desirable for foreign banks.

In 2001, the Federal Reserve Board revised Regulation K, intended to expand permissible activities abroad for U.S. banking organizations, which also had a positive effect on foreign banks in the United States. The revisions would streamline their application process, liberalize provisions allowing a foreign bank to be exempt from nonbanking prohibitions, and implement provisions of the 1994 interstate banking law that affects foreign banks.

AMERICA AND THE WORLD

Analysts expected that foreign banks interested in securing a significant presence in the United States, both as a source of dollar funding and with a view to active participation in international lending, would focus on establishing a branch or subsidiary bank in a home state and combining it with edge corporations in several other states.

Banks from a group of 10 countries operate about half of the U.S. offices of foreign banks but account for a majority of the assets. The G-10 countries are the 11 participants in the General Arrangements to Borrow of the International Monetary Fund; namely, Belgium-Luxembourg, Canada, France, Germany, Italy, Japan, the Netherlands, Sweden, Switzerland, the United Kingdom, and the United States. Japanese banks with offices in the

United States had nearly \$213.6 billion in assets in 1999, a decrease of 23.6 percent from the previous year. Germany had \$210.5 billion in assets, up 42.7 percent from 1998. France had \$163.8 billion (down 4.4 percent for the year) and Canada \$125.1 billion (up 2.1 percent). Although banks from non-G-10 countries, particularly in Latin America and Asia, have also opened many U.S. offices since the early 1980s, they represented a relatively small segment of the industry in the early 1990s.

After the introduction of International Banking Facilities (IBFs) in the United States in December 1981, foreign banks established IBFs at many of their U.S. offices. An IBF is a segregated set of asset and liability accounts that may be established at a banking office located in the United States for the purpose of conducting transactions with foreign residents without being subject to federal reserve requirements or to deposit insurance coverage and assessments. At the end of 1992, about half of the total assets of U.S. agencies and branches of foreign banks were booked as their IBFs. The agencies and branches accounted for more than two-thirds of IBF activity.

The U.S. international banking industry faced a plethora of problems and opportunities at the dawn of the twenty-first century. As transnational financial services have increased, the significance of national borders has decreased. Globalization has also accelerated the speed at which financial transactions take place. Although this has triggered explosive growth in emerging economies, it has also made these states vulnerable to financial crises. The rapid capital outflows made possible by globalization triggered the 1997 Asian meltdown that spread to Brazil and Russia. Banking regulators both within the United States and abroad were called on to coordinate efforts and to cooperate with their international counterparts to deal with these situations. Foreign banks have played a large role in the development and stability of the U.S. banking and financial system. This role, coupled with the growth of international financial services, presents foreign banks with significant growth opportunities in the United States well into the 2000s.

FOREIGN TRADE AND INTERNATIONAL BANKING INSTITUTIONS

This category covers establishments of foreign trade companies operating in the United States under federal or state charter for the purpose of aiding or financing foreign trade. Also included in this industry are federal or state chartered banking institutions that only engage in banking outside of the United States.

NAICS CODE(S)

522293 (International Trade Financing)

The deregulated posture of the U.S. financial sector in the late 1990s resulted in a more international banking market by the early 2000s. While for much of the twentieth century the regulatory environment was aimed at restraining banking concentration and bank involvement in other financial activities, such restrictions gave way to more liberalized capital flows and a more relaxed attitude toward consolidation and foreign involvement, both by U.S. banks operating overseas and by foreign banks in the United States. According to the Institute of International Bankers, in the early 2000s three other factors also contributed to the increasingly international nature of banking: the reliance of national economies upon one another, the globalization of trade, and technological developments that enhanced both communication and transportation.

The number of foreign banks with offices in the United States totaled approximately 700 at the turn of the millennium, controlling assets of \$1.38 trillion. Of these,

305 were branch banks; 81 were agencies; and 90 were subsidiaries more than 25 percent owned by branch banks; 211 were U.S. representative offices of foreign banks; 12 Edge Act and Agreement Corporations; and three New York investment companies in which a majority is owned by foreign banks.

Back in 1919, the U.S. government adopted a federal law called the Edge Act named for its sponsor, Republican Walter E. Edge of New Jersey. The Edge Act of 1919 allowed the Federal Reserve to charter foreign and domestic banks to permit them to participate in international trade finance and investment through what became known as Edge Act banks. These banks were allowed to expand their offices in more than one state without the usual nonbanking restrictions.

An Edge corporation offers foreign banks and their affiliates ways to expand operations in the United States without being subject to the nonbanking restrictions set by the Bank Holding Company Act of 1956. Edge banks can accept deposits and engage in a broad array of financial activities, without necessitating a foreign office to purchase international loans or process credit.

The late 1970s witnessed a great expansion of Eurobanks, which acquired an increased share of the U.S. banking market, generating heated political debate in the U.S. Congress. This dialogue resulted in the International Banking Act of 1978, implemented to equalize regulatory treatment of foreign and U.S. banks doing business in the United States. This act, along with revisions to Regulation K (International Banking Operations), gave foreign banks and affiliates the right to own a majority of shares in these Edge corporations.

Prior to revisions to the Edge Act in 1984, the Fed used the “transaction-by-transaction” approach, which imposed fairly stringent constraints on the U.S. operations of the Edge banks. This approach required that all deposits to Edge corporations be related to international transactions and that all transactions with domestic residents be related to identifiable international transactions. With the debt crisis in the 1980s, combined with a flood of consolidations and bank mergers, many Edge banks disappeared.

In 1984, three major revisions were made. Two of the revisions expanded the U.S. activities of the Edge banks, while the third closed a loophole in the Edge banking statute that permitted three nonbanking firms to enter the Edge banking field.

The first revision expanded U.S. activities to provide full banking services—deposit-taking, lending, and other services—to any entity that engaged in international business. These companies included international airlines, shipping lines, and export-trading companies that were engaged exclusively in international activities and

that were restricted to international business by their charters or licenses.

The second revision permitted an increase from \$2 million to \$15 million in the amount an Edge bank could invest or lend in permissible activities without prior approval from the Federal Reserve.

The third revision to Regulation K closed a loophole in the existing Edge banking laws, which allowed nonbank financial service companies to acquire the charters of existing Edge banks without the requirement of prior approval of the Federal Reserve. The new statute required any persons to give 60 days of notice before acquiring 25 percent or more of the voting shares of an Edge corporation. This regulation allowed the Fed to impose conditions necessary to prevent adverse effects such as conflicts of interest, undue concentration of resources, or unsound banking practices.

Although subject to capital restrictions and the limitations of the Edge Act, an Edge corporation could engage in contracts to finance activities involving projects performed substantially abroad, importing or exporting goods, assembly or repackaging of goods imported or exported, issuing long-term debt, and financing the costs of production of goods and services for export. In addition, the Edge was involved in buying and selling spot and forward foreign exchange, issuing securities to finance foreign activities, guaranteeing debts of customers, acquiring participation in extensions of credit, and holding securities or buying and selling securities upon the order of the customer.

An Edge possessed certain limited powers as a corporation. It had the power to maintain its corporate existence for 20 years, to sue and be sued, to make contracts, to appoint officers and employees, to elect directors, and to adopt by-laws. The banking powers of an Edge corporation with a final permit included borrowing and lending money, issuing letters of credit, and effecting transactions in coin, bullion, exchange, and securities.

U.S. banks, which are bound by law to focus foreign investment only in other banks, are able, by investing in Edge corporations, to spread their portfolios into just about any foreign company. By 1998, about 70 percent of U.S. banking assets of foreign subsidiaries was channeled through Edge corporations.

While restrictions from interstate banking diminished substantially, the benefits for foreign activities remained attractive to some firms. As of 1998, there were still more than 30 Edge branches, concentrated primarily in New York and Miami, with assets of \$18 billion.

International banking facilities (IBFs), a legal classification created in 1981, differed from Edge corporations in that they had no separate organizational identity but constituted separate accounts established by host banks, includ-

ing both U.S. banks and U.S. branches of foreign banks. IBFs were compelled by law to limit their activities to international transactions that demonstrably did not directly affect U.S. markets. Such facilities offered several incentives, such as the exemption from reserve requirements and, in some states, favorable tax status. In 1998, such facilities possessed \$46 billion in assets for U.S. banks and \$169 billion for U.S. branches of foreign banks.

The passage in 1999 of the Gramm-Leach-Bliley Act, also known as the Financial Services Modernization Act, paved the way for new conglomerations of financial services formerly prohibited by the Glass-Steagall Act of 1933. Among other provisions, the Financial Services Modernization Act allowed for the creation of financial holding companies, by which banks might combine diverse financial operations, such as insurance firms, brokerages, securities underwriters, travel agencies, and others within one establishment. It thus opened the door, for instance, to mergers between U.S. insurers and foreign banking operations as well as between foreign and domestic banking concerns, without necessitating the divestiture of one party's operations by the merged company. For a foreign banking firm operating in the United States to establish a financial holding company, the Federal Reserve had to bestow a sound rating on the firm's capitalization and management based on an evaluation of accounting and lending practices, the nature of the firm's capital exposure, and its reliance on federal support to meet capital standards, among other considerations.

The further deregulation of the U.S. financial sector at the end of the 1990s spurred the increased centralization of foreign firms' U.S. banking operations. While relaxed restrictions on interstate banking led to substantially increased merger and consolidation activity among U.S. banks, foreign banks likewise recognized the need for greater efficiency and centralization in order to compete with U.S. players. Fuji Bank Ltd. and Sanwa Bank Ltd. closed down many of their U.S. branches in order to shore up and expand the operations of regional headquarters. Meanwhile, some U.S. states, such as Delaware, went to great lengths to attract foreign banks through the relaxation of tax laws. In 1999 Delaware Governor Tom Carper signed into law the Foreign Banking Amendments, which allowed foreign banking concerns to establish Delaware as their home state, thereby allowing them to maintain branches with full banking capabilities equal to those of out-of-state U.S. banks.

Total U.S. banking assets of foreign banks increased sharply from \$27 billion in 1972 to \$1.38 trillion in 2001. The combined U.S. banking and nonbanking assets of international banks totaled more than \$3 trillion. European banks held 80 percent of this total, while Asia accounted for 10 percent. South America, Central America, and North America were responsible for the remain-

ing 10 percent. International banks spent roughly \$20 billion per year on their U.S. operations; roughly half of this total was spent on employee compensation. In fact, international banks employed a total of approximately 120,000 individuals in the United States.

Leading foreign banks operating in the U.S. in the early 2000s included Mitsubishi Tokyo Financial Group of Japan, Société Generale of France, Mizuho Financial Group of Japan, Bank of Nova Scotia, and the Bank of Montreal.

Of all the foreign banks, Canada, France, and the United Kingdom had the largest number of bank offices in the United States. The U.S. cities with the greatest numbers of foreign bank offices are New York, Los Angeles, Chicago, Miami, and San Francisco.

SIC 6091

NONDEPOSIT TRUST FACILITIES

Establishments in this classification are primarily trust companies engaged in fiduciary business, but not regularly engaged in deposit banking. Some of these establishments occasionally hold limited amounts of special types of deposits, and their uninvested trust funds are usually classified as deposits. These nondeposit trust facilities may have either National or State charters. This industry does not include establishments operating under trust company charters, which limit fiduciary business to that incidental to real estate title or mortgage loan activities, which are classified in **SIC 6361: Title Insurance.**

NAICS CODE(S)

523991 (Trust, Fiduciary, and Custody Activities)

A trust company is primarily involved in establishing trusts, mechanisms under which the company manages assets for the benefit of a third party. In the

establishment of these trusts there are typically three parties. The first is the trustor, who is the party creating the trust and also maybe known as the settlor, grantor, or donor. Second is the beneficiary for whose benefit the trust is established. Finally, the third party is the trustee, who is responsible for the management and preservation of the property of the trust estate.

Trust arrangements became more popular in the 1990s. They are often established to provide for the education of children and provision for old age. Once the trust is created, it is irrevocable, even by the trustor himself, unless there is express provision for revocation or the purposes of the trust have been accomplished. Trusts allow an individual to guard against the dissipation of wealth while still allowing for the necessary use of available funds.

A trust is a fiduciary relationship in which one person or entity is the holder of the legal title to property, subject to the equitable obligation to keep or use the property for the benefit of another. The trust company must use the assets entrusted to it in the best interest of the beneficiary of the trust.

A trust company is a company organized for the purpose of executing such arrangements. The functions of these companies can be divided into two broad categories: individual trusts and corporate trusts. Individual trusts act in several capacities including executor, administrator, trustee, guardian, conservator, custodian, and conservator in lunacy. Corporate trusts act as fiscal agents, registrars of stock, transfer agents, trustees under deed of trusts, depository for protective committees, reorganization committees, and escrow agents.

Individual trusts are often established for individuals with lack of business experience, people in poor health, absentee property holders, the elderly, and persons traveling or residing in foreign countries. In these cases the trust company will take complete charge of the assets and property of the individual and collect all income due the estate. The trust company must also make all payments required by the estate, such as property taxes, etc.

Corporate trusts are often established to act as a trustee under a mortgage securing an issue of bonds, as a financial or fiscal agent of a municipal or private corporation, as a transfer agent and registrar, as a depository for protective and reorganization committees, and as an escrow agent. These functions tend to be more specialized and complex than those associated with individual trusts.

The history of the trust can be traced to feudal concepts of property and have become a part of American law through the common law of England. From this early point in time, trusts served the purpose of preserving property so that the beneficiary could benefit as recipient of income from the principal of the trusts.

Many different fields of endeavor are represented in this industry classification. Financial professionals play a key role, just as their supporting functions have played a role in the development of these new financial services. In addition to these, lawyers are heavily represented because this field is so tightly constrained by the principles of property and banking laws.

During the 1990s, the trust field was as competitive as the rest of the financial services marketplace when the Baby Boom generation discovered trusts as a way to safeguard wealth realized during the soaring stock markets of those years. In 1996, 148 nondeposit trust companies managed 560,058 accounts valued at \$1.1 trillion. Many banks operated nondeposit trust companies as subsidiaries. Representative nondeposit trust facilities include Amalga Trust Company Inc., which had 1997 assets of \$6.1 billion; First of America Trust Co., with 1998 assets of \$14.4 billion; Imperial Trust Co., with 1997 assets of \$9.3 billion; and Mercantile Trust Company N.A., with 1997 assets of \$28.7 billion.

SIC 6099

FUNCTIONS RELATED TO DEPOSITORY BANKING, NOT ELSEWHERE CLASSIFIED

This category includes establishments primarily engaged in performing functions related to depository banking, not elsewhere classified.

NAICS CODE(S)

- 522320 (Financial Transactions Processing, Reserve, and Clearing House Activities)
- 523130 (Commodity Contracts Dealing)
- 523991 (Trust, Fiduciary, and Custody Activities)
- 523999 (Miscellaneous Financial Investment Activities)
- 522390 (Other Activities Related to Credit Intermediation)

This industry comprises several types of functions related to depository banking including the transmittal of financial information between institutions and electronic payment services. Some of the primary functions that constitute this category are automated clearinghouses, check cashing agencies, check clearinghouse associa-

tions, deposit brokers, electronic funds transfer networks, escrow institutions other than real estate, fiduciary agencies other than real estate or trust, foreign currency exchanges, money order issuers, smart card issuers, representative offices of foreign banks, safe deposit companies, tax certificate sale and redemption agencies, and traveler's check issuers. Each of these functions is organized and operates differently.

Automated Clearinghouses. An automated clearinghouse processes and delivers electronic debit and credit payments among participating institutions, usually commercial and savings banks, savings and loan associations, and credit unions. The electronic debits include pre-authorized mortgage payments and insurance premiums that are deducted from a customer's account. The electronic credits include pre-authorized direct payment of paychecks and dividends that are added to a customer's account. Automated clearinghouses are similar to check clearinghouses, in that all of the obligations are sorted and payment instructions are recorded electronically.

There are typically five steps in an automated clearinghouse transaction. First, the customer authorizes an electronic entry to their account. Second, the company introduces the electronic payment data through its bank. Third, the originating institution receives electronic payment data from the company. Fourth, the automated clearinghouse receives the electronic entry from the originating institution, processes it, and delivers the electronic payment to the appropriate institution. Fifth, the receiving institution posts the electronic entry to the customer's account.

In 2000, there were four automated clearinghouses that serviced some 13,000 financial institutions grouped into 24 regional associations. This system facilitated efficient clearing of accounts and reduced costs for participating institutions. There is no question that electronic payment systems continue to grow in popularity. To highlight one indicator, by 2000, 60 percent of all paychecks in the non-governmental sector were directly deposited via automated systems, up from a mere 8 percent 15 years ago.

Check Cashing Agencies. Check cashing agencies are small organizations that cash checks for a fixed fee. They do not require that a customer have an account to cash a check.

Clearinghouse Associations. A clearinghouse association is a voluntary group of banks located in the same city and having a mutual agreement to facilitate the daily exchange of checks, drafts and notes among themselves. The New York Clearinghouse Association is a good example of just such a group. Its computerized communications network, called CHIPS, allows for large sums of money to be electronically transferred among members, thereby eliminating the need for official bank checks.

Electronic Funds Transfer Networks. Electronic funds transfers (EFT) describe any transfer of funds not initiated by a written instrument that originates through an electronic terminal, telephone, computer, or magnetic storage device and authorizes a financial institution to debit an account. Examples include point-of-sale transfers, automated teller transactions, direct-deposit of funds, and transfers initiated by telephone pursuant to a pre-arranged plan.

EFT transactions can be divided into two broad categories: commercial transactions and consumer transactions. The former arise when an originating institution uses an automated clearinghouse to collect payments from or make payments to consumers and corporate entities. The latter encompass all retail banking services, such as deposits, withdrawals, and queries. These retail transactions are facilitated by point-of-sale systems and automated teller machines, or ATMs.

Escrow Institutions, Other Than Real Estate. Escrow institutions hold written agreements entered into among three parties and deposited for safekeeping with the third party as custodian. It can be delivered to the receiving party only upon the performance or fulfillment of some pre-arranged condition. The escrow institution is legally obligated to adhere to the terms of the agreement with respect to the involved parties.

Fiduciary Agencies, Other Than Real Estate. A fiduciary agency is an organization entrusted with certain property of a principal for a specified purpose. The fiduciary agency is required to act in the best interests of the principal in achieving the goals outlined in the trust instrument.

Foreign Currency Exchanges. Foreign currency exchanges convert one type of currency into another at a given exchange rate. That rate is determined by the supply and demand of the desired currency plus processing fees and/or commissions charged by the retail institution. Commissions are either fixed or a percentage of the total amount of currency purchased. Many of these agencies are affiliated with banks or travel agencies and are usually located in areas frequented by tourists.

Money Order Issuance. Money orders are a type of credit instrument that allow the payment of money to the named payee through a safe means without the use of a checking account. Money orders can typically be issued by commercial and savings banks, as well as other institution such as the U.S. Postal Service and American Express Company.

Regional Clearinghouse Associations. Automated clearinghouses are assembled in regional networks to facilitate the clearing of accounts within and between regions. All of the automated clearinghouses participate in an interre-

gional network that enable them to exchange electronic payments with others throughout the United States. The Automated Clearing House (ACH) Network is a nationwide batch-oriented electronic funds transfer system governed by the NACHA operating rules. The rules provide for the interbank clearing of electronic payments for participating depository financial institutions. The American Clearing House Association, the Federal Reserve system, Electronic Payments Network, and Visa are central clearing facilities through which financial institutions transmit or receive ACH entries. In 1998, 5.3 billion ACH transactions were processed with a total value exceeding \$16 trillion.

Representative Offices of Foreign Banks. A representative office is a facility set up with an agent or officer of the foreign bank who is empowered to act on behalf of the bank. A representative office typically handles only a limited amount of business, serves to maintain contacts and look for new business opportunities. They generally do not process financial transactions or perform similar activities handled by branches or at the main office.

Safe Deposit Companies. Safe deposit companies are institutions organized to provide facilities for the systematic safekeeping of securities, contracts, wills, insurance policies, jewelry, and any other valuable documents and property. These organizations exist alone or as a part of a larger institution such as a bank or trust company. A customer leases a box for a fixed period, usually on an annual basis. The customer is then assigned a box that can only be unlocked when two keys are used. One of these keys is given to the individual, and the other is retained by the company. The institution becomes responsible for the safety of the stored goods. The box is kept in a large vault, entry is strictly controlled, and positive identification is required. Safe deposit companies are state-chartered, similar to state banks.

Travelers' Check Issuance. Travelers' checks are international checks that are not drawn on any specific bank, but are payable at virtually all banks worldwide. These checks are guaranteed by well-known institutions, such as international credit card companies like American Express or Visa. These instruments offer a convenient and safe form of currency and can be purchased from most banks for a 1 percent fee. If travelers' checks are lost or stolen, no loss is likely to be incurred since only the payee could cash them and the counter signature has to be written in the presence of the person cashing them. The owners of travelers' checks are typically reimbursed for their loss, as long as the second signature was not written.

SIC 6111

FEDERAL AND FEDERALLY SPONSORED CREDIT AGENCIES

This classification includes establishments of the federal government and federally sponsored credit agencies primarily engaged in guaranteeing, insuring, or making loans. Federally sponsored credit agencies are established under authority of federal legislation but are not regarded as part of the government. They are often owned by their members or borrowers.

NAICS CODE(S)

522293 (International Trade Financing)

522294 (Secondary Market Financing)

522298 (All Other Non-Depository Credit Intermediation)

INDUSTRY SNAPSHOT

The federal government created several organizations to provide services to communities where they otherwise would not be available or would not be affordable. It also created entities to encourage activities that are seen to be in the national interest. Most of these services are targeted at rural communities. Due to the sparse populations in these areas, as well as the instability of local income-producing enterprises, it is often not profitable for private firms to provide services such as credit and telephone services. In other cases, such as student loan financing, the government has an interest in promoting and encouraging the field's continued vibrancy.

Rural lending in particular is often affected by peripheral circumstances in the industry. The consolidation of banks in the later decades of the twentieth century (the number of commercial banks decreased by 45 percent between 1984 and 2002, from 14,496 to 7,966) tended to have a negative impact on rural lending, particularly when rural banks were merged with larger urban banks. According to the *Journal of Agricultural Lending*, "larger regional institutions may not have the same expertise or motivation to reinvest in local production processes." Also of concern was the 69 percent decrease in

Farm Credit System associations from 377 in 1998 to 118 in 2001.

The organizations in this industry classification, while government sponsored, should not be strictly interpreted as government organizations. In fact, they are typically more private than public. The board and chief executive officer are typically appointed by the president of the United States, and its operations are nominally overseen by a cabinet-level secretary; however, the day-to-day operations of the organization are left to the staff. Furthermore, these agencies operate under the assumption that they are accountable for their continued financial well-being. The operational details of these organizations can vary greatly.

ORGANIZATION AND STRUCTURE

A wide variety of agencies are included under this classification. These agencies are described below.

Banks for Cooperatives. The first U.S. banks for cooperatives were established in Massachusetts. A law was passed May 14, 1877, authorizing the establishment of cooperative savings fund and loan associations. These associations later became known as cooperative banks. Cooperative banking takes several forms: building and loan associations; credit unions; federal land bank associations; labor banks; savings and loan associations; and savings banks.

Commodity Credit Corporation. The Commodity Credit Corporation (CCC), originally incorporated in Delaware in 1933, was operated and managed in close affiliation with the Reconstruction Finance Corporation. In 1939 the CCC became part of the Department of Agriculture, and in 1948 the CCC became an agency of the United States under a permanent federal charter.

The amended charter authorized the CCC to support prices of agricultural commodities through loans, purchases, payments, and other operations; support production and marketing of agricultural commodities; procure agricultural commodities for sale to other government agencies, foreign governments, and domestic, foreign, or international relief or rehabilitation agencies; dispose of surplus agricultural commodities; and establish policies to increase domestic consumption of agricultural commodities through the development of new markets, marketing facilities, and uses.

The CCC normally uses the customary conventions and mechanisms of trade and commerce to pursue its purchasing and selling operations and in storing, transporting, processing, and handling commodities, which often entails contracting the use of plants and facilities. The CCC has authority to acquire equipment, as well as to rent or lease office space. The CCC is not allowed to acquire real property or any interests in real property

except to protect its financial interests and to provide adequate storage facilities. Cold storage facilities may only be built or bought when Congress has approved money to do so.

The operations and activities of the CCC are administered by the Agricultural Stabilization and Conservation Service (ASCS), an organization within the Department of Agriculture. The operations of the CCC are governed by the Food Security Act of 1985. This act extended CCC support of sugar beets and sugarcane and continued the soybean loan support program and quotas for peanuts. The Farm Act also authorized the CCC to offer commodity marketing loans to enhance U.S. competitiveness abroad, make rental payments to producers to move erodible land from production, intervene in dairy markets to support prices, and make payments to dairy producers to eliminate excess capacity. Finally, the act continued the previous "target price" system to augment commodity loans in supporting farm income and prices. "Target prices" form the basis on which agricultural subsidies are calculated. These subsidies, applied to wheat, feed grain, cotton, and rice producers who conform to specified standards and are eligible to receive subsidy payments are equal to the difference between the target price and the higher price of the market or the CCC loan value of the commodity.

To finance its activities, the CCC borrows from the U.S. Treasury, as well as from private lenders. The CCC is managed by a board of directors, which is chaired, *ex officio*, by the Secretary of Agriculture. The remainder of the board consists of six directors who are appointed by the president with the advice and consent of Congress. Not more than three of the directors may be of the same political party. The board is required to meet at the Secretary's convenience at least every 90 days.

Export-Import Bank. The Export-Import Bank (Eximbank) was incorporated in 1934 under the laws of the District of Columbia. The receipts and disbursements of the bank were removed from the U.S. budget by the Export Expansion Finance Act of 1971. The Export-Import Bank Act, as amended by legislation in 1968, provides for a board of directors consisting of five members. The members, appointed by the president with the advice and consent of Congress, consist of the president of the Eximbank, who serves as the board's chairman, the vice president, and three others. Of these, not more than three may be of the same party.

The primary objective of the bank is to aid in financing exports and imports as well as facilitating international trade and the exchange of commodities between the United States and foreign countries. The Export-Import Bank Act was designed to encourage the use of private capital for trade purposes but considers other

factors in making loans not typically associated with corporate lending, including human rights considerations, adverse effects on U.S. industry, scarcity of materials, and domestic employment.

The Eximbank offers several programs. These include direct credits to borrowers outside the United States, export credit insurance, and export credit guarantees. The Eximbank also participates in the Foreign Credit Insurance Association (FCIA) with the insurance industry. The FCIA was established in 1961 to provide credit protection for U.S. exporters. The policies issued by the FCIA insure repayment in case of default by foreign buyers. These policies cover medium- and short-term transactions. The Eximbank also guarantees repayment to those commercial banks that finance these types of transactions as well as insuring service contracts and leases. Eximbank loans carry the lowest interest rate allowed by the Organization for Economic Cooperation and Development (OECD).

Farmers Home Administration. The Farmers Home Administration (FHA), a division of the Department of Agriculture, operates under Title V of the Housing Act of 1949; the Consolidated Farmers Home Administration Act of 1961; and Part III, Title A, of the Economic Opportunity Act of 1964. It was originally established under the Farmers Home Administration Act of 1946.

The Farmers Home Administration operates primarily in rural areas of the United States and takes applications for loans in a wide range of areas. The applications are reviewed and approved by a local committee, which is composed of three people, at least two of whom must be farmers. The money for the loans and grants made by the Farmers Home Administration comes from appropriations from Congress and private lenders who make loans, which are guaranteed by the agency. Most of the loans offered are of the latter type.

Loans made by the Farmers Home Administration include operating loans to small family farmers who cannot get the credit needed to make improvements and adjustments needed for successful farming, recreation, and nonfarm enterprises. Operating loan borrowers are expected to refinance their operating loans as soon as it is feasible to do so. Other loans available to farming families from the FHA are farm ownership, individual soil and water conservation, and recreation loans; these loans allow farmers to buy or extend their existing farms or ranches. Individual soil and water conservation loans help farmers in developing, conserving, and making proper use of their land and other resources, while recreation loans allow farmers to convert part of their existing land to income producing recreational land.

The FHA also is empowered to make additional loans for various purposes. These include loans to Indian

tribes and tribal corporations for the acquisition of lands within the reservation or community; loans to farming associations to develop communal resources such as irrigation projects; rural housing loans to families of low and moderate income in areas with a population of not more than 20,000 where there is a lack of housing mortgage credit; emergency loans to farmers in areas affected by natural disasters to resume farming operations; watershed protection and flood prevention loans to local communities to finance projects that protect and develop land and water resources in small watersheds; loans for natural resource conservation and development in specified areas; emergency livestock guarantees to lenders making loans to ranchers to continue operations during difficult periods; and rural industrialization and development loans to local community organizations for the purpose of improving the economic and environmental climate in the community.

Federal Home Loan Mortgage Corporation. The Federal Home Loan Mortgage Corporation (FHLMC), or Freddie Mac, was established in 1970 under Title II of the Emergency Home Finance Act of 1970. This agency was established to strengthen the secondary markets in residential mortgages insured by the FHA or guaranteed by the Veterans' Administration. The agency also helps develop secondary markets for non-federally insured or guaranteed residential mortgages. The agency buys mortgages from members of the Federal Home Loan Bank System and other financial institutions that are insured by agencies of the U.S. government. The agency then repackages and sells these loans.

The capital stock of the FHLMC consists of one class nonvoting shares of common stock, which are only issuable to the 12 Federal Home Loan Banks. The board is composed of three members of the Federal Home Loan Bank Board, whose chairman is also the chairman of FHLMC.

The FHLMC was created to encourage the growth of secondary markets for residential mortgages in order to increase the effective supply of these mortgages by making these investments more attractive. The agency developed a standardized home loan application and single-family appraisal report, as well as uniform documents for mortgages. The agency introduced an automated underwriting system in 1972 and the guaranteed mortgage certificate (GMC) in 1975. Although the Federal Home Loan Mortgage Corporation is an organization created under the auspices of the U.S. government, it is not considered a federal agency. It is taxable under relevant federal laws.

Federal Intermediate Credit Bank. Title II of the Federal Farm Loan Act of 1923 established the 12 Federal Intermediate Credit Banks (FICBs). These banks were created to discount or buy short- and medium-term

notes from commercial banks and other financial institutions holding notes of farmers and ranchers. The capital stock of the FICBs are owned by production credit associations, local credit cooperatives organized under the Farm Credit Act of 1933.

The FICBs work closely with the various production credit associations (PCAs). PCAs are primary lenders that provide rural communities with short- and medium-term credit for operating, capital, and other needs. These loans vary in maturity length from a few months to seven years. The PCAs often work in conjunction with commercial banks to provide these services to rural customers. As primary lenders, the PCAs sustain losses to the extent of available resources. The PCAs adopted mutual loss sharing, participating loan plans, or both to spread the risk. The borrowers of the individual PCAs elect the board of directors.

The FICBs loan money to farmers, ranchers, producers and harvesters of aquatic products, operators providing farm services, and rural residents. They make loans to discount commercial paper for local financial institutions. The FICBs also help the production credit associations make sound credit available in rural areas. FICBs issue stock and sell participation certificates to raise capital. While the majority of their loans are made for production purposes and mature within one year, farm and rural home loans may have extended terms of up to 10 years and loans to producers and harvesters of aquatic products may be made for up to 15 years.

Federal Land Banks. The Federal Land Banks complement the mission of the Federal Intermediate Credit Banks by offering long-term farm mortgage loans. The Federal Land Banks were created by the Federal Farm Loan Act of 1916. This act also created the Federal Land Bank associations—local farmer borrowing associations through which the Federal Land Banks make loans. The stock of the Federal Land Banks is owned by the Federal Land Bank associations whose stock is owned by farmers and ranchers who are members of the association as well as borrowers.

Federal Land Banks mortgage loans may not exceed 85 percent of the appraised value of the property (97 percent if the loan is guaranteed by a government agency) on terms of 5 to 40 years. The majority of the loans have a 20-year maturity. Each borrower is required to buy stock in the local association equal to 5 percent of his loan, and the association is required to buy an equal amount of stock in the district's Federal Land Bank.

Federal National Mortgage Association. The Federal National Mortgage Association (FNMA), or Fannie Mae, was created by the Reconstruction Finance Corporation in 1938. The FNMA became a government-sponsored private corporation through Title VIII of the Housing and

Urban Development Act of 1968. It is responsible for secondary mortgage operations for home mortgages.

As a government-sponsored organization, the FNMA is accorded certain advantages not normally accorded to business corporations. The Secretary of the Treasury may buy FNMA obligations at any time, although the corporation's management tries to conduct its business so as to avoid the need to use this option. Another advantage the FNMA enjoys is that its common stock and other securities are exempt from Securities and Exchange Commission (SEC) Laws and regulations to the same extent as U.S. government securities. The FNMA, however, does voluntarily disclose the same information as required by the SEC. Finally, the FNMA is exempt from state and local taxes, except real property taxes.

The corporation's obligations are issuable through the facilities of the Federal Reserve banks. Since the obligations of the FNMA are classified as federal agency securities, they are given favorable consideration by the financial markets. Technically, however, the FNMA's issues are not federal government obligations, nor are they federally guaranteed by the U.S. government. While FNMA is not an agency of the U.S. government, it is subject to federal supervision and oversight from the offices of Housing and Urban Development and Treasury.

Government National Mortgage Association. The Government National Mortgage Association (GNMA), or Ginny Mae, was created in its current form in 1968 after being originally chartered under Title III of the National Housing Act of 1938. It is a corporate organization of the U.S. government with no capital stock or board of directors. The GNMA operates under the supervision of the Secretary of the Department of Housing and Urban Development.

The GNMA is involved in several programs related to residential mortgage finance. These projects include: 1) special assistance in the financing of federally underwritten mortgages (typically the GNMA buys the mortgages from private lenders at below market prices and sells them to private investors at market prices); 2) management and liquidation of the portfolio of existing mortgages; 3) management of the Government Mortgage Liquidation Trust, Small Business Obligations Trust, Federal Assets Liquidation Trust, and Federal Assets Financing Trust; 4) guaranty of the timely payment of principal and interest on trust certificates and other securities issues by the Federal National Mortgage Corporation, as well as its own mortgage backed securities and those of other approved organizations.

National Consumer Cooperative Bank. The National Consumer Cooperative Bank was established in 1978 by the National Consumer Cooperative Bank Act. The mission of the bank is to encourage new and existing consumers and

self-help cooperatives in the areas of health care, housing, consumer goods, and other public interests. The bank helps improve the quality of available goods and services to consumers. To accomplish this goal the bank makes loans to credit-worthy cooperatives at market interest rates. Institutions that do not qualify for credit may receive special financial and technical help from the bank's Office of Self-Help Development and Technical Assistance.

The bank is governed by a board of directors that consists of 15 members who are appointed by the president. Eight of these members are appointed from the ranks of the executive department heads, and the remaining seven are experienced members of the public. The bank is an independent financial institution raising capital through the sale of its bonds, debentures, notes, and other instruments. The U.S. government is not responsible for any obligation of the bank.

Rural Electrification Administration. The Rural Electrification Administration (REA) was created in 1935 as an emergency relief program. It was later authorized to continue as a permanent program by the Rural Electrification Act of 1936. The REA was established as a lending agency with responsibility for developing a program for rural electrification. It later expanded its involvement in modernizing rural areas by extending telephone service to rural areas. In 1973 the REA began guaranteeing loans made by private lenders. Since its founding, about 1,000 electric and 900 telephone utility systems have received loans from the REA.

The REA administrator, its chief officer, is appointed by the president subject to U.S. Senate confirmation. The REA operates under the supervision of the Under Secretary of Agriculture for Small Community and Rural Development.

REA loans are made from a revolving fund in the U.S. Treasury, which is replenished through collections on outstanding and future loans, borrowings from the Treasury, and sale of financial instruments. The REA also guarantees loans for large-scale projects. Guarantees are considered for projects if REA loans could have been made to the project. The loan itself may be obtained from any organization qualified to make, hold, and service the loan. All of the policies and procedures of the REA are applicable to the loan.

Student Loan Marketing Association. The Student Loan Marketing Association (SLMA), or Sallie Mae, is a private corporation created in 1972 by amendments to the Higher Education Act of 1965. The mission of the SLMA is to expand the money available for student loans by providing liquidity to educational lenders involved in the guaranteed loan program. As of 2001, Sallie Mae managed \$36.9 billion in guaranteed student loans and had \$46.6 billion in total assets.

The SLMA offers three programs under its student loan program: a loan purchase program; a warehousing advance program; and commitment programs. To provide liquidity for institutions involved in educational loan programs, the SLMA offers a program of loan consolidation, purchase of auxiliary loans, and a program of loan participation. The SLMA is also engaged in a health education assistance program for students. Loans originated under the SLMA's loan programs are either insured or reinsured by the federal government.

After enjoying steady growth during the mid-1990s, Sallie Mae saw its sales plummet nearly 50 percent to \$2.02 billion in 2002. However, its net income rose 106.2 percent between 2001 and 2002 to a total of \$792 million. Sallie Mae employs approximately 6,011 people in its corporate office in Washington, D.C., and in its 10 sales and loan servicing centers. No longer able to rely on government protection from loan default costs, Sallie Mae was as of 2002 in the process of being privatized, a process it planned to complete in 2006.

BACKGROUND AND DEVELOPMENT

While each of these separate entities included under this industry classification has a distinct history and development, certain themes are common to all. Many of the programs were created or are the result of legislation passed in the wake of the Great Depression. The need for these services was most apparent in rural regions of the country, which were some of the hardest hit by the economic downturn of the 1930s. This legislation is collectively known as "New Deal," legislation passed during the Franklin D. Roosevelt administration.

The recession of the late 1980s and early 1990s soured the public's support of government expenditures in all areas, including federally sponsored organizations. This diminished public support led to more intense government scrutiny of proposed spending programs. However, since the organizations in this industry classification are largely self-supporting, they escaped some of the difficulties faced by other purely government programs. The need for the services provided by these organizations continued into the 1990s. As of the early 2000s, many rural communities remained in desperate financial conditions. The recession also caused a general tightening of credit, making many rural borrowers ineligible for credit through other credit agencies.

CURRENT CONDITIONS

While rural community issues are not limited to subjects of agriculture, certain farming trends may affect this industry. Despite industry concerns that banking consolidation might make securing rural loans more difficult, according to the United States Department of Agriculture (USDA), farm debt reached a record \$202 billion

in 2002, exceeding its previous record of \$193.8 billion in 1984. The USDA expects farm debt to increase roughly 4 percent in 2003 to reach \$210 billion. At the same time, farm net worth is predicted to increase due to an increase in asset value greater than the growth of debt. Since the early 1990s, rising farm asset values have helped to offset increasing debt levels. As stated in a USDA report, because farm real estate values have risen faster than farm mortgage debt, “the degree of farmland leverage has declined slightly. This has provided farm investors with an added equity cushion to lessen the impact of any short-term declines in income or asset values.”

Regarding home mortgage trends in the industry, both Freddie Mac and Fannie Mae announced increased limits for single-family mortgages for 2000. The new limit of \$252,700 per single-family mortgage represented an increase of 5.3 percent over the 1999 ceiling for single-family mortgages of \$240,000. Also, the declining home interest rates of the early 2000s, which caused a spike in new home mortgage applications, boosted both profits and sales for Freddie Mac and Fannie Mae.

INDUSTRY LEADERS

The public companies Freddie Mac and Fannie Mae are industry leaders in the sense that they do a relatively larger portion of business in the industry than other lender brokers. One of every six mortgages in the United States is indirectly financed by Freddie Mac. Private competitors in the industry have objected to the unique business hybrid existence of a company like Fannie Mae, complaining that Fannie Mae has a competitive advantage in the lending market. Fannie Mae had sales of \$50.8 billion in 2001, reflecting a one-year sales growth of 15.2 percent. Fannie Mae's net income in 2001 was \$5.9 million, an increase of 32.5 percent. Freddie Mac saw its sales grow 1.7 percent to \$36.7 billion during 2002. The company had net income in 2002 of \$5.7 million, a 39 percent increase from the previous year.

WORKFORCE

Organizations covered in this industry classification range in workforce size from 11,000 to 225,000 employees. These employees represent all of the disciplines found in the private lending sector, including secretaries, financial analysts, managers, and clerks. These organizations are affiliated with the government to some degree and thus have many employees in the Greater Washington, D.C., area. Similarly, many of the organizations serve rural constituencies, so many employees involved with those organizations live in communities of fewer than 50,000.

SIC 6141

PERSONAL CREDIT INSTITUTIONS

This category covers establishments primarily engaged in providing loans to individuals. Also included in this industry are establishments primarily engaged in financing retail sales made on the installment plan and financing automobile loans for individuals.

NAICS CODE(S)

522210 (Credit Card Issuing)
522220 (Sales Financing)
522291 (Consumer Lending)

INDUSTRY SNAPSHOT

“Credit” is derived from the Latin word “credo,” which means “I believe.” It typically refers to a purchase or the power to make a purchase of goods for enjoyment in the present while deferring payment to a future date. Thus, the transaction consists of a transfer and delivery of goods in the present in exchange for a promise of future payment.

The granting of credit depends upon three factors: character, capacity, and capital. Each of these factors introduces some risk into the transaction. The risk of lending on character is called “moral risk.” The risk of lending on capacity is called “business risk.” The risk of lending on capital is called “property risk.” An ideal borrower will meet a minimum of requirements set for evaluating each of these three risks.

Since it is impossible for most companies to determine how their credit applicants are ranked in each of these categories, they must obtain their information from centralized sources. These sources are credit-reporting agencies. Credit reporting agencies keep files of information on all consumers who have made credit transactions at some point in their lives. Credit granting institutions may purchase these files to evaluate the “credit worthiness” of individual applicants. Since misuse or abuse of these files can be financially detrimental to the consumer, the credit reporting industry is heavily regulated. Adverse information must be removed within seven years—except bankruptcy, which remains in a credit file for 10 years. Disputed information that cannot be verified must be removed, and access to the file must be granted for the individual concerned. Finally, the information may only be given to authorized users.

The personal credit industry encompasses many diverse organizations. These participants range from General Motors Acceptance Corp. (GMAC), with 2001 sales of \$25.4 billion and 29,390 employees, to tiny one-office credit firms with a handful of staff and assets under \$1 million.

The U.S. economic recession in the early 2000s helped fuel consumer debt levels, as well as personal bankruptcies, to record highs. While many personal credit institutions experienced increased business as a result of the increased debt load carried by consumers, these businesses were also faced with the increased likelihood of loan defaults.

ORGANIZATION AND STRUCTURE

Personal credit transactions are regulated by the Uniform Commercial Code (U.C.C.) and the Uniform Consumer Credit Code (U.C.C.C.). Additionally, a number of pieces of legislation are designed to protect the consumer, including the Fair Credit Reporting Act. Each of the various entities that constitute this category has varying organizations and structures.

Automobile Loans. Since automobiles are too expensive for most individuals to purchase with cash, most new car purchases are made with the assistance of automobile loans; these types of loans are typically made by banks and finance companies. This type of consumer lending typically has a maturity of 8 months, although maturities of 60 months and longer are not uncommon.

Automobile loans may be either direct or indirect. Direct automobile loans are made to the consumer to purchase an automobile and are secured by a chattel interest in the auto. Indirect automobile loans are made by the auto dealer. Under this arrangement the dealer collects the required information from the consumer and furnishes it to the bank. The bank then either accepts or

rejects the applicant. Usually the dealer packages the loans in bundles and sells them to banks; these loans tend to have higher delinquency rates than direct loans.

The automobile loan is the most common type of consumer loan, accounting for more than 40 percent of all consumer credit. Normally consumers spend about 5 percent of their income on automobiles, down from nearly 7 percent in the 1970s. Banks, however, make less than 40 percent of all automobile loans. The remainder of the loans are made by auto manufacturers’ financing divisions. These financing entities offer below market rates, as well as more flexible financing options to stimulate the sales of their products.

Banks also offer “floorplan” financing to support dealers’ leasing programs. “Floorplan” financing, or trust receipt financing, is a form of inventory financing under which the bank holds title to the automobile inventory. The automobile dealer is considered the borrower in these transactions and is loaned funds to buy the inventory from suppliers. The dealer holds the inventory in trust for the bank and then sells inventory to consumers. Subsequently, these proceeds are paid to the bank, but the dealer keeps the mark-up of the retail price over the payments due the bank. When the sale is made on a credit basis, the dealer often sells the obligation to the bank.

Consumer Finance Companies. Consumer finance companies are small loan companies that specialize in personal loans under the small loan laws of the various states. These establishments are often called personal finance companies.

Financing of Automobiles, Furniture, Appliances, Personal Airplanes, etc., Not Engaged in Deposit Banking. The financing of personal property is included under the general title of consumer credit. Consumer credit is the short- and medium-term debt owed by individuals to financial institutions, retailers, and other distributors for financing consumer purchases of goods and services, but not including real estate mortgages and insurance policy loans. In 1995 the total consumer installment credit outstanding was \$1.02 trillion. Of that, \$353.3 billion was for automobile loans, \$395.2 billion was for credit card loans (plus bank overdraft privileges and the like), and \$276.2 billion was for other types of loans.

Due to the disparate positions of the creditor and consumer in negotiating credit terms, the government regulates this industry very heavily. The Consumer Credit Protection Act of 1968 assures that every consumer with a need for credit is given meaningful information with respect to the cost of that credit. This means that the dollar amount of the finance charge, as well as the annual percentage rate computed on the unpaid balance, must be disclosed. Other information must also be disclosed to allow the consumer the opportunity to read-

ily compare the various credit terms offered by different sources.

The Consumer Credit Protection Act and other related regulations apply to banks, savings and loan associations, department stores, credit card issuers, credit unions, automobile dealers, consumer finance companies, hospitals, and any other organizations that extend or arrange credit to which a finance charge is added. Residential mortgage brokers, craftsmen, doctors, dentists, and other professionals are also subject to these regulations. The act does not apply to business and commercial credit (governed by the U.C.C.), credit to government entities, transactions covered by the SEC, and credit over \$25,000 except for household and agricultural uses.

Interest on consumer credit transactions is typically computed in one of two ways. For open-end credit accounts with credit cards and revolving charge accounts in retail stores, finance charges are imposed on unpaid balances each month. To determine the monthly finance charge rate, the annual rate is divided by 12. For example 1.5 percent might be applied per month for an annual rate of 18 percent. For other forms of credit, including loans and sales credit, the total amount, number of payments, and due dates are negotiated with the consumer. Examples of these transactions include an automobile loan or the purchase of a large appliance on department store credit.

Installment Sales Finance, Other Than Banks.

Installment sales are sales of goods under a definite schedule of payments, which involve a specified cash outlay as a down payment with the balance payable in agreed upon periodic installments until the item is paid for. This type of sale is a relatively recent phenomenon. Before 1922, installment sales were confined to a small number of retail outlets, typically those specializing in lower quality merchandise. In the late 1920s, this type of transaction became more popular after its success in the automotive industry and intense promotion by consumer finance companies. Automobile sales have been the most prevalent form of installment sales through the present day.

Installment sales are based on one of two legal documents. The first is a conditional sales contract under which the title, or ownership, of the item remains with the seller. The second is the chattel mortgage under which the buyer holds title subject to a lien in favor of the seller. As the various states have detailed and complex legislation on conditional sales, most creditors favor the chattel mortgage, which is governed by Article 9 of the U.C.C. Under this process, the buyer signs a promissory note, secured by the product, that constitutes a promise to repay the debt. The mortgage will typically contain an acceleration clause (causing the entire debt to come due upon certain conditions that indicate default) and a power of sale clause (allowing the seller to repossess the

item and sell it subject to certain conditions that indicate default).

Other terms may also be present in chattel mortgages. A "balloon" installment plan is one under which the initial payments are small but a later one is very large, usually requiring refinancing. Another financing plan is the "open end" type of chattel mortgage under which additional purchases may be made on an installment basis. Under this arrangement the seller retains a lien on all of the purchased goods whether they have been paid for or not. If the buyer defaults on a later purchase, the seller may repossess all of the items purchased. While many of these provisions still exist, the current trend is toward consumer-oriented legislation that renders such excessively punitive practices illegal or non-binding.

The following are some of the most important pieces of federal legislation regulating consumer credit:

The Consumer Credit Protection Act of 1968. The key provisions of this act are: Title I, the Truth-in-Lending Act, which provides for consumer credit cost disclosure; Title II, which contains penalties for extortionate credit transactions; Title III, which contains restrictions on garnishments; and Title IV, which provides for the establishment of the National Commission on Consumer Finance to report and make recommendations to Congress on consumer credit topics. Title V pertains to the issuance of credit cards, liabilities of credit card holders, and the fraudulent use of credit cards. Title VI contains provisions relating to credit information and credit reports and gives credit consumers the right to confront the preparers of credit reports and correct any misstatements of facts contained in such reports. The act also prohibits unwarranted disclosure of the information contained in these reports, requires the elimination of erroneous information, and protects against unfair credit reporting practices.

The Fair Credit Billing Act, an amendment to the Truth-in-Lending Act, states that consumers shall have fair methods available for the correction of billing errors.

The Equal Credit Opportunity Act declares that creditors cannot discriminate against consumers seeking credit on the basis of sex or marital status.

The Real Estate Settlement Procedures Act requires that a standard real estate settlement form be developed in compliance with the provisions of the Truth-in-Lending Act for use in all transactions involving federally funded or secured mortgage loans. This form includes a clear and conspicuous itemization of all settlement charges imposed upon the buyer and seller, as well as greater disclosure of the nature and costs of real estate settlement charges.

The Home Mortgage Disclosure Act requires that mortgage lending be free of discriminatory bias and requires that depository institutions with offices in metro-

politan areas and with assets of over \$10 million identify the geographic distribution of their home mortgage loan.

The Consumer Leasing Act, another amendment to the Truth-in Lending Act, requires that consumers be provided with full information regarding the terms of their leases of personal property, including open-end and closed-end vehicle and furniture leases.

The Fair Debt Collection Practices Act makes abusive and deceptive debt collection practices illegal for those the act defines as debt collectors, as opposed to the primary lender.

The Truth-in-Lending Simplification and Reform Act exempts all extensions of credit for agricultural purposes from the disclosure provisions of the Truth-in-Lending Act, eliminates disclosure requirements calling for periodic statements from lenders in connection with closed-end credit transactions, and allows an exception to the "cooling off" period for consumers who pledge their homes as collateral in open-end credit arrangements.

The Installment Sale Revision Act liberalizes the rules for postponing tax on property that is sold on the deferred payment basis.

Most of this legislation was passed between the late 1960s and mid-1970s in response to a broader concern for consumer protection. Currently, the consumer credit industry is one of the most heavily regulated segments of the economy.

As installment selling has become more established, commercial banks have also become involved in this industry. To remain liquid, finance companies and retailers often sell these obligations, or chattel paper, to banks or factors. The bank pays cash, normally at a discount, to the seller who turns the buyer's obligation over to the bank.

In the late 1970s, the Carter Administration attempted to restrain consumer credit to curb inflation. The Board of Governors of the Federal Reserve System implemented several programs in compliance with this broader policy, including a voluntary credit restraint program; a program of restraint on specified types of consumer credit, including credit cards, check overdraft plans, unsecured credit, and secured credit, where the proceeds are not used to finance the collateral; an increase in the marginal reserve requirement on managed liabilities of Federal Reserve member banks and a decrease in the base amount on which these charges applied; a 10 percent deposit requirement on managed liabilities of non-member banks and a 15 percent deposit requirement on any increase of money market funds over the March 14, 1980, base period; and a surcharge on frequent discount borrowing by large Federal Reserve member banks.

Morris Plans Not Engaged in Deposit Banking. Morris Plans are named after Arthur J. Morris who founded a

system of personal loans in 1910 at the Fidelity Savings & Trust Co. of Norfolk, Virginia. Morris Plan loans are made on a monthly repayment basis, with the first month's installment deducted from the face value of the loan and the remaining balance. This arrangement makes the effective interest rate about twice the nominal rate. Because of the permissive banking laws effective at the time, the plan evolved as a loan for the amount desired, nominally to purchase an investment certificate, to be paid for in monthly installments with the credit for the payments going to the certificate rather than the loan account. A variation on this scheme credited the monthly payments to a deposit account. Thus, under either scenario, the effective rate of interest, about twice the nominal rate, did not violate usury laws. Currently, several states have modified their banking laws to allow Morris Plans, avoiding the need to resort to legal actions.

In addition to providing loan funds, Morris Plans also provide life insurance for borrowers. Borrowers can purchase life insurance policies for the full amount of their loans; if the borrower dies while the loan is outstanding, the insurance would be applied to the full amount of the loan, and the remainder would be paid to the family or estate.

Mutual Benefit Associations. Mutual Benefit Associations, or Mutual Associations, are savings banks, savings and loan associations, insurance companies, and credit unions that are not organized under state corporation laws as stock corporations but are owned by their depositors, policyholders, or members. In the mid-1990s, these included mutual savings banks, savings and loan associations, and credit unions. Savings and loan institutions are either state or federally chartered and deposit insurance is available from state and federal insurance agencies for these institutions.

Mutual savings banks, savings and loans, and credit unions are permitted to sell federal mutual certificates, which allow these institutions to efficiently build their net worth and reserves. These certificates are obligations that are subordinated to savings accounts, savings certificates, and debt obligations of the mutual benefit association. The target net worth-to-resources ratio is 3 percent and the desired net worth-to-liability ratio is 6 percent.

Personal Finance Companies, Small Loan: Licensed. These organizations specialize in personal loans, which are cash loans to individual borrowers for such purposes as refinancing payments on medical bills, taxes, and insurance premiums. These companies also provide cash for transactions that will permit cost savings for borrowers.

The industry is very closely regulated. Personal finance companies are subject to related statutes in all 50 states, the District of Columbia, and Puerto Rico. Most of the loans made by these companies are subject to a state

version of the Uniform Small Loan Law or the Model Consumer Finance Act. These institutions are also subject to state laws that regulate sales financing and revolving credit, insurance premium financing, home repair financing, second mortgages on homes, and usury laws. Personal finance companies must also comply with the Uniform Consumer Credit Code and the Federal Consumer Credit Protection Act.

Personal loan companies operate either as chains with many locations or as independent offices. The primary customers of these institutions are wage earners in the lower income bracket. To target these customers, most personal loan companies are located in industrial centers and urban areas where they can generate sufficient volume or in jurisdictions that allow them to charge the high interest rates necessary to maintain profitability.

Most of the receivables of these companies are unsecured. They are most concerned with the ability of the borrower to repay the obligation out of monthly income as opposed to the ability to repossess and liquidate security. Because of the frequently urgent nature of such loans, the application process tends to be simplified and streamlined.

Personal finance companies, also known as consumer credit companies or small loan companies, have been instrumental in educating consumers in the management of personal finance, particularly in advising against over-borrowing and improper management of personal finances.

BACKGROUND AND DEVELOPMENT

While each of the separate entities included under this industry classification has a distinct history and development, there are issues that are common to all.

As the American economy has become more consumer oriented, many options that allow consumers easier access to products have been created. Most of these fall under the personal finance industry. By the mid-1990s, personal finance was one of the largest and most aggressive sectors of the broader finance industry.

From the late 1960s to the mid-1970s, a wave of regulations were passed by Congress in response to the public's demand for greater protection from unfair practices by the government. This wave of regulation was designed to protect the consumer from unfair credit collection practices and unconscionable credit terms by requiring creditors to adhere to stricter standards and fully disclose consumer credit terms.

Many personal credit institutions sell their loans to other companies. This frees money for new loans and investments. While this practice is not new, it intensified during the early 1990s. In other cases, the loans are serviced for a fee by companies other than the lender, which allows the loan originator to free resources nor-

mally used in processing loan-related paperwork. The booming economy of the mid-1990s allowed credit companies to prosper. GMAC, for example, saw its total assets rise by \$8 billion from year-end 1995 to year-end 1996. The company operates from nearly 600 offices worldwide and services 7.2 million customer accounts. GMAC's primary business remains what it has always been, financing consumer purchases of new cars. But the widely diversified company also finances home mortgages, home equity loans, various insurance products, and other lines of business. Since its founding in 1919, GMAC extended \$870 billion in credit to help finance more than 138 million vehicle purchases.

The competition between credit card companies intensified in the late 1980s and early 1990s, as consumer confidence decreased and the public grew more reluctant to buy on credit during the prolonged recession. In 1993, MasterCard International Incorporated had the largest change in volume, with a 23 percent increase, compared with 16 percent for Visa International and 10 percent for American Express Company. Most of this difference was attributed to MasterCard's aggressive co-branding program. In co-branding, a card issuer joins with another organization, a car manufacturer for example, to offer a card jointly with benefits from both companies including rebates on purchases from the co-branding company. By the end of 1993, MasterCard had issued 25 million co-branded cards to consumers.

U.S. Banker reported that consumer debt was on the rise again by the end of 1997. The American Bankruptcy Institute of the Administrative Office of the United States Courts reported that consumer debts during the 1990s grew twice as fast as mortgage debt, which grew 60 percent faster than consumer earnings. The personal loan industry was also challenged by the trend of increasing personal bankruptcy; in 1996, for example, \$30 billion of consumer debt in the United States was discharged in bankruptcy, leaving credit agencies with nothing. Credit agencies took preventative measures to try to slow the trend, including raising interest rates and putting more effort into collections.

Personal credit agencies also looked to form new alliances with credit counseling agencies in an attempt to stave off the effects of consumer bankruptcy. Visa, for example, ran 70,000 radio information spots in 1997 to persuade debt-ridden customers to consider working with credit counseling agencies. The National Foundation for Consumer Credit reported in 1997 that it expected to counsel 1.5 million consumers, a 20 percent increase from the previous year.

CURRENT CONDITIONS

The late 1990s marked a period of unprecedented spending in the United States. When the economy began

to weaken in 2000, consumer debt began to climb to record levels. The average consumer credit card debt in American households grew from \$7,842 at the end of 2000, to \$8,234 at the end of 2001, and \$8,940 by the end of 2002. Between 2001 and 2002, credit card debt grew 8.5 percent, and since 1997, credit card debt has grown 36 percent.

Because of this mounting debt, along with higher unemployment levels, some analysts predict that personal bankruptcies will increase by 8 percent in 2003 to reach 1.65 million. During the last three months of 2002, bankruptcy filings reached a record 395,129. Between 2001 and 2002, personal bankruptcies grew 5.7 percent to reach more than 1.57 million.

Bank credit cards account for roughly 18 percent of personal consumption expenditures made by U.S. consumers. Retail credit cards and debit cards account for another 6 percent. According to CardWeb.com Inc., debit and credit cards will account for roughly 30 percent of all U.S. personal consumption expenditures.

Advertising spending by the leading credit card networks, including Visa, MasterCard, Discover, and American Express, exceeded \$800 million in 2001. Marketing dollars spent by individual card issuers, such as banks, totaled roughly \$10 billion that year. Some analysts predict that credit card advertising efforts may wane in 2002 and 2003, due to adverse market conditions. In particular, personal credit institutions that offer credit to those individuals labeled credit risks are expected to curb their marketing expenditures.

INDUSTRY LEADERS

As of December 31, 2001, the top 10 bank credit card issuers in the United States were Citigroup, MBNA America, Bank One, Chase, Capital One, Provident, Bank of America, Household Bank, Fleet, and Direct Merchants. Combined, they held a 78 percent share of the U.S. credit card market.

Visa operates as the leading consumer payment brand in the world, ahead of both MasterCard and American Express. Total Visa cards in circulation, including credit cards and other types of payments cards, exceeded 1 billion as of 2002.

In the U.S. automobile financing sector, the market leader in the early 2000s was GMAC, which held assets of roughly \$200 billion in 2002. Other leading automobile financiers include Ford Motor Credit Co. and Toyota Motor Credit Corp.

WORKFORCE

This industry classification includes many diverse employers who employ anywhere from 20 to 20,000 workers. The employees in this field represent diverse

backgrounds in the finance industry and its related support services. These workers include bankers, tellers, loan officers, secretaries, and security personnel.

RESEARCH AND TECHNOLOGY

In the late 1990s, credit companies that had been forced to downsize adopted the use of new technology to compensate for previous staff functions. According to *Business Credit*, such technology allowed personal credit agencies to maximize efficiency and increase productivity. The technology that the industry adopted generally included software that addressed accounts receivable functions or addressed task-specific applications. According to a 1999 survey by *Business Credit*, companies generally spent amounts ranging from a few hundred dollars to \$100,000 for such software. The survey noted that the personal credit industry would be expected to interface increasingly with the Internet. An example of such an interface is provided by the Internet company Creditland, which was founded in 1998 and directs consumers to good matches for personal loans, auto loans, mortgages, or credit cards.

SIC 6153

SHORT-TERM BUSINESS CREDIT INSTITUTIONS, EXCEPT AGRICULTURAL

This industry includes establishments primarily engaged in extending credit to business enterprises for relatively short periods. Private establishments primarily engaged in extending agricultural credit are classified in **SIC 6159: Miscellaneous Business Credit Institutions**.

NAICS CODE(S)

522220 (Sales Financing)

522320 (Financial Transactions Processing, Reserve, and Clearing House Activities)

522298 (All Other Non-Depository Credit Intermediation)

INDUSTRY SNAPSHOT

Credit generally refers to a purchase, or the power to make a purchase, of goods for use in the present—with payment deferred to a future date. Granting credit typically depends upon three factors: character of the borrower, capacity to repay, and capital used as collateral. Each of these factors introduces some risk into the transaction. The risk of lending on character is called “moral risk,” the risk of lending on capacity is called “business risk,” and the risk of lending on capital is called “property risk.” An ideal borrower will combine a minimum of each of these three risks.

Lenders are often not in a position to evaluate a business against these criteria as easily as they could with an individual. Consequently, they may contact either general or special mercantile agencies to find needed information. General agencies, such as Dun & Bradstreet, collect information on a wide range of business enterprises nationwide. Special agencies limit their coverage to one or few business areas and may operate nationally or locally.

General agencies furnish general and special reports. General reports are leased by subscribers on a quarterly basis and contain information on capital (based on financial statements), and credit, denoting the grade of credit ratings. Special reports are limited to specific businesses or companies and are obtained under contract. These reports are more extensive than the general reports, and contain background as well as general information. Credit reporting agencies collect their information from several sources, including direct investigation, trade creditor and banking connections, insurance records, and public records. The lenders usually pay an annual fee to these agencies in exchange for an unlimited amount of information.

A large portion of modern business is conducted on a credit basis. The need for credit arose from a complex system of manufacturers, suppliers, distributors, and retailers in the modern market economy. Credit allows the smooth operation of such a system. A cash-only business is virtually impossible in the 1990s.

ORGANIZATION AND STRUCTURE

Business transactions, including credit transactions, are regulated by the Uniform Commercial Code (UCC). The UCC is a standardized commercial law effective in most U.S. jurisdictions whose goal is to simplify interac-

tions between businesses. The numerous entities that constitute this category have varying organizations and structures.

Purchasers of Accounts Receivable and Commercial Paper. Accounts receivables are promises from customers to pay for goods or services that have already been rendered. Commercial paper is any form of short-term negotiable instrument that arises out of a commercial transaction, to be distinguished from speculative, investment, real estate, personal, or public transactions. Many companies receive financing by using their accounts receivable as collateral, or selling the accounts outright at a discount.

Factors of Commercial Paper. Factors provide financing on accounts receivable by discounting accounts receivable on a non-recourse basis. Upon buying the accounts, the factor assumes the position of the seller—including the risk of default and credit losses—and may not hold the original seller liable in the event of loss. The factor then pays the entity that sold the account, paying upwards of 85 percent of the face value of the account receivable. The remaining amount is considered a discount fee, which is the factor’s payment. In short, factors buy the accounts on an “as is” basis. Customers then pay factors. Factors often are also engaged in inventory financing, secured loans against fixed assets and other resources, as well as unsecured loans. They may also offer financial advisory services.

Sellers benefit from using factors because they are able to avoid tying up working capital in accounts receivable for the full credit period, which may be several months. Another advantage enjoyed by sellers using factors is that they may eliminate their in-house credit and collection departments.

Financing of Dealers by Motor Vehicle Manufacturers’ Organizations. Automobile manufacturers offer “floor plan” financing to support dealers’ sales and leasing programs. “Floor plan” financing, or trust receipt financing, is a form of inventory financing under which the bank holds title to the automobile inventory. The dealer is loaned money to buy the inventory from the original equipment manufacturer and holds the inventory in trust for the manufacturer. As the borrower sells inventory to consumers, he pays these proceeds to the manufacturer. The dealer keeps the mark-up of the retail price over the payments due the manufacturer. When the sale is made on a credit basis, the dealer often sells the obligation to the manufacturer. This practice is used in other industries as well as the automobile industry.

Mercantile Financing. Mercantile financing is typically done through the sale of mercantile paper. Mercantile paper is a note, acceptance, or bill of exchange made

or endorsed by concerns engaged in jobbing, wholesaling, or retailing of commodities.

Working Capital Financing. Working capital refers to an entity's net current (or liquid) assets, or current assets minus the current liabilities (those expected to mature within one year). This excess, called free working capital, is the cash available to meet a company's liabilities as they mature over this one-year period. This liquidity is achieved by a number of means including trade credit, bank loans, factoring, and sales of accounts receivable.

BACKGROUND AND DEVELOPMENT

As the U.S. economy became more complex and competitive in the 1980s and 1990s, businesses needed increasingly flexible short-term financing to remain competitive. This flexibility is provided by a business credit market that offers a variety of financing options.

Co-branding led business credit institutions to get involved in other services. General Motors (GM), for example, has always been involved in financing the sale of its cars to consumers and floor plan financing. In the early 1990s, GM got involved in credit card financing in a co-branding arrangement with MasterCard, thus providing automobile and credit card financing to its customers. By 1994, GM had earned \$9.4 billion from financing. Ford Motor Credit has also been involved in this type of co-branding financing, earning \$21.3 billion in 1994.

CURRENT CONDITIONS

Throughout the 1990s, most business credit institutions broadened the range of services offered. In the late 1990s, the major credit card companies began to offer purchasing or procurement cards in addition to typical business credit cards. These cards were designed to make the purchase of small items cheaper and more efficient. The average company conducts 90,000 transactions—typically individual purchases of \$10,000 or less—annually. The cost of each of these transactions is about \$80, but can be minimized through the use of procurement cards.

All three major credit card providers—MasterCard International Incorporated, American Express, and Visa USA—adapted their services in the late 1990s to facilitate electronic commerce conducted business-to-business. In late 1999, MasterCard and American Express expanded their alliances with e-commerce businesses: MasterCard allied itself with Commerce One, which tailored its BuySite and MarketSite to accept online payment with the MasterCard Corporate Purchasing Card; American Express increased the number of affiliations with e-commerce companies in its portfolio to 10, adding Clarus, Extensity, Sun-Netscape Alliance, and Trilogy to its affiliations with Ariba, Commerce One, Concur Technologies, Intelisys, Remedy, and tradex Technologies.

At the same time, Visa USA focused its efforts on tailoring its procurement cards toward the newly-defined global commodity code standards merging the United Nations' Common Coding System (UNCCS) and Dun and Bradstreet's Standard Products and Services Codes (SPSC) to create UN/SPSC Codes specifically for electronic commerce. SAP ag, Visa's ally in e-commerce, adopted this coding system to streamline its purchasing systems, paving the way for other affiliates such as Ariba.

All of the major international credit card companies—American Express, MasterCard International and its affiliates Europay and Mondex, Visa International, and JCB of Japan—joined forces in the Smart Card Security Users Group (SCSUG) to create a standardized system, called Common Criteria, for evaluating the security of smart cards. The astronomical increase in online credit card use brought with it the inherent fraud enabled by transactions conducted in such a public forum. Credit card security thus became a key issue, not only in terms of real protection, but also in terms of consumer perceptions of security.

WORKFORCE

The short-term business credit industry includes many diverse companies, employing anywhere from 2 to 50,000 employees. These occupations include bankers, tellers, loan officers, secretaries, and security personnel.

MISCELLANEOUS BUSINESS CREDIT INSTITUTIONS

This industry covers establishments primarily engaged in furnishing intermediate or long-term general and industrial credit, including the finance leasing of automobiles, trucks, and machinery and equipment. Also included in this industry are private establishments primarily engaged in extending agricultural credit. Federal and federally sponsored credit agencies primarily engaged in extending agricultural credit are classified in **SIC 6111: Federal and Federally-Sponsored Credit Agencies**. Establishments primarily engaged in other

types of leasing of passenger cars and trucks are classified in various automotive rental and leasing industries.

NAICS CODE(S)

522220 (Sales Financing)

522293 (International Trade Financing)

522298 (All Other Non-Depository Credit Intermediation)

BACKGROUND AND DEVELOPMENT

Modern business is frequently conducted on a credit basis. The need for credit developed as market economies became more complex and included many players: manufacturers, suppliers, distributors, and retailers. Credit facilitates smooth operations.

The decision to extend credit depends upon three factors: character, capacity, and capital. Each factor introduces risk to the transaction. The risk of lending on character is called moral risk. Business risk involves lending on capacity. The risk of lending on capital is called property risk. An ideal business borrower will combine a minimum of each.

Lenders are often not in a position to evaluate a business against these criteria. To verify a credit applicant's creditworthiness, a lender may contact either general or special mercantile agencies to find needed information. General agencies, such as Dun & Bradstreet, collect information on a range of business enterprises nationwide, while special agencies limit their coverage to one or a few business areas and may operate either nationally or locally.

General agencies furnish two types of reports. General reports are leased by subscribers on a quarterly basis and contain capital ratings, based on financial statements, and credit ratings, denoting the grade of credit. Special reports are limited to specific businesses or companies and are provided under contract. These reports are more extensive than the general reports and contain background as well as general information. Credit reporting agencies collect their information from several sources including direct investigations, trade creditor and banking connections, and public and insurance records.

Business transactions, including credit transactions, are regulated by the Uniform Commercial Code (UCC). The UCC is a collection of modernized, codified, and standardized laws that apply to all commercial transactions, except real property. The code is binding in most U.S. jurisdictions and has standardized most commercial law.

Automobile Finance Leasing. As automobile purchases require significant capital investment, most new car purchases are made with the help of automobile financing typically made by banks and finance companies. Under a lease arrangement, the financier keeps the

automobile's title. The customer usually makes monthly payments and has an option to buy the vehicle at the end of the lease period.

Banks also offer floor plan financing to support dealers' leasing programs. Floor plan financing, or trust receipt financing, is a form of inventory financing under which the bank holds title to the automobile inventory. The dealer is loaned money to buy the inventory from suppliers and holds the inventory in trust for the bank. As the borrower sells inventory to consumers, he pays the bank. The dealer keeps the mark-up of the retail price over the payments due the bank. When the sale is made on a credit basis, the dealer often sells the obligation to the bank.

Agricultural Credit Institutions. There are two types of agricultural credit institutions: federal and commercial. Federal institutions include the Federal Land Banks and Land Bank Associations, the Federal Intermediate Credit Banks, Production Credit Associations, District Banks for Cooperatives, the Commodity Credit Corporation, Agricultural Stabilization and Conservation Service, Federal Crop Insurance Corporation, Farmers Home Administration, Rural Electrification Administration, and the Rural Telephone Bank.

These federal institutions were created to provide credit opportunities to communities in which financial services otherwise were neither available nor affordable. The federal government has also created organizations to encourage activities that are in the national interest. Most of these services are targeted at rural and agricultural communities. For example, the federal government is deeply involved in the financial structure of the agricultural industry because of the former's interest in protecting the nation's ability to produce food. In many communities, sparse populations and an unstable agricultural business creates a nonprofitable environment for private firms to provide credit.

These organizations, while government sponsored, are typically more private than public. The board and chief executive officer are typically appointed by the president and the institution's operations are nominally overseen by a cabinet level secretary; however, the day-to-day operations of the organization are left to the staff. Furthermore, these agencies operate under the assumption that they are accountable for their continued financial well-being.

Many commercial organizations provide agricultural credit with the support of federal institutions. Commercial lenders may extend credit to an agricultural endeavor that is secured or guaranteed by the federal agency involved. The type of financing may be short-, medium- or long-term, depending upon the terms of the agency's support and the needs of the borrower.

Farm Mortgage Companies. Farm mortgage companies provide credit for farm and home purchases. These mortgages may be private or backed by government institutions such as the Farmers Home Administration (FHA).

The Farmers Home Administration helps farmers get mortgages for homes or personal farms. The agency, a division of the Department of Agriculture, operates under the Consolidated Farmers Home Administration Act of 1961, Title V of the Housing Act of 1949, and Part III, Title A of the Economic Opportunity Act of 1964. It was originally established under the Farmers Home Administration Act of 1946.

The Farmers Home Administration operates primarily in rural areas. Offices, located in county-seat towns, accept applications for loans that are designed to provide enough income to raise families' living standards to allow them to make payments on their debts. The applications are reviewed and approved by a local committee that is composed of three people, at least two of which must be farmers. The money for the loans and grants made by the administration come from appropriations from Congress and private lenders who make loans guaranteed by the agency.

Finance Leasing of Equipment and Vehicles. The acquisition of equipment and vehicles represents a significant capital investment. Therefore, most equipment and vehicle purchases are made with the help of some type of financing, often leasing. Lease financing is typically made by banks and finance companies. Under a lease arrangement the financier retains the title to the equipment. The customer typically makes monthly payments and has an option to buy the equipment at the end of the lease period.

Intermediate Investment Banks. The twelve Federal Intermediate Credit Banks (FICBs) were created by Title II of the Federal Farm Loan Act of 1923. These banks were created to discount or buy short- and intermediate-term notes of agricultural business from commercial banks, savings and loans, and other financial institutions.

The FICBs work closely with Production Credit Associations (PCAs). PCAs are primary lenders that provide rural communities with short- and medium-term credit for a variety of needs. The loans they offer vary in maturity length from a few months to seven years. The PCAs often work in conjunction with commercial banks to provide these services to their rural customers. As primary lenders, the PCAs sustain all losses to the extent of available resources. The PCAs have adopted mutual loss sharing, participating loan plans, or both, to spread their risk. The borrowers of the individual PCAs elect that institution's directors.

The FICBs loan money to farmers, ranchers, producers and harvesters of aquatic products, operators pro-

viding farm services, and rural residents. They make loans to and discount commercial paper for local financial institutions. The FICBs also help the Production Credit Associations in making sound credit available in rural areas. The FICBs issue stock and sell participation certificates to raise capital. The majority of their loans are made for production purposes and mature within one year. Farm and rural home loans, however, may have extended terms of up to 10 years. Loans to producers and harvesters of aquatic products may be made for up to 15 years.

Small Business Investment Companies. Investment companies are typically involved in three activities: investing, reinvesting, or trading securities; issuing face amount certificates of the installment type; and holding investment securities having a market value exceeding 40 percent of the issuer's total assets.

In the United States, investment companies are a relatively new phenomenon. They did not become commonplace until after 1923, and grew quickly through the 1960s, leading to increased regulation. Investment companies are regulated by the Securities and Exchange Commission (SEC). In general, there are five areas of regulation: registration, adequacy of capital, conservatism of capital structure, investment policies, and management practices and procedures. The SEC periodically inspects investment companies to ensure compliance with their regulations.

Livestock Loan Companies. Livestock loan companies are sanctioned by the Federal Reserve Act as companies organized for the purpose of lending credit to cattlemen and ranchers for the purchase, raising, and marketing of cattle and other livestock. They may be either independent institutions or affiliated with local banks. As affiliates, livestock loan companies are exempted from the restrictions outlined in Section 23-A of the Federal Reserve Act.

There are several steps in making a livestock loan: the borrower provides a sworn statement of his/her financial condition, the cattle are inspected, a search of public records to determine the status of any liens is completed, a chattel mortgage is executed, usually at 25 percent above the amount of the loan, and the note is executed.

Livestock loan companies relieve commercial banks of the burden of carrying cattle paper, which often amounts to several million dollars. These companies frequently act as intermediaries between borrowers and money center banks. They may also be involved in rediscounting some classes of cattle paper for purchase by the Federal Reserve Banks.

Machinery and Equipment Finance Leasing. Since machinery and equipment represent a significant expenditure of cash, most businesses finance these purchases.

Leasing is one type of financing arrangement. As with automobile leasing, the financier keeps the title to the equipment, while the customer typically makes monthly or quarterly payments and has an option to buy the equipment at the end of the lease period.

INDUSTRY LEADERS

In a March 1999 issue, *American Banker* listed the top 10 finance companies based on commercial receivables and total receivables for 1998. Atop both lists was General Electric Capital Services of Stamford, Connecticut, with \$77 billion in commercial receivables and \$122 billion in total receivables, up 17.12 percent from 1997. Ford Motor Credit Co. of Dearborn, Michigan came in second place in commercial receivables with \$28 billion, but it outpaced GE Capital in total receivables with \$131 billion, up 12.45 percent over 1997. General Motors Acceptance Corp. of Detroit rivaled Ford in commercial receivables with \$27 billion, but GM lagged behind Ford in total receivables with \$99 billion, up 16.46 percent from 1997.

Rounding out the top 10 were the following companies: Associates First Capital Corp. of Irving, Texas, with \$24 billion in 1998 commercial receivables and \$61 billion in total receivables, up 10.37 percent from 1997; IBM Credit Corp. of Stamford, Connecticut, with \$14 billion in 1998 commercial as well as total receivables, down 5.33 percent from 1997; CIT Group Holdings Inc. of New York City; Heller Financial Inc. of Chicago; FINOVA Group Inc. of Phoenix, Arizona; Caterpillar Financial Services Corp. of Nashville, Tennessee; and Philip Morris Capital Corp. of Stamford, Connecticut.

WORKFORCE

Each of the organizations covered in this industry classification are small or medium-sized companies employing between one and 25,000 employees as loan officers, secretaries, financial analysts, managerial staff, and clerks, to name a few.

These organizations are spread throughout the country. Some of these organizations are government related and have employees concentrated in the greater Washington, D.C., area. Similarly, since many of the organizations serve rural constituencies, a significant portion of the industry's workforce lives in communities of less than 50,000 inhabitants.

MORTGAGE BANKERS AND LOAN CORRESPONDENTS

This industry covers establishments primarily engaged in originating mortgage loans, selling mortgage loans to permanent investors, and servicing these loans. They may also provide real estate construction loans.

NAICS CODE(S)

522292 (Real Estate Credit)

522390 (Other Activities Related to Credit Intermediation)

INDUSTRY SNAPSHOT

The mortgage loan industry differs from other industries in its passivity: whereas new products and services can create new markets in other industries, the mortgage industry remains at the mercy of homeowners and buyers, who almost never buy on impulse. Instead of creating new markets, mortgage bankers must respond to existing markets and anticipate marketplace changes, transforming their services in reaction to larger societal forces, such as population demographics and interest rates. This passivity forces the industry to be dynamic, constantly shifting to meet new demands, such as rising rates of first-time homebuyers, and take advantage of new opportunities, such as e-commerce. At its core, the mortgage industry remains solid because home ownership represents an enduring aspect of American life.

The mortgage financing industry experienced record-high results for combined purchase and refinancing transactions of \$1 trillion in 1993; 1998 results surpassed this watershed mark, and a new record of \$2.3 trillion was set in 2001. Double-digit interest rates still existed in 1993, thus refinancing fueled that year's record transactions. In 1998, refinancing still accounted for some transactions, as borrowers took advantage of low interest rates to decrease their mortgage payments from above 8 percent to below 7 percent. When average interest rates dipped below 7 percent in 2001 and below 6 percent in 2002, the industry saw an unprecedented spike in refinancing activity, which fueled a record volume of mortgage originations in both years. These low interest rates also sparked growth in new transactions, particularly by the growing segments of first-time homebuyers, low-income buyers, minorities, and immigrants. Lenders realized that fair and affordable lending not only made ethical sense, but also made very good business sense.

ORGANIZATION AND STRUCTURE

As liaisons, mortgage bankers are more than just loan brokers, because they maintain a responsible pres-

ence from the time mortgage loans are created until they are paid in full. The mortgage banker functions in a continuum extending from the seller/builder of the property to the seller's agent, to the mortgage borrower, to the mortgagee (the mortgage banker), and to the mortgage investor. Mortgage bankers specialize in the origination or production of mortgage loans for sale to the secondary mortgage market. Many mortgage lenders make or buy loans, while some sell loans, and others service loans. Mortgage bankers link the three functions.

The housing finance system in the United States includes many private and public institutions and several levels of market activity. The mortgage lending/investment process involves the provision of housing credit to borrowers by institutions and individuals who hold housing loans in their portfolios. However, a number of institutions may come between the ultimate investors, and the characteristics of the mortgage asset may be transformed along the way as insurance and guarantees are attached and as securities replace the original mortgage loans.

Residential mortgage loans are made (originated) in primary markets where lenders and borrowers conduct business. Borrowers get mortgage credit in these markets mainly from depository institutions or mortgage banking companies. Since the 1930s, mortgage loans made in primary markets typically have been long-term, fixed-rate instruments with level payments that pay off (amortize) the principal balance over the term of the loan. However, new types of mortgage instruments emerged recently to serve the various needs of borrowers and investors. Most of the new mortgage instruments provide for adjustable interest rates, graduated payment schedules, or some combination of these features.

Institutions operating in primary mortgage markets may hold the mortgages they originate, adding them to their asset portfolios. In many cases, however, originators sell their loan production on secondary markets, thereby replenishing their supplies of loanable money. Transfers of outstanding mortgages among mortgage investors also take place in secondary markets.

Sales of mortgage loans from originators to investors inevitably involve some cost, but such transfers are often necessary for the effective functioning of the housing finance system. Secondary market transactions may be needed to correct interregional imbalances in the supply of and demand for mortgage credit, or to move mortgage assets from one type of institution to another within the same market area. The latter need arises within a system characterized by specialization and division of labor. One type of institution may perform a mortgage banking function, specializing in mortgage origination and servicing and selling assets to investors who choose not to perform these functions. Such a division of functions can be en-

couraged by federal or state regulations governing the activities of various types of institutions.

There are several types of loan instruments available to individual and institutional investors:

Fixed-Rate Mortgages. Historically, 30-year fixed-rate mortgages have been the loan instrument of choice for many borrowers. The changing conditions in the mortgage market, however, coupled with sharp fluctuations in interest rates, have increased the demand for shorter maturities, more interest-sensitive loans, and nontraditional mortgage instruments.

Adjustable-Rate Mortgages (ARMs). Because of the thrift crisis in the late 1980s, lenders began offering adjustable rate mortgages. Lenders, buffeted by interest rate risk, looked to shift the risk to the borrower. In exchange, they offered borrowers a lower initial rate. What was once an instrument designed to keep housing affordable during periods of high interest rates turned into an interest rate gamble for a growing number of borrowers. Borrowers that opt for fixed-rate loans anticipate stable or increasing interest rates. If they are wrong, they can refinance later. Borrowers that choose adjustable plans believe that rates will decline. In its brief history, the ARM has shown resilience as a loan product and unexpected risk for borrowers and lenders.

Convertible ARMs. These instruments have been available for years, but have been marketed aggressively only during high interest rate periods. This type of mortgage vehicle gives the borrower the benefit of a low initial rate with the option to refinance to a fixed-rate mortgage at about half the typical refinance cost. The convertible ARM may be attractive to lenders with loan-servicing portfolios, since they would be less likely to see refinance business go elsewhere. If the borrower switches to a fixed-rate mortgage when rates are low, however, the lender will have a portfolio of low-rate, fixed-rate loans.

Shorter Term Mortgages. Fixed-rate mortgages with terms shorter than the traditional 30-year instruments have become tremendously popular since the early 1980s. They are expected to become increasingly popular as borrowers see the value of their mortgage interest deductions decline as they move into lower tax brackets. Moreover, during periods of low inflation, borrowers can pay down their principle in cheaper dollars. The 15-year loan historically had rates between 40 and 50 basis points (a basis point is equal to 0.01 percent) below the 30-year loan, and has lower overall financing costs. The higher monthly costs make the 15-year loan available mainly to affluent borrowers. This has helped keep default rates low, making it a good intermediate term asset for portfolio lenders and attractive to investors. Industry estimates place default rates on 15-year loans at about half that of 30-year mortgages.

Bi-Weekly Mortgages. Bi-weekly mortgages are similar to 15-year or 30-year mortgages except that the borrower pays half of the scheduled monthly payments every two weeks. This creates the equivalent of 13 monthly payments a year, resulting in a much faster pay-off. A 30-year mortgage would be paid off in 19 years with this instrument. Virtually all bi-weeklies are fixed-rate loans, and much of the bi-weekly volume is generated by refinancing. Borrowers take advantage of declining rates to lock in a fixed-rate, shorter term loan with slightly lower monthly payments. Lenders target sophisticated, second- and third-time homebuyers for this product. The loan usually is tied to a checking or deposit account from which payments are debited directly. Delinquency rates on this instrument are extremely low, especially in cases in which the financial institution requires one or two payments to be kept in the deposit account at all times.

Home Equity Loans. Since the passage of 1986 tax reform legislation, home equity loans have become increasingly popular. These loans generally are tied to the prime rate, and may be tax deductible. They are usually revolving lines of credit with little standardization. Because of this, there is not an active secondary market for home equity loans. Investors are wary of potentially high default rates, as well as how legislators will respond to the collection process.

Portable Mortgages. A loan for movers, the portable mortgage traveled to the United States from Canada (as did the bi-weekly). With a portable loan, the lender hopes to keep the mortgage loan even in the event of relocation by the borrower. A borrower who moves to another house may take this loan with him without paying additional points. In the event that a borrower needs additional money, they are added to the loan at the prevailing rates, making a portable blend.

BACKGROUND AND DEVELOPMENT

For most of its history, the mortgage banking business was comprised of a relatively small number of independent firms who acted as intermediaries between borrowers and permanent mortgage investors. The major part of their activities concentrated on residential loan origination, and most of that consisted of Federal Housing Administration (FHA) and Veterans Administration (VA) loan production. Savings and loan associations dominated most of the conventional residential market and there were few sources of mortgage capital besides such traditional mortgage investors as thrifts and life insurance companies. It was, for the most part, a private market where available capital disappeared when interest rates rose and capital availability tightened.

Before 1970, the Federal National Mortgage Association (Fannie Mae) provided one of the few national secondary markets through its whole-loan purchase and sale

program. Even that program, however, was limited to government loans. The establishment of the Federal Home Loan Mortgage Association (Freddie Mac) in 1970 and the entrance of Fannie Mae and Freddie Mac into the conventional secondary market in 1972 initiated the expansion and rise in importance of secondary market activities for all mortgage lenders. This factor manifested itself through the standardization of loan documentation and underwriting criteria and a consistent market presence that the private secondary market had never achieved.

The 1980s were a transitional period for mortgage bankers. The first great challenge was the high level of interest rates that all but shut down origination volume. Creative lenders took advantage of liberalized lending regulations, and the result was a vast expansion in the menu of mortgage banking products, including more than 200 types of adjustable rate mortgages and a sometimes bewildering profusion of graduated payment, growing equity, shared equity, wrap, and second mortgage loans. As so often happens, the wishes of consumers and investors were diametrically opposed: investors demanded loans that would adjust immediately to the market, while consumers sought out loans that looked as fixed as possible (with lower interest rates of course). For a long while mortgage bankers despaired as thrifts dominated the origination market with teaser rate adjustable rate mortgages.

The marketplace eventually winnowed the product menu down to a few manageable choices, and the lower interest rates of the late 1980s increased the popularity of fixed rate loans. The competitiveness of mortgage bankers was enhanced not only by the return of a fixed rate environment, but also by two other factors that dramatically changed the industry: the savings and loan crisis and the rise to dominance of mortgage-backed securities (MBS).

The thrift industry was at once a blessing and a bane: while thrift investors were primary outlets for whole loan products, thrift originators were frequently unbeatable competitors. However, the same shortsighted impulse that led thrifts to aggressively push market teaser rate ARMs (some of which had caps below the prevailing level of fixed rates) led to a multitude of other dubious business decisions that sealed their fate. At the same time that thrifts were diminishing in importance as investors, the MBS was coming into its own. By the late 1980s, even ARMs and jumbo loans were being packaged into generic MBS and resold through Wall Street to institutional investors, many of whom would never dream of investing in a whole loan product. Early fears that the thrift investor base could never be replaced proved groundless. The MBS products provided an ongoing source of capital.

By the mid-1980s, government deregulation, lax underwriting standards, and some of the more dubious prod-

ucts offered earlier in the decade were producing catastrophic results. Lenders passed on risks to mortgage insurers, many of which failed to adequately monitor the situation. Losses mounted because of the growing number of loan defaults. Industry analysts pointed to payment shock or equity erosion or other factors as the reason. It eventually became clear that equity was the single most important determination of credit risk. As underwriter ratios were tightened, many underwriters complained that the insurance companies were punishing them for the borrowers' sins. Gradually, insurers analyzed the delinquency and default experience of millions of loans and arrived at sensible standards that protected the interests of borrowers, lenders, insurers, and investors.

Just as the early 1980s were dominated by the effects of high interest rates, the second half of the decade was strongly influenced by declining interest rates. This had several profound effects. Origination and refinance volume soared, and this opened up many profitable opportunities for mortgage bankers. As a result, new products began increasing the investor base for mortgage loans, while at the same time dampening the volatility of most mortgage bankers' earnings.

As a result of economic fluctuations of the 1980s and early 1990s, mortgage banking and the mortgage finance industry began to undergo fundamental changes that altered the role of traditional participants, opened the market to new players, saw Wall Street emerge as a major provider of mortgage capital, and radically changed the nature of the secondary mortgage market.

The dramatic changes in mortgage banking have been driven by a series of developments that have affected all financial services. Each development would have been significant in its own right, but in combination they have altered mortgage financing beyond recognition.

Mortgage Securities and Wall Street. Mortgage lenders recognized long ago that the original secondary market lacked the ability to consistently provide mortgage capital in the amounts needed or the geographic distribution required to adequately meet the housing needs of the nation. With no central marketplace, an awkward and non-liquid investment vehicle, and non-standard documentation, mortgages could not compete in the capital markets when demands for capital exceeded the available supply from thrifts and other portfolio lenders.

Mortgage-backed securities, which offered access to the broad investor base and capital formation abilities of Wall Street, were revived with the creation of the Government National Mortgage Association (GNMA, or Ginnie Mae) in 1968 and the issuance of the first GNMA pass-through securities in 1970. Mortgage-backed bonds had once been widely used in the 1920s, but had a dismal

record in the depression of the 1930s. With the government guarantees on the underlying mortgage collateral and on the securities themselves, GNMA securities traded on Wall Street began to attract nontraditional mortgage investors. At about the same time, Freddie Mac initiated pass-through securities backed by conventional residential mortgages. By the mid-1970s, residential mortgages, government and conventional, had been accepted as viable security collateral by the investment community. The result was a rapid growth in the volumes and types of mortgage securities in the marketplace.

In addition to reaching a huge investor base and new sources of capital, the securities markets offer a speed of execution and efficiency of pricing that the traditional secondary mortgage markets cannot match. As a result, the securities markets have been outlets for increasingly large percentages of residential mortgage production. Securities markets drive mortgage pricing nationwide, heavily influence mortgage product design, and reduce the mortgage finance industry's reliance on mortgage portfolio lenders.

Economic Influences. Since the early 1980s, as mortgage securities were assuming a major role in mortgage financing, changes occurred in the basic economics of all financial markets that have forced major alterations in the way mortgage banking operations are planned and managed. The magnitude of interest rate movements and the speed with which they occur have reached levels unknown and unanticipated before the 1980s. The collapse of mortgage security prices in the spring of 1987 illustrated the potential volatility of the market, which can be influenced by factors unrelated to mortgage rates or the housing capital markets.

This volatility made the mortgage banker's job of risk management much more complex and difficult. Mortgage bankers put together strategies and operating procedures, which include sophisticated reporting systems, to monitor and control the risk exposure of their operations.

Further complexities have been added to the business with the wider variety of mortgage products offered to borrowers, whose preferences often shift from one loan type to another as the economic climate and expectations change. This tendency is illustrated by the changing market share of originations by fixed-rate, adjustable-rate, and balloon loans. As mortgage rates fall, fixed-rate products and balloon loans tend to dominate the market. As rates rise, lower initial rates bring adjustable products a larger share of the market. The mortgage banker's risk position changes with each shift, and swift action is required to maintain prescribed risk exposure limits.

As the economics of the marketplace changed, so have the economics of mortgage banking. The industry

has become a complex financial services business requiring analytical skills, financial modeling, and forecasting abilities far beyond the levels necessary in the past. The resources required to compete effectively made it challenging for the small, independent firm to survive and nearly all of the medium and large mortgage banking operations are now subsidiaries of larger diversified institutions.

With the dominant role of mortgage securities and the impact of economic changes felt in all sectors of the mortgage finance industry, the composition of the participants in the industry has also changed. Wall Street firms, commercial banks, nonfinancial corporate giants, and traditional portfolio lenders are playing a part in mortgage banking with various degrees of influence and success.

Securities dealers have become the primary market makers as the bulk of residential mortgage originations are used to collateralize mortgage securities, primarily through secondary loans originating from Freddie Mac, Fannie Mae, and Ginnie Mae. Many major Wall Street firms ventured into primary, or direct, mortgage banking activities in the 1980s, establishing their own mortgage banking operations, and buying and selling mortgages and loan servicing rights. Most of these ventures disappeared or are serving small, specialized markets, and Wall Street's emphasis returned to mortgage securities and the derivative securities that developed as the mortgage security markets matured. Some of the industry leaders in this area include: Goldman Sachs, Salomon Brothers, and The First Boston Corporation.

In 1996, Fannie Mae held a portfolio of more than \$286 billion in secondary home mortgages and Freddie Mac held a \$610 billion portfolio. Countrywide Credit Industries, Inc. led the primary lending market in 1996 with roughly \$22 billion in loans concentrated in California.

Thrift institutions and the thrift industry have been decimated by the consequences of the excesses, incompetence, and fraud of the 1980s. They are no longer the major source of mortgage capital and their market share dropped from 41 percent of the loan origination market in 1987 to 24 percent in 1992. About 2,000 viable institutions remained after the cleanup was completed, but their presence in the market has been severely diminished. Most thrifts will continue to maintain a mortgage loan portfolio, but not on a scale that will make them primary sources of mortgage money as they had been before the 1980s.

Commercial banks, particularly such large national banks and bank holding companies as Fleet National, Chase Manhattan/Chemical, and Bank of America, emerged as major players in mortgage banking. Many of

the nation's largest mortgage banking operations are subsidiaries of these institutions. The banks view mortgage banking as a natural extension of their mortgage lending operations and as a cross-selling opportunity, while the mortgage banking operations benefit from the credit facilities and financial presence of the parent institution in the marketplace.

Nonfinancial corporations and holding companies acquired or built some of the largest mortgage banking operations in the country with mixed results. Some operations have done very well and continue to prosper, but others have struggled. As in the case of commercial banks, the parent organization has to understand the business of mortgage banking and the operating disciplines that it requires if the mortgage banking operation is to succeed.

Life insurance companies and pension funds have long been viewed by mortgage bankers as prime sources of mortgage funds, but tapping these sources has not been easy. Life insurance companies returned to residential mortgage investment in the 1980s, after effectively leaving the field 20 years earlier, but most did so by setting up their own mortgage companies. Like Wall Street's venture into mortgage banking, most of these operations have been closed or shut down, although several life insurance companies, such as Prudential Home Mortgage and Metropolitan Life, have had success in the mortgage banking segment. Pension funds rarely provide mortgage bankers with direct access to money and tend to invest in mortgages through mortgage securities.

Investment in mortgages by individuals has grown faster than all expectations. Individuals generally prefer Ginnie Mae securities and often invest through mutual funds. As with pension funds, individual investors funnel money directly to the mortgage market. In doing so, individuals receive a higher yield on their investment than they would by depositing their money in savings institutions.

Like the broader financial services industry, the mortgage industry continued to be swept by changes during the 1990s. These changes were driven by deregulation, competition, and technological advances. Since the 1980s, private mortgage companies that do little but originate loans have become the main source of mortgage lending. There were approximately 4,000 of these companies in the United States in 1996 (out of about 12,000 total organizations making mortgage loans) and they accounted for nearly 60 percent of all new mortgage loans, or originations. This is nearly double the share that mortgage companies had in 1987. The next largest source by volume of mortgages was commercial banks, followed by the thrift industries, which as recently as 10 years earlier had dominated the industry. Other mortgage lenders included credit unions and life insurance companies. During 1996, some

\$784 billion in one-to-four-unit residential mortgage loans were originated in the United States. That is somewhat below the peak of just over \$1 trillion worth of loans originated in 1993, but the record year had been strongly influenced by a wave of refinancings as mortgage rates dipped to their lowest point in years.

While the cost of entry into loan origination continues to be low, the financial sources necessary to compete and succeed as a full service mortgage banker increased dramatically. As a result, the industry is increasingly dominated by the largest players, including behemoths like General Motors Acceptance Corporation (GMAC), which in 1996 originated more than \$3.4 billion of new residential loans representing more than 30,000 home loans.

Although there may always be a profitable niche for small originators, that niche may be in mortgage brokerage, and the outlook for the medium-sized mortgage banking firm that services its own loans is much less certain.

A number of the largest mortgage bankers grew very quickly in the late 1980s and early 1990s through bulk purchases of loan portfolios. The secondary market for mortgage loan securitization fueled the growth in origination volume. Although the volume of mortgages sold into the secondary market tends to vary with changes in the volume of fixed-rate lending (as opposed to variable rate loans), the percent of home loans sold through the secondary market in 1996 was 56 percent. That was down from a peak of 65 percent during 1993, but it represents a sizable increase over the 33 percent level of 1988, when the market was not as mature.

Consolidation transformed the mortgage loan industry in the 1990s. Between 1980 and the late 1990s, 7,000 banking institutions merged, though few of these mergers centered around mortgage financing. However, the consolidations did affect the industry: in 1990, 28 percent of home loans originated from 25 lenders; as of September 1998, the top 25 lenders accounted for 53 percent of home loans. In October 1999, Intuit Inc. of Mountainview, California, paid \$370 million in stock to buy out market leader Rock Financial Corp. of Bingham Farms, Michigan, which generated 1998 revenues of \$90 million and closed more than \$2.3 billion worth of residential loans in 1998. Intuit merged Rock's Web site, RockLoans.com, with its own loan site, QuickenMortgage.com. In addition to consolidations, the industry experienced spin-offs: in 1998, for example, Ford Motor Co. spun off Associates First Capital Corp., which earned \$387 million in the third quarter of 1999, a 22 percent increase over third quarter 1998, due at least in part to the success of this spin-off.

The process of consolidation did not always create more efficiency, though; often, newly consolidated companies experienced growing pains, and the quality of their

service declined. In this climate, niche lenders and small, local specialists thrived. For example, companies responsive to the Hispanic market stood to gain from the demographic and economic growth of this sector. Whereas Hispanics made up 11 percent of the population in the late 1990s, this population accounted for 18 percent of all new homeowners from 1996 through 1998. In the first half of the decade, Hispanic owner-occupied housing units increased 34 percent. The U.S. Bureau of the Census forecasted the Hispanic population to grow to 15 percent of the total U.S. population by 2015 and 25 percent by 2050. Companies such as Countrywide Home Loans, Inc., of Pasadena, California, benefited from these demographics by employing bilingual employees and translating loan literature into Spanish.

Another niche market in the late 1990s was the emergent trend of the so-called money-back home loan, which allowed borrowers' monthly payments to be placed in an insurance policy rather than against the principal of the loan. At the end of the term, the value of the policy could potentially exceed the principal of the loan and provide the borrower with a cash payment of the surplus. This method was common in international markets such as the United Kingdom but was still relatively new in the United States.

CURRENT CONDITIONS

At the turn of the twenty-first century, forecasts called for the continued growth of total outstanding mortgage debt, which would increase by 7 percent to 9 percent annually, according to Fannie Mae. The Board of Governors of the Federal Reserve pegged the total outstanding mortgage debt at \$4 trillion at the end of 1997; this figure grew to \$7.5 trillion in 2001 and \$7.9 trillion in 2002. That year, according to the Bond Market Association, mortgage companies accounted for approximately \$4 trillion of that debt; commercial banks, \$1.9 trillion; savings institutions, \$740 billion; individuals, \$721 billion; federal and state agencies, \$396 billion; and life insurance companies, \$245 billion.

What most forecasters did not predict were the record low interest rates that the prolonged economic downturn fostered in 2002. In September of 2002, the average fixed interest rate on a 15-year mortgage totaled 5.31 percent, compared to 8.25 percent in May of 2000. Over the same time period the average fixed interest rate for a 30-year mortgage fell from 8.55 percent to 5.92 percent. With mortgage rates at their lowest point since the 1960s, one-to-four family mortgage originations exceeded \$2 trillion for the first time in history, reaching \$2.03 trillion in 2001. Refinancing accounted for 57 percent of that total, compared to the 19 percent of one-to-four family mortgage originations it had secured a year prior. The number of new homes sold grew from 877,000 in 2000 to

a record 908,000 in 2001 and 976,000 in 2002. Despite a weakening economy, along with growing levels of unemployment, the historically low interest rates helped propel the average sale price of homes in the United States to a peak of \$226,700 in 2002.

Another factor impacting the industry was the advent of electronic commerce via the Internet in the late-1990s, which significantly transformed mortgage financing by allowing customers to apply for loans online and receive responses much more quickly than in the past. One of the first Web-based mortgage companies, E-Loan, was founded in 1997. Over the next two years, the concept of transacting mortgages online gained credence, prompting other major lenders to set up their own Web sites. One popular site, LendingTree.com, allowed customers to submit a single application for which three or four lenders would compete. According to Massachusetts Mortgage Bankers Association Executive Director Kevin Cuff in the October 2002 issue of *Boston Business Journal*, "Obviously, the online application process in the last 12 months has skyrocketed, and the reason for that is the interest rate is dropping and the refinance rate is rising. It's the only way for people to keep up."

LOAN BROKERS

This category covers establishments primarily engaged in arranging loans for others. These establishments operate mostly on a commission or fee basis and do not ordinarily have any continuing relationship with either borrower or lender.

NAICS CODE(S)

522310 (Mortgage and Other Loan Brokers)

INDUSTRY SNAPSHOT

The loan brokers industry is comprised of firms principally engaged in arranging loans between borrowers and lenders. Such enterprises commonly earn a fee or commission for their services. The industry is dominated by mortgage brokers, though loan agents also arrange miscellaneous business, farm, and personal loans.

Although loan agents and brokers have existed for centuries, the industry received little respect or attention before the 1980s. In fact, as late as the mid-1980s, brokers were relatively insignificant players in the multi-billion dollar mortgage lending business. In the late 1980s and early 1990s, however, several factors combined to propel the industry to unprecedented stature. Low interest rates, a trend toward outsourcing and contracting by financial institutions, and a shift in the structure of U.S. financial markets were the most prominent forces boosting industry success.

Interest rates reached near record lows in the early 2000s, pushing total U.S. mortgage originations over the \$2 trillion mark for the first time ever. In 2001, mortgage brokers were originating more than \$1 trillion in loans annually. This was equivalent to roughly 55 percent of all mortgages originated in the United States, compared to just 20 percent in 1987. Roughly 30,000 mortgage brokers operated in the United States in the early 2000s, compared to none in the 1970s.

Mortgage loan brokers in the late 1990s began offering a variety of mortgage options for customers, including the adjustable rate (ARM) mortgage (designed to help customers take advantage of low rates but placing the risk on the customers' shoulders should rates suddenly climb) and hybrid or two-step mortgages. Two-step mortgages offered customers an initially low five- to seven-year rate, with the rate then climbing above the market rate. These loans served to let customers borrow with a lower outlay and the hybrid mortgage qualified buyers for more money than under traditional mortgage qualifying means. By the early 2000s, however, many of these options had become less popular due to falling interest rates.

ORGANIZATION AND STRUCTURE

Although loan agents and brokers serve other markets, mortgage loans comprise the vast majority of industry sales. The four-step mortgage lending process includes: originating the loan, which entails approving and selling a mortgage to a customer; funding or underwriting the loan; selling the mortgage in the secondary mortgage market, which supplies lenders with cash to make new loans; and servicing the loan, which involves collection, reporting, and administrative management duties. Most mortgage brokers are concerned only with the first step of the process, mortgage origination. However, some brokers facilitate the buying and selling of mortgages in the secondary market.

A broker, by definition, acts as an intermediary between a buyer and a seller in a transaction. He may represent either party, and he does not take possession of goods or property or deal on his own account. The broker receives a fee or commission from one or both of the parties that is usually based on a percentage of the value of the transaction. Brokers differ from dealers in that dealers are transacting on their own account and may have a vested interest in the transaction. Brokers fill an important marketing need by bringing buyers and sellers together. They also facilitate transactions by providing expertise and advice to buyers and sellers.

The two basic types of mortgage brokers are retail and wholesale. A retail broker, or third party originator (TPO), takes a loan application from a potential buyer and submits it to a lender. The lender reviews the application to determine whether or not to grant the loan. If the lender makes the loan to the applicant, the broker secures a commission, usually between 1 percent and 2 percent of the loan amount. Some lenders also pay a fee to the broker for rejected applications.

Wholesale mortgage brokers represent a smaller segment of the industry. They arrange the purchase and sale of mortgages that have already been originally funded. They help bankers find investors for their mortgages, so that the bank will have money to make new loans, for example. They also solicit retail brokers and mortgage originators that are seeking the most beneficial mortgage terms for their clients.

Mortgage brokers can deliver many benefits to lenders and borrowers. For instance, because brokers are able to efficiently search several institutions to find the best terms, they save time for consumers and help them get the lowest rates and closing costs. In addition, brokers often act as their customers' advocate, walking them through the application process and helping them to avoid delays caused by minor technicalities. Sometimes they are even able to reduce closing costs or waive special fees. Brokers commonly speed up the mortgage process by providing a candid preliminary assessment of what a buyer can afford before the consumer applies for a loan. Brokers are also able to offer several different mortgage options to buyers, whereas individual lenders usually have a more limited selection of lending instruments.

Mortgage brokers benefit the lending industry by providing a more flexible and less costly channel for originating mortgages. Brokers can alleviate a bank's or saving and loan's need to hire and support a sales staff, for instance. By outsourcing their origination activities, banks are able to eliminate many management and administrative costs, education and training expenses, facility expenditures, and salaries and benefits required by an in-house mortgage origination staff. Brokers also allow

lenders to geographically diversify their lending operations and to enter and exit different markets very quickly.

Types of Brokers. Most mortgage brokers can be classified into one of four different categories, though "full-service" firms may participate in two or more areas of the business. Traditional mortgage brokers are typically lenders of last resort. Consumers sometimes turn to this type of broker when they are unable to secure a market rate loan through a lending institution. As a result, these agents usually deal with high-risk, high-interest loans, and often participate in the fractionalization of mortgages, meaning that more than one investor is involved with a single mortgage.

Conventional residential mortgage brokers represent 70 to 90 percent of the industry. These professionals work with consumers to secure the best possible loan terms for their particular needs. They represent products offered by the largest financial institutions that are indirectly supported by government sponsored secondary market institutions, such as Fannie Mae and Freddie Mac. Wholesale brokers are also included in this group.

Commercial mortgage brokers arrange loans for nonresidential or multifamily properties. This market differs in that it is not supported by secondary market agencies, and it is not subject to the state and federal regulation imposed to protect residential consumers. Commercial brokerage fees are often three or four times greater than residential mortgage commissions. However, lucrative fees can be elusive because commercial loans are much more difficult to close. Commercial brokers also deal with a wider variety of lenders, including insurance companies, pension funds, and foreign investors.

A fourth sector of the industry is made up of firms that broker government and miscellaneous loans. Federal Housing Administration and Veteran's Administration loans make up most of this market.

Competitive Structure. In 1997, the National Association of Mortgage Brokers (NAMB) boasted a membership of 5,000, one-third the number of total brokers in the country. They also had chapters in 38 states. The industry is difficult to track because many of its participants overlap into other lending, banking, and brokerage activities, and because it was growing very quickly in the early 1990s.

Most brokerage firms are very small shops with between 1 and 10 employees. Some firms have as many as 50 workers. Though they are self-employed, some brokers act as agents, working only for a single lender. Such agents and brokers usually operate on 100 percent commission, but may also receive health benefits or application fees. Other brokerage arrangements include fran-

chise operations that maintain chains of mortgage brokering shops on a regional or national scale.

The industry is regulated primarily through state laws that are designed to protect consumers against fraud and to discourage financial misconduct. Although some states, such as Mississippi, have few constraints, others have more advanced regulatory structures. Florida, for instance, required brokers to take 24 hours of classes on mortgage finance before applying for a license in the early 1990s, and required brokers to disclose all fees that they received. In Illinois, brokers are licensed annually and tested every other year, their loans are spot-checked, they must be bonded, and they must prove a net worth of \$25,000. The American Association of Residential Mortgage Regulators (AARMR), which served as a clearinghouse for reports of industry fraud in the industry, was trying to encourage more uniform state legislation in the early 1990s.

BACKGROUND AND DEVELOPMENT

Mortgage lending in the United States was limited before the 1930s. Savings institutions and life insurance companies were the primary lenders for homebuyers. They often relied on mortgage bankers to originate and service their loans. These lenders typically required a 50 percent down payment on a piece of property, and usually offered a loan term of only five years. Because lenders placed themselves at significant risk in these transactions, they charged high interest rates. As a result, the market for mortgage loans was negligible in the early part of the twentieth century.

The Great Depression, which catapulted large numbers of mortgages into foreclosure and bankrupted many lenders, gave birth to a new lending system in the United States. Realizing the need for a stable and accessible mortgage market, the federal government created the Federal Home Loan Bank (FHLB) system in 1932, the Home Owners Loan Act in 1933, and other programs that sought to reduce the risk of mortgage lending and enforce industry standards. These initiatives, along with FHA and VA programs, served to insure mortgages with government funds and to protect consumers.

The mortgage banking industry flourished in the post-war economic boom. Banks and other financial institutions, which bought many mortgage banking operations, integrated origination and servicing activities into their organizations. As mortgage lending ballooned, the secondary mortgage market evolved as a place for lenders to sell their loans to investors. Wholesale mortgage brokers emerged to unite these investors and lenders.

Although some retail brokers also served the industry in the 1960s and 1970s, loan origination remained an activity provided almost solely by mortgage banks and savings and loans. Loan brokers, in fact, were often

viewed as seedy moneylenders that charged excessive fees and rates to arrange loans for problem borrowers. Rather than relying on sound credit analysis, brokers usually protected themselves by insuring that the borrower had a substantial amount of personal equity in a property.

Several developments in the 1980s served to radically alter the mortgage brokering industry, as well as most other U.S. financial services industries. High bond rates and the term structure of interest rates in 1981 caused a massive shift of money from thrift institutions to money market funds. Because they had no money to make loans, mortgage-lending institutions laid off thousands of loan originators to whom they paid salaries. Many displaced originators became self-employed mortgage brokers who worked off commissions or on contract, rather than salary.

In 1982, money market rates plummeted and institutional lenders were again prepared to lend. Rather than hiring new originators, however, many institutions continued to look to brokers to supply their mortgages. As mortgage activity accelerated in the early and mid-1980s, an identifiable, respectable mortgage brokerage emerged to service the origination function. Many brokers expanded their services, and even began franchising their businesses. Savvy lenders, meanwhile, concentrated on underwriting, funding, and service activities, causing many organizations that retained the retail origination function to become less competitive.

Increasing the importance of the mortgage brokers role in the 1980s was the introduction of hundreds of financial instruments that lenders began offering to potential borrowers. Adjustable rate mortgages (ARMs), for example, grew in popularity as hundreds of new ARM options allowed buyers to access a plethora of interest rate structures and payment terms. Before the 1980s, mortgage lenders offered a relatively homogenous product. Borrowers basically had to choose only between government and conventional loans. Inundated with financing options in the 1980s, borrowers began to seek the aid of brokers that could identify the best product for their individual needs.

In addition to increased outsourcing of originations and the development of new mortgage products, a third advancement affected the brokerage industry during the 1980s—the rapid proliferation of new mortgage securities. Among other consequences, these new securities succeeded in luring short- and intermediate-term investors to the market, and in lubricating the flow of money for new loans. Although retail mortgage brokers indirectly benefited from these developments, many traditional wholesale brokers found themselves displaced by securities trading and brokerage firms that sold securitized mortgages on over-the-counter markets.

Although changing financial markets gave birth to a respected mortgage brokering industry in the early and mid-1980s, it was not until the late 1980s and early 1990s that the industry rocketed to prominence. Historically low interest rates, which caused massive mortgage refinancings and spurred new originations, contributed to trends started earlier in the decade and pushed industry revenues to all-time highs.

While brokers originated a negligible share of all mortgages before 1981, by 1988 brokers had captured about 20 percent of the market. By the early 1990s, the industry was selling about 45 percent of the more than \$800 billion worth of mortgages originated annually in the United States, resulting in total fees and commissions of between \$10 and \$14 billion. Some of the most successful individuals were generating as much as \$500,000 per year in fees.

Massive growth in the mortgage brokering industry is reflected in NMBA membership growth. Started in 1973, the NMBA had just a few hundred members by 1980. Membership jumped to about 440 by 1988. By 1991, more than 1,200 brokers belonged to the Phoenix organization. Furthermore, the NMBA estimated that about 16,000 companies were providing mortgage-brokering services in the early 1990s that were not association members. Likewise, in 1988 more than 85 percent of all applicants to the Mortgage Bankers Association (MBA) were classified as brokerage companies—up from a minute fraction of that amount in the early 1980s.

Mortgage brokers had grown to dominate entire regions in some areas of the United States. In California, for instance, more than 70 percent of all mortgages were originated by brokers in 1991. “In 1984 there were not five mortgage brokers in the state of New York,” said Ralph LoVuolo, Sr., President of LoVuolo & Company, Inc., in *Mortgage Banking*. “Now there are almost 2,000.”

As interest rates continued to fall in the early 1990s, the mortgage brokering industry expanded. Lenders were seeking increasingly faster processing times, high volume, geographic diversity, and lower overhead that they could achieve by outsourcing their origination activities. Consumers were also becoming more comfortable with the concept of using mortgage brokers rather than traditional lending institutions. By 1993, brokers were originating about 50 percent of all U.S. mortgages. The percentage remained the same through 1996, with mortgage brokers originating approximately \$405 billion worth of loans.

Though the industry faced few obstacles to continued growth, one imminent threat promised to snuff out massive profit opportunities that characterized the 1980s and early 1990s—rising interest rates. Rates on long-term mortgages dipped below 7 percent in the early 1990s, at the same time that ARMs fell to less than 4

percent. Homeowners subsequently rushed to refinance their mortgages or to buy new homes. By 1994, though—after reaching 30-year lows—interest rates appeared to have stabilized and were even inching back up. In early 1997, the average mortgage rate for a 30-year loan was approximately 8.25 to 8.5 percent, while a 15-year loan was around 7.75 to 8 percent.

Brokers who had been involved in the mortgage industry for long periods of time were well aware of the cyclical nature of the business. In fact, many brokers left other jobs to participate in the industry during the refinancing boom of the late 1980s and early 1990s. Many of those same workers planned to exit or reduce their dependence on the industry as rates climbed. They would go back to real estate appraisal, commercial brokerage, insurance underwriting, or some other job and wait for the next industry upswing.

Despite the expectation of higher interest rates and waning mortgage activity, industry participants were generally optimistic about the future. The recent surge of growth had served to establish respect for brokers. Once viewed suspiciously by most lenders, brokers were now viewed as potentially excellent sources of originations. Even federal secondary marketing organizations, such as Freddie Mac, were buying brokered mortgages in 1997, and extolling the advantages of such purchases. Greater respect and acceptance of brokers by financial institutions meant that brokers would likely increase their share of the mortgage market in the mid- and late 1990s, thereby reducing the negative effects of rising interest rates.

Other factors were also expected to buoy industry earnings during the inevitable down-cycle. One such influence was a lending practice called “warehousing.” Warehouse lenders provide loans for other lenders to use to underwrite new mortgages. In 1993, about 25 domestic banks and a dozen foreign banks were making warehouse lines of credit available to mortgage banks and even mortgage brokers. Many more organizations were expected to begin making warehouse loans.

In the long term, the mortgage brokerage industry should proliferate as lenders increasingly outsource their originations. Because the origination business is localized and service-oriented by nature, small mom-and-pop shops will continue to dominate. Companies that underwrite, sell, and service the loans that brokers originate, however, will consolidate. Only the largest, most efficient, technologically advanced lenders will remain competitive. Smaller lenders will be consumed by their larger competitors as the industry consolidates. As a result, brokers will supply increasingly fewer lenders in the 1990s and into the twenty-first century.

As the industry matures, brokers can expect to experience greater competition and lower profit mar-

gins. Fluctuating interest rates and housing starts, however, will insure periods of high profitability. Increased regulation will also play a role in the industry's evolution.

Fraud and Regulation. While most mortgage brokers in the mid-1990s were legitimate, lax industry regulation contributed to widespread abuse by some brokers. Second-mortgage scandals, particularly, were marring the industry's reputation in the late 1980s and early 1990s. In one type of scheme, for example, dishonest brokers offer to provide home improvement services to prospects. They convince homeowners to take out a second mortgage on their home to pay for the repairs. Besides charging interest rates as high as 20 or 30 percent, the brokers may also deliver shoddy construction. Such brokers typically operate in low-income neighborhoods where their prospects do not have access to normal bank credit. In 1996, California was trying to pass a measure that would regulate these kinds of high-interest, high-fee loans. A federal law went into effect in 1995 that addressed some of the problems. Other scams involve fraudulent documents and embezzlement of lenders' funds.

Broker fraud lawsuits were filed in Alabama, California, Georgia, Virginia, and many other states in the mid-1990s. In 1996, the state of Idaho, for the first time, passed legislation regulating mortgage brokers in an effort to protect consumers. According to FBI and mortgage professionals, 10-15 percent of all loan applications in the mid-1990s involved some kind of fraud.

In an effort to stem fraud and protect the reputation of legitimate operators, several states were scrambling to regulate the fast growing industry. New regulation was aimed at requiring brokers to prove a minimum net worth and to secure bonding. Some states in the mid-1990s were also striving to develop fee limits and to mandate written agreements between brokers and customers. In general, regulators were seeking increased disclosure requirements for borrowers and investors, and stricter licensing requirements.

Many legitimate brokers were wary of what they viewed as federal and state government intrusion. Some observers believed, for example, that a lack of uniformity in state regulations would severely impede the efforts of some lenders to establish national networks of brokers. Other brokers believed that regulation would squelch profits. In 1993, brokers in Illinois, one of the more heavily regulated states, were already spending an average of \$4,000 to \$8,000 annually on license and audit fees, examinations, and state spot-checking programs. Likewise, brokers in Arizona were required to pass a course, two exams, and post a \$10,000 bond before they could operate.

Regulation also occurred at the federal level in the mid-1990s. Fannie Mae, for instance, required participating lenders to spot-check 10 percent of all the mortgages they produced, and revise discretionary samplings of brokered loans. Likewise, the Department of Housing and Urban Development was pressuring the industry to disclose its fees. Other brokers welcomed new regulations as a way to exterminate illegitimate operators.

Mortgage interest rates remained low in the late 1990s and reforms instituted by Freddie Mac and Fannie Mae helped loan brokers offer the customer more for their mortgage loan dollar. In 1999, Freddie Mac created options to lower the cost of mortgage insurance, required for homeowners with less than 20 percent of a down payment for the total mortgage amount. Such reforms could save a customer with a 30-year, \$100,000 mortgage anywhere from \$1,302 to \$2,800. For larger mortgages, loan brokers could offer customers savings of several thousand dollars.

Fannie Mae worked with loan brokers to make mortgages available to underserved customer populations, under the institution's Trillion Dollar Commitment, an endeavor with the goal of "pledging a trillion dollars in housing finance to serve underserved families, and offering lenders cutting-edge mortgage products and technology," according to Fannie Mae CEO and Chairman Franklin D. Raines. Between 1994 and 1999 the initiative targeted \$700 billion to fund such mortgages. Fannie Mae worked with the loan brokering industry under the initiative by creating partnerships with lenders and making use of technology to provide flexibility to the lending process.

CURRENT CONDITIONS

In the early 2000s, the U.S. Department of Housing and Urban Development proposed several reforms to the Real Estate Settlement Procedures Act (RESPA). The reform most likely to affect the mortgage brokerage industry, if the reforms to RESPA are enacted, is the Guaranteed Mortgage Package (GMP), which requires lenders to give buyers a guaranteed price prior to receiving a purchase commitment. According to the November 2002 issue of *Mortgage Banking*, GMP presents an opportunity for mortgage brokers mainly because "mortgage brokers have proven time and time again they are the earliest adopters and true innovators of the origination business. If the GMP creates an environment in which originators must aggressively compete by offering the best package, who is likely to be able to compete? The innovative mortgage brokers, who will have both choice and competition on their side."

It is this ability to compete that has propelled the mortgage broker segment to its position in the mortgage industry; mortgage brokers represent the single largest

segment of the U.S. home mortgage industry. In 2001, with interest rates lower than they had been since the 1960s, the mortgage industry originated more than \$2 trillion in loans for the first time ever. Mortgage brokers handled roughly 55 percent of these loans.

INDUSTRY LEADERS

The loan and mortgage brokering industry is highly fragmented. Because of its localized nature, no firms dominate the industry on a national, or even regional, scale. Because most participants are privately held and are not required to publish operating results, little financial data exists about firms within the industry. In 2003, the average brokerage firm operated a single office and used roughly 25 employees to handle a total of 125 loans per year.

Industry leaders include Manhattan Mortgage Co., of New York City, which secured more than \$4 billion in loan revenues in 2002 and operated as the top residential mortgage brokerage in the metropolitan New York area. Randall Mortgage, Inc., based in Dublin, Ohio, was ranked the leading residential mortgage brokerage in central Ohio in 2000.

In the mid-1990s Norwest Mortgage Inc. was a leader in mortgage origination, leading competitors with \$55 billion in originated loans. Norwest was also the top servicer of residential mortgages (nearly 206,000) for investors. Norwest merged with Wells Fargo in 1998 to become Wells Fargo and Co. Wells Fargo and Co. had 2002 sales of \$28.4 billion, reflecting a one-year sales growth of 5.9 percent. The company had net income in 2002 of \$5.4 billion. In 2002 retail lending giant Lehman Brothers posted total sales of \$16.7 billion with a one-year sales growth of 25 percent, followed closely by rival Credit Suisse First Boston with \$13.6 billion in sales.

WORKFORCE

Although the mortgage brokering industry lacks statistical data that is available for most industries of its size, a study released in 1992 by the NMBA indicated that the average brokerage firm had six employees, had been in business for five years, and had a net worth of \$75,000. A NMBA survey released one year later, though, showed that the median broker originated \$26 million in mortgages in 1992—a 65 percent increase over 1991.

Many brokers earn in excess of \$200,000 or even \$500,000 per year, and the average industry income is very high at peak times. Brokers also enjoy independence and flexibility in comparison to many salaried employees. The business has its drawbacks, however. For instance, mortgage brokering is a highly cyclical business. During periods of rising interest rates many brokers experience rapid and significant declines in income levels. In

addition to cyclical downturns, brokers usually work long hours and spend many nights and weekends meeting with prospective clients at their convenience.

Also frustrating brokers is the fact that 50 percent of all the loan applications that they assemble for their clients are rejected by banks, resulting in zero fees for the broker. Furthermore, most brokers spend their first few years on the job making cold calls to attorneys, CPAs, and real estate brokers to build a referral base for future business. Finally, mortgage brokering can be very stressful. “You’re the primary contingency whether a deal flies or not,” said Karen Dell, loan consultant for California-based First Federal in the *Los Angeles Business Journal*. “People have a lot of money at stake, so their tempers can be short.”

Employment prospects for the industry were positive going into the mid-1990s. Besides general growth in the demand for brokers and originators, the demand for support staff should also rise. The Bureau of Labor Statistics estimates that jobs for secretaries and clerical staff in the industry should rise by more than 40 percent between 1990 and 2005. Positions for bill and account collectors should jump by 54 percent. Management support and credit analyst positions should increase by more than 50 percent as well.

RESEARCH AND TECHNOLOGY

The mortgage brokering industry is highly dependent upon modern office technology and, in effect, is a corollary of the information age. There are 0.8 laptop computers per originator in the industry, according to the 1992 NMBA survey, much more than almost any other U.S. industry. Almost all brokers are heavily dependent on fax machines to send and receive loan and credit information. Nearly half of all brokers are part of a computer network, and 13 percent access a computerized loan origination system that lists rates among real estate agents. About four-fifths of all brokers used some form of mortgage processing software in 1993.

In addition to creating an environment which allowed brokers to efficiently originate loans, information technology was also driving increased efficiency of the financial markets, on which mortgage brokers depend to buy their originations and pay their fees. Successful lending institutions were using complex information systems and software to eliminate overhead and reduce administrative costs. Such advances were a driving force behind lender consolidation.

New systems were already being implemented in the mid-1990s that sought to provide a better link between lenders, brokers, real estate agents, and even consumers. New Mortgage Bankers Association of America and American National Standards Institute standards had been developed regarding electronic communications.

Countrywide Funding Corp., for example, offered its brokers access to DirectLine Plus, a system that allows brokers to find current data on loans-in-process 24 hours a day. Mortgage companies were moving toward delivering brokers full access to their integrated processing systems.

Advances in technology continued to expedite the mortgage lending process in the late 1990s for lenders and customers. Newly developed software tools such as Desktop Underwriter allowed lenders to use flexibility in evaluating individual loan applications. Fannie Mae CEO Raines estimated that such software increased the amount of low down payment loans that the institute was able to buy, as well as decreasing delinquency among its borrowers.

Loan brokers continued to be served by advances in Internet technology in the late 1990s. In late 1999, IMX(r) Exchange, an online commerce resource for loan brokers, collaborated with Byte Enterprises and Contour Software to improve the efficiency of services available to loan brokers. The collaboration produced the online feature XpressPost(TM), which would allow loan originators to post applications online in real time and receive immediate bids for loans from brokers that were part of the IMX(r) network.

SIC 6211

SECURITY BROKERS, DEALERS, AND FLOTATION COMPANIES

The securities industry is made up of establishments primarily engaged in the purchase, sale, and brokerage of securities. This industry also encompasses investment bankers, which originate, underwrite, and distribute issues of securities. Firms in this industry essentially serve as financial intermediaries, matching investors with entities that need money. They also provide a pricing mechanism for the investment market, and furnish a vehicle for the liquidation of investors' assets. Although many of these firms also provide investment consultation, companies engaged predominantly in advisement are classified in **SIC 6282: Investment Advice**.

NAICS CODE(S)

- 523110 (Investment Banking and Securities Dealing)
- 523120 (Securities Brokerage)
- 523910 (Miscellaneous Intermediation)
- 523999 (Miscellaneous Financial Investment Activities)

INDUSTRY SNAPSHOT

In 1995 there were 981 companies with revenues of \$176.26 billion and 429,900 employees. In that year U.S. corporate stock and bond sales rose to \$709.3 billion from \$705.7 billion in 1994, due to a robust calendar of common-stock offerings. Behind the strong financing activity was a blend of lower interest rates and higher stock prices, which together spurred more and more individual investors to buy common stock. One of the most vibrant areas of the common-stock underwriting market was the initial public offering, as 572 companies came to market for the first time in 1995. Total debt sales, including convertible offerings, slipped to nearly \$611 billion in 1995 from \$628.8 billion in 1994. But asset-backed offerings jumped 42 percent to \$107.1 billion.

Major U.S. stock markets smashed an array of trading records in 1995. Average daily volume on the over-the-counter NASDAQ (National Association of Securities Dealers' Automated Quotations System) stock market reached 400 million shares, up 36 percent from 1994. Average daily volume on the New York Stock Exchange (NYSE) totaled a record 346 million shares, up 19 percent.

In a dramatic recovery from record losses that bludgeoned dealers and brokers in 1990, the industry realized its highest revenues in history in 1995. While the future of the highly volatile securities market is nearly impossible to predict, economic and demographic trends—such as the aging of baby boomers—offered hope for continued healthy security markets throughout the 1990s.

ORGANIZATION AND STRUCTURE

Securities firms have three major functions in financial markets: they provide a mechanism that links people who have money with those seeking to raise money; they deliver a means of valuing and pricing investments; and they offer a vehicle that investors can use to liquidate their investments. Entities in the market that are served by securities firms include individuals, corporations, and governments.

Securities firms typically serve the first function, raising capital, through investment banking and brokerage activities. By acting as an intermediary between those with and those without capital, the firms channel funds between various sectors of the economy. The second function, pricing, is served when companies provide timely information to the marketplace about investments. The essential ability of securities firms to deliver this information quickly has made U.S. capital markets the world's most efficient. Liquidity, the third function, is served as brokers and dealers buy and sell securities for investors as efficiently as possible to avoid losses not related to market conditions.

Although not considered an integral function in the financial market, advisement and product development services offered by many full-service securities firms are significant factors in the dynamics of the industry. Companies continually strive to develop and refine financial instruments specifically tailored to customer needs. These instruments are designed to accomplish myriad investment goals including sheltering taxes, maximizing dividends, or increasing capital gains. Firms that engage in investment counseling provide extensive research for potential investors. These activities entail: obtaining information on the customer's investment strategy and goals; providing information on various investment vehicles; offering advice on specific market trends and forecasts; providing information regarding government initiatives such as tax laws; and recommending investments that match the customer's needs.

Types of Securities. Firms buy and sell an enormous variety of securities for their customers. These securities generally can be categorized as either equity or debt instruments. Equity instruments, most often stock, represent ownership interest in a firm and entitle the owner to a portion of the company's profits. Debt instruments, on the other hand, signify a promise on the part of the issuing entity to repay, at a specified time, a sum of money and an amount of interest for use of that money. Created as a means of raising capital, both debt and equity vehicles are often purchased and sold numerous times through various securities markets.

In addition to trading in traditional corporate stocks and bonds, securities firms were selling increasing

amounts of alternative investment vehicles in the 1990s. These vehicles included municipal (state and local) bonds, junk bonds, options, mutual funds, asset and mortgage-backed securities, futures, and real estate investment trusts.

Two vehicles that continued to receive increased emphasis in security markets in the 1990s were derivatives, such as futures and options. An option is a contract to purchase or sell shares of a particular stock. The contract specifies the security, the purchase or sale price, the life of the option, and the number of shares that the contract represents. A "put" option gives the owner the right to sell a security, while a "call" option allows the owner the choice of buying a security. In contrast to an option, a future is a commitment to receive or deliver a specified quantity and quality of a commodity by a specified future date. A future can be used to insure a transaction price at a date prior to the actual exchange.

Types of Firms. Many securities firms serve as both brokers and dealers in the market. A broker is an agent who buys and sells securities on behalf of a client for a commission or fee. A dealer is a principal that buys and sells on its own account with the intention of making a profit. Firms that serve as broker-dealers typically have a headquarters office supported by numerous branch offices. The branch offices sell and market the company's services, while the main office handles administrative activities, research, and product development. Depending on the type and extent of services offered beyond brokerage and dealing activities, securities firms fall into one of several categories.

For instance, national full-line firms provide a range of services for both retail and institutional customers. These companies usually have many offices nationwide. Examples of such firms include Merrill Lynch and Paine Webber. Investment banking firms, such as Goldman Sachs and First Boston, primarily provide institutional customers with services related to underwriting new securities issues, and mergers and acquisitions. They may also act as brokers and dealers. Regional firms offer full lines of securities products to customers within a particular geographic area. Large firms of this type are Robert W. Baird, Wheat First Securities, and Alex Brown.

In addition to full-service, investment banking, and regional firms, the marketplace also includes discount brokers. These companies allow retail customers to buy and sell securities for less than they would have to pay to a full-service broker. Because discount brokers usually do not offer investment advice, have sales staffs, or act as marketers for financial products, they are able to charge lower commissions. Popular firms in this category include Charles Schwab and Olde Discount.

Industry revenues remained highly concentrated among the top-tier firms, as they have been since the

inception of the industry. In the early 1990s, the top 25 brokers garnered over 80 percent of all industry revenues. Furthermore, the top 10 brokers amassed nearly 70 percent of all industry revenues.

Primary Marketplaces. Industry participants buy, sell, and issue securities in three primary markets: exchange, over-the-counter (OTC), and money. Exchange markets provide organized trading facilities for stocks, bonds, and/or options. These facilities act as auction houses, where securities brokers and dealers essentially bid for securities. Organizations must meet requirements set forth by the exchange in order to have their securities listed, or made available for trade, on the exchange. The New York Stock Exchange (NYSE) is the best-known exchange, but others include the American Stock Exchange (AMEX), Midwest Stock Exchange, and the Chicago Board Options Exchange.

OTC markets, in contrast to organized exchange facilities, consist of a network of brokers and dealers that represents customers in the purchase or sale of securities. No central location exists for this type of market. Trading departments of securities firms negotiate price with customers or their agents over the telephone. OTC markets usually trade in securities of companies that are small in comparison to those on organized exchanges.

The money market trades mostly in short-term securities that have a maturity of one year or less. These instruments are characterized by high liquidity and typically trade in high denominations. Examples of securities traded in this market are U.S. treasury bills, certificates of deposit, and commercial paper. As with OTC markets, money markets do not have central trading places, and the market is composed primarily of banks and firms that borrow or invest large amounts of money for a short term.

BACKGROUND AND DEVELOPMENT

The U.S. securities industry gradually evolved from a mix of financial services available as early as 1800. These services, and the subsequent development of a sophisticated industry, mimicked financial markets that developed in Europe in the eighteenth century. In fact, much of the early investment banking activity in the United States, which was responsible for issuing the first securities, was conducted through joint ventures between Europeans and Americans. Many of the famous families that helped to shape the American securities market are still well known, such as the Rothschilds, Warburgs, and Barings.

Throughout the nineteenth century the development of the American securities industry lagged several decades behind that of Europe. However, the Civil War and the construction of the U.S. railroads created a demand for financial services that spurred the growth of the in-

vestment banking and securities industry. In fact, government securities sold during the Civil War represented the first successful security offering made to the general public on a large scale. This opened the way for sales and distribution systems that would be used by securities firms throughout the twentieth century. Some of the larger investment banking houses that dominated the nineteenth-century securities industry in the United States included Kuhn Loeb, Morgan, Lehman Brothers, and Goldman Sachs.

The securities industry rapidly expanded after World War I, as the prosperity of the 1920s caused an almost insatiable appetite for securities. Despite massive growth in the popularity of municipal and utility issues, for the first time in 1929 the volume of even more popular stock issues surpassed the amount of bonds issued. Throughout the 1920s investment bankers raced to meet the demand for new securities. Even an influx of foreign securities was insufficient to satisfy consumers.

The immense success of the securities industry, however, foreshadowed its rapid decline and the subsequent transformation of its structure. The industry that had evolved by 1930 was loosely regulated and was dominated, many people at that time believed, by an exclusive network of power brokers. In addition, banks were allowed to participate in both commercial and investment banking activities, which created a conflict of interest for many firms.

The Industry Crash and Reformation. The stock market crash of 1929 confirmed the suspicions of many that the securities industry was in need of reform. A variety of New Deal legislative orders quickly transformed the industry into one of the most regulated sectors of the American economy. In 1934 Congress established the Securities and Exchange Commission (SEC) to protect investors against fraud and mismanagement by securities firms and other investment entities. The Securities Exchange Commission (SEC) performs legislative, judicial, and executive functions. The most inclusive and far-reaching piece of legislation enacted by the SEC in the 1930s was the Glass-Steagall Act. Other laws included the Revenue Act, the Securities Act, and the Securities Exchange Act. These laws required stricter standards of disclosure and erected a barrier between investment and commercial banking. They were also used to strengthen the banking industry and to reduce speculative risks that threatened the health of the U.S. economy.

The result of the industry transfiguration was a relatively stable securities market throughout most of the remainder of the twentieth century. After 1930 the industry gradually grew and prospered under SEC regulation until the late 1960s, when demand for new business boomed. The amount of new common stock issued in-

creased from about \$10 billion in 1965 to a peak of over \$40 billion by 1968. New issues of bonds reflected a similar pattern. Although the dynamics of the industry had changed significantly after 1930, the industry remained dominated by several of the larger brokerage houses until the late 1970s, when the increased volume allowed smaller companies to begin to establish a presence in the market.

One of the greatest developments in the securities industry occurred in 1975, when commissions that securities firms charged were deregulated, and negotiated rates were allowed. Since this time, market volume has increased dramatically, and new service offerings have increased. For example, the volume of common stock issued skyrocketed from about \$40 billion per year in 1975 to over \$75 billion by 1985. During the same period, the amount of new bond issues leapt from \$40 billion to over \$110 billion per year.

The 1980s. Deregulation of commission rates, a strong market demand for new issues of securities in a vibrant economy, and the increase in the volume and number of new financial instruments all contributed to the growth of the securities industry in the mid-1980s. Between 1982 and 1986 combined industry commissions on securities rose from \$6 billion to over \$12.6 billion, and total industry revenues jumped from \$23.2 billion to \$50 billion. Industry employment soared from about 170,000 in 1980 to a peak of 262,000 in 1987. In addition, merger and acquisition activity by American companies, which securities firms handled, proliferated throughout most of the decade, peaking at over \$250 billion of completed deals in 1988. Leveraged buyouts and junk bond issues, both of which were high margin activities for securities firms, also added to industry growth and profitability.

Just as the boom of the 1920s foreshadowed the fall of securities markets in the 1930s, the mid 1980s were a prelude to industry setbacks in the late 1980s and early 1990s. The stock market crash on Black Monday, in October of 1987, significantly diminished activity and profits for securities firms during the next few years. As equity and debt trading declined, and mergers and acquisitions decreased between 1987 and 1990, pre-tax income for the entire industry plummeted from \$8.3 billion in 1986 to \$3.2 billion in 1987 and only \$800 million by 1990. As industry employment fell to less than 210,000 in 1990, Wall Street posted its worst year on record.

As if economic woes were not enough, the industry was also rocked by scandals in the late 1980s. Arrests and indictments of executives from some of the largest brokerage houses in the United States shook up Wall Street. Charges by the SEC ranged from insider trading, or trading while in possession of non-public information, to concealing stock ownership. Charges against Dennis

Levine, of Drexel Burnham Lambert Inc., and Ivan Boesky in 1986 led to subsequent investigations of a number of prominent Wall Street figures. Boesky received three years in prison and a \$100 million civil penalty. Levine was sentenced to serve four years in prison and was fined \$362,000.

Increased Competition. At the same time that the securities industry was experiencing its volatile rise and fall during the 1980s, it was also undergoing structural changes. The initiation of negotiated competitive commissions in 1975 gradually reduced the percentage of company revenues created by commissions. In fact, commission income as a percentage of total industry revenues plummeted from over 40 percent in 1976 to 16 percent by 1990.

Other regulatory changes also jostled the market. Some of these laws were prompted by scandals that tarnished the industry's image during the 1980s, while others were a result of a changing marketplace. For instance, the Glass-Steagall Act was essentially dismantled, as regulators tried to make the U.S. banking industry more competitive in global markets. Additionally, the Tax Equity and Fiscal Responsibility Act (TEFRA) and Rule 415 also affected the industry. TEFRA, which increased reporting requirements for securities companies, compelled firms to invest in costly information technology. Rule 415 allowed multiple security offerings to be covered by one underwriting, thereby increasing fee competition in the industry.

Besides regulatory changes, three major factors increased the competitiveness of the industry. First of all, the pool of investment dollars grew because of large increases in the size of pension funds, a trend that was expected to accelerate through the end of the twentieth century. Secondly, interest-rate volatility was partly responsible for growth in the trading of fixed-income investment products, which increased opportunities for commissions in the industry. Finally, rapid growth in the federal deficit resulted in a large increase in the available pool of U.S. government investment instruments, causing increased trading in bonds.

One effect of these changes was the entrance of new players in securities markets. Banks, insurance companies, and investment advisors, among others, all began competing for a piece of the securities market pie in the late 1980s, placing downward pressure on securities firms' profits. Furthermore, discount brokers, many of which charged as much as 90 percent less than full-service firms, cornered 20 percent of the individual investor market during the 1980s.

Securities firms reacted to increased competition and reduced commission income in two ways. First, they emphasized the services side of their business, relying less on income from buying and selling securities and

more on money management and advisory services. Secondly, the number of firms in the industry declined, as companies merged to benefit from economies of scale. Besides mergers between securities firms, several large firms also merged with insurance companies and other institutions that complemented their role in the market. For example, Kemper Insurance Company merged with five regional broker-dealers. The number of securities firms fell from a peak of 9,515 in 1987 to 7,610 in 1992.

Despite significant setbacks for securities firms triggered by the 1987 stock market crash and aggravated by increased competition, the industry staged an amazing recovery by 1991 and 1992. Following one of its worst years on record in 1990, industry pre-tax income rose to historical highs of \$8.6 billion in 1991 and over \$10 billion in 1992. Low interest rates and high stock prices sparked much of the activity. Lower rates increased the amount of new debt offerings and encouraged corporations, municipalities, and homeowners to refinance their existing debt. Because stock prices were high in relation to company earnings, corporations tended to issue more new equities.

However, the bond market crashed in 1994 as a result of an unexpected rise in interest rates. Furthermore, brokerage companies experienced slowdowns in underwriting and trading. Firms became stuck with unwieldy cost structures that outstripped revenues. Thus, Wall Street firms curtailed expansion plans and eliminated more marginal businesses.

In 1995 pre-tax profits of NYSE-member securities firms soared. Virtually all revenue components posted increases led by trading gains. Commissions and asset management fees also hit new highs. In 1995 securities firms took in \$6.58 billion in disclosed underwriting fees, making 1995 Wall Street's third best year ever. Triggering the surge in fees was robust activity in stock sales, the most lucrative underwriting sector. Stock sales yielded \$4.02 billion in fees alone, or nearly two-thirds of all underwriting fees.

Another positive factor in 1995 was the volume of mergers and acquisitions activity. In 1995 all records for mergers and acquisitions activity in the United States and abroad were broken. An unprecedented \$458 billion in deals was announced by U.S. companies, up 32 percent from the old record of \$347 billion reached in 1994. Globally, a record \$866 billion in transactions was reached, up 51 percent from the \$572 billion announced in 1994. However, investment bankers took a back seat in a number of the transactions. Some of the biggest deals were hammered out by chief executives. Even though deal volume was 35 percent above 1988, the best year of the 1980s, many of 1995's deals were crafted without all the complicated financial arrangements, such as junk bonds and bridge loans, that can generate large fees.

In late 1996, the Federal Reserve Board loosened the cap on banks' underwritings from 10 percent to 25 percent of the revenue in their securities' affiliates. Furthermore, during 1996, industry firms continued to diversify their revenue bases. A generally favorable environment for financial assets continued to provide a backdrop for impressive profits postings in the industry. Mutual fund inflows and trading volumes increased.

During 1997 there was an increasing pace of consolidation among Wall Street firms. For example, in January 1997 Morgan Stanley announced a \$10.2 billion merger with Dean, Witter, Discover & Co.

CURRENT CONDITIONS

The late 1990s saw the advent of online trading, a trend that revolutionized and changed the industry. According to an article in *The Economist* (8 May 1999), one of every six shares traded during 1999 was traded through the Internet, or 500,000 shares per day. In 1994 there were no online brokerage accounts; by 1999, 5 million of these accounts were active. Online brokerage firms were typically discount brokerages, with an average commission of \$15.00 per trade, much less than the full-service brokerage fee of \$100 to \$300 per trade. Traditional brokerages such as Merrill Lynch appeared not to be concerned with the rising competition—arguing that the discount online brokerage model was not sustainable in a business sense. Online brokers in 1999 continued to shape their niche in the industry by offering additional services and products such as insurance or online research on companies. The CEO of Prudential Securities, a traditional firm without online trading, suggested that the value for consumers in sticking with a traditional firm lay with the advice that the firm could provide, rather than the actual execution of the trade, which online providers excel at, and offer at a cheap price.

Performance among online brokerages varied as these companies evolved in the late 1990s. A *Kiplinger's* article (November 1999) surveyed the performances of online brokerages and found a disparity in the quality of service provided. Among the disadvantages of online brokerages were long phone waits (one investor lost \$5,000 because he couldn't get through to the firm), computer crashes, or difficulty logging onto the brokerage site. Advantages included low brokerage fees from some companies (good for frequent traders) and information available on a brokerage site. Using several criteria for ranking online brokerages (including commissions, responsiveness, margin rates, availability of initial public offerings [IPOs], broker knowledge, and Web site), Kiplinger's ranked Accutrade and Ameritrade highly. Web Street Securities received the lowest overall rating. *Forbes* 1999 Annual Report (11 January 1999) noted that Charles Schwab, a traditional brokerage firm, had done

well both in establishing dominance in the mutual fund market and in online brokerage services.

INDUSTRY LEADERS

The largest security broker-dealer in the United States in 1991 was Merrill Lynch and Company, Inc. of New York. The firm is the world's largest equities underwriter, providing financing, investment, and insurance services to clients worldwide. Merrill Lynch is one of the few financial services companies to have achieved strength in both the retail and institutional markets at home and abroad. Despite the unprecedented bull market in the United States, the company has made significant acquisitions overseas, such as Smith New Court PLC, a global securities firm based in Great Britain. In 1996, Merrill Lynch had total worldwide revenues of more than \$25 billion.

Morgan Stanley, a premier institutional brokerage firm, employed more than 12,000 individuals in 1996. In that year the firm was ranked number one in global announced mergers and acquisitions transactions and number three in worldwide common stock underwriting, according to Securities Data Co. Morgan Stanley's network of offices spans 22 countries, and the firm's Morgan Stanley Capital International indices serve as benchmarks for international investors. In 1996, the firm generated net revenue of \$5.8 billion.

Merrill Lynch remained the largest U.S. securities firm in 1998, with 49,800 employees. Fidelity Distributors retained the greatest market share (as of February 1999) for a mutual fund at 12.84 percent. The Fidelity Magellan Fund had the greatest market share of mutual funds (during the first quarter of 1999) at \$85.86 billion dollars.

WORKFORCE

Since 1980 the securities industry has, on average, grown faster than other industries. However, employment in the industry has been highly volatile compared to other segments of the economy. Tasks performed by workers in many occupations in the security brokerage industry have been transformed, as global markets have expanded, and computerized trading has increased. The industry has increased employment in highly technical professional occupations such as computer scientists and statistical financial analysts and has streamlined managerial and internal analysis jobs. The increase in the professional share of the industry's employment has largely offset a decrease in the managerial share.

With more commercial banks gaining their Federal Reserve approval to open securities affiliates, the demand for experienced research, sales, and trading people is greater than the supply. Money-center banks, such as Chemical Bank and Chase Manhattan, have hired dozens of experienced professionals in these areas.

Employment in the field typically requires knowledge of finance and investments, although many brokers in the past have started their careers with little of either. Jobs usually are available in one of five basic functional areas: sales and marketing, where securities or financial products are sold directly to customers; investment banking; research; trading, which often entails buying and selling on an exchange floor; and finance and administration. Although salaries in more traditional business functions are similar to other industries, salaries in commission-based positions in brokerage or sales can vary greatly depending on the market and the success of the worker.

One of the most glamorous and high-paying areas, and the most difficult to break into, is investment banking. Although employment in the field declined after the mid 1980s, the industry remains cyclical, and economic growth could open more opportunities in this field. Successful investment bankers typically work long hours, have a master's degree in business administration, and work in one of a few large metropolitan areas, particularly New York.

The greatest job growth in the securities market during the 1990s is expected to be in financial services and operations. Money management, financial consulting, and other fee-based services are expected to grow. Likewise, operations positions in the industry should increase faster than average throughout the 1990s. Operations departments are basically responsible for maintaining customer accounts, updating records, and handling cash and securities receipts and deliveries. As companies struggle to keep costs down, and securities markets increasingly become electronic, firms will continue to invest in advanced information processing and delivery systems.

During the consolidation, merging, and downsizing of Wall Street brokerages in the 1990s, many brokers became independent. Between 1992 and 1997, independent brokers across the United States increased by 23 percent, though that amount tapered slightly in 1998, when large, traditional brokerage firms attempted to woo independent brokers back to their firms. By the late 1990s, 96,000 independent brokers offered services nationwide. Independents cited an ability to offer flexibility to customers, since these brokers were not limited to offering products from a parent company.

Regional securities brokers also took advantage of Wall Street downsizing to beef up their own staff. While firms like Merrill Lynch and Company planned to cut its staff by 5 percent (or 3,400 people) in 1998, smaller regional firms like Piper Jaffray of Minneapolis, Minnesota, used funds of \$730 million to hire additional staff.

Brokerages in the late 1990s attempted to better reach untapped potential customers by hiring women and minority brokers. According to the Securities Industry

Association, nearly 800,000 potential customers represent untapped women or minority markets in the country. But CEO Joseph Grano of Paine Webber Inc. (*American Banker*, 2 June 1998) admitted that the industry had a long way to go in hiring minorities, claiming that the industry had a difficult time attracting them and retaining them. Other executives cited industry consolidation and resistance to change as barriers in hiring more women or minority brokers.

AMERICA AND THE WORLD

Securities firms in the United States, as well as in other countries, often deal in foreign markets to access untapped capital, among other reasons. By issuing a security in a foreign market, a company can increase the success of its offering simply by increasing the size of the potential market. A second important impetus for buying and selling overseas securities is to achieve greater returns and asset diversification. Although the United States maintains the largest and most efficient securities industry and markets in the world, foreign securities industries were becoming increasingly competitive, and overseas markets more attractive, in the early 1990s.

The international securities market began to realize explosive growth in 1983. U.S. purchases and sales of foreign stocks skyrocketed from \$15.7 billion in 1982 to \$320.3 billion in 1992. Purchases and sales of bonds during the same period bounded as well, from \$61 billion to \$824 billion. At the same time, foreign purchases and sales of U.S. stocks and bonds increased at an even greater pace. Combined sales and purchases of U.S. stocks and bonds spiraled from \$296 billion in 1982 to \$5.1 trillion by 1992, a 17-fold increase.

Although new technology was the greatest reason for the emergence of the global securities market, as discussed later, regulatory reform on all continents was also an important factor. This has resulted as governments have discovered that globalized financial markets encourage flows of capital to regions offering the best returns. They also recognized that open markets have allowed investors to achieve greater portfolio diversification, thus creating more stable markets.

The United States has been a leader in the opening of markets for foreign investment. During the 1980s, the SEC revised many of its rules to assure that capital raising in the United States by foreign issuers was not unnecessarily hampered. In 1990, the SEC adopted Rule 144a, which made it easier for large institutions to trade certain securities among themselves, thereby encouraging foreign issuers to invest in U.S. markets despite U.S. disclosure requirements. In 1991, the SEC acted again by allowing certain Canadian firms to issue securities prepared in accordance with Canadian requirements, rather than under U.S. laws. Furthermore, in the

1990s, foreign companies increasingly issued American Depository Receipts (ADRs) in the United States in order to obtain additional sources of equity capital.

Similar breakdowns in barriers of overseas markets in the 1980s and early 1990s were encouraging U.S. securities firms to venture abroad as well, often despite less efficient overseas markets. For instance, surplus countries — such as Japan — have opened their markets as a result of pressure from other nations seeking a greater balance of world capital flows. In fact, Japan and England both led other Asian and European nations to deregulate their markets when both countries abolished many of their controls in 1979. Further reorganization of financial markets by the European Community promises more efficient markets in the future.

The ramifications of global markets for the U.S. securities industry include the potential for a broadened role in world financial markets, more investment alternatives and financial products, greater access to capital, and a greater volume of transactions. As markets continue to become more efficient, and foreign securities industries become more advanced, however, the global market will also mean greater competition for U.S. firms.

RESEARCH AND TECHNOLOGY

Advances in technology continued to have a marked impact on the securities industry in the 1990s. Technology was rapidly changing the entire structure of the industry in several ways. Companies were relying increasingly on computer automation to reduce costs and to meet federal reporting requirements. In addition, markets and exchanges in the United States were becoming more “electronic” each year, allowing various trading functions to be conducted by computer. Finally, computer technology was quickly creating a global securities market in which investors and capital seekers around the world could collaborate.

Successful securities firms in the 1990s were those that had made, or were making, the technological leap from transaction processors to information processors. Firms were coordinating sales, trading, and financial advisory services through advanced information system networks. This was allowing companies to reduce transaction costs, make better investment decisions, and deliver new products more quickly, thereby increasing customer service and lowering overhead costs. Advanced information systems were also becoming vital as a result of increased SEC reporting requirements.

Besides making companies within the industry more productive, information technology was also altering the way that securities were bought and sold in the marketplace. For instance, programmed trading allows brokers and dealers to complete transactions by computer, rather than from the floor of an exchange. Although critics of

this system argue that it creates excessive market volatility, increased regulation of the system following the 1987 market crash has alleviated resistance.

Automated trading techniques will increasingly influence the market, as they continue to deliver greater cost benefits. For instance, in 1988 the average cost of executing an order on the floor of the NYSE for a firm was \$12.87 using one of its own brokers, and \$24.32 for an independent broker. Using Designated Order Turn-around (DOT), the automated system, the cost fell in the range of \$4.84 to \$8.67 per transaction, depending on the number of daily transactions a company made on the system.

In addition to changes it has prompted in the way firms and markets operate, information technology has had the most notable impact upon global securities markets. Advancements in telecommunications and satellite systems allow investors and capital seekers to monitor and participate in world markets on a minute-by-minute basis. By the mid- to late 1980s, however, issuing procedures had been simplified and accelerated to the point that borrowers could offer issues in several national markets simultaneously. Indeed, all market participants now have access to information allowing them to swiftly orchestrate complex financing techniques that simultaneously integrate multiple national markets.

While great strides have been made in uniting international markets with new technologies, there was still enormous room for improvement going into the mid-1990s. Industry leaders in participating nations were still in the process of developing a central or global depository/clearance system, which would essentially settle trades of securities made by members of separate nations. A system of this type, similar to the one that exists for trades made in the United States, would make markets more efficient. Furthermore, many nations were still overcoming their reluctance to allow computerized access to their financial markets.

SIC 6221

COMMODITY CONTRACTS BROKERS AND DEALERS

This industry classification includes establishments primarily engaged in buying and selling commodity contracts (futures) on either a spot or future basis for their own account or for the account of others. These establishments are members, or are associated with members, of recognized commodity exchanges. Establishments primarily engaged in buying and selling commodities are classified in wholesale trade. However, the Chicago Board Trade doesn't trade, it just provides facilities for members to trade future and options contracts.

NAICS CODE(S)

523130 (Commodity Contracts Dealings)

523140 (Commodity Brokerage)

In 1997, 2,044 establishments operated under this industry classification, most of which were commodity contracts brokerages. The industry employed 17,763 people and generated \$5.3 billion.

In general, brokers are independent traders who bring together buyers and sellers of the same commodity and execute their orders. The broker receives a commission on each of these transactions. These brokers are agents of their clients and are, therefore, subject to the law of agency in their dealings with their clients. In contrast to the broker's role as an agent, a dealer acts as a principal in relations with customers. This is the only difference between commodities brokers and dealers.

Commodities brokers and dealers are engaged in the trade of commodities on either a current, "spot," or a future basis. Commodities are typically agricultural, mineral, or other basic products and financial futures that are traded on a commodity exchange. The products are generally substitutable. This means that the purchaser is unlikely to differentiate between one unit of the product and another. Agricultural products such as wheat, corn and soybean contracts are written with certain grade and other specifications as standardized contracts stating the quantity and quality of the product.

The commodity exchanges are organizations that are owned by their members for the purpose of bringing buyers and sellers together. The transactions made by these parties can be performed on a spot basis, in which the commodity is sold for cash and immediate delivery, or on a future basis, under which the purchaser has the right to buy a commodity at a future time at a fixed price. There are a number of these exchanges throughout the country, all of which are supervised by the federal government under the Commodity Exchange Act administered by the Commodity Futures Trading Commission.

Commodity prices are quoted on either a spot or future basis on an electronic board each time they change. Future prices are quoted based on the date of delivery of the contracted commodities. Prices are quoted as they occur based on trades in trading pits during specified hours. Trades are only made by members. There has been a trend in the commodities futures markets to move away from traditional commodities. As the type and number of commodity futures contracts have increased, brokers have handled ever higher volumes.

Commodity brokers and dealers range in size from large operations to small businesses. Industry leaders include Smith Barney, Andersons Investment Service Corporation, Archer Daniel Midland Company, Bank America Corporation, Bankers Trust New York Corporation,

Bunge Corporation, Citicorp, Credit Lyonnais, Rouse USA Ltd., Dean Reynolds, Inc., First Chicago Corporation, Goldman Sachs Company, J.P. Morgan Futures Inc., Merrill Lynch Futures Inc., and Yamaichi International.

SIC 6231**SECURITIES AND COMMODITIES EXCHANGES**

This category includes establishments primarily engaged in furnishing space and other facilities to members for the purpose of buying, selling, or otherwise trading in stocks, stock options, bonds, or commodity contracts.

NAICS CODE(S)

523210 (Securities and Commodity Exchanges)

INDUSTRY SNAPSHOT

This classification is divided into two distinct industries: stock exchanges and commodities exchanges. Each of these industries has its own structure, history, and participants. Modern securities exchanges in the United States are voluntary entities organized for centralized trading. These organizations' constitutions, bylaws, rules, and regulations govern the members and the trading of issues listed by the exchange. These organizations do not trade the listed securities themselves; rather, they provide the facilities required for organized trading. Stock exchanges also aid the marketability of their listed issues by providing the facilities required for high-volume trade and by requiring the firms listed on the exchange to observe standards in accounting and reporting. These functions make the issues accessible and enhance public confidence in the exchange and its listed securities.

The Securities Exchange Act of 1934 regulates the trade of securities in the United States. This act created the Securities Exchange Commission (SEC) and required any brokers or dealers engaged in the exchange of securities to report these transactions to the SEC, unless the exchange was registered as a national securities exchange, was specifically exempted, or was not practicable

and necessary or in the public interest for the protection of the investors to require such registration.

In addition to these formal exchanges, the over-the-counter market is also very significant. Over-the-counter transactions do not have a central market in which they are executed. Instead, they are negotiated over the phone or, more commonly, electronically. The NASDAQ (National Association of Securities Dealers Automated Quotation), in particular, has grown in importance, gaining market share of stock listings over the regular exchanges.

Bonds, too, are an exception. Although various stock exchanges list bonds, they are traded primarily by bond houses and major commercial banks. The bond market is primarily institutional, with commercial banks as the primary investors. It is not heavily regulated, and there is no federal agency dedicated to overseeing the bond market other than the SEC.

Commodities exchanges are typically organizations that are owned by trading members and are organized to facilitate transactions between buyers and sellers of various commodities. These exchanges are regulated by three different acts. First, the Commodity Exchange Act of 1922 established the Commodity Exchange Commission, which consisted of the U.S. Secretary of Commerce, Secretary of Agriculture, and Attorney General. Second, the Commodity Exchange Act of 1936 attempted to limit fraud, manipulation, and excessive speculation. Finally, the Commodities Futures Trading Commission Act of 1974 created the Commodities Futures Trading Commission, which succeeded the Commodity Exchange Commission.

ORGANIZATION AND STRUCTURE

Securities exchanges are governed by the Securities Exchange Act of 1934 and regulated by the SEC. The SEC has three major responsibilities: ensuring the provision of full and fair disclosure of all material facts concerning securities offered for public investment, pursuing litigation for fraud when detected, and registering securities offered for public investment. The SEC's activities are similar to judicial proceedings, and appeals from its decisions are taken to the U.S. Court of Appeals. Structurally, the SEC is composed of five commissioners appointed by the president for five-year terms. No more than three of these commissioners may be from the same political party. The chairperson is also designated by the president.

Commodities exchanges are regulated by the Commodities Futures Trading Commission subject to the Commodities Exchange Act of 1922. This act, along with its later amendments in 1936 and 1975, subjects commodities, commodity futures, and option trading to federal supervision and restricts trading to futures exchanges designated and licensed by the commission. The Com-

modity Exchange Commission was originally established by the Security Exchange Act of 1922 to supervise commodity exchange, but the commission was succeeded by the Commodity Futures Trading Commission upon the passage of the Commodity Futures Trading Act of 1974.

In general, both the stock and commodities exchanges are governed by a board of directors who are elected from the membership of the exchange. In some cases board members are also selected from outside the exchange's membership to represent the public. The members are individuals or other legal entities who own a "seat" on the exchange. Seats are generally acquired by purchasing existing seats from previous members. The individual exchanges derive their income from membership dues, listing fees, and specialized services. This income is used to cover the operational expenses of the exchange.

BACKGROUND AND DEVELOPMENT

Prior to 1934, the exchange of stocks in the United States was unregulated. The exchanges that existed at the time were only limited by a sense of duty to their members and concern for their reputation. This system was sufficient through the bull market of the 1920s; however, the 1929 stock market crash and resulting Great Depression brought this system under renewed scrutiny.

In 1933, Congress passed the Securities Act, establishing disclosure requirements. This act was followed by the Securities Exchange Act in 1934, which brought stock exchanges under federal regulation. The act created the SEC and required all transactions to be completed on exchanges registered with the SEC. This registration required the exchange to file a registration statement containing various information and documents. Every corporation listed on the exchanges was also required to register with the SEC and to file annual reports and other periodic updates.

In 1975, amendments to the Securities Exchange Act mandated the creation of a National Securities Market by the SEC. This system is composed of automated linking of various stock exchanges. The links were created to stimulate competition in the market. These changes were implemented due to the increased volume of trading, as individual investors were slowly being replaced by institutional investors. The exchanges adjusted to this new market by altering their rules and adopting automation. From 1975 to 1987, the yearly volume of trade on the New York Stock Exchange increased tenfold.

Despite comprehensive automation, the market strained to handle the volume of transactions caused by the market collapse on Black Tuesday, October 19, 1987. That crisis led to the adoption of circuit breaker mechanisms, which halt trade when prices fall too quickly. The exchanges have also increased floor space and computer

system capacity, and have raised specialists' capital requirements. Many experts believe that these changes have made the U.S. exchanges more reliable and resilient.

One major development during the 1990s was the advent of communications technology that enabled trading to be conducted off exchange floors. Electronic Communications Networks (ECNs) are alternative trading systems that function much like stock exchanges—collecting, displaying, and automatically executing customer orders. In 1994, charges were made that NASDAQ market makers were charging excessive markups on trades they executed. In response, the SEC effectively forced the adoption of Order Handling Rules in 1997. The rule requires dealers to post customers' orders on NASDAQ's screen or send them to an electronic communications network that would post them for everyone's viewing. ECNs were thus inadvertently allowed into the exchanges.

Day-trading firms, which for years had sought greater market access to NASDAQ, soon rushed in to set up ECNs. The oldest and largest of the ECNs is Reuter Group PLC's Instinet. ECNs, which are regulated by NASDAQ's parent, the National Association of Securities Dealers (NASD), accounted for nearly 30 percent of NASDAQ's share volume in 1999.

Competition from the ECNs also caused the exchanges to expand the hours of trading. Because ECNs are set up to offer round-the-clock trading, exchanges would have to do the same to protect their market from eroding. Most of the world's largest stocks already trade in three major time zones, namely, the United States, London, and Tokyo. Related changes as a result of continuous trading would mean further growth for discount brokers and Internet trading. Newspapers and television networks would adjust their financial reporting to fulfill the demand, and more people would be added to the workforce to cater to the trading activities.

In 1999, a new SEC rule commonly known as "Reg ATS" (Alternative Trading Systems) took effect. This regulation allows ECNs and other electronic trading systems to actually become stock exchanges. ATSS are small, private systems that are lightly regulated and are able to make quick innovations. They serve to drive down the cost of trading and to spur innovations such as extended trading hours and online trading via the Internet.

The rise of the Internet as a revolutionary new form of interactive communication has also affected the delivery of financial information by providing investment tools or executing securities transactions. By the end of 1996, Internet technology had made stock quotes available on dozens of Web sites, and most suppliers were giving the data away. This change in the delivery of securities data has contributed to the boom in online trading.

According to Forrester Research, there were about four million online brokerage accounts at the end of 1998. This number was predicted to rise rapidly. The largest discount brokers, such as Charles Schwab, have witnessed their online account share of their total account base jump from 5 percent to 60 percent by 1999.

Online brokers grew from 1 to 100 in just three years, as reported by Gomez Advisors in 1998. Most Internet brokers are the online offspring of traditional financial service firms. Coupled with the online account growth of traditional service firms offering online access was the growing account base of the predominately online-only brokerage such as E*Trade, Ameritrade, and Datek Online.

The number of online trading individuals also grew 53 percent to 6.1 million in a year from 1998 to 1999, according to Cybercitizen Finance. Given this lightening-fast growth, the exchanges are confronted with the question of what constitutes an exchange and the role it will play in the future.

Prior to 1922, commodities exchanges were unregulated. In 1922 the Grain Futures Act was passed, beginning the regulation of commodities exchanges. In 1936, this act was amended to include commodities other than grain, and in 1975, an independent federal agency was created to administer the provisions of this act. In addition to the trend toward more regulation, the commodities exchanges have also mirrored the stock exchanges' move towards greater automation.

Early in the 1990s, futures exchanges started to seek alliances to boost business. In 1992, the Chicago Mercantile Exchange (CME) launched Globex, with the Singapore International Monetary Exchange (Simex) and France's Matif as partners. In 1993, the New York Mercantile Exchange (NYMEX) opened its Access system in London, listing its own energy contracts. The quest for listing on international exchanges thus continued.

Setting up global networks to create a globally linked marketplace that provides cross-border opportunities for investors worldwide has become the goal of the exchanges. By 1999, an alliance between Eurex, the all-electronic German/Swiss derivatives exchange, and the Chicago Board of Trade (CBOT) was announced. Soon after, CME and the London International Financial Futures & Options Exchange (Liffe) linked up their electronic platforms, Globex2 and Liffe Connect, to allow members to trade each other's short-term interest rate contracts electronically. Liffe chairman Brian Williamson believes that the partnership brings to their customers international access to a wide range of products, lower transaction costs, and a more efficient use of capital.

The New York Stock Exchange (NYSE) is the largest equities marketplace in the world, with 3,025 companies worth more than \$16 trillion in global market capital-

ization. As of year-end 1999, the NYSE had 280.9 billion shares worth approximately \$12.3 trillion listed and available for trading. Over two-thirds of the roster of NYSE companies has listed with the exchange within the last 12 years.

Since its inception in 1971, NASDAQ has steadily outpaced the other major markets to become the fastest-growing stock market in the United States. The NASDAQ difference is in its market structure. In contrast to traditional floor-based stock markets, NASDAQ has no single specialist through which transactions pass. NASDAQ's market structure allows multiple market participants to trade stocks through a sophisticated computer network linking buyers and sellers from around the world. This successful model has pushed other exchanges to reinvent themselves. For instance, the London Stock Exchange, the Singapore Stock Exchange, and Japan's JASDAQ all adopted NASDAQ's screen-based, floorless electronic market system.

As the NYSE continues to face stiff competition from alternative trading systems, it has announced several plans to modernize and transform its operation. The main plan is to list itself as a public company. Like other for-profit companies, the NYSE found that the quickest way to modernize was to find an Internet business partner and, in this case, an ECN. For NYSE, it will set up its own electronic communications network to automatically match small orders of up to 1,000 shares. Coupling with this initiative, the NYSE might also increase the free time that specialists have to give member firms coming over the NYSE's electronic routing system without charging. These initiatives mean less income for its specialists and floor brokers but offer its Wall Street member firms better service at reduced cost. NASD is also planning to spin off the NASDAQ Stock Market as a for-profit entity. The Pacific Exchange has likewise taken action to reinvent itself as the nation's first for-profit stock exchange.

When an exchange goes public, institutional investors are able to buy a large enough stake in it to affect the rules that govern listed companies. The question becomes whether the exchanges can both trade on and regulate the exchanges. The NASD's plan is for the regulatory portion to retain its not-for-profit status. However, there are increasing numbers of shares traded over electronic networks that are not governed by any self-regulating organizations. Of course, one would assume that the institutional investors with equity in the exchange would act in the best interest of the exchange with respect to rules governing it. Otherwise, the listed companies can leave the exchange and take their business elsewhere.

At the same time the exchanges were protecting their stakes, the SEC was completing Market 2000 in 1993, its first review of the U.S. equity market for 20 years. This SEC paper asked respondents to identify regulatory

anachronisms and called for comments on Rules 390 and 500. Rule 390 bans member firms from trading issues listed on the exchange prior to 1979 off the exchange's floor while it is open. Rule 500 requires a two-thirds majority vote of shareholders in favor to de-list a company. By the end of 1999, the board of the New York Stock Exchange voted to repeal Rule 390, moving into line with the wishes of the SEC. With the rule eliminated, firms could transfer more of their customers' orders from public markets into their own trading rooms.

In the options market, the exchanges are competing to list big companies. The Chicago Board Options Exchange (CBOE) listed Dell Computer Corp. in August 1999, a major contract that before had been listed solely by the Philadelphia Stock Exchange (PHLX). The unwritten rule was that certain marquee contracts are listed by one single exchange. Because CBOE ignored this agreement, PHLX listed CBOE's Coca-Cola and Amex's Apple Computer Inc. to position themselves accordingly. By September, CBOE listed 29 other previously single-listed contracts, notably Microsoft Corp., Sun Microsystems Inc., and 3Com Corp.

The competition is favored by the SEC and the Commodities Futures Trading Commission (CFTC), which have taken steps to encourage multiple listing of equity options and approve the applications of screen-based systems as contract markets.

The growth of information technology and the rise of NASDAQ and Internet trading have changed the landscape of the securities industry. The information that was once privileged to bankers and Wall Street elites is now at everyone's fingertips. More changes will occur as the Internet matures.

CURRENT CONDITIONS

During a time of economic prosperity, unprecedented stock trading volume and IPOs, and the dot-com boom of the late 1990s, U.S. markets peaked in March 2000. Beginning with the failure of many of the new high-tech darlings after that date, markets began a decline that continued and worsened with various economic factors, including the events of September 11, 2001, which destroyed the World Trade Center and shut down NYSE operations for four days due to damage to telecommunications and computer systems. Other factors accounting for the slide in markets included ongoing terrorist fears, military action in Afghanistan, and the war with Iraq in early 2003. By mid-2002, the market had lost an estimated \$7 trillion since its peak in 2000. The NASDAQ dropped to 1997 levels, and Standard & Poor's 500-stock index lost more than 40 percent of its value. Corporate accounting scandals falsifying companies' earnings, including Enron and WorldCom, also shook investor confidence, and markets were not quick to rebound.

Securities industry personnel manage the accounts of nearly 93 million investors directly and indirectly through corporate, thrift, and pension plans. In 2002, the industry generated \$214 billion in U.S. revenue and \$285 billion in revenues worldwide. As of year-end 2002, the NYSE listed nearly 2,800 companies and had 363.1 billion shares, an 18.1 percent increase from 307.5 billion shares in 2001. The dollar value of those shares was worth approximately \$10.28 trillion, a decrease of 2 percent from 2001. The average share price in 2002 was \$28.30, down \$5.80 per share from \$34.10 registered in 2001. As 2002 ended, the NYSE's market share of listed securities dropped below 80 percent for the first time in its history, illustrating the increasing competition from the NASDAQ as well as regional exchanges and electronic communications networks. In January 2003, however, the NYSE's market share topped 80 percent once again. The 80 percent figure represents a commonly accepted resistance level, and a drop below that level causes many analysts to revise ratings of specialist firms.

By 2002, NASDAQ, the leading electronic stock market worldwide, was also the second leading market in the United States, trading approximately 3,600 companies on its floorless market. In 2001, NASDAQ handled 471.2 billion shares—more share volume than all other major U.S. stock markets combined—and its listings' market value was nearly \$2.9 trillion, a 470 percent increase over the last decade. Former parent NASD spun NASDAQ off in a string of private sales, while retaining about 55 percent of its stock. NASDAQ common stock now trades OTC. The exchange hoped to become a completely public, for-profit entity in 2003 with a proposed initial public offering that year, but some analysts were skeptical about the feasibility of the plan in such a short amount of time.

Although the NYSE and NASDAQ both established emergency backup systems after the events of 9/11 to ensure there was no disruption in trading if a terrorist attack should occur, the Bush administration announced in March 2003 that it had also acted to upgrade the security of U.S. financial markets against possible future attacks. Due to security reasons, not all the steps taken by the government could be revealed, but they included beefing up physical protection of important financial institutions, as well as secured communication lines among financial regulators in times of crisis.

In May 2003, the NASDAQ petitioned the SEC to repeal the NYSE's Rule 500, nicknamed the "Roach Motel," that makes it nearly impossible for companies listed with NYSE to move to the electronic stock market. NASDAQ argued that the rule was anticompetitive and that no other exchanges have such limitations on delisting. Indeed, NASDAQ itself saw many companies move to the NYSE after the tech bubble burst in 2000.

INDUSTRY LEADERS

Securities Market Centers. At the end of 1999 there were eight major stock markets operating in the United States, including seven stock exchanges and NASDAQ, the first floorless, screen-based market center in the world. The two largest of these market centers by far are the New York Stock Exchange (NYSE) and the NASDAQ stock market. Other major exchanges include: Boston Stock Exchange, Chicago Stock Exchange, Chicago Board of Options, Cincinnati Stock Exchange, Pacific Stock Exchange, and Philadelphia Stock Exchange.

The "Buttonwood Agreement" established the New York Stock Exchange in 1792. Today the NYSE is generally recognized as the world's most prestigious and influential stock exchange, although beginning in 1994 the NASDAQ has regularly surpassed it in annual trading volume. More than 3,000 companies are traded on the NYSE, and the aggregate market value of these companies was approximately \$9.4 trillion at the end of 1997.

The NASDAQ stock market was created in 1971 as the world's first electronic market listing small companies. In the 1980s, NASDAQ experienced substantial growth as hundreds of new technology firms rushed to have their shares listed in this high-tech marketplace.

Even as NASDAQ enjoyed almost uninterrupted growth, however, the American Stock Exchange (Amex) suffered from a steady decline in its company listings and trading volume. At the end of 1997, more than 5,400 hundred companies were listed on NASDAQ, compared to 771 for the Amex. Although finding itself unable to compete effectively with NASDAQ's tech-heavy appeal or the Big Board's blue chip prestige, the Amex did develop into the country's second-largest options market behind the Chicago Board Options Exchange.

The National Association of Securities Dealers, Inc. (NASD) and the American Stock Exchange merged at the end of 1998 to maximize the efficiencies of both organizations. NASDAQ and the Amex continue to operate as separate markets under the NASDAQ-Amex Market Group, a subsidiary of the NASD that oversees both market systems and explores technological efficiencies and international opportunities. Since the merger, one area of growth for the Amex has been in the area of Index-Based Products or Exchange Trade Funds (ETFs), such as Standard & Poor's Depository Receipts (SPDRs), World Equity Benchmark Shares (WEBs), and NASDAQ-100 Index Trading Stock (QQQ or "Cube"). These increasingly popular investment instruments provide investors with an alternative to index-based mutual funds as a way to achieve "instant" diversification in the stock market.

The United States' third largest exchange, the financially struggling Amex was back up for sale in 2001. Other exchanges considered purchasing it, including the NYSE,

Hong Kong Stock Exchange, and Eurex, as well as several investment and venture capital firms, but they ultimately lost interest. Once the second leading exchange in options market making, the Amex was surpassed for the first time in April 2003 by the International Securities Exchange, an all-electronic exchange. Its decision to trade NASDAQ stocks also fell flat, with trading volume of those stocks under 1 percent. One of the exchange's biggest drawbacks is the inability to execute orders automatically, and although Amex executives plan to implement immediate execution in the near future, some industry insiders argue that until then, growth cannot occur.

Commodities Exchanges. There are 13 major commodities exchanges currently operating in the United States. Of the 13, four are the most significant. The Chicago Board of Trade (CBOT), founded in 1858, is the most important grain exchange in the United States. Approximately 90 percent of the world's grain futures are traded on its floors. In addition to commodities, CBOT is also involved in the financial futures and options markets as well as precious metals. CBOT is regulated by the Commodities Futures Trading Commission subject to the Commodities Exchange Act.

The Chicago Mercantile Exchange (CME), founded in 1919, provides a national market for transactions in spot and futures contracts for commodities. The CME is also a leading exchange for futures trading in financial instruments and foreign currencies. The CME was regulated by the Commodities Futures Trading Commission subject to the Commodities Exchange Act. In 2002, the CME demutualized, becoming a holding company, and went public.

The Commodity Exchange (COMEX), created by the post-Depression merger in 1933 of four exchanges, is one of the largest and most active commodities exchanges in the world. COMEX provides an organized, centralized market where commodities contracts of precious metals are traded. In 1994, COMEX was bought by the New York Mercantile Exchange (NYMEX), which trades futures in precious metals, oil, and gas. COMEX maintains its name as a division of NYMEX.

Commodities exchanges of lesser importance include: Amex Commodities Exchanges, Inc., Chicago Rice and Cotton Exchange (CRCE), Coffee, Sugar & Cocoa Exchange (CSCE), Kansas City Board of Trade (KCBOT), Mid-America Commodity Exchange (MACE), Minneapolis Grain Exchange (MGE), New York Cotton Exchange (CTN), New York Futures Exchange (NYFE), and the Philadelphia Board of Trade (PBOT).

WORKFORCE

According to the Securities Industry Association, the securities industry employed more than 612,000 people

in 1997. This figure represents a 36 percent increase in five years, reflecting the growth in investment activities that began in the earlier part of the decade. According to the Bureau of Labor Statistics, by 2002 the U.S. securities industry employed more than 700,000 individuals.

AMERICA AND THE WORLD

One major trend in the securities industry that came to the fore in the 1990s and 2000s is globalization. More than ever before, U.S. investors poured money into foreign stocks during the 1990s, with over \$1.4 trillion worth of foreign stocks being traded in 1997 alone. Similarly, foreign investors found much to attract them in the U.S. stock market.

The continued strength of the U.S. equity market, and global mergers and acquisitions, have attracted international companies to list their stocks on the U.S. exchanges. About 200 foreign companies per year list in the United States, and the number has been rising. NYSE has experienced substantial growth in this sector over the years since 1985. As of July 1999, 382 non-U.S. companies were listed, more than triple the number in 1994.

At the end of 2002, NASDAQ listed well over 400 foreign companies of its nearly 4,000 total companies. Overseas, the London Stock Exchange listed more than 500 foreign companies (85 of which were U.S. firms), to go along with the 2,400 British firms included on the exchange. Foreign companies were also particularly well represented on the exchanges in Switzerland, Amsterdam, and Brussels.

The most compelling globalization trend for the past few years, however, is the move toward cooperative undertaking among exchanges both regionally and worldwide, and the related move toward 24-hour continuous trading of stocks.

NASDAQ has ambitious plans for global expansion, with plans to set up a European equity exchange that eventually will be electronically linked both with its established U.S. market and with NASDAQ-Japan. The latter was scheduled to be launched in late 2000, to be co-run by the NASD and Japan's Softbank. In 2001, the exchange opened a liaison office in Bangalore, India, and acquired Easdaq to create NASDAQ Europe. Also that year, NASDAQ and the London International Financial Futures and Options Exchange (LIFFE), one of the leading electronic derivatives exchanges in the world, began a joint venture to list futures on single stocks, narrow and broad-based indices, and other futures products. The joint exchange, NASDAQ Liffe Markets, began trading in 2002 and listed 91 products.

Along with NASDAQ's plans there is a drive toward the creation of a pan-European stock market that was launched in early 1999—spearheaded by the London

Stock Exchange and the Deutsche Borse. Of course, even prior to the emergence of true worldwide markets and platforms for stocks and derivatives, most of the world's largest stocks already trade in a nearly full-day environment, as they are listed on exchanges in the United States, Europe, Japan, and elsewhere in Asia.

Increasingly, Asian stock markets are tied to the U.S. stock market as American investors make up a large part of Asian stocks. While U.S. markets struggled in 2002, Asian stock markets managed to remain strong, although the struggling U.S. economy eventually had negative affects in the Asian markets as well.

Talk of a worldwide exchange—in which investors might buy shares of American or European companies—increased by industry insiders in 2002. Facing regulatory problems, however, insiders speculated that an alliance between a European and American exchange would ultimately result in separate entities allied more strategically than economically. Speculation especially centered around the popular London Stock Exchange as a possible participant in such an alliance.

RESEARCH AND TECHNOLOGY

In a world of ECNs, discount brokers, and instantaneous online access to investment information and trading opportunities (and the resultant growth of day trading), the North American securities industry as a whole spends billions of dollars per year on information technology. Eleven-and-a-half billion dollars were spent in 1996 alone. Like securities firms, stock markets are faced with an ongoing need to keep themselves technologically current—especially given the rush toward instigating continuous around-the-clock securities trading in a truly global market.

NASDAQ, which is already an electronic trading system, is in many respects best positioned to respond to current trends in technological change. Indeed, by the end of 1999, fully 30 percent of all NASDAQ transactions were being handled by ECNs.

NASDAQ has taken several steps to assure its technological infrastructure will be able to keep up with the demands of the marketplace. In late 1997, NASDAQ and MCI began working to develop a new telecommunications infrastructure for the stock market. The system is designed to be able to handle up to 8 billion shares traded per day. Also in 1997, NASDAQ introduced a trio of new Web sites: NASDAQ Online, NASDAQ Newsroom, and NASDAQ Trader. Following the merger with the Amex in 1998, NASDAQ Online—designed to provide executives of NASDAQ-listed companies with up-to-the-minute market intelligence—was renamed NASDAQ-Amex Online. The merger between the two also provided Amex with access to a new electronic limit order book, order routing, and transaction system, intended to allow

investors and market professionals to electronically execute orders from both on and off the trading floor.

The NYSE spent \$2 billion on new technologies during the 1990s. By the end of 1999, the NYSE's communications system had been upgraded so that it could handle systemic traffic of up to 1,000 messages per second—double the capacity of just two years earlier.

In a move to enhance productivity, the NYSE rolled out Smart Report in 1998, a new feature of its specialist display book designed to help free up specialists to focus on maintaining an orderly market. Another recent focus of technological improvements by the NYSE has been its Broker Booth Support System (BBSS), which provides member firms with direct electronic links from upstairs desks to the trading floor, to points of sales, and ultimately to the customer. Begun in 1993 with 16 terminals in use, the BBSS had grown by 1998 to more than 700 terminals in use.

As a result of new post-9/11 resiliency standards, it was announced in April 2003 that NYSE members must completely integrate with the Internet by the end of that year, by adopting IP-only linkages to the Big Board. First announced by the exchange the previous year without any specific instructions or deadline, the move was intended to modernize NYSE stock trades outside of the exchange's floor and also make communication with members less expensive and more secure while providing greater flexibility. The NYSE found in studies related to 9/11 that NYSE member firms using IP links had faster recoveries after the attacks than members using legacy systems. Although the development suggested the NYSE was moving closer to adopting electronic trades, the exchange would still function as a traditional floor-based business.

The NYSE made further headway into current technology in 2003 when the SEC approved a request to allow the use of cell phones on the floor of the exchange for off-floor communications. Floor brokers had been required to communicate to off-floor locations using a telephone at a broker's booth. Although cell phones had been in use at the exchange since 1994, they were not permissible for external calls due to regulatory issues over floor brokers taking orders from customers without an accurate record. The NYSE paved the way for expanded cell phone use by introducing a system to ensure a proper trail of orders. Customers now are able to speak directly to a floor broker to place orders.

For its part, NASDAQ unveiled its SuperMontage in October 2002, a high-tech platform that would enable firm quote delivery and millisecond execution, support complex trading strategies, and offer unprecedented amounts of information to stock brokers. The implementation of SuperMontage came after three years of devel-

opment and a \$1 million investment. One of the highlights of the system was its ability of users to enter and protect multiple orders. NASDAQ hoped the system would bring back users of ECNs, which have gained 48 percent of trading of stocks placed on NASDAQ compared to 22 percent performed on NASDAQ's systems.

INVESTMENT ADVICE

This category covers establishments that participate in the investment advisement industry and are predominantly engaged in furnishing information and advice to companies and individuals concerning securities and commodities. These firms serve their clients on a contract or fee basis. Establishments that provide advice but also act as brokers or dealers are excluded from this category.

NAICS CODE(S)

523920 (Portfolio Management)

523930 (Investment Advice)

INDUSTRY SNAPSHOT

A broad spectrum of advisory firms makes up the industry and is responsible for managing billions of dollars of U.S. and foreign assets every year. Mutual fund assets alone, of which investment counselors in the industry manage a significant portion, totaled more than \$6

trillion. Mutual funds controlled more U.S. money than banking institutions.

The business of providing investment advice was deeply shaken in the aftermath of the terrorist attacks of September 11, 2001. Already dealing with a slow-down in the economy, investment firms reeled from the blow delivered to the U.S. economy by these events. The most apparent problem was the immediate decline of the American market. Stock prices plummeted, and investors quickly went from looking to make a profit to desperately trying to control losses. There was also an underlying problem of an overall decay of trust by investors in the dependability of the investments to provide positive results. A volatile market and poor return fueled mistrust and disillusionment among investors. A rash of accounting scandals, including Enron, also disheartened investors.

ORGANIZATION AND STRUCTURE

Futures and investment advisory firms, investment counseling services, research organizations, and mutual fund managers compose the investment advice industry. Several companies offer a multitude of services for all segments of the market, serving as “one-stop shops” for their clients’ every need. Other organizations provide expertise in just one area, such as real estate investment research, indexing, or international hedging. Many of these firms form alliances with other specialty companies to deliver a package of client services. Although many firms exist solely to meet the market demand for these services, numerous industry participants offer advisory services only as a sideline. For instance, much of the advice and management of funds in the United States and abroad is provided by insurance companies and banks that are engaged primarily in other industries.

Futures and investment advisory firms typically provide advice and manage pools of funds for institutional clients. On a fee or contract basis, these firms seek to minimize their clients’ exposure to risk in relation to the level of return that a client is seeking. Advisory firms that manage large pools of funds often seek the services of specialty firms that can provide expertise in a single area, such as real estate. In addition, many of these firms are often employed by larger players in the industry, such as mutual fund managers.

Investment counseling services may also assist institutions and provide services to larger firms. These firms, however, may also offer portfolio management services to individuals. Counselors will develop and manage an investment strategy that is specifically tailored to one individual’s financial goals. Counselors consider the client’s tax status, retirement plans, and other factors in an effort to protect and increase the client’s resources. Though many firms require a minimum account size of at

least seven figures, customers benefit from the individual attention. Money managers often charge between 1.5 and 3 percent of the account per year for their services.

Mutual Fund Managers. The largest single segment of the investment advice industry belongs to mutual fund managers. In mid-1999, there were 7,521 mutual funds. A mutual fund is effectively an investment company that pools the money of many individual investors. Investors buy shares in the fund and the company invests the shareholders’ cash for them. The company hires an adviser, or management company, to develop an investment strategy and to manage the fund.

Mutual fund investors do not benefit from individualized service as they might from a personal counselor. Mutual funds, however, allow small investors access to professional investment advisers who would otherwise be inaccessible—and at a relatively low cost. Furthermore, a wide variety of funds exist that are tailored to the needs of specific types of investors, allowing people with smaller accounts to place their money in funds that match their financial needs.

Most fund advisers receive a fee for stock selection and portfolio management activities based on the average value of the assets under management. Depending on the type of services provided and the category of fund managed, fees typically range from .20 percent (for index funds) to more than 1 percent of average annual fund assets. The management fee is usually set on a declining scale relative to fund size. The management company may administer and pay for some or all of the following: office space and personnel; portfolio managers and traders; regulatory compliance activities; preparation and distribution of prospectuses, advertising, and shareholder documents and reports; bookkeeping, accounting, and tax services; and bonding and insurance.

As of 1999 the six largest investment managers by total assets directed 93 percent of the \$6 trillion in assets. Banks and insurance companies managed a large portion of those assets, however. In fact, four bank and trust companies and one insurance company were included in this elite group. The typical U.S. pension plan had about 39 percent of its assets in U.S. stocks, 20 percent in bonds, 14 percent in the company’s own stock, 9.5 percent in international stocks, and 7.2 percent in guaranteed investment contracts.

BACKGROUND AND DEVELOPMENT

Individual segments of the investment advisory industry have varied histories. Most advisory services and financial markets in the United States were originally derived from European markets—particularly those in the United Kingdom. After their inception, however, U.S.

financial markets were more heavily influenced by domestic market conditions and regulatory developments.

The roots of U.S. futures trading, for example, date back about 200 years, when supply and demand imbalances in regional cash markets and agricultural commodities arose. Following the creation of organized futures exchanges between 1850 and 1900, hedging with futures eventually became an integral component of portfolio management theory. Investment advisers and fund managers found that they could use futures, as well as other instruments such as options, as tools to reduce risk and increase overall portfolio returns for their clients.

Opportunities for firms that offered futures advice services proliferated in the 1980s and early 1990s as growing numbers of individual speculators began putting trading decisions in the hands of professional money managers who specialized in futures. Between 1980 and 1992, the number of commodity futures pool operators registered with the Commodity Futures Trading Commission grew 28 percent, to 1,350. The amount of money under management by these pools increased during the same period from \$675 million to about \$20 billion.

Growth in Mutual Fund Management. In contrast to futures, the first American mutual fund was not organized until 1924, when Massachusetts Investors Trust was started. The stock market crash of 1929 and World War II both served to hamper development of this industry throughout the late 1940s, when fewer than 100 funds representing only about \$2 million existed. Opportunities for investment advisers who managed mutual funds remained relatively meager throughout the 1970s, although several new types of funds were developed during the mid-1990s.

In the late 1970s and early 1980s the demand for mutual fund advisers, as well as for investment consultants who served these managers, began to escalate. A combination of economic and regulatory factors made mutual funds more appealing to both individuals and some institutional investors. Furthermore, the increase in the number of no-load funds, which did not charge an entrance fee, made mutual funds more attractive until the mid-1980s. As assets in the mutual fund industry soared during the 1980s for a variety of reasons, the demand for fund advisers swelled. Mutual fund assets under management skyrocketed between 1986 and 1996 from about \$700 billion to about \$3.5 trillion dollars by 1996 and to \$6 trillion in 1999. Growth in individual retirement accounts helped swell mutual fund assets. By 1999, retirement accounts held one-third of mutual fund assets.

Increasing Fees. The fees that advisers were charging to investment companies also escalated in the 1980s. Contracts that had traditionally been set at a fee of about .5 percent of managed assets jumped to an average of between

.75 percent and 1 percent for funds organized during the late 1970s and 1980s. Another implication of growth in the 1980s that managers of some of the more popular funds realized was a loss of investment flexibility. As managers of these funds saw their fees jump as assets inflated into the billions of dollars, they found that they could not achieve investment returns similar to what they had generated prior to the rapid growth of assets. As a result, some larger funds struggled to keep market share from smaller competitors.

Pressures to hold down investment management fees were growing and alternative pricing arrangements were gaining favor. Managers handling international equity assets were reaping higher fees for their work than their colleagues managing domestic assets. Also, the fees on domestic equity categories easily outdistanced the charges on domestic fixed-income securities.

Competition Increases. Despite the growth in the amount of assets under management by firms primarily engaged in the investment advisement industry, the share of the total money management market served by these companies fell in the early 1990s. Banks and insurance companies increased their advisory services in an effort to offset losses in their core businesses. In addition, large publicly traded brokerage firms, such as Salomon Brothers Inc., Merrill Lynch & Co., and Prudential Securities Inc., moved into money management as they diversified from transaction-based businesses into fee-based ones. Furthermore, regulatory developments supported this trend by reducing the traditional distinctions between financial institutions. The result was more homogenous, though increasingly competitive, financial markets.

Going into the late 1990s, the investment advice industry continued to experience both growth and turbulence in most market segments. Strong securities markets, shifting demographics, increased competition, changes in the structure of financial industries, and expanding global markets were all having a marked impact on industry activity.

Despite the recession of the late 1980s and early 1990s, futures and investment advisers, investment counselors, and mutual fund managers all enjoyed steady growth rates. Firms that managed mutual funds or provided expertise used by mutual fund managers realized the greatest gains. Aside from strong securities markets, fund advisers benefited from an infusion of capital into long-term funds, as money continued to flow out of banks and long-term insurance instruments into more flexible mutual funds that provided higher returns. The growth in defined contribution pension plans, such as the 401(k), imbued large amounts of cash into the funds. Particularly benefiting from growth in mutual fund assets were money management firms that capitalized on expertise in a specific asset class, such as mortgage-backed securities.

Another trend continuing into the twenty-first century was industry consolidation. To achieve greater economies of scale and to offer one-stop-shop services to larger institutional clients, investment management firms began acquiring or merging with their competitors in the late 1980s. The consolidation trend accelerated in the mid-1990s. In 1994 Mellon Bank paid the equivalent of \$1.8 billion to the stockholders of mutual fund manager Dreyfus. Also, Swiss Bank announced the purchase of institutional asset manager Brinson Partners, whose principals would receive \$750 million for payment in an 11-year earn-out. In 1995 the acquisition of Wells Fargo Nikko Investment Advisors by Barclays PLC created one of the largest institutional money managers in the world, with \$205 billion in assets. By 1999, former giants Scudder, Dreyfus, Founders, Stein Roe, Invesco, and Mutual Series had all merged with banks and other financial institutions.

Growth continued during 1999, but slowly. There were 654 fund managers and only 52 new funds that year. Overall, sales fell 40 percent from 1998 to 1999. The slow growth rate continued to cause greater competition industry wide. Of the 654 fund managers, the top six companies controlled 93 percent of the industry.

Another notable trend was the rise of passive investing. During 1995 and 1996, the majority of active money managers failed to match the returns of the S&P 500 index. Accordingly, there was dramatic growth in the value of funds devoted to indexing, a strategy that sought only to match the market's returns (after fees) rather than outperform the averages. Index funds thwarted the existing fee structure because they charged less than half the fees of active managers.

In 1999 the index fund rose to prominence. This fund intended to match a market index such as the S&P 500. Competitive on price, index funds caused lower returns for their managers. At the end of 1999, Vanguard Group, Inc., led this sector, with sales double those of FMR Corp., known commonly as Fidelity Investments.

In the long term, the investment advisory industry was expected to realize slower growth than it enjoyed in the 1980s and early 1990s. Although aging baby boomers would be investing larger amounts of money in preparation for their retirement years, banks and insurers would continue to accrue greater shares of the money management market. Furthermore, costs associated with managing mutual funds were expected to increase at a faster rate than advisory fees, placing downward pressure on company profit margins. Unfavorable economic developments could also deliver an unforeseen blow to the industry.

CURRENT CONDITIONS

After the initial shock of September 11 began to wear off, money managers waited for the investment

environment to stabilize and customers to return. However, after a number of false hopes of recovery during 2002, investment firms continued to look for the inevitable upswing in the economy. Discussing the uncertain times, Joe Rob noted *USA Today Magazine* in January 2003: "Never before in my nearly 40-year career as a financial professional have I seen so many people so confused about so much. None of the old adages seems to apply anymore. Sacred truths have become suspect or simply irrelevant. No one feels this more keenly than those wondering how best to protect the assets they have managed to accrue, and how best to invest them for what seems an uncertain future." According to Rob, several time-worn investment assumptions have simply been tossed out the window, including a belief that blue chip stocks will dependably provide a 10- to 12-percent per year return over any given time frame and that the S&P will regularly bring 15 percent returns on average.

Despite growing misgivings concerning the existence of anything like a "sure thing," the economic instability along with the political uncertainty of the twenty-first century that included war with Iraq in 2003 caused many Americans to rethink their economic future. According to a study commissioned by the Consumer Federation of America and the Financial Planning Association, 92 percent of those surveyed considered financial planning important, and 53 percent reported that they had become more interested in financial planning since September 11, 2001.

The shift in the market led to several changes in how investment firms conduct business. Although financial planners were looking for new customers, they were no longer courting small investors, as was popular during the previous 20 years. During the two-decade-long span of the bull market, public participation in investing broadened greatly, spurred in part by the ill-advised lure of frequent on-line trading. To garner more of the market, mutual fund advisers began offering products with no-load options, namely, no up-front fees. Individual investors responded by opening millions of accounts with very small initial sums. In 1980 less than 6 percent of American had money in mutual funds; by 2001, over 70 percent of American had invested in mutual funds.

The investment firms soon discovered that many of these tiny accounts sat idle and were too small to cover the cost of simply maintaining them. On average an account must have \$3,000 to \$4,000 to provide sufficient return to pay for the basic expenses of administering the account (i.e., basic accounting, statements, etc.). As a result, firms began significantly increasing the initial investment required to purchase their products. For example, Vanguard, known for its low-investment funds, scrapped its across-the-board \$500 minimum investment. Now some of its most popular funds require a \$25,000

investment with special discounted fees for \$250,000 investments. Other investment firms announced that they would discontinue selling funds to the public altogether. As a result, funds must be purchased through a broker, who usually charges a 5 percent fee, and thus targets more-moneyed clientele.

Another current trend in the financial advice industry is for more businesses to vie for a share of the investment advice market. For example, State Farm, traditionally an insurance company, recently changed its motto to "We do more than just insurance," highlighting the company's move into the financial services field. At the same time, banks are also trying to become a one-stop shopping center for all their customers' financial needs, including investment advice.

INDUSTRY LEADERS

FMR Corporation of Boston, Massachusetts, better known as the Fidelity Group, is the world's leading mutual fund company, serving approximately 18 million individual and institutional clients. Fidelity manages nearly 340 funds and has some \$775 billion in assets under management. In 2002 the company reported a net profit of \$808 million on revenues of \$8.9 billion. The Vanguard Group, of Malvern, Pennsylvania, is the second investment firm in the United States, with more than \$590 billion in assets under management. The company reported \$1.57 billion in revenues in 2002.

Merrill Lynch is the long-time king of the retail/wholesale financial management sector. The company reported a net income of \$2.6 billion on revenues of \$18.6 billion in 2002. However, the company continued to struggle with bad publicity caused by allegations of biased research and possible involvement in the Enron accounting scandal. Goldman Sachs, another giant in the industry, posted a net income of \$2.1 billion on revenues of \$22.85 billion in 2002. Morgan Stanley posted a net income of \$3.1 billion on revenues of \$32.4 billion, and Salomon Smith Barney, a subsidiary of Citigroup, reported a net income of \$1.8 billion on revenues of \$21.3 billion in 2002. Charles Schwab, the world's largest discount broker with eight million clients and over 400 branch offices across the United States, reported a net income of \$109 million on \$4.1 billion in revenues in 2002.

WORKFORCE

According to the U.S. Department of Labor Bureau of Labor Statistics, there were 190,540 people employed by services allied with the exchange of securities in 2001. Of this total, 15 percent were management positions. Chief executives reported a mean annual income of \$131,150; general and operational managers, \$107,590; advertising and promotion managers, \$115,080; financial managers, 108,010; and marketing managers, \$98,920.

Business and financial operations occupations accounted for one-third of the industry's jobs. Personal financial managers reported a mean annual income of \$73,250; financial analysts, \$83,030; and accounts and auditors, \$55,220. Sales-related occupations consist primarily of securities, commodities, and financial services sales agents, with a reported mean annual salary of \$84,880. Thirty-four percent of the industry's jobs are office and administrative support occupations, with an overall mean annual salary of \$35,140.

Job growth in the advisement industry was projected to be greater than the average for all U.S. industries throughout 2005. Much of the growth would occur in firms that were principally engaged in other industries, such as banks and insurance companies. Besides clerical and support positions, the industry employed large numbers of portfolio managers, financial analysts, and other investment professionals.

Other growth fields in the industry were expected to be in the areas of computer and information systems, which could experience over 80 percent growth between 1992 and 2005, and in sales. The greatest number of jobs would arise in larger metropolitan areas, particularly in Boston, Los Angeles, and New York.

AMERICA AND THE WORLD

According to the annual survey in *Pensions & Investments*, the top 50 international and global money managers grew by 27.4 percent in the year that ended March 31, 1996, to \$357.3 billion. A year earlier, the top 50 managed a total of \$280.48 billion and in 1994 the top 50 managed \$240.14 billion.

As fund managers continue to increase foreign investment to achieve greater returns and to reduce risk, the demand for international investment expertise should accelerate at the start of the twenty-first century. The demand for services by foreign investors will also likely increase as other countries increase investment abroad and seek respected U.S. financial expertise.

Although sales of U.S. fund shares was negligible prior to 1993, interest by foreign investors in U.S. funds was growing as financial markets became more globalized. In fact, in 1993 the Securities and Exchange Commission was actively working to liberalize international fund sales and to create uniform global investment regulations that would eventually result in nearly seamless world financial markets. Although these events could increase competition from foreign firms, U.S. advisement firms were expected to benefit from integrated markets.

RESEARCH AND TECHNOLOGY

Technological innovation affected the investment advice industry in two notable ways in the mid-1990s. First, smaller firms formed alliances that allowed them to

compete with larger one-stop shops. Second, global and domestic markets became more integrated and efficient.

Driving both industry developments were advanced information systems that allowed people to access and exchange information almost instantaneously. For instance, small specialty firms found that they could forge partnerships with other firms using information systems. While each member of the alliance retained their expertise, the groups were often able to deliver a comprehensive service package for a lower fee than that charged by many institutional advisers.

As information systems permeated every corner of the global marketplace, investment advisers benefited from instant access to global financial markets. Electronic trading and satellite information networks provided the information that was necessary for the industry to efficiently take advantage of global investment opportunities. Furthermore, new reporting and service delivery systems allowed advisement and management firms to reduce labor costs and errors and to maintain profit margins in the face of increased competition.

Competition was also expected to continue into the year 2000 from the wave of online investing. Unhappy with the industry's small growth, many people were beginning to manage their own money. Forecasters expected the trend to continue only in the short run, because the general public was not trained or knowledgeable about the industry.

SERVICES ALLIED WITH THE EXCHANGE OF SECURITIES OR COMMODITIES, NOT ELSEWHERE CLASSIFIED

Services allied with the exchange of securities and commodities, not elsewhere classified, include companies that support financial markets. This industry excludes firms that provide investment advice or offer investment research and management services. Encompassed are a wide variety of companies that offer expertise in a broad variety of miscellaneous activities.

NAICS CODE(S)

523991 (Trust, Fiduciary, and Custody Activities)

523999 (Miscellaneous Financial Investment Activities)

Commodity and security clearinghouses are corporations established by an exchange in order to facilitate the execution of trades. This is accomplished by transferring funds, assigning deliveries, and guaranteeing the performance of all obligations. Member firms regularly submit statements to clearinghouses that indicate a net balance in each security or commodity on the exchange, along with the net amount to be paid or received, in order to balance the member's account.

A securities' custodian is a company, usually a commercial bank, that holds someone's assets for safekeeping in an account. For a fee, the custodial institution may collect dividends, interest, and proceeds from securities' sales, and disburse funds according to a customer's instructions. A quotation service is a firm that provides statements or listings of the prices at which securities trade. These quotes are often the last prices at which trades took place, but they may also be the current bid or asking price.

Transfer agents are another type of company in this industry. These organizations are usually banks or trust companies and are appointed by a second party to transfer its securities. The agent may also maintain current rec-

ords of securities owners for transmitting dividends, reports, or securities distributions.

This industry originated in the United States in the early to mid 1800s, during the emergence of various U.S. financial markets. The establishment of the Securities and Exchange Commission (SEC), soon after the Great Depression in 1929, boosted many services. The SEC established various regulations that encouraged, and often mandated, the use of many of the miscellaneous services that now exist. The industry realized rapid growth during the post-World War II economic expansion.

Strong securities markets in the 1990s enabled most sectors of the industry to benefit from very active markets through the end of the century. The Dow Jones Industrial Average continued to reach new heights throughout the late 1990s, zooming well past the 10,000 mark.

The major challenge facing the industry in the mid 1990s is the proliferation of discount trading via the Internet. As of 1998, online trading leaders, in terms of market share, were Schwab at 27.4 percent, Waterhouse at 12.4 percent, E*Trade at 11.8 percent, Datek at 10.0 percent, Fidelity at 9.4 percent, and Ameritrade at 7.6 percent. While many securities dealers offer online trading — such as Merrill Lynch, Quick and Reilly, Charles Schwab, Jack White — new companies like E*TRADE, which typically have very low trading charges and convenient online account services 24 hours a day, provide serious competition for established industry leaders. According to *Fortune*, “Market share is difficult to measure because players like Schwab and American Express don’t break out their numbers . . . it appears that E*Trade is the leading Internet trading firm, with more than 6,000 Internet-based transactions a day.”

As reported by *U.S. Banker* in their April 1999 edition, top clearinghouse firms in terms of market share were Bear Stearns at 10 percent, Pershing at 9 percent, Fidelity at 6 percent, CSC at 4 percent, Southwest Securities at 4 percent, and U.S. Clearing at 4 percent.

SIC 6311

LIFE INSURANCE

This classification provides coverage of establishments primarily engaged in underwriting life insurance. These establishments are operated by enterprises that may be owned by stockholders, policyholders, or other carriers.

NAICS CODE(S)

524113 (Direct Life Insurance Carriers)

524130 (Reinsurance Carriers)

INDUSTRY SNAPSHOT

The insurance industry in America, particularly the life insurance industry, is considered a pillar of the economy, with assets of \$3.3 trillion in 2001. Tied as it is to the public interest, the life insurance industry has been subject to governmental scrutiny and legislation almost since its inception more than two centuries ago. There were about 1,549 companies that underwrote life insurance and annuities at the end of 2000, with premiums totaling \$472 billion in 2001, compared to \$405 billion in 1997. Thanks to an unprecedented level of consolidation in the late 1990s and early 2000s, the top 10 life and health insurance companies accounted for more than 40 percent of these premiums in 2001.

ORGANIZATION AND STRUCTURE

Although insurance companies may operate according to similar principles, the life insurance industry is hardly homogeneous. Companies do not charge the same amount for premiums, do not charge for expenses the same way, do not pay the same amount of commission to sales agents, do not provide the same kind or amount of training, do not sell the same products, and are not equally solvent. The one commonality throughout the industry is that licensed life insurance salespeople act as agents for their companies. These agents write several different kinds of life products, or policies, that the company offers.

Companies usually have a number of field offices, or branches. Large insurance organizations strategically place these around the country so that agents may market to as many potential clients as possible. Agents order or issue policies, collect premiums, renew and change existing coverage, and help clients with questions or problems related to coverage. Many agents who previously worked for large life insurance organizations branch out on their

own and become independent agents. They will often continue to retain the company they worked for to underwrite the policies they sell.

Nearly all life insurance is issued by either mutual or stock life insurance companies. Mutuals have no stockholders, only policyholders, and the policyholders elect the board of directors who run the company. In this way, mutual policyholders participate in the fiscal management of the company and share in decisions regarding mortality expense, overhead costs, and investment rate of return. With \$5.2 billion worth of life insurance in force, mutuals accounted for 35.7 percent of all the life insurance in force with U.S. life companies in 1995. Stock companies, on the other hand, are owned by their stockholders. They provided \$9.4 billion worth of life insurance, or 64.3 percent of the total. Other sources of life insurance include fraternal societies and the federal government. Taking all of these sources into account, there was \$12.9 trillion of life insurance in force at the end of 1995, or an average of \$131,600 per American household.

There are four major categories of life insurance: ordinary, group, industrial, and credit. Ordinary life insurance accounted for approximately 60 percent of all life insurance in force at the end of 1995. More than doubling from 1985 to 1995, there was \$7.5 trillion of ordinary life insurance in force in the United States at the end of 1995, with whole life insurance accounting for more than half of that total. Most of the rest of the ordinary life insurance in force was accounted for by some type of term life insurance. From 1985 to 1995 the amount of group life insurance increased from \$2.6 trillion to \$4.8 trillion, with term life accounting for nearly all group life insurance in force. Industrial life insurance decreased over the decade from \$28.2 billion in 1985 to \$20 billion in 1995. The amount of credit life insurance, which is designed to pay the balance of loans in case the borrower should die, increased from \$199.5 billion in 1993 to \$231.3 billion in 1995.

Half of all full-time workers in commerce and industry in the United States are enrolled in retirement plans other than Social Security. Private pension plans are established by private agencies such as commercial, industrial, labor and service organizations, and nonprofit organizations. Individual Retirement Accounts (IRAs) or Keogh Plans are set up by individuals. Pension plans can be administered by the holder of the plan, placed with banks or trust companies, or insured with life insurance companies. At the end of 1995, life insurance companies covered plans with 65.4 million people and provided retirement income to 6.4 million people. More than 24 million people were covered by government-administered plans at the end of 1995. The federal Old-Age and Survivors Insurance (OASI) system, part of the

Social Security program, remained the most comprehensive government retirement program offered. There were 173 million people eligible for Social Security benefits at the end of 1995.

BACKGROUND AND DEVELOPMENT

Life insurance companies in the United States can be traced back to 1759, when "The Corporation for Relief of Poor and Distressed Presbyterian Ministers and of the Poor and Distressed Widows and Children of Presbyterian Ministers" was founded by the Synod of the Presbyterian Church. The oldest insurance company in the world, the firm is still fully operational as the Presbyterian Ministers' Fund. The industry began to take on a more formal, mathematics-based foundation when, in 1789, Professor Edward Wigglesworth at Harvard prepared a modified table of mortality. This was the first crude attempt to scientifically predict the probability of risk, or to compute premiums and reserves on a scientific basis. Comparing the probability of risk to revenues generated from policy sales and the size of claim settlements has been the formula the industry has relied on to establish itself as a viable business.

In 1794, the Insurance Company of North America became the first general insurance company to sell life insurance in the nation, but the company sold only six policies and discontinued its operations in 1804. Nevertheless, the Pennsylvania Company for Insurance on Lives and Granting Annuities was incorporated in 1812 and became the first company formed to issue life insurance policies and annuities. Soon after this the New York Life Insurance and Trust Company formed and became the first company to employ life insurance agents. By the late 1840s, general insurance laws began to come into effect, and in 1851 the state of New Hampshire established the first regulatory body to examine the affairs of insurance companies.

The insurance industry became more structured as the nineteenth century progressed, a result of governmental legislation and self-regulation. Around 1857, the first pension funds for government employees were established, and in 1861, Massachusetts required nonforfeiture values as part of life policies. These and other covenants of the industry began to materialize when publications such as the *American Experience Table of Mortality* were issued (1868). Covering experiences from 1843 to 1858, this document remained the most frequently consulted mortality table used by American companies until the 1940s. Whether or not the industry should have been granted national jurisdiction and been compelled to abide by national or state regulations was a hotly debated issue. It was not until 1869 that the U.S. Supreme Court held that insurance is not a transaction in commerce, thus affirming the validity of state regulation of insurance.

Insurance agents, the backbone and front-line of the industry, were first organized in Chicago in 1869. The issuance of life insurance is transacted by selling the client an insurance policy. In 1873, the first weekly premium policy was issued, and the first industrial insurance agency system was introduced in the United States. The American Express Company played a very active role in formulating employer pension plans, as did the Baltimore & Ohio Railroad Company, which set up the first formal pension plan supported by employer and employee contributions in 1880. This was followed by the establishment of cash surrender values mandated by law in Massachusetts in 1880, and the adoption of pension plans for professors at age 65 with a minimum of 15 years service. This represented the first private college retirement plan in the country. Later, the first pension plan for public school teachers was established in Chicago, and the Steel Company set up the first pension plan in a manufacturing company.

In 1911, the first group life insurance for employees was introduced. World War I prompted the federal government to get involved in insurance as well. Life insurance for servicemen was offered under the War Risk Insurance Act of 1917, subsequently known as U.S. Government Life Insurance. Soon after, the Federal Civil Service Retirement and Disability Fund was created by Congress. Another major advance in the insurance industry occurred in 1921, when Metropolitan Life Insurance Company issued the first group annuity contract. The Revenue Act of 1921 deemed employer contributions to profit sharing trusts to be tax-exempt. Provisions were extended to pension trusts in 1926. The first examinations of life underwriters, those who actually underwrite and issue policies as representatives of insurance companies, were held seven years later.

Regulation. As the industry developed, the federal government continued to enact legislation with far-reaching effects on the insurance industry. The Temporary National Economic Committee was charged with investigating the industry and making regular reports to Congress regarding its structure and development. Contrary to its previous decision, the U.S. Supreme Court held in 1944 that insurance is commerce and that, when conducted across state lines, is interstate commerce and subject to federal laws. In 1945, the McCarran-Ferguson Act declared that the regulation of insurance by states is in the public interest and granted an exemption from the anti-trust laws to the extent that business is regulated by state law.

A major step for federal employees was achieved when the Federal Employees' Group Life Insurance Act of 1954 was introduced. This act ensured that federal employees would be provided group life insurance and accidental death and dismemberment insurance through

private insurance companies. In 1965, the Servicemen's Group Life Insurance Act was introduced, providing members of active duty in the uniformed armed services with group life insurance underwritten by private insurance companies with the Veterans Administration. In 1976, the first individual variable life insurance policy was issued, followed by the first "universal" life insurance policy in 1977.

A lot federal regulation was aimed at insuring equal access to insurance regardless of age and sex. The Supreme Court decided in *Norris vs. Arizona* that employee retirement benefits based on contributions made after August 1, 1983, must be calculated without regard to the sex of the employee. The Retirement Equity Act of 1984 lowered the minimum age for vesting and participation purposes, insured that written consent of the spouse would be required before joint and survivor coverage may be waived under pension plans, and required the payment of a survivor annuity in case of a vested participant who dies before the annuity starting date.

The taxation of life insurance companies has always been a strongly contested issue. The Tax Reform Act of 1984 included universal life insurance within the definition of life insurance, thus preserving its favorable tax treatment. Two years later, the Tax Reform Act of 1986 eliminated the tax deductibility of IRA contributions for highly paid people who are covered by pension plans. Also reduced was the maximum contribution to salary reduction, or 401(k) plans; the deductibility of interest paid with respect to loans on corporate-owned life insurance policies was also limited. A year later, the Revenue Act of 1987 established more expedient funding requirements for under-funded pension plans, a variable rate premium, and a lower full-funding limitation for qualified plans. Finally, in 1988 the Technical and Miscellaneous Revenue Act created a class of life insurance contracts, the policy loans and surrender payments of which are subject to taxation rules similar to deferred annuities and made many changes related to 401(k) plans.

The Bull Market. Assets of U.S. life insurance companies reached a record high of \$2.1 trillion in December 1995. This represented an increase of 10.4 percent, or \$201 billion, over 1994. Assets of U.S. life insurance companies were invested in corporate bonds, government securities, stocks, mortgages, real estate, policy loans, and other assets. U.S. life insurance companies increased their holdings in stock by 32 percent over 1994.

Managers of insurance company investment portfolios were rewarded with a fairly stable year in 1996, after 1995 when interest rates rose dramatically. In November 1996 the Dow Jones Industrial Average broke 6500 for the first time. In the bond market, life and health insurers increased their holdings of below-investment grade

bonds to 6.1 percent of their fixed income portfolio, still well below the levels maintained during the late 1980s and early 1990s. Insurance investment in mortgage-backed securities continued to decline in 1996 as a percentage of fixed income portfolios, reaching 26 percent after being reduced to 30 percent in 1995 and 33 percent in 1994. Overall, the financial stability of the industry continued to improve.

Continuing its record-setting trend, life insurance in force reached a record high in 1995 of \$12.6 trillion, an increase of 7.7 percent over 1994. Life insurance remained by far the largest segment of all insurance sold. Purchases of individual and group life insurance in 1995 were \$1.6 trillion. Traditional whole life and combination insurance accounted for 55 percent of policies sold, a decrease from 58 percent in 1993. Universal and variable life insurance accounted for 21 percent of new sales. Approximately 78 percent of all U.S. households owned some form of life insurance in 1994, and the average amount per insured household was \$159,100.

The average size of life insurance policies sold also continued to increase. In 1995 the average new individual policy was \$82,310, compared to \$79,710 in 1994 and \$75,350 in 1990. Approximately half of all new policies bought in 1994 were for people between the ages of 25 and 44, with 38 percent of those insured buying term policies and 22 percent buying universal or variable life policies.

In the mid-1990s, the life insurance industry also began gradually letting go of the safest investment mentality, left over from bad real estate investments in the 1980s. More companies were looking to pump up the returns in their portfolios, usually consisting of common equities, public bonds, and commercial mortgages. The portion of stock holdings began to rise and more companies began holding commercial mortgages directly.

CURRENT CONDITIONS

Net premiums written in 2001 reached \$472.7 billion for life and health insurance companies, compared to \$405.6 billion 1997. Annuities, which were virtually nonexistent prior to the 1970s, accounted for more than 50 percent of total premiums in 2001. Individual and group life insurance accounted for 26 percent of premiums, while health and accident insurance brought in another 20 percent. It was this reliance on annuities that propelled unprecedented growth in the life insurance industry at the turn of the twenty-first century as a booming economy prompted an unprecedented number of U.S. consumers to invest in retirement vehicles such as mutual funds and annuities. Net income for the industry reached a record \$24.1 billion in 2000. However, the stock market plummeted in late 2000 and remained low throughout 2001, a trend which undermined the entire investment

industry and more than halved the life insurance sector's net income to \$11.4 billion in 2001. The terrorist attacks on the World Trade Center towers in New York City that year, which cost the insurance industry dearly, were also a factor in this downturn.

Consolidation in the late 1990s and early 2000s allowed the industry giants to grow even larger. A record 51 mergers and acquisitions, worth a total of \$32 billion, took place among life insurers in 1998. Three years later, although the total number of mergers and acquisitions had fallen to 33, these deals grew in total value to \$36.1 billion. In 2001 the top 10 life and health insurance firms in the United States accounted for 41.1 percent of the market in terms of premiums written and 42.3 percent of the market in terms of assets. This compares to the 49.6 percent of the market held by the top 20 life insurers in 1995. In 2001 the top 10 U.S. life insurance companies, ranked by direct premiums, were American International Group, Hartford Life Inc., Metropolitan Life, ING Group, AEGON USA Inc., Prudential of American Group, New York Life, Nationwide Group, Mass Mutual Financial Group, and GE Financial Assurance Group.

Many life insurance companies set up as mutual companies have taken the step toward demutualization as a means of capitalizing on the bullish stock market. Some companies have opted to move to a mutual holding company first; this allows the company to sell off subsidiaries in anticipation of becoming stockholder owned. In December of 2001, Prudential completed its demutualization, joining industry leaders like MetLife and John Hancock.

The Internet has changed how many industries conduct business, yet the life insurance industry was embracing the Internet slowly in 1999. Some companies have had early success in this direct-selling environment; yet the industry as a whole spent only 3.5 percent of its revenue on information technologies, and only 25 percent of the companies in the industry were selling on the Internet in the late 1990s. This is expected to increase in the early 2000s as customers become accustomed to 24-hour-a-day, 7-day-a-week shopping opportunities.

WORKFORCE

There were approximately 1,549 U.S. life insurance companies in operation in 2000. The number has decreased steadily since 1988, when there were 2,343 companies.

Agents usually receive some sort of financial assistance from the companies they are affiliated with while they build a client base. They are also usually placed on a stipend or retainer, which is often replaced by straight retainer to cover monthly expenses. Life insurance companies often help agents with basic expenses such as office furniture and supplies, though most agents cover

their own travel, telephone, entertainment, and other expenses. Agents may receive commissions in two ways: a first-year commission for making the sale (usually 55 percent of the total first-year premium), or a series of smaller commissions paid when the insured pays his or her annual premium (usually 5 percent of the yearly payments for nine years). Most companies will not pay renewal commissions to agents who resign.

Incomes of insurance agents vary greatly. Income depends on the agents' own skill and knowledge of the industry, as well as the strength of the industry and market. Each year, about 20,000 agents qualify for the "Million Dollar Round Table" by selling policies with a face value of more than \$1 million. Agents in their first five to 10 years on the job earned an average of \$42,000 in the early 1990s. Those with 10 or more years selling life insurance averaged \$65,000 a year.

AMERICA AND THE WORLD

Widely varying economic conditions, personal income levels, living and health standards, and other circumstances make it difficult to make direct comparisons of national levels of life insurance ownership between countries. One statistical measure that reduces the influence of these diverse factors is the ratio of life insurance in force to national income. This ratio has generally shown improvement in most countries since 1984. In the United States, for example, that ratio was 191 percent in 1994, indicating that the amount of life insurance in force in the United States equaled 191 percent of U.S. national income. In 1994, Japan led all nations, followed by Korea (349 percent), South Africa (250 percent), Canada (245 percent), Ireland (233 percent), and The Netherlands (220 percent). Other countries whose life insurance in force exceeded their national income included Australia, France, Sweden, Norway, Denmark, and Germany.

Beyond 2000, U.S. life insurers face the prospect of having increasingly larger global competitors operating in their own market. At the end of 1995, there were only three U.S. life insurers ranked among the top 10 insurers globally based on assets. Prudential ranked fifth in the world, followed by Teachers Insurance Annuity Association (TIAA/CREF) at eighth, and Metropolitan Life at tenth. Three of the top four largest insurers were based in Japan. Since 1950, when 74 percent of all insurance premiums originated in North America, the percentage of total premiums has shifted away from the United States. By the mid-1990s, only 32 percent of all insurance premiums originated in North America, and 68 percent came from the rest of the world.

U.S. life insurers have established international operations largely through acquisitions and joint ventures. New opportunities were expected to open up in Europe toward the end of the 1990s, as European countries began

to dismantle their welfare states and privatize such areas as pension coverage, health, and unemployment insurance. Latin America was a hot market for U.S. life insurers in the mid-1990s, as companies were attracted by stabilizing economies, growing middle classes, and the privatization of some state-run pension programs. Aetna Inc., for example, was expected to invest as much as \$390 million for a 49 percent stake in a joint venture with Brazil's largest insurer, Sul America Seguros. Other life insurers with expanded operations in Latin America included Metropolitan Life, ITT Hartford Group, New York Life, and Principal Financial Group. The expansion continued in the late 1990s, when Aetna set up a joint venture with a Polish bank in 1999 to sell retirement products in Poland and Prudential formed a new life insurance company in Argentina.

While U.S. companies looked overseas to expand sales, many European companies looked to the United States as fresh markets for their products. In 1999 two European companies announced plans to acquire U.S. insurers—Transamerica by Aegon and Life USA by Allianz.

SIC 6321

ACCIDENT AND HEALTH INSURANCE

This category covers establishments primarily engaged in underwriting accident and health insurance. This industry includes establishments that provide health insurance protection for disability income losses and medical expense coverage on an indemnity basis. These establishments are operated by enterprises that may be owned by stockholders, policyholders, or other carriers. Establishments primarily engaged in providing hospital,

medical, and other health services on a service basis or combination of service and indemnity bases are classified in **SIC 6324: Hospital and Medical Service Plans**.

NAICS CODE(S)

524114 (Direct Health and Medical Insurance Carriers)
525190 (Other Insurance and Employee Benefit Funds)
524130 (Reinsurance Carriers)

INDUSTRY SNAPSHOT

More than 1,000 companies provided accident and health insurance in the United States in the early 2000s, writing roughly \$96 billion in premiums. Commercial carriers faced earnings pressure due to higher medical claims and higher expenses. The increasing growth of managed care companies (see **SIC 6324: Hospital and Medical Service Plans**) throughout the 1980s and 1990s had forced many carriers to suppress necessary rate increases in the face of intense price competition. However, managed care companies themselves began to face cost containment issues in the early 2000s. As some managed care businesses found themselves forced to increase premiums, commercial carriers were able to levy rate increases as well.

ORGANIZATION AND STRUCTURE

Accident and health insurance is provided on an indemnity basis by commercial carriers and Blue Cross & Blue Shield plans. Under indemnity insurance, the insurer pays the insured directly for any hospital or physician costs for which the insured is covered. Other providers of accident/health insurance include specialty health insurers, self-funded employer plans, and government plans. The accident and health line consists of the following categories: group, credit, collectively renewable, non-cancelable, guaranteed renewable, nonrenewable, and other individual health and accident lines.

Accident/health insurance companies may also provide service plans in connection with health care providers. Insurance companies arrange to pay health care providers for any service for which an enrollee has coverage. Under the service plan, the insurance company effectively agrees to provide the insured with health care services, rather than reimbursement dollars. Service plans offer the advantages of reduced paperwork and reduced financial liability for the insured.

In addition to voluntary insurance, a second type of private health insurance is managed care. Managed care plans, or prepaid health plans, have increased in popularity during the 1980s and the 1990s. By the mid-1990s, managed care plans had proven their ability to control medical costs more effectively than traditional fee-for-service insurance plans. Under a managed care plan, a person can enroll in an organization that charges a

monthly fee. In return for this monthly fee, the enrollee receives access to health care services from the organization. Organizations that offer such prepaid plans include Health Maintenance Organizations (HMOs), Preferred Provider Organizations (PPOs), and Exclusive Provider Organizations.

BACKGROUND AND DEVELOPMENT

Accident and health insurance, like other lines of insurance, serves to spread the consequences of a loss that would normally fall upon a single individual over the members of a large group. It also ensures that health care providers will be paid for services that an uninsured individual would otherwise not be able to afford.

Although the concept of insurance dates back more than 2000 years, the first form of health insurance in the United States can be traced back to the 1800s, when merchant seamen paid a modest premium to obtain health care as they traveled from port to port. Health insurance as it is known today, however, is a relatively new concept that has its roots in the Great Depression of the 1930s.

The most popular form of health insurance is major medical expense protection, which insures a person for a maximum amount of loss. The insured pays a deductible, usually \$100 to \$500. This plan of insurance is favored because it protects against catastrophic losses yet avoids administrative burdens associated with smaller claims below the deductible amount. Critics of this type of insurance, though, believe it discourages preventive treatment and encourages inflation of health costs.

Growth of the Industry. It is only since the 1960s that the accident/health industry has grown massively in proportion to other types of insurance. One of the greatest reasons for the explosion in the popularity of health insurance during this time has been the increase in benefits offered by employers.

After World War II, health insurance became a popular benefit for employees. Health insurance premiums were, and remained in the early 1990s, tax-deductible to the employer and were not taxable to the employee. Therefore, it became a cost-effective form of compensation. Also, as unions began to find it more difficult to gain wage increases for their members, health care benefits became an increasingly popular bargaining tool.

One of the primary reasons for the growth of the accident/health insurance industry was the advent in the 1970s of modified agreements that shifted a greater amount of health care risk to the employers that offered employee insurance plans. Under these agreements insurers, employees, and health care providers had little reason to control health care costs because the employers, as policyholders, were paying the insurance bill. In fact, one result of these agreements was that insurance com-

pany profits increased in proportion to the rise in the cost of medical care. These circumstances resulted in an unprecedented rate of growth in group health insurance, an average of 15 percent per year in the 1970s and early 1980s.

Industry Stagnation. By 1983, changes in the American economy began to dictate a need for change in the accident/health insurance industry. Employers began to shift more of the insurance burden to their employees, as economic stagnation exerted downward pressure on company profits and a new corporate cost-consciousness developed. At the same time that employers were trying to reduce their insurance expenses, insurance companies were battling new economic and regulatory forces. Skyrocketing inflation, deregulation of banks and financial institutions, and public pressure to cap rising insurance rates all contributed to a decline in industry profitability. In response to the new business environment, insurance companies changed their products, marketing objectives, underwriting goals, and investment strategies. The end result of these changes by the early 1990s, however, was reduced industry stability, record financial losses, and company insolvency.

In addition to other problems in the industry, health care costs continued to spiral upward much faster than inflation throughout the 1980s and early 1990s. This trend helped to open the door to accident/health insurance alternatives such as HMOs and other managed care alternatives. Moreover, the current system excludes millions of Americans, a situation that threatens to change the structure and dynamics of the entire accident/health insurance industry.

Legislation. Accident/health insurers in the United States are subject to regulation at both the state and federal levels. Many of the regulations are designed to require that insurers maintain sufficient reserves to cover future liabilities. Other regulations require that companies not discriminate against certain customers or raise premium rates above certain levels that are deemed competitive by the governing body. Additional legislation that has had a significant impact on the industry relates to Medicare and Medicaid, which ensure coverage for elderly and poor citizens.

Investment Income. With a pool of large reserves to invest, insurance companies can offset some of their underwriting losses with investment income. Managers of insurance company investment portfolios were rewarded with a fairly stable year in 1996, after 1995 when interest rates rose dramatically. In November 1996 the Dow Jones Industrial Average broke 6500 for the first time. In the bond market, life and health insurers increased their holdings of below-investment grade bonds to 6.1 percent of their fixed income portfolio, still well

below the levels maintained during the late 1980s and early 1990s. Insurance investment in mortgage-backed securities continued to decline in 1996 as a percentage of fixed income portfolios, reaching 26 percent after being reduced to 30 percent in 1995 and 33 percent in 1994.

Spiraling Health Care Costs. Rising health care costs made underwriting profits difficult to obtain for insurers. As costs escalate, so do claims by policyholders. Insurers have been unable to raise premium rates at the same rate as health care inflation rates. Some critics maintain that the current insurance system is partly to blame for escalating health care costs because it provides little incentive for providers to control costs. In fact, some observers believe that the current system provides an incentive for providers to perform superfluous tests, procedures, and services. Many other factors, though, have contributed to the rise in costs. They include: the burgeoning elderly population that requires additional health care, increased reliance on expensive medical equipment and technology, the shift of some costs from the government to private insurers, the costs of long-term illnesses such as AIDS and cancer, and an overall greater demand for health care services. Moreover, the meteoric rise in the cost of medical malpractice insurance has also taken its toll.

Medical savings accounts (MSAs), given improved tax status as part of the Health Insurance Reform Act of 1996, also known as the Kassebaum-Kennedy Bill, promised to offer employers a chance to reduce their health care costs. As envisioned, MSAs would combine a high-deductible catastrophic health insurance plan with an employer-paid account that employees could use to pay their regular medical expenses. Commercial carriers were prepared to join the MSA market in 1997, should they prove to be popular.

Industry Reform. Accident/health insurers are under increasing pressure from both state and federal governing bodies that seek to regulate the industry. After President Clinton's national health care reforms failed in 1994, state initiatives dominated the reform agenda in 1994 and 1995 and continued into 1996. The political realities of election year 1996 again forced Congress to address the issue of health care reform at the national level. The result was the passage of the Kassebaum-Kennedy health insurance reform package.

Key elements of the Kassebaum-Kennedy bill of 1996 included portability, guaranteed coverage, group purchasing for small groups, and medical savings accounts (MSAs). While the impact of this legislation has yet to be determined on accident and health insurers, some companies left states that had enacted similar reforms concerning community rating, guaranteed issue, and similar measures.

Increasing Competition. Higher medical claims and higher expenses increased earnings pressure in 1996. Intense price competition dramatically affected the medical loss ratios of accident and health insurers. With HMOs and other managed care organizations aggressively increasing their enrollment, some well-known commercial carriers left the health insurance business in 1996. Those leaving the field included Massachusetts Mutual Life Insurance Co. and John Hancock Mutual Life Insurance Co. Uncertainties about health care reform, changing demographics, and potential tax reforms on nonqualified products were expected to continue to pressure accident and health insurers.

CURRENT CONDITIONS

Life insurance companies, which underwrite accident and health plans as well, numbered 1,549 in 2001 and took in a total of \$472 billion in premiums. About 20 percent, or \$96 billion, came from underwriting health insurance. The continued move to managed care plans is responsible for the slowdown in premiums—health and accident insurance accounted for almost 21.3 percent of premiums for life insurance companies in 1997.

However, the distinction between commercial carriers and managed care companies began to blur in the late 1990s and early 2000s. According to an October 2002 issue of *Fortune*, “over the past decade consumers have increasingly migrated to what’s known as preferred-provider organizations, or PPOs. Such plans contract with an extremely broad network of physicians and hospitals, cover all out-of-network care once an annual deductible is met, and reimburse doctors almost entirely on a fee-for-service basis. In other words, PPOs are so loosely managed that they’re essentially old-fashioned fee-for-service indemnity plans in drag.” In 2002, enrollment in PPO plans increased to 52 percent of all insured employees, compared to just 28 percent in 1996. Over the same time period, enrollment in HMOs declined from 31 percent to 26 percent.

Some analysts believe this trend bodes well for commercial carriers, which had been offering indemnity plans all along. The increased flexibility of the PPO has also brought with it higher costs, forcing many managed care providers to raise their premiums. As a result, commercial carriers may find themselves better able to compete.

INDUSTRY LEADERS

Tampa, Florida-based Metropolitan Life Insurance Co. is the largest individual life, accident, and health insurance company in the United States, with assets of \$193 billion in 2002. Not far behind MetLife is Prudential Insurance Company of America, which held assets of \$188 billion in 2002. Both firms participated in the indus-

try’s continued consolidation in the early 2000s. Prudential paid \$1.15 billion to acquire American Skandia Inc., while MetLife paid \$966 million for Aseguradora Hidalgo S.A.

After MetLife and Prudential, the top insurers in 2002 were Teachers Insurance and Annuity Association of America, with assets of \$136 billion; Northwestern Mutual Life Insurance, with assets of \$105 billion; and Hartford Life Insurance Co., with assets of \$86 billion.

WORKFORCE

Employment in the accident/health insurance industry is representative of employment in the overall insurance industry, which also encompasses life and property/casualty insurance. In fact, most people employed in accident/health insurance work for multi-line insurers. Employers in the insurance industry consist mainly of either insurance carriers or insurance agents and brokers.

Jobs in the accident/health industry include administrative support, sales, executive, and managerial positions. More than half of all employment in the insurance industry is in the area of administrative support, which includes secretaries, word processors, and bookkeepers. Other occupations in this category include insurance policy processing clerks, claims clerks, and claims examiners and investigators.

Twenty percent of insurance employees have executive, administrative, or managerial jobs. Many of these workers are underwriters that evaluate applications to determine the risk involved in issuing a policy. Underwriters gather information on applications, review associated risks, and apply underwriting standards to reach a decision about whether or not to cover applicants for insurance. Typical career progression is from underwriter to senior underwriter to underwriting manager. Because many underwriting managers progress into general management, this occupation is popular for those seeking access to upper level management opportunities.

Other administrators and managers are employed as accountants, investment managers, or policy managers. Statistically, one of the most lucrative and rewarding opportunities in this category is that of actuary. Actuaries use mathematical models and statistical techniques to analyze risk and to create and price accident/health products. Candidates for managerial positions usually have a college degree as well as knowledge of finance, economics, or accounting.

AMERICA AND THE WORLD

The U.S. accident and health insurance industry is the largest and most advanced in the world, with premiums of \$472 billion in 2001. Although it was originally modeled after the British health insurance system, the industry in America differs from that of many other

industrialized nations because it is one of the most privatized in the world. While most other nations, such as Canada and Britain, have already addressed rising costs and inaccessibility of health care with nationalized plans, the United States has maintained a relatively competitive and private system, with the notable exceptions of Medicare and Medicaid.

U.S. life insurers have established international operations largely through acquisitions and joint ventures. New opportunities were expected to open up in Europe toward the end of the 1990s, as European countries began to dismantle their welfare states and privatize such areas as pension coverage, health, and unemployment insurance.

RESEARCH AND TECHNOLOGY

As markets became more competitive and profit margins continued to narrow during the 1990s, successful insurers were those that best utilized the efficiencies that automation and innovation could provide. A 1996 study of 25 top life/health insurers revealed that key success factors included efficiency in information technology, policyholder service, and underwriting.

With narrower margins and intense price competition, cost reduction continued to play an important role in achieving profitability for accident/health insurers. Besides reorganization and downsizing, the most effective way to achieve these ends was through computer automation. By implementing information technologies already proven effective in manufacturing industries, insurers hoped to significantly improve customer service, reduce errors, improve new product delivery time, and reduce human intervention.

By integrating all their company information into one system, insurers were able to synthesize efforts in product development, marketing, sales, and customer service. In addition, many companies were putting new litigation management systems to work for them that allowed law departments to accelerate access to legal research data, internal company information, and client data. This information is used to protect company interests and combat fraud.

Examples of new technology that accident/health insurers were integrating into the industry in the 1990s included open-systems architecture computer systems, network computing, computer-aided software engineering tools, multi-media training tools, and information management and delivery systems that use satellites. Industry regulators were also using this new technology to identify potentially insolvent insurers.

Another facet of research and technology, and one that has hindered the accident/health insurance industry, relates to the technological innovation that characterizes

the health care industry. Although new medical technology has saved lives and improved the quality of health care in the United States, it has also created a financial burden for health insurers and has increased the likelihood of federal intervention that may negatively impact the industry.

On the other hand, the industry is seeing an increased emphasis on medical technology that serves to create more efficient procedures and services. These advances could help pave the way toward reduced costs, as well as improved service in the future.

SIC 6324

HOSPITAL AND MEDICAL SERVICE PLANS

The hospital and medical service industry, also commonly referred to as the managed care industry, is comprised of establishments providing hospital, medical, and other health services to enrollees or members of a prearranged plan or agreement. Many of these establishments also provide traditional health insurance vehicles. Managed care plans typically arrange to provide medical services for members in exchange for subscription fees paid to the plan sponsor. Members receive services from physicians or hospitals that also have a contract with the sponsor. Thus, managed care plans integrate the financing and delivery of appropriate health care services to covered individuals.

NAICS CODE(S)

- 524114 (Direct Health and Medical Insurance Carriers)
- 525190 (Other Insurance and Employee Benefit Funds)
- 524130 (Reinsurance Carriers)

INDUSTRY SNAPSHOT

Although they serve the same basic function as traditional insurance plans, managed care plans differ because the plan sponsors play a greater role in administering and

managing the services that the health care providers furnish. For this reason, advocates of managed care in the late 1990s argued that it provides a less expensive alternative to traditional indemnity insurance plans. However, steep premium increases levied by managed care providers in the early 2000s, largely the result of the higher costs associated with the increased flexibility offered by many managed care plans, blurred the distinction between managed care and traditional indemnity plans.

Managed care had grown rapidly in popularity beginning in the early 1980s, as health care and related insurance costs skyrocketed. Following some financial setbacks for managed care companies in the late 1980s, enrollment in managed care plans increased dramatically throughout the 1990s. In 1999, more than 107 million people were enrolled in one of four types of managed care plans: health maintenance organizations (HMOs), preferred provider organizations (PPOs), exclusive provider organizations (EPOs), and point-of-service plans (POS). Nearly 375 HMO and PPO plans were in operation in 2000, and roughly 85 percent of all covered workers were enrolled in managed care plans versus traditional insurance plans. Factors that contributed to the rapid growth of managed care included the improved benefits with lower premiums and deductibles. Analysts attributed the slow growth in the cost of health care during the 1990s to the rise of managed care plans.

However, managed care providers began to raise their premiums for corporate clients at the turn of the twenty-first century. Premiums increased by 11 percent in 2001 and by another 12.7 percent in 2002. Some analysts predict an increase of up to 22 percent in 2003.

ORGANIZATION AND STRUCTURE

Managed health care plans, or pre-paid plans, exist in various forms yet all plans serve the same basic function—to spread the risk of extensive losses suffered by one individual across an entire membership group that is exposed to similar risk. By pooling the health care dollars of many subscribers, individual enrollees are assured of receiving care that they otherwise might not be able to afford. Managed care differs from traditional insurance in that members of managed care programs typically have less freedom to choose their health care providers, thus limiting the plan member's control over the quality and delivery of care in a managed system. Members of managed care plans usually must select a "primary care physician" from a list of doctors provided by the plan sponsor.

As managed care plans evolved into the twenty-first century, competing plans offered innovative health care delivery in response to the preferences of consumers. Still, all plans had certain elements in common. Common factors included arrangements with selected providers to

furnish a set of health care services to members, definition of explicit standards for the selection of health care providers, maintenance of ongoing quality assurance standards, and the utilization of review programs. Additionally, significant financial incentives were set in place to discourage members from using providers and procedures not covered by the plan. In 1999, 181.4 million Americans were enrolled in managed care plans. Many of these people participated in plans offered through their employer. Statistically, 85 percent of U.S. workers covered by company insurance plans participated in some form of managed care, in keeping with a trend for increasing numbers of employers to offer a managed care option as part of their health benefits package. An estimated 89 percent of all commercially insured Americans were members of managed care plans by the year 2000.

How Managed Care Works. Managed care plan administrators act as middlemen by contracting with health care providers and enrollees to deliver medical services. The enrollees pay a set fee that entitles them to services. The plan administrator then supervises the health care providers. Subscribers benefit from reduced health care costs, and the health care providers profit from a guaranteed client base.

Enrollment in managed care plans appeals to members because it can provide savings over traditional indemnity insurance plans, which typically serve the singular function of claims reimbursement. Contrary to traditional insurance plans, managed care sponsors are highly motivated to suppress health care costs and deliver quality services. Indemnity insurance in contrast offers little incentive to control the cost of health services. The savings of managed care result from an active role taken by the plan sponsor in determining the most cost-efficient means of delivering care to its members. Sponsors of managed care, for example, work with health care providers to increase outpatient care, reduce administrative costs, eliminate complicated claims forms procedures, and minimize unnecessary tests. Plan sponsors accomplish these tasks by reviewing each patient's needs before treatment and requiring a second opinion before authorizing doctors to administer care. Likewise, hospitalization of a plan member requires prior authorization, and services performed by specialists cannot proceed in the absence of approval. Some managed care plans offer bonuses to doctors for avoiding expensive tests or costly services performed by specialists, and some sponsors employ award bonuses to doctors in return for shortening the time a patient stays in the hospital. Practices such as these, according to critics of managed health care, can easily lead to under treatment.

Managed care instead places emphasis on preventive medical techniques that help patients avoid serious future health problems, which, in turn, reduce cost. For instance,

managed care plans typically authorize regular physicals and checkups at little or no charge to their members, to prevent or detect long-term complications at an early stage. Many plans offer cancer screenings, stress reduction classes, programs to help members stop smoking, and other services that save the sponsor money in the long run by keeping the plan member healthy. Some plans offer financial compensation to members who lose weight or achieve fitness goals. For example, one plan offered \$175 to overweight members who lost 10 pounds and gave \$100 to members who participated in fitness programs.

Managed care plans exist in many forms. Most popular are health maintenance organizations (HMOs) and preferred provider organizations (PPOs). Other plans that combine elements of HMOs and PPOs include exclusive provider organizations (EPOs), point of service plans (POS), third party administrators, and competitive medical organizations. In addition to these established plans, many employers and organizations offer hybrid plans that combine various forms of insurance and managed care into programs that offer multiple options for members of their group. In 1999, 79.3 million Americans were covered by HMOs, 89.1 million by PPOs, and 13 million by EPO plans.

Health Maintenance Organizations. The most popular plan, the basic HMO, characterizes the description of managed care plans provided above. HMOs, with 70 million enrollees in 1999, boasted a 30 percent market share among managed care providers, up from just under 60 million people at the end of 1996.

Four organizational models exist for the HMO; these define the respective relationship between plan sponsors, physicians, and subscribers. Under the first model, called *independent practice associations (IPA)*, HMO sponsors contract with independent physicians who agree to deliver services to members for a fee. Under this plan, the sponsor pays the provider on a per capita, or fee-for-service, basis each time it treats a plan member. Under the second model, the *group plan*, an HMO contracts with a group of physicians to deliver client services. The sponsor then compensates the medical group on a negotiated per capita rate. The physicians determine how they will compensate each member of their group. Another model, called the *network model*, is similar to the group model but the HMO contracts with various groups of physicians based on the specialty that a particular group of doctors practices. Enrollees then get their service from a network of providers based on their specialized needs. In a fourth model, the *staff arrangement*, doctors practice as employees of the managed care plan sponsor. The HMO owns the facility and pays salaries to the doctors on staff. This type of arrangement allows the greatest control over costs but also has the highest start-up costs.

Preferred Provider Organization. A PPO is a variation of the HMO and combines features of indemnity insurance and HMO plans. A large insurer or a group of doctors or hospitals typically organizes a PPO. Under this arrangement, networks of health care providers contract with large organizations to offer their services at a reduced rate. The major difference from the HMO is that PPO enrollees retain the option of seeking care outside of the network with a doctor or hospital of their choice. They are usually charged a penalty for doing so, however. Doctors and hospitals are drawn to PPOs because they receive prompt payment for services; also PPOs provide access to a large client base. PPOs held a 30 percent share of the market in 1999, an equivalent amount to that held by HMOs.

The PPO industry tends to be more fragmented than HMOs, with numerous independent firms providing regional and local services. Some of the larger PPOs have started providing programs and designing products that are similar to those offered under HMO plans. One type of plan that has emerged is the exclusive provider organization (EPO), which is essentially a smaller PPO provider network offering higher discounts. Most EPO plans provide few, if any, benefits when an out-of-network provider is used.

Point of Service. POS plans have a 20 percent market share. These combine characteristics of HMOs and PPOs. Like PPOs, POS plans use a network of providers. Covered individuals select a primary care physician who controls referrals to specialists. As long as the covered individual uses a plan provider, there are few or no out-of-pocket expenses. If care is received from a provider not in the plan, then the covered individual pays higher co-payments and deductibles, and the provider is reimbursed by the plan.

Demographic Influences. The type and magnitude of managed care offerings varies significantly with age, region, and the size of the employer delivering the managed care plan. HMOs and PPOs tend to appeal to younger families with children, yet traditional insurance plans are most popular with elderly people. Only 25.7 percent of the Medicare segment relies on managed care, while 61 percent of Medicaid recipients turn to managed care. Managed care plans also tend to be more popular with large employers, although the growth rate of managed care offerings in smaller companies is greater. According to *OR Manager* in 1998, more than one-half of HMOs were located in the Pacific regions or in the Northeast, with HMOs most prevalent on the Pacific Coast. California had 14 million enrollees by 1997, and HMOs in the Pacific Northwest held a market share of 47 percent, the highest in the United States. Enrollments were highest in New York and California in the latter half of the 1990s, while the growth rate of HMOs in Mississippi, at 103 percent, was the highest across the nation. HMO penetra-

tion at that time was lowest in the southeastern United States. While population density may also be a factor in attracting managed care plans, the demographic variances in managed care popularity are mainly the result of differences in the rate at which health care costs have escalated for different segments and regions of society.

BACKGROUND AND DEVELOPMENT

The use of managed care in the United States coincides with the use of health care insurance itself. It was first used by the U.S. Public Health Service to provide medical treatment for merchant seamen who traveled from port to port. In the 1800s, managed care expanded to cover some corporate employees and some government employees, including railroad workers. Henry J. Kaiser and Dr. Sidney Garfield, to provide medical care for San Francisco shipyard workers, started the first major plan in the 1930s. This plan was offered to the public at large in the 1940s.

Although plans similar to the Kaiser plan were formed during the 1950s and 1960s, managed care did not become available to the population until the 1970s, when society began to address spiraling health care costs. The Federal Health Maintenance Organization Act of 1973 stimulated the growth of the industry by providing grants and loans that expanded plans and spawned new HMOs. Although a few companies, such as Kaiser and Group Health of Puget Sound, offered managed care plans in 1973, less than 3 percent of Americans were enrolled in them.

Spiraling Health Care Costs. The greatest reason for the advent and popularity of managed care has been spiraling health care costs, which many critics blame on the traditional indemnity insurance system. Throughout the 1980s and much of the 1970s, average health care costs in the United States jumped an average of 15 percent per year. Furthermore, between 1965 and 1992, health care expenditures, as a percentage of the Gross Domestic Product (GDP), soared from 6 percent to more than 15 percent. Between 1988 and 1993, health care expenditures rose 63 percent, reaching \$889 billion.

As health insurance costs skyrocketed, so did the cost of all types of health insurance. From 1989 to 1991, for example, the average employee contribution to company sponsored health insurance plans increased 50 percent while the amount of services diminished and deductibles went up. As employers began to scale back their insurance offerings to save money, the number of uninsured Americans rose to nearly 35 million by 1992. Many smaller businesses were forced to terminate their health benefits.

These considerations caused employers and individuals to seek new forms of insurance in the 1980s and

1990s—such as HMOs and PPOs—that could contain costs while still providing satisfactory service. Others, including some government regulators, were advocating a nationalized health care plan similar to those in Canada or Great Britain. In the early 1990s, the United States remained one of the only industrialized countries in the world that relied on a privatized system of health care.

Industry Growth. During the 1970s, the HMO industry grew by approximately 25 percent, serving about 4 percent of the U.S. population by 1980. The HMO industry achieved its greatest period of growth during the 1980s. During this decade, the number of HMOs soared to about 700 in 1987, and enrollment jumped to include approximately 15 percent of the population.

In addition to rapid growth in the number of people enrolled in HMOs, PPOs became a popular form of care and grew at a faster rate than HMOs during the mid-1980s. Between 1984 and 1993, the number of PPOs bounded from 115 to nearly 900, with almost 40 percent of the population having the choice to enroll in PPOs through their employer. The PPO industry tended to be more fragmented than the HMO industry, with numerous PPOs offering regional or local services.

HMO industry profits began to sag in 1986. The number of people enrolling in HMOs began to decrease in 1988, with the number of HMOs falling from 707 in 1987 to about 546 by 1993. These trends reflected increasing start-up costs, increased mergers and acquisitions, and concerns by some people that HMOs would not be able to control costs as well as first hoped.

The effect of increased start-up costs was demonstrated in the growth rate of new HMOs between 1988 and 1991. In 1991, only four new HMOs were formed, compared with seven in 1990, 19 in 1989, and 34 in 1988. The sluggish economy and lack of start-up capital that was common in the late 1980s and early 1990s contributed to the fall in newcomers to the market. Many of the very large companies that had entered the industry in the 1980s remained unprofitable into the 1990s.

Increased economic pressures were also responsible for the merger and acquisition trend that reduced the number of HMOs in the late 1980s and early 1990s. While overall industry profits continued to grow in the early 1990s, many underfunded HMOs experienced financial difficulty.

The dramatic growth of the managed care industry can be seen by comparing the market share of managed care plans in 1988 and 1993 to that of traditional indemnity health insurance. In 1988, conventional health insurance held a 71 percent market share. The managed care share of the market was split between HMOs with 18 percent, and PPOs/POSs at 11 percent. By 1993, managed care accounted for 51 percent of the market, and

conventional health insurance had fallen to 49 percent. Within the managed care industry, HMOs accounted for a 22 percent market share, the fast-growing PPOs accounted for 20 percent, and POSs took 9 percent. In 1996, HMOs replaced traditional indemnity plans as the primary choice for health care coverage by employers. Of the 1,151 firms with 200 or more employees surveyed, HMO enrollment rose during 1995. Memberships, which were at 29 percent at mid-year in 1995, rose to 33 percent in the first half of 1996. Meanwhile, enrollment in conventional health plans fell from 31 percent to 26 percent over the same time period. The survey showed that enrollment in some type of managed care reached 74 percent—a dramatic increase from 29 percent in 1988.

After experiencing financial problems in the late 1980s, managed care industry profits recovered during the early 1990s. Rapid growth, reduced medical costs, and the promise of stable premium rates characterized results in 1995. Some larger HMOs reduced premiums to boost enrollment. One of the largest and most profitable publicly traded HMOs, United HealthCare Corporation, announced it would sacrifice its 1995 profits by cutting premiums to increase enrollment. In 1999, United HealthCare Corporation ranked fifth largest in the United States.

Mergers and Acquisitions. Before 1996 there was little blending of HMO companies and traditional insurance companies, but that quickly changed with a series of well-publicized acquisitions. United HealthCare Corporation acquired MetraHealth Companies, Inc. toward the end of 1995. MetraHealth was formed earlier in 1995 by combining the group health care operations of Metropolitan Life Insurance Company and The Travelers Insurance Group. At the time of the acquisition, MetraHealth served more than 10 million individuals, nearly 6 million of whom were in network-based care programs. Other mergers included the entry of Humana, Incorporated into the traditional finance and insurance industry with the acquisition of Emphesys Financial Group and one of its subsidiaries called Employers Health Insurance Company, and a major acquisition that involved the takeover of WellPoint Health Network.

Government Reform. Managed care companies were poised to benefit from political changes in 1993 that promised to promote the industry. The most crucial development was the election of Bill Clinton as president. Clinton promised in his campaign to deliver a national health care plan within his first 100 days in office. He promised a plan that would reduce costs and provide some type of care for all Americans. In 1993, First Lady Hillary Rodham-Clinton orchestrated the development of a national health care reform package that promised sweeping changes. However, by 1994 it was clear that Clinton's health reform initiatives were dead.

State initiatives dominated the reform agenda in 1994 and 1995 and continued into 1996. In November 1996, two anti-managed care referendums failed in California and Oregon, an indication that consumers remained concerned with the higher costs associated with traditional indemnity insurance. The political realities of election year 1996 again forced Congress to address the issue of health care reform at the national level. The result was the passage of the Kassebaum-Kennedy health insurance reform package.

Key elements of the Kassebaum-Kennedy bill included portability, guaranteed coverage, group purchasing for small groups, and medical savings accounts (MSAs). This legislation impacted managed care companies by increasing expenses due to regulations requiring upgrading and evaluating care. Federal and state regulations concerning 48-hour hospital stays for new mothers, for example, put increased pressure on profit margins by increasing costs for managed care companies.

While some large organizations experimented with health care cost controls that forced competitive pricing, many individuals and small businesses sought ways to participate in managed care systems. One solution advocated by government reformists in the early 1990s was health insurance purchasing cooperatives (HIPCs). HIPCs allowed individuals or small groups to pool their buying power and negotiate cheaper managed care.

Although some groups found ways to control their health care costs through managed care and managed competition, critics of managed care accused HMOs of "shadow pricing," a technique used to keep premiums just below the level of expensive indemnity plans. They also argued that some managed care providers were engaged in competitive practices that would eventually hurt the overall quality of the U.S. health care industry.

Profitability. In 1996, the managed care industry experienced falling margins resulting in less profitability. It was a combination of aggressive rate reduction and unrealized medical cost savings that contributed to many managed care companies losing favor with Wall Street. Another factor that put pressure on profit margins was the banding together of doctors and hospitals to negotiate higher provider fees. As a result, enrollment increased by an average of 19.2 percent in 1996, while margins declined to 0.2 percent, down from 2.4 percent in 1995. As a result of falling margins, the industry changed its focus from enrollment growth to one of managing medical costs to achieve profitable margin levels.

According to a study conducted by Weiss Ratings of Palm Beach Gardens, Florida, and reported in *Healthcare Financial Management*, managed care premiums rose by 3 to 4 percent in the mid-1990s and continued the slow rise, or else remained flat, through the end of the decade.

These single-digit increases in premiums were commensurate with the rate of inflation, yet more than 50 percent of HMOs failed to achieve profitability by 1997 and again in 1998 as margins remained under 1 percent. It was provider-owned plans that suffered most severely from the ominous economic conditions of the managed care industry, with average losses estimated at \$19 million.

In devising plans to curb escalating health care costs through managed care, regulators looked to examples of HMOs in the relatively new managed care industry. Although many HMOs were successful in the 1990s, others had failed. Furthermore, many of the new arrangements and innovations involving HMOs indicated that, as the federal government prepared to implement comprehensive reforms, the free market was beginning to deal effectively with spiraling health care costs. Managed care plans offered employers a chance to save on their medical expenses. According to the A. Foster Higgins survey, it cost employers an average of \$3,739 to insure each indemnity member in 1996, an increase of 2.4 percent over the previous year. That cost compared with \$3,185 for each HMO member, a decrease of 2.2 percent. With increasing numbers of indemnity plan participants converting to managed care membership, the market for managed care became saturated, which intensified competition between providers.

The volatility of HMOs in the 1990s was seen when Humana Corp. experimented by vertically integrating its hospital business with its HMO start-up operation during the 1980s. Although the strategy met with initial success, it eventually alienated many physicians and competing HMO networks. Doctors who were not a part of the Humana network started directing their patients away from Humana hospitals and facilities. As a result, Humana split the HMO and hospital businesses into separate divisions in 1993. The splintered corporation grew to be the sixth largest managed care provider in the United States, with 6.2 million enrollees by 1999.

One successful example of the implementation of HMOs to curb costs involved a plan implemented by Xerox Corporation using the managed competition concept. Like many companies, Xerox offered a combination of indemnity and HMO plans to its employees. However, the company also used a "benchmark" system that limited company funded premiums per employee to the level of premiums charged by the least expensive HMO plan. This caused HMOs competing for Xerox employees to reduce their premiums and subsequently served to keep the rising cost of premiums in check. The program allowed employees to pocket the savings offered by the more efficient plans or pay extra for choosing indemnity plans that offered more freedom in choosing physicians. Xerox distinguished itself among employers over the well-publicized situation, through the practice of closely

monitoring the HMOs that serviced the corporation, to ensure that its employees received satisfactory care. Similarly, through an innovative administrative policy, Minnesota became the first large employer to base its health care contributions for employees and dependents on the lowest-priced HMO in each county.

Customer Satisfaction. In 1999, *American Medical News* quoted Employer Benefit Research Institute statistics indicating that 49 percent of Americans expressed satisfaction for their PPOs, while only 35 percent of HMO members were satisfied with their respective plans. The largest positive response, however, came from fee-for-service plan participants, of whom 64 percent were satisfied. This was in direct contrast to a report issued seven years earlier by the National Research Corporation indicating that people were most satisfied with HMOs and least satisfied with fee-for-service plans. Additionally, the earlier survey indicated that while 85 percent of the people were at least somewhat satisfied with their health plan, younger respondents reported the least amount of contentment. Furthermore, it was the younger respondents who were also the most likely to convert from traditional to managed care plans. As a result of the findings of the later survey, the managed care industry contracted Waylon Advertising of St. Louis, Missouri, to create an advertising campaign to help shed a more positive light on the industry. Along with the American Association of Health Plans, other members of the coalition that contracted the advertising campaign included Aetna U.S. Healthcare, Blue Cross and Blue Shield Association, and CIGNA Healthcare.

CURRENT CONDITIONS

A number of factors helped to boost the profits of industry leaders like Aetna and United Health in the early 2000s. Between 2000 and 2002, one of the largest expenses faced by managed care providers, increases in prescription drug costs, actually began to slow, from 19 percent in 1999 to 16 percent in 2002. At the same time, however, managed care providers began to levy substantial increases in premiums, which rose nearly 24 percent, more than three times the rate of inflation, between 2000 and 2002. In addition, premiums are expected to grow another 22 percent in 2003. According to the October 2002 issue of *Fortune*, industry consolidation has helped give managed care companies negotiating power with their corporate clients. "Big insurers are swallowing little ones—roughly a third of small firms have been gobbled up in the past few years—giving better pricing leverage to the 600 or so remaining players."

Realizing that they will not likely be able to continue raising premiums this substantially without seriously alienating corporate clients, who are forced to choose between passing increases along to employees or swal-

lowing the cost themselves, many managed care companies have begun experimenting with “consumer driven” health plans. These plans put the onus for securing affordable healthcare on consumers by giving them a set number of medical dollars, such as \$500 or \$1,000, to spend each year. Those who exceed this limit are responsible for additional medical costs up to a set deductible, such as \$1,500 or \$3,000. Once expenses exceed that amount, the managed care plan then resumes making its typical payments. In 2001 Aetna became the first managed care provider to launch such a plan with the introduction of HealthFund.

INDUSTRY LEADERS

In 1999, Blue Cross and Blue Shield System/HMO-USA was the largest provider of managed care (by enrollment) in the United States with 47.7 million members, more than twice the enrollment of the second largest provider, Aetna U.S. Healthcare. Blue Cross/Blue Shield surpassed Kaiser Permanente as the largest HMO organization at the end of 1995, according to rankings published in *The New York Times*. Throughout the United States, the 62 member plans of the Blue Cross and Blue Shield Association reported that 52 percent of their members were covered by POS contracts, PPO plans, or HMO plans in March 1996. That translated into one-sixth of the U.S. population being covered by the Blues’ managed care plans.

Aetna Incorporated, with 13 million enrollees and 2002 revenues of \$19.8 billion, was the second largest managed care provider in the United States. CIGNA Corporation, also with 13 million enrollees, had sales of \$19.3 billion that year.

Kaiser Foundation Health Plan was the largest non-profit managed care provider in the industry, with 8.6 million enrollees. Kaiser, founded during the 1930s, remained the oldest managed care provider in the United States at the end of the twentieth century. The organization had sales of \$22.5 billion in 2002, reflecting a 14.2 percent growth over the previous year.

The merged conglomerate of Minnesota’s United HealthCare—a part of the UnitedHealth Group—increased its membership to cover an additional 10 million individuals through acquisitions. Among United HealthCare’s expanded membership, 5.9 million individuals were members of network-based care programs. The group’s sales were a reported \$25 billion in 2002, which comprised a growth of 8 percent. With 6.4 million enrollees, United HealthCare Corporation was the fifth largest managed care plan provider in the United States in the late 1990s.

Humana, Incorporated was the sixth largest managed-care provider in the United States, with 6.2 million enrollees and 2002 revenues of \$11.1 billion.

WORKFORCE

The increase in the popularity of managed care, in conjunction with an aging U.S. population requiring more care, ensures a stable employment market within the industry well into the twenty-first century. The jobs in the managed care industry parallel the positions that existed previously within the health care and health insurance industries. The basic difference, however, is that organizational structures within the managed care industry are subject to an excessively bureaucratic management environment. Additionally, employee and practitioner compensation trends within managed care organizations call for lower wages than health care providers such as doctors, nurses, and facility administrators have traditionally commanded.

Managed care offers similar positions in the insurance and health care fields: jobs in finance, accounting, sales, and administrative support. Managed care health professionals are equivalent to those in other health care environments: physicians, nurses, physical therapists, lab technicians, and occupational therapists. Nurses, who were in particular demand during the 1990s, reported greater job satisfaction in the managed care fields than within the traditional hospital structure.

In 1998, Blue Cross and Blue Shield Association employed 150,000 workers, and Kaiser Foundation Health Plan employed 100,000, although neither corporation showed employee growth for the year. The largest employee growth for that year was at Aetna; with 33,500 employees the company realized an employee increase of 16.9 percent for one year. Nearly as large was the employee growth at Humana, which realized an increase of 16.4 percent for a one-year count of 16,300 employees. Third-ranked CIGNA grew to 49,900 employees for 4.6 percent growth, while UnitedHealth Group increased its staff to 29,200, a 1.4 percent increase.

RESEARCH AND TECHNOLOGY

The managed care industry has been a major innovator and implementer of advanced research and technology. This is partly because the industry is focused on cost containment. Another reason is most companies in the managed care industry are relatively new and more open to change. In fact, indemnity insurers and hospitals later implemented many of the advances first developed in the managed care industry.

The managed care industry has become increasingly competitive, with HMOs and PPOs vying—and sometimes actually bidding—for contracts to serve the employees of different companies and organizations. As a result, managed care companies with the most advanced information systems and the most effective automation have excelled. Many companies are using new technol-

ogy to help them provide a “one-stop-shop” for employers seeking efficient managed care benefits for their employees.

Kaiser Foundation Health Plans signed a 10-year, \$70 million contract (to run through 2002) with an IBM subsidiary for the development and management of information systems in its expansion regions. Other managed care companies used information systems to integrate data about clinical and support services, medical staffs, and enrollees with data from internal operations such as cash management, human resources, and strategic and financial planning. These “seamless” health care delivery systems monitored and lowered treatment costs, reducing human error and intervention in the administrative process, thus speeding treatment. These advances also spilled over into the areas of ambulatory services and medical legal functions.

In 1999, the health care industry invested \$19.9 billion dollars in research and development, not including research by drug manufacturers and medical equipment suppliers.

SIC 6331

FIRE, MARINE, AND CASUALTY INSURANCE

This classification covers establishments primarily engaged in underwriting fire, marine, and casualty insurance. These establishments are operated by enterprises that may be owned by stockholders, policyholders, or other carriers.

NAICS CODE(S)

524126 (Direct Property and Casualty Insurance Carriers)

525190 (Other Insurance and Employee Benefit Funds)

524130 (Reinsurance Carriers)

INDUSTRY SNAPSHOT

A total of 3,215 fire, marine, and casualty insurance companies operated in the United States in 2000, compared to an estimated 3,800 companies in the mid-1990s. These companies accounted for 32.1 percent of the insurance industry's \$956.8 billion in premiums that year.

Throughout the 1990s, the industry was plagued by a decrease in the growth of demand for insurance coverage, as well as a series of catastrophic events, both of which undermined profits. Net income of \$36.5 billion declined to \$29.9 billion in 1998, \$22.5 billion in 1999, and \$20.7 billion in 2000. However, this gradual decline paled in comparison to the fallout experienced by the property/casualty industry in 2001. Already struggling with severely reduced investment income, due to the economic downturn in the United States, the fire, marine, and casualty insurance industry was hit with extraordinarily high expenses from the September 11 terrorist attacks. As a result, the industry posted a loss—its first ever—of \$6.9 billion in 2001, and its net worth that year declined 8.7 percent to \$289.6 billion.

ORGANIZATION AND STRUCTURE

The fire, marine, and casualty insurance industry, commonly known as the property/casualty industry, is part of the larger primary insurance industry, which also encompasses both life and health insurance. In addition to these three types of primary insurance, the reinsurance industry serves life, health, and property/casualty companies. Some companies participate in more than one primary industry segment.

Companies within the property/casualty industry provide financial protection for businesses, individuals, and other entities against property loss or losses by third parties for which the insured is liable. The two major segments of the industry are business and personal insur-

ance, each of which accounts for almost 50 percent of the total dollar amount of property/casualty insurance premiums written.

Within all segments of the property/casualty industry, several types of insurance are available. Although most property/casualty insurance traditionally has been written to cover homes, automobiles, and other property, other types of coverage include workers' compensation, product liability, and medical malpractice. Of all the available lines, automobile insurance is the largest segment of the industry, accounting for over 45 percent of property/casualty insurance premiums written in 1992. Automobile insurance accounted for the largest increase in premiums, up \$5.6 billion. Several other market segments account for the remainder of premiums in existence.

Workers' compensation insurance is the second largest segment of the individual market. A study released in early 1996 stated that insurers paid out \$16 billion in asbestos losses alone between 1993 and 1995. Premiums for workers' compensation dropped 5 percent to \$29.7 billion and accounted for just 13 percent of the property/casualty premiums written in 1992. Furthermore, fire and marine insurance combined represented less than 7 percent of all premiums written for individuals during that same year.

The entire insurance industry, including life, health, and property/casualty, is comprised of four functional groups: insurers, who carry the risk of their clients; field organizations, which provide client services such as settling claims and writing insurance; intercompany associations or bureaus that, among other things, establish standards of practice, influence legislation, and determine rates; and associations of agents and brokers that promote the interests of the field organizations.

Financial Structure. Insurance companies generate profits by selling, or underwriting, policies to customers and then investing these revenues in income producing assets. Therefore, insurers may derive revenues, or losses, both from collecting premiums on insurance and from investment income. Insurers are in the precarious position of selling products and services before they are sure how much these products and services will cost to provide.

One factor distinguishing the property/casualty industry from other primary insurance industries is the nature of its investment activities. Future liabilities tend to be short term, compared to the life or health insurance industries, and are much less predictable. In addition, most property/casualty policy claims are settled quickly. Therefore, insurers must invest predominantly in assets that they can quickly convert to cash. For instance, bond holdings alone typically constitute over 70 percent of

property/casualty industry assets, and stocks account for about 20 percent. These figures contrast the life insurance industry, which usually invests about 20 percent of its assets in relatively liquid mortgage loans and real estate.

Competitive Structure. Although industry growth stagnated in 1989 and throughout the early 1990s, the number of U.S. property/casualty insurers jumped 34 percent between 1979 and 1988. Of the nearly 20,000 companies that comprised the industry by 1994, 85 had 1,000 or more employees, and 275 had between 250 and 500 employees. Employment decreased in the early 1990s as insurers moved to streamline operations and dropped to 545,400 in 1993. Employment was up again in 1994 to 610,368. Advertising and customer service are also important elements of competition within the industry, since the industry is characterized by relatively homogeneous products that are difficult to differentiate from company to company.

BACKGROUND AND DEVELOPMENT

The concept of insurance developed in response to society's desire to spread the consequences of a loss that would normally fall upon a single individual over the members of a large group exposed to the same hazard. Through a system of equitable contributions, members of a large group can reduce the risk of disastrous personal loss. The result is an atmosphere of certainty, rather than uncertainty, regarding accidental or disastrous occurrences.

One widely cited definition of insurance emanated from a court case in Great Britain in 1806: "Insurance is a contract by which the one party, in consideration of a price paid to him adequate to the risk, becomes security to the other that he shall not suffer loss, damage, or prejudice by the happening of the perils specified to certain things which may be exposed to them."

Insurance companies concern themselves only with pure risk, which involves only the negative possibility of loss. Conversely, insurers must avoid insuring business risk, or speculative risk, which involves the chance of both loss or gain. In addition, the clients insured by companies must stand to lose by the happening of the event contemplated. Otherwise, the arrangement would amount to little more than a wager and would be unenforceable or illegal.

Other conditions that must be met in order for a group to be insured against an event are: the insurer must be able to quantify the risk of the event occurring; persons exposed to the risk must feel a sense of responsibility for the loss; the insurer must be capable of shouldering the burden of loss; and the events involved must be purely subject to chance.

Property/casualty insurance is limited to loss or destruction of property by fire, windstorm, hazards of the

sea, earthquake, water leakage, explosion, riot and civil commotion, vandalism, theft, forgery, and vehicle collision. In addition, loss of property can result from liabilities related to compensation of injured workers, property damage caused to others, and negligence concerning the use of personal property.

Evolution. Organized systems of fire, casualty, or marine insurance have existed since at least the fifteenth century when a marine insurance industry emerged to serve Italian traders. The industry did not develop into a form resembling what exists today until the seventeenth century in England, following The Great Fire of London in 1666. This event prompted the development of a sophisticated fire insurance industry, which helped to lay the groundwork for the gradual development of a broader property/casualty industry. Rapid industrialization in the western world during the nineteenth and twentieth centuries sped the industry's development, as a decrease in individual independence magnified the benefits of insurance.

In the United States, it was not until early in the twentieth century that the hazards of wind, water, damage, and explosion were added to the established lines of fire insurance. Other forms of insurance followed, such as personal accident, which covers costs related to illness and accident; liability; and workers' compensation insurance. A turning point occurred in the U.S. property/casualty industry in 1948, when states began allowing insurance companies to write policies on several lines of insurance, rather than limiting companies to just one segment of the market. This practice, called multiple-line underwriting, had long been in practice in the rest of the world. Significant trends shaping the industry as it entered the 1990s included an increased emphasis on computers and automation in virtually all aspects of the market and the continued globalization of the industry. The trend continued into the late 1990s.

Regulation and Legislation. One aspect of the U.S. property/casualty industry that separates it from insurance industries in most other countries, aside from its sheer size, is its detailed system of government regulation. Until the 1940s, regulation was the exclusive province of state and local governments. However, in 1944 the Supreme Court, in *United States v South-Eastern Underwriters Association*, ruled that insurance is commerce—commerce that is conducted between state lines. By redefining its scope, the Court made the entire insurance industry subject to the powers of Congress under the Commerce Clause of the Constitution. Congress then gave states until 1948 to revise their regulatory structures to meet certain standards laid down by the act. State revisions enacted during that time were sufficient to preclude excessive federal intervention. However, events in the early 1990s again threatened the authority of states

to regulate the industry, and increased federal regulatory action seemed likely.

Another legislative event with a significant impact on the industry is California's Proposition 103, legislation which California residents voted to enact in 1989. The proposition required property/casualty insurers to reduce, or rollback, automobile insurance rates by 20 percent. Enforcement of the proposition was postponed until 1992. This legislation reflected growing consumer discontent with escalating insurance costs nationwide and provided a testing ground for states considering similar legislation. Many insurers responded by reducing, or stopping, business in California.

Record losses from catastrophes, a lack of good investment alternatives, and a sluggish economy were the three predominant factors that converged to make 1992 a historically dismal year for the property/casualty industry. Small improvements over 1991 in the dollar value of premiums written, combined with capital gains realized from the sale of assets, were the only factors that kept earnings positive for that year.

By the mid-1990s, federal regulators argued that the state regulatory system was inefficient and had contributed to the financial instability of the industry. By requiring more stringent regulations concerning financial health, federal regulators hoped to strengthen the fiscal soundness of the industry and force companies to operate responsibly.

In 1997, an effort to reduce unnecessary regulatory burdens on casualty insurance was making strong headway in many states. NAIC invited insurance industry representatives, including the American Insurance Association, to present proposals for reducing regulations for large purchasers of commercial insurance. In March 1997, NAIC outlined several regulatory relief proposals, and the industry anticipated more action to follow.

In the late 1990s, the minimum workers compensation rate law was repealed, commercial lines were deregulated, and there was a move to repeal the Glass-Steagall Act. In addition, in 1999 OSHA proposed regulations to protect workers suffering from musculoskeletal problems. The agency proposed ergonomic standards that had insurers and businesses up in arms. The insurance industry stated it did not oppose worker safety, but felt the OSHA proposals discouraged worker/employer relations in discussing workplace safety; proposed coercive regulations without thought to employer motivation; and added significant costs with provable benefits.

Catastrophes. Catastrophes were the single greatest affliction for the industry in the early 1990s, resulting in over \$22 billion in combined losses. Of all the catastrophes during 1992, Hurricane Andrew was the most expensive. Its damage in Florida and Louisiana in August

1992 racked up record claims topping \$15 billion for the industry. Less than one month after Andrew, Hurricane Iniki blasted the Hawaiian Islands, wreaking an additional \$2 billion in destruction. In addition, tornadoes ripped through the South and Southwest in that same year, causing \$130 million in damage, and the Chicago floods reaped another \$300 million in claims. A few months after the Chicago floods, riots in Los Angeles amounted to \$750 million in damage. In early 1993, a heavy snowstorm on the East Coast dealt a \$1 billion blow to property/casualty insurers. These catastrophes contributed to a staggering loss in underwriting income of over \$34 billion in 1992, compared to the past record high loss of \$25 billion in 1985. In comparison, underwriting losses from 1989 to 1991, which were also burdened by exorbitant catastrophic claims, averaged about \$20 billion.

Catastrophes, especially hurricanes in the Atlantic, mounted in the first half of 1998 making it the fifth worst year since 1950. In 1998, the industry's policyholder surplus rose only 7.5 percent, compared to a rise of 22.2 percent in 1997. The catastrophic losses totaled \$10 billion for the year, compared to only \$2.6 billion in 1997. The losses, combined with reduced investment yields and year-to-year capital gains, accounted for this decline. In 1999 the catastrophes did not let up; with tornadoes and other weather-related phenomenon, 1999 was predicted to be the second worst year since 1994 in terms of catastrophic losses.

Investment and the Economy. A second factor contributing to financial stress within the industry during the early 1990s was excess capital and comparatively poor investment opportunities in the sluggish economy. Property/casualty insurers began to rely increasingly on investment income to shore up their earnings in the 1980s. However, low interest rates and limited investment returns began to limit this source of revenue by the early 1990s. By liquidating \$9 billion in assets to realize capital gains, insurers were able to boost their income in 1992, but at the expense of weakening the economic strength of the industry.

A third problem for insurers in the early 1990s was the sluggish economy. The dollar amount of premiums written increased just 3 percent in 1992—well below the 6 percent growth rate which some analysts had predicted, but slightly greater than the growth in 1991. Stagnant growth in premium rates, partly because of regulatory rate suppression, compounded financial difficulties for insurers.

Insolvency. Besides catastrophes, a sluggish economy, and low interest rates, the property/casualty industry continued to suffer from a relatively high rate of company insolvency. Between 1984 and 1992, over 370 companies

failed, compared to a total of only 141 in the 15 years prior to 1984. Most of these insolvencies involved smaller companies. But despite the 1992 catastrophes, there were only nine insolvencies during the first half of 1993.

Although the root cause of many failures was mismanagement or fraud, a more aggressive regulatory environment resulted in a greater number of company failures than would have otherwise occurred. In addition, Hurricane Andrew alone was a major cause of at least nine of the failures. Some industry observers believe that the number of insolvent companies peaked in 1990 and may have been decreasing since that time. Nevertheless, insolvency has been a major contributing factor to the increase in federal and state industry regulation.

Democratic Michigan Representative John Dingell addressed the regulators' interests when he introduced a controversial bill in April 1992. The Dingell Bill was designed to enforce uniform capital requirements for insurers. Industry reactions were mixed, and many industry leaders opposed the bill. In response to federal regulatory attempts such as the Dingell Bill, the National Association of Insurance Commissioners (NAIC) tried to strengthen state requirements and avoid increased federal entanglement in the industry. Pressures to increase federal regulation mounted in 1992 when there were congressional efforts to reform the McCarran-Ferguson Act, which exempted insurers from Federal antitrust laws. Reform of this act would mean the loss of an important defense for insurers against federal involvement in the regulatory process.

Increased Competition. The second significant long-term challenge for industry participants in 1997 was increased competition. This challenge meant a reduction in the workforce and consolidation, by merger and acquisition, for many property/casualty companies. In 1997, the Providian Corporation announced that its shareholders approved the merger of the company's insurance operations with AEGON USA, a subsidiary of Netherlands based AEGON, NV, one of the largest listed insurance organizations worldwide.

Insurance giant Aetna sold its Casualty and Surety Company to the Travelers Group for \$4.1 billion in 1997, creating the largest writer of personal automobile insurance through the independent agency system. Sagging industry profits, foreign expansion into the United States, and market segmentation were a few of the factors driving this trend.

Limiting their participation in the industry to specific market segments in which they had developed expertise is one way companies sought to increase their chances of maintaining profitability in the 1990s. Companies wanting to compete effectively also were learning to become more efficient through automation and customer focus.

Many companies, especially smaller ones, were seeking to merge with other companies to strengthen their capital position. In addition, many companies were looking into ways to streamline operations and reduce the size of their workforce. Expansion into foreign markets offered another opportunity for property/casualty insurers to shore up profit margins. "Companies must downsize, consolidate divisions, reduce their employee base, and enhance their capital spending . . . to compete globally," according to Robert M. Demichele, president of the Reinsurance Corporation of New York, in *Best's Review, Property/Casualty Edition*. In June 1997, the American Insurance Association (AIA) urged Congress to support tax legislation that would help to make the U.S. property/casualty insurance industry more competitive in the global marketplace.

Mergers continued in 1999 as insurance companies looked to diversify and expand their offerings. In mid-1999 Allstate announced it would buy the personal lines from CAN, a transaction worth \$1.2 billion. In addition, The Hartford bought Omni to augment its product line and expand its non-standard auto operations.

CURRENT CONDITIONS

The fire, marine, and casualty insurance industry experienced its worst year in history in 2001, thanks to the sharp economic downturn and the September 11 terrorist attacks. For the first time ever, the industry posted a net loss, which totaled \$6.97 billion. Although net income had been declining steadily since the late 1990s, from \$36.53 billion in 1997 to \$20.75 billion in 2000, due at least in part to waning demand, the industry had never before experienced such a sharp downturn in a single year. The economic recession that had been plaguing U.S. insurers in the early 2000s had undercut investment income for property/casualty insurers. In 2001, investment income dropped 8.9 percent to \$37.1 billion. Costs related to the terrorist attacks caused the industry to experience an operating loss of \$25 billion, compared to a gain of \$9.9 billion in 2000.

Environmental liability continued to pose a potential major threat to profitability in the early 2000s as claims related to asbestos were on the rise. According to the July 2002 issue of *Claims*, "a surge in annual claim filings and the rescinding of previous settlement agreements between plaintiff attorneys and defendants has changed the asbestos litigation environment, increasing costs to defendants." Mold claims also increased in the early 2000s. Large environmental claims typically are made many years after the cause of the claim occurs, making it difficult for insurers to predict cleanup cost liability. One study estimates that cleaning up known hazardous waste sites could cost over \$750 billion over 30 years, excluding litigation costs which could double that figure. Be-

cause property/casualty insurers can potentially be stuck with the entire bill, many analysts believe firms need to consider building reserves of assets to address those future claims. Some have already done this; for example, Chubb Co. upped its reserves by \$700 million in 2002 to help offset increased asbestos claims.

INDUSTRY LEADERS

Of the top 10 companies writing 45 percent of the property/casualty industry's \$323.4 billion in premiums in 2001, the State Farm Group of Illinois was the largest as of 2001. State Farm services 65.8 million policies, employing 69,000 people and enlisting the services of 17,000 agents. One in five cars in America is insured by State Farm, which is the largest insurer of automobiles, homes, and pleasure boats. Premiums in 2001 totaled \$37.9 billion, compared to \$25.7 billion in premiums in 1998. Assets that year reached \$88.3 billion.

Allstate Insurance, also of Illinois, is the nation's largest publicly held property and casualty insurance company. It has over 14,000 agents and 20 million customers in the United States, Canada, and Japan. The company offered multiple lines of insurance and was started in 1931 by Sears, Roebuck & Company. The company had increased revenues for 1998—up 3.3 percent over 1997 to \$21.8 billion. Premiums in 2001 totaled nearly \$22 billion, and assets reached \$39.2 billion.

WORKFORCE

Even in companies that were not adding jobs, more opportunities were available through attrition and shifts in the workforce than were available in most other industries. With a strong economy and many companies showing increased sales and profits in the mid-to-late 1990s, the job market is strong. Opportunities existed in five functional areas, including sales, claims, underwriting, accounting/finance, and professional staff support positions.

The greatest number of jobs in existence in the insurance industry, by far, are sales positions, and this field is also the most accessible for people trying to enter the industry. Sales positions are available at the tens of thousands of local insurance offices scattered throughout the United States and Canada.

Although a career in sales involves more risk than many salary positions, it can be one of the most rewarding jobs in the industry, combining personal freedom with an income in excess of over \$100,000 per year. Success in the field typically requires an outgoing, entrepreneurial, and persistent personality. The profession can also be quite demanding, requiring 60 or more hours of time per week during the first few years of selling. Another significant drawback for property/casualty salespeople is industry cycles, which usually mean periods of low income.

A position in claims in the property/casualty industry involves assessing the dollar value of damage a policyholder has sustained and authorizing payment by the parent company. Claims adjusters combine knowledge with experience to judge how much damage the company will cover. In comparison to sales, claims positions are highly detailed-oriented and structured. Claims adjuster is a responsible position, which can lead to promotions within the company to a claims examiner, who handles complex claims, or a claims supervisor, who manages claims adjusters and examiners.

Underwriters are faced with the task of determining which applicants for insurance the company will reject or accept and how much coverage the applicant may receive. This assignment involves gathering information on applicants, reviewing associated risks, and applying underwriting standards to reach a decision. Underwriters specialize in either personal or business lines of property/casualty insurance, although most underwriters start out in personal lines. In 1994, underwriters held 96,000 jobs, with 38 percent in fire, marine, and casualty. The median earnings of full-time wage and salaried underwriters were about \$30,800.

Insurance accountants are typically charged with auditing functions, examination of policyholders' financial records as part of the underwriting process, or enforcing underwriting guidelines prescribed for underwriters by the parent company. Finance professionals, on the other hand, are usually more involved with financial and investment analysis, marketing research, and sales forecasting. Employers of both accounting/finance and underwriting professionals usually seek applicants with analytical backgrounds in economics or business administration.

Property/casualty insurers hire large support staffs to administer important functions that support the revenue producing activities within the company. These disciplines include actuaries, lawyers, marketers, and others. Actuaries use mathematics to determine insurance rates and policies and to establish pricing and investment guidelines, which will increase profits. The actuarial field involves complex mathematical modeling and most actuaries endure years of examinations before becoming fully designated within their profession. This occupation is also ranked among the highest in worker satisfaction and pay.

Insurance law provides excellent opportunities for attorneys, especially in the litigation arena. Because every insurance policy is a binding legal contract, attorneys receive more emphasis in the industry than they do in most other industries. Although salaries are typically below those found in the top law firms, they are similar to other corporate law positions. Other opportunities exist in public relations, customer service, and loss control. Loss control is a relatively new specialization which involves

finding ways to prevent injury, theft, and damage—mostly by educating policyholders.

AMERICA AND THE WORLD

The United States has the largest and most advanced insurance industry in the world. During 1992, over \$276 billion, or 43 percent, of the \$649 billion in non-life insurance premiums in the world were written in the United States. Europe followed closely with about \$237 billion, and Asia made up the third largest market at \$95 billion. The Latin American market lagged far behind at approximately \$7 billion in premiums. The United States leads the world market for non-life insurance, with 42.3 percent of the premiums. Next is Japan with 12.3 percent, followed by Germany with 9.5 percent and the United Kingdom with 5.8 percent. The size of the U.S. market is due primarily to health and casualty insurance, and private insurers rather than the public sector, provide most of the health insurance.

During the mid-1980s, the surge in multinational companies and international trade and investment encouraged the growth of many international insurance companies. Insurers, including property/casualty insurers, from the United States, Asia, and Europe expanded internationally through avenues such as branches, subsidiaries, and joint ventures. Although global expansion in the property/casualty markets slowed after 1988 as world markets recessed, it continues to offer opportunities for insurers.

From the viewpoint of United States insurers, global expansion has two sides—U.S. expansion and investment abroad and foreign expansion and investment in the United States. U.S. insurers are becoming increasingly active in foreign expansion either through cross-border trade, in which foreign customers are covered by a company in the United States, or subsidiaries, which are located in the country where the customer is located. Sales by U.S.-owned insurance companies in other countries topped \$36 billion in 1991, mostly from non-life insurance operations including income from investments. The majority of these sales occurred in Europe (\$11 billion).

Regulatory developments in the European Community (EC) have been directing its members to liberalize their markets for insurance and offered new opportunities for U.S. property/casualty insurers in the 1990s. These developments include countries that were opening their insurance markets to foreign investment for the first time, EC efforts to standardize accounting and reporting practices, and EC directives that made it easier for companies to transact business across country borders. Several EC countries, especially in Southern Europe, have opened this insurance sector to foreign investment.

New opportunities also existed in Latin America and Asia. Latin governments were deregulating the insurance

industry and allowing foreign investment for the first time. The North American Free Trade Agreement (NAFTA) has opened up the small Mexican property/casualty market, allowing U.S. insurers to operate equally with Mexican insurers. Asian countries offered an even larger potential for U.S. expansion abroad as incomes in this region continued to grow. Taiwan and Korea continued to be particularly attractive to U.S. insurers.

The newest opportunity exists in the People's Republic of China, where in 1995 a national insurance law was enacted. For 30 years after the founding of the present republic, the country had only one insurer, the state-owned People's Insurance Company of China. Few Chinese had insurance, but in an era of increasing opportunity and risk, more than 100 million took out property coverage in 1995. Competition is slowly growing, and foreign insurance firms are seeing a potentially lucrative market. Since 1992, China has only permitted two foreign firms, one of them the American International Group, licenses to sell insurance, first in Shanghai and more recently in Guangzhou. While it waited for a license, the U.S. firm Chubb Insurance committed \$1 million during the latter half of the 1990s to set up a school in Shanghai to train regulators and agents. China's entrance to the World Trade Organization at the turn of the century is expected to give U.S. firms further access to this growth market.

Foreign Involvement in the United States. Although opportunities existed for U.S. insurers abroad in the mid-1990s, many property/casualty insurers felt that significant barriers still existed for U.S. companies trying to compete overseas. Conversely, the American market was very open to foreign competition. An opportunity to create a more level playing field for the industry existed, however, under the Uruguay Round Group of Negotiations on Services under the General Agreement on Tariffs and Trade (GATT) during 1993. These rules could allow U.S. insurers to enter and operate in foreign markets on an equal basis with domestic insurers in the future.

Foreign insurance company investment in the U.S. market surpassed U.S. activity abroad during the 1980s. Foreign owned insurers had sales of \$72.9 billion in 1991, up sharply from \$62.6 billion in 1990, primarily due to foreign acquisitions. They captured more than 11 percent of the market in 1991 and sold non-life insurance policies worth more than \$39 billion. These companies expanded into the U.S. property/casualty industry by acquiring American companies, buying interests in U.S. companies, or by creating new subsidiaries in the United States.

U.S. insurers have become more active overseas in recent years, with sales of \$36.2 billion in 1991. The key markets for U.S. insurers are Canada, Europe, and Japan,

primarily in non-life operations. Cross-border trade in insurance is a small but important part of the U.S. insurance market. U.S. based insurers received more than \$5.5 billion of premiums from overseas in 1992, and premiums of \$11.9 billion went to foreign-based insurers to cover risks in the United States. Most premiums sent abroad went to Europe or the offshore centers like Bermuda for reinsurance. Reinsurance premiums sent abroad represented about one-third of the reinsurance market in the United States. Foreign-owned insurers from all lines in the United States had sales of \$72.9 billion in 1991.

The most significant investments included Germany's Allianz Holding Company's acquisition of Fireman's Fund Insurance Companies in 1991 and BAT Industries (UK) acquisition of Farmers Insurance Group in 1988. These two deals amounted to over \$5 billion of foreign investment. In addition to a share of the U.S. insurance market, foreign investors have benefited from access to superior technology related to automation, claims adjusting, risk management, actuarial methods, investment practices, and information technology. In 1997, AEGON NV of The Netherlands acquired the insurance section of the Providian Corporation.

RESEARCH AND TECHNOLOGY

Companies in the property/casualty industry have been slower than their U.S. counterparts to integrate advanced research and technology into their operations. However, two of the most important keys to success in the industry during the 1990s were increased use of market research and customer focus, along with integration of advanced automation technologies that can reduce costs and improve service.

In the late 1990s, insurers were striving to become more customer focused in response to the increasingly competitive property/casualty environment. Part of this strategy included finding out exactly what the customer needs and fulfilling that need, often with very niche-oriented insurance products. Insurers were continuing to increase their efforts in the research and development of new and more specialized insurance products that could be offered at competitive prices. The purpose of these new products was to either bring new customers into the market or to cause customers already in the industry to switch from competitors' products.

Even more important than new product development and research, however, was the implementation of automation technologies, which will improve customer service, reduce errors, improve delivery time, and reduce human intervention in the entire insurance process. Insurers that had already implemented computerized automation were enjoying increased speed of new product delivery to the market, as well as reduced personnel expenses.

Examples of new technology, which property/casualty insurers were integrating into the industry in the late 1990s, included open-systems architecture computer systems, network computing, computer-aided software-engineering tools, multi-media training tools, and information management and delivery systems that use satellites. Industry regulators were also using this new technology to identify potentially insolvent insurers. Several companies have realized significant cost reductions and improved customer service through comprehensive automation programs.

SIC 6351

SURETY INSURANCE

This classification provides coverage of establishments primarily engaged in underwriting financial responsibility insurance.

NAICS CODE(S)

524126 (Direct property and Casualty Insurance Carriers)

524130 (Reinsurance Carriers)

INDUSTRY SNAPSHOT

Surety insurance, sold in the form of a surety bond, is a tool used to guarantee the performance by one party of an obligation to another. It differs from other types of

insurance in several ways — including the number of parties involved, the way companies determine premium rates, and in the way that the burden of risk is apportioned. The most common type of surety insurance is construction bonding, which insures that contractors will be able to complete a construction contract and pay their suppliers and subcontractors. Other common types of surety insurance include bonding of employees (fidelity insurance), license and permit bonds, and court bonds.

ORGANIZATION AND STRUCTURE

Surety insurance can cover almost any contractual agreement, whether the contract is written or implied. Although it is often classified as a line of property/casualty insurance, surety is similar to other types of insurance only in that it is a form of risk management. Because it is different in other ways, surety bonding is usually offered through a separate division or department within an insurance company and is governed under a different set of laws from other insurance lines.

Surety insurance involves three parties: the principal, the obligee, and the surety (insurer). The principal is the party who agrees to perform an obligation. For example, a builder may contract to construct a building. The obligee expects the principal to fulfill a contract. In the example above, the obligee would be the party with which the builder agreed to construct the house. The surety, then, is the party which guarantees that either the principal will perform adequately or the obligee will be compensated for the principal’s failure. For instance, if the principal finished building only part of the house and then quit, the surety might compensate the obligee for any losses incurred in getting another builder to finish the home. In the example, and in most cases, the surety is not necessarily responsible for fulfilling the broken contract, but only for the obligee’s losses related to completion of the contract. For this reason, surety insurers do not necessarily cover risks associated with devastating losses, but only with varying degrees of default risk.

Another major difference from other types of insurance is that surety insurers look to the insured party for repayment of losses it incurs. In the example, the surety would be entitled to recover its losses from the principal, unless the principal was insolvent. For this reason, the risk associated with writing bonds has traditionally been very low. In fact, theoretically the surety anticipates no losses if the underwriter has used the necessary information about the principal required to determine whether or not to write the bond.

Surety insurance also differs from other insurance lines in the methods insurers use to determine premium rates. Because the risk to the surety is usually very low, premium rates for surety bonds are primarily service fees and are less influenced by the risk of loss. Fidelity insur-

ance, which covers a company against losses caused by dishonest performance by its employees, is a major branch of the surety industry. By the mid 1990s, fidelity bonds constituted about 31 percent of all direct surety premiums written.

Company Structure. The surety market is divided into the standard market and the specialty market, each of which is served by different types of surety companies. The standard market represents the more traditional approach to surety bonding and is served primarily by large national agency companies. These companies tend only to underwrite clients which have a very sound financial history and represent little risk of insolvency or contract default. In addition, many national agency companies only underwrite contracts which assure \$25,000 to \$50,000 in gross premiums per year. In 1995, national agency companies wrote nearly 60 percent of all surety premiums, with about 30 percent written by regional companies and 11 percent by direct writers. Of these premiums, the 20 leading surety writers accounted for \$1.87 billion in premiums—69.1 percent of the \$2.71 billion surety market. National agency companies wrote 68 percent of all fidelity premiums in 1995, with 10 percent written by regional companies and 22 percent by direct writers. The top 20 fidelity writers accounted for \$843.6 million in premiums written, or 91 percent of the \$927.5 million fidelity market.

The specialty market, on the other hand, is served primarily by regional agency companies. These companies are less strict in their underwriting requirements and will generally bond contractors that the standard market may have rejected. Regional companies are able to serve these clients because they require collateral of 20 percent to 30 percent of the bond obligation for each contract they insure. In addition, regional companies are more likely, and able, to vigorously pursue recovery from their clients in the event of default.

The biggest expense for surety underwriters involves qualifying applicants, not providing loss compensation. Surety writers do not expect losses, and they focus their efforts on screening out risky applicants. Premium rates reflect the cost of providing a credit-based guarantee rather than loss compensation. In the mid 1990s, surety writers showed an improved operating ratio, indicating they were controlling costs such as commission and brokerage expenses and other underwriting expenses associated with screening applicants.

Market share in the surety industry is split between national agency, multi-line companies, which serve the standard surety market, and regional agency companies, which serve the specialty market. In 1995, national agency companies wrote nearly 60 percent of all surety premiums and 68 percent of all fidelity premiums. Re-

gional companies wrote about 30 percent of surety premiums and 10 percent of fidelity premiums, and direct writers wrote 11 percent of surety premiums and 22 percent of fidelity premiums. Of the surety premiums, the 20 leading surety writers accounted for 69.1 percent of the surety market. The top 20 fidelity writers accounted for 91 percent of the fidelity market.

Major Products. Surety products can be separated into two categories: those that are easy to obtain, and those that are more difficult. Bonds that are relatively easy to obtain typically involve small amounts of money or present a low level of risk to the surety. Bonds in this category include license and permit bonds, which protect city or state governments against claims that arise because of a license which the government body issued to some party. Court fiduciary bonds, which bond a person named to handle money for an estate, and judicial bonds, which ensure that a plaintiff will pay damages to a wrongly charged defendant, also fall into this category. Public official bonds, which bond officials against losses resulting from their failure to conduct their duties within the confines of the law, are also easy to obtain. Bonds that are difficult to obtain include construction-related bonds such as performance, payment, and bid bonds.

Legislation. Surety companies benefit from state and federal legislation that requires bonding of various types of contracts. These laws require, for instance, that employers who self-insure employee benefits are bonded. Similarly, many states require automobile owners who have been in an accident to post a bond of financial responsibility before they allow them to operate their vehicles again. One of the most prominent pieces of legislation in this regard is the 1935 Federal Miller Act, which requires prime contractors in the United States to provide a performance bond for any construction contract which exceeds a certain amount. In 1992, this amount was \$25,000 in total construction costs.

BACKGROUND AND DEVELOPMENT

Although the concept of suretyship dates back more than 2,000 years to ancient Babylon, the commercial surety industry in the United States did not begin until 1884 with the incorporation of the American Surety Corporation of New York. Since that time, the industry has grown steadily and, until recently, has had comparatively high profitability. The industry realized its greatest growth and profitability during the rapid national expansion that occurred between the end of World War II and the early 1970s. During this time, the construction industry was not very competitive, a booming economy created demand for all lines of bonds, and profit margins were high. During the past 20 years, however, increased competition, as well as an overall decrease in demand for construction, has reduced profit margins for insurers and

increased the risk of default and insolvency for those insured or bonded. Surety and fidelity underwriters showed profitable underwriting results in the late 1980s and 1990s, with surety lines being profitable from 1989 through 1995 and fidelity lines being profitable from 1986 through 1995. Surety premiums written increased steadily from 1987 through 1994. Premiums written for fidelity bonds, after double-digit increases from 1985 through 1987, declined from 1988 through 1992, then began increasing slightly from 1992 through 1995.

There were \$2.8 billion in direct premiums written for surety and fidelity bonds in 1995, with \$2.71 billion for surety bonds and \$927.5 million for fidelity lines. For surety lines, that represented the third straight 9 percent or better annual increase, while fidelity lines posted a 2.1 percent increase in net premiums written. Surety and fidelity underwriters showed profitable results in the late 1980s and 1990s. In 1995, surety underwriting profits nearly doubled to \$276.9 million, while fidelity underwriting profits were flat — up only 1.9 percent to \$232.9 million. By comparison, most other lines in the property and casualty insurance industry experienced underwriting losses from 1979 through 1995. In 1995, the overall property/casualty industry posted underwriting losses of \$18.1 billion.

Although distinctly different, the surety industry is considered a small part of the overall property and casualty insurance industry. In 1995, surety and fidelity insurance accounted for about \$2.8 billion in premiums written — a small amount compared to the \$250.7 billion in net premiums written by property and casualty insurers in 1994. Surety and fidelity underwriters showed profitable results in the late 1980s and 1990s. In 1995, surety underwriting profits nearly doubled to \$276.9 million, while fidelity underwriting results were flat, up only 1.9 percent to \$232.9 million. In terms of premiums written, surety bonds recorded a 9 percent annual increase from 1993-95. Premiums written for fidelity bonds decreased steadily from 1988-92, then began showing small percentage gains through 1995.

CURRENT CONDITIONS

In some ways, the surety insurance industry works opposite to the rest of the insurance industry, thus acting as a counterbalance for integrated companies. For example, the overall industry chalked up 1997 as a banner year, in part due to the mild weather attributed to the influence of El Nino, which resulted in low catastrophe losses for the insurance industry. By comparison, 1998 represented a worse year, with more catastrophic weather requiring more insurance-financed construction. The surety industry experienced 1997 and 1998 conversely: the mild weather of 1997 meant less catastrophe-based construction, hence less surety bonds; on the other hand, the more catastrophic

weather of 1998 created more construction work requiring more surety bonds, thus bolstering the surety industry.

Since a large part of surety and fidelity insurance is related to the construction industry, the industry tends to follow the cycles of the overall economy. The industry has been helped by good economic conditions in the 1990s, including low interest rates, low inflation, and stable oil prices. Other factors influencing the industry's performance include federal initiatives to build infrastructure and natural disasters that increase demand for construction bonds.

Legislation passed by Congress in 1991 was expected to expand the role of surety insurers in the cleanup of environmental waste sites. The laws free sureties from liabilities for tort claims related to default by bonded contractors. This could be an important development for sureties during the next few decades and beyond because of the potential for increased environmental cleanup costs and the billions of government dollars already earmarked for the Superfund cleanup. On the other hand, legislation that could raise the minimum cost for federal construction contracts, which must be bonded from the current level of \$25,000 to \$100,000, could hurt the industry. This legislation would allow contractors to bid on and complete smaller construction jobs without having to buy a bond under the Federal Miller Act.

In reality, the Superfund did not produce the kinds of results expected because its funding got bogged down in Congressional debate. Only one-third of the sites covered by the Superfund were cleaned up as of 1998. However, that year Congress tried to jump-start the Superfund by allocating \$650 million of expedited funds.

INDUSTRY LEADERS

Of the companies which primarily provide surety insurance, the industry leaders include Travelers Surety and Casualty Co. of Hartford, Connecticut, whose 200,000 employees generated \$27 billion in sales for 1998. MBIA of Armonk, New York, with 46 workers, a mere fraction of Travelers', created more than \$12 billion in sales for the same fiscal year. In comparison, MBIA's sales represented \$268 million per employee, while Travelers generated only \$135,000 per employee. AMBAC Financial Group Inc. of New York City garnered more than \$11 billion in sales for the same fiscal year on the work of 340 employees, each of whom generated almost \$33 million. Although many surety companies began by providing only surety or fidelity insurance, many of the companies in this industry now provide multiple lines of insurance.

WORKFORCE

The entire property and casualty insurance industry employed about 616,000 people in 1994, while non-

property/casualty insurers employed about 935,000 people. Of the approximately 6,000 insurance companies in the United States, about 3,300 sell some form of property and casualty insurance. Many of the property/casualty companies offer multiple lines of insurance, including surety insurance. However, about 900 national property/casualty companies account for most of the sales. Surety insurance accounted for approximately 1.1 percent of property/casualty sales in 1995 and accounted for a similar proportion of the jobs within the industry.

Job opportunities in the surety industry mimic those available in the larger property/casualty insurance industry. Positions in the surety industry, as in the property and casualty industry, are available in sales, underwriting and accounting, legal, and staff support.

Job opportunities also exist at regional agency companies, most of which do not provide other lines of insurance. Because these regional companies emphasize collateralized contracts and tend to vigorously pursue losses from bonded clients that default, positions with these companies require fewer credit and underwriting skills and more legal knowledge related to subrogation.

AMERICA AND THE WORLD

Although it had a late start, the surety industry in the United States is the largest and most sophisticated in the world. However, its organization and structure closely parallels the surety industry of Great Britain, after which it was modeled. While the fire, marine, and casualty insurance industry in the United States experienced an influx of foreign investment and participation during the 1980s, the surety industry remained relatively local. This is due in part to the advantage which regional companies have when pursuing losses in court from clients that default on bonds.

Another factor responsible for a lack of cross-border activity within the industry is the nature of surety insurance compared to other lines of insurance. Surety bonding more closely resembles a fee-based service than it does typical insurance underwriting. Therefore, the investment advantages gained through foreign ventures are diminished.

RESEARCH AND TECHNOLOGY

Because its basic function has changed little since its inception in 1884, the U.S. surety industry has been slow to realize the advantages of efficiency available through increased automation. The industry is just beginning to implement automated systems to ease workload. The types of automation include computer networking, information delivery and management systems, and multimedia training tools. Automation is especially important as the industry continues to become more price competitive.

Another important technical development for surety insurers in the early 1990s was a corporate interest in the use of surety bonds as a tool to obtain low-cost financing. Firms with strong credit ratings found that they could issue debt using company assets as collateral and then obtain surety bonds that guaranteed payment of the debt. By doing this, the firm which bought the bond could eliminate the risk of company insolvency related to the insured debt. This technique allowed companies to obtain low-cost financing during the credit crunch of the early 1990s. It also provides a potential new market for sureties throughout the 1990s.

SIC 6361

TITLE INSURANCE

This classification covers establishments primarily engaged in underwriting insurance to protect the owner of real estate, or lenders of money thereon, against loss sustained by reason of any defect of title.

NAICS CODE(S)

524127 (Direct Title Insurance Carriers)

524130 (Reinsurance Carriers)

Typical title defects result from liens and encumbrances on a property related to unpaid taxes, land use

and zoning restrictions, unsettled contractor disputes for work done on the property, and unrecorded deeds. Title insurance also protects the buyer and lender from fraud perpetrated by the seller.

Title insurers must carefully analyze government records and legal documents to determine the risk of defects for a title on a given parcel of property. The insurer must then underwrite an insurance policy for the buyer that reflects the character of the property title under consideration. Although title searches and warranty deeds have been used to assure title validity in the past, title insurance grew in popularity during the 1980s and early 1990s because it was the most absolute form of protection.

The 1990s were a turbulent period for the industry, which experienced one of its worst years in 1991, when operating losses exceeded \$190 million. Business stabilized in 1992 as demand for title insurance increased and many companies reported operating profits for the first time in many years. A large drop, however, in the number of refinancings in 1994, due to higher interest rates, placed more financial pressure on companies that carried over into 1995. Large companies such as Chicago Title and Trust Co. and Lawyers Title Insurance Corp. tried to reverse their decline in profits by instituting staff cut-backs and salary reductions.

To combat downward pressure on profits, title insurance companies tried to increase efficiency by automating, laying off employees, improving services, and increasing lines and regions of service through mergers and acquisitions of smaller companies. In addition, many companies were able to find work in the foreclosure industry, serving law firms and banks, and by offering new real estate services (e.g., loan servicing and appraisals). By the late 1990s the industry had ridden out the serious financial hardship that occurred because of problems and rapid fluctuations in the real estate resale and new construction market.

Between 1986 and 1999 the number of companies providing title insurance in the United States fell from 85 to fewer than 70, and the market became increasingly controlled by several large companies. During this time a number of title companies failed; many of the companies that were left merged so as to pool resources and capital. In late 1999, Fidelity National Finance announced the purchase of number-one-ranked Chicago Title Corp. in a \$1.2 billion merger. With combined 1998 revenues of \$3.4 billion, this merger created the largest title insurance company in the United States.

The industry was using new developments in computer technology to aid in the underwriting process. Several companies were leading the way with artificial intelligence systems designed to predict the likelihood of

default by a mortgage borrower and other automated services. PMI Mortgage Insurance Co. instituted an advanced system employing statistical predictive models to aid in the underwriting process. United Guaranty Residential Insurance Co. collaborated with IBM Corp. to develop an expert system that could render underwriting decisions in less than 10 seconds, and Stewart Title began a similar electronic document preparation service as well as a flood determination company.

Despite their use of computer technology, the title insurance industry was finding it much more difficult to streamline the records search process using computers and automation. Except for major metropolitan areas, most county governments charged with collecting title records were still maintaining them just as they did 100 years ago, according to Chicago Title. Although checking the ownership of a parcel of land was a straightforward process, in order to ensure the validity of title for a buyer, title insurance companies had to also track prior owners of the land and determine if the land had any easements, liens, or other encumbrances. Title insurance companies were limited in that they could be only as efficient as the county in which the records were kept. For most counties, there was only a limited amount of information maintained in a computerized database, and this information was typically indexed in only one way, usually either by seller or buyer. Rarely were property records indexed by legal description, address, or type of document. This significantly hampered the investigation required to underwrite a policy of title insurance.

SIC 6371

PENSION, HEALTH, AND WELFARE FUNDS

Establishments primarily engaged in managing retirement, health, and welfare funds comprise what is commonly called the pension fund industry. Companies owning pension funds are called fund sponsors. Sponsors maintain funds for the purpose of meeting future obligations, such as benefit payments to retired employees. Some sponsors manage their own funds, or reserves, while others hire fund managers or consultants to conduct their investment activities.

NAICS CODE(S)

523920 (Portfolio Management)

524292 (Third Party Administration for Insurance and Pension Funds)

525110 (Pension Funds)

525120 (Health and Welfare Funds)

INDUSTRY SNAPSHOT

Total pension fund assets in the United States amounted to \$6.79 trillion in 2000, down from \$6.85 trillion in 1999. In the late 1990s, the industry was characterized by the scramble for increasingly diversified investment strategies, as fund managers attempted to safeguard long-term stability while registering strong short-term yields in the surging U.S. financial markets. Private funds, which had grown to account for 71.5 percent of all pension fund assets in 1998, accounted for only 66 percent of assets by the end of 2000. The growth of private funds had been attributable to a number of factors, including uncertainty regarding the future of the public pension system, a relaxed regulatory environment in the financial sector, and the strong economy. However, the economic downturn in the early 2000s caused some consumers to shy away from the private fund market.

According to the Federal Reserve Board’s *Flow of Funds Accounts of the United States*, roughly 31 percent of all U.S. household assets were held in pension funds in 2002, continuing a long trend; the figure stood at 29.1 percent in 1998 and 23.3 percent in 1990. Pension funds held \$2.1 trillion in corporate equities in 2000. Pension

funds are expected to grow at an increasing rate in the early 2000s as the baby-boomer population ages.

ORGANIZATION AND STRUCTURE

Pension funds are essentially vehicles by which workers can save income generated during their productive years to help them maintain a reasonable living standard when they retire. More than 80 percent of employers offer some type of savings plan that will provide pension or retirement benefits to at least some of their employees. In addition, workers can invest in pension vehicles such as life insurance or various tax-deferred annuities that act as funds.

Pension funds operate under the assumption that money, which the employer or employee places into the fund, will earn interest income at a rate greater than inflation. The more interest and savings that accrue over a period of time, the more money will be available to provide benefits for the employee at retirement. Pension funds are generally favored over most other long-term savings plans because they benefit from a favorable tax status. These tax laws allow employees to defer taxes on both their savings and the interest income that those savings produce.

Government Agencies. Federal, state, county, and municipal governments all provide pension plans for their employees. Publicly owned corporations, such as the Tennessee Valley Authority, also fall into this category. In addition, the federally funded Old Age Survivors’ Insurance (OASI) fund is included in this group. These public funds constitute approximately 29 percent of all pension assets. OASI is the largest, by number of members, of all government pension funds. This national program of social insurance is designed to cover all persons employed in the United States with the exception of clergy, some state employees, and most federal workers. Unlike national insurance programs in other countries, OASI entitlements are not based on need but rather on previous individual contributions. In 1999 more than 175 million Americans were covered under OASI and the fund maintained about \$350 billion in assets.

Most federal employees who are not covered by OASI are included in the Civil Service Retirement System (CSRS) or Federal Employees Retirement System pension funds, which provide retirement, survivorship, and disability benefits to career employees of the federal government. Participation in these plans is compulsory. In 1999 these plans covered a combined five million workers and maintained approximately \$430 billion in assets.

State and local pension funds, which cover public employees, together covered an estimated 18 million employees in 1998, with assets of \$2.34 trillion.

Private Plans. Private plans that employ fund managers exist in both the nonprofit and commercial sectors. These funds (exclusive of funds managed by insurance companies) accounted for approximately 71.5 percent of all pension assets. Organizations in the nonprofit sector include churches and service associations, while commercial entities include for-profit establishments. Together, these pension funds accounted for about \$5.7 trillion in assets in 1998. Funds sponsored by insurance companies include persons covered by Keough or other self-employment plans, Individual Retirement Accounts (IRAs), and various tax sheltered annuity savings plans. Pension assets sponsored by insurance companies amounted to \$1.4 trillion, or 17.5 percent of all pension assets, in 1998.

Pension funds in the private sector, as well as some funds in the public sector, can be classified as either “defined benefit” or “defined contribution” plans. Defined benefit plans, once the most popular type, promise annuities—beginning at retirement—that are usually based on the worker’s years of service and average wage during the last few years of employment. With a defined contribution plan, firms effectively contribute to an employee’s savings account. The accumulated tax-preferred savings belong to the worker, who usually receives a lump sum at retirement. In 1998, private defined benefit plans carried about \$2.1 trillion in assets, with 62 percent invested in equities; while defined contribution plans held about \$2.2 billion, with 69 percent in equities.

In order to receive tax-preferred status for their private pension funds, managers must comply with Internal Revenue Service (IRS) regulations and guidelines. The Federal Employee Retirement Security Act (ERISA) of 1974 is the principal legislative tool used to govern pension funds. It imposes minimum funding requirements, primary fiduciary responsibilities, and disclosure criteria. For instance, a fund manager must show that its reserves cannot be diverted prior to the satisfaction of all liabilities and that it will not discriminate in favor of its more highly paid employees. Details about the fund must also be made known to employees or members.

An important element of the private pension fund market is the Pension Benefit Guaranty Corporation (PBGC). This government agency insured the pensions of 42 million Americans in about 44,000 defined benefit pension plans during 1999. If a company defaults on its retirement benefit obligations to its members or their dependents, the PBGC assumes liability.

Fund Management Structure. Pension fund management entails two basic activities: serving members or employees covered by the plan and directing investment and management of asset reserves. The fundamental provisions of any pension plan sets forth rules of eligibility, conditions for the receipt of pensions, a pension benefit

formula, and a source of contributions. Companies that sponsor funds usually place control of the funds with a corporate trustee. Trustees, or custodians, oversee the funds to ensure that they comply with federal regulations. Trustees also supervise investment decisions made by fund managers.

While many fund sponsors hire outside consulting and investment firms to assist with investment of their pension reserves, most also have fund managers in-house, or within their organization. The fund manager may, in turn, hire several other managers or consultants who specialize in various investment activities. Administration activities, such as handling fund members’ needs and delivering payment services, are often handled separately by the fund sponsor.

A pension fund manager is charged with three basic duties: developing a financial profile of the fund, developing investment policies, and formalizing an investment program. The financial profile essentially describes the plan’s funding structure. The funding structure consists of existing assets such as cash and investments, obligations for currently retired employees, obligations for future retirees, and expected future contributions by both employees and the fund sponsor. The plan’s funding structure is influenced by several factors, including the growth stage of the company, estimates for future employee and profit growth, expected future investment returns, and future tax rates.

When developing investment policies, managers must adopt return objectives, risk constraints, and asset diversification requirements. These components, when properly synthesized, serve to minimize the risk of investment losses and ensure that the minimum return necessary to meet future obligations is realized.

Finally, the formalization of the investment program requires selection of an investment committee to review strategy; definition of an asset allocation plan; creation of a detailed investment portfolio strategy; and the determination of an effective means of monitoring, evaluating, and reporting investment results. For example, the manager must determine the proportion of assets that are placed into stocks, bonds, real estate, international assets, or other investment vehicles. A common method that fund managers use to gauge the performance of their funds is comparison with standard indexes. Market indexes, such as the Standard & Poor’s 500 stock index, serve as benchmarks to judge the effectiveness of the manager’s strategy.

Financial Structure. Although thousands of pension plans served both the public and private sectors in 1998, the control of assets was steadily gravitating toward the largest funds. The top 200 funds maintained assets of \$3.7 trillion that year, amounting to 38 percent of all

pension-fund assets. The top 100, moreover, controlled \$3.1 trillion, up from a mere \$270 billion in 1979.

BACKGROUND AND DEVELOPMENT

Pensions for military personnel have existed for centuries. The pilgrims of Plymouth Colony enacted a crude pension system for their soldiers in 1636. The first pension law in the United States, however, was implemented in 1789 and promised benefits to those who enlisted in the colonial army.

The concept of providing pensions for retired employees did not begin until the nineteenth century in Europe and did not significantly spread to the United States until the early twentieth century. One of these first pension plans set up a fund for teachers in New Jersey in 1896. Similar plans soon followed. One of the first federal pension funds was the Federal Civil Service Retirement and Disability Fund, established in 1920. Public plans that followed set up funds to benefit retiring policemen, firemen, and congressmen.

Just as it helped to establish public pension plans, legislation has been a great impetus for the advancement of the private pension industry. The Revenue Act of 1921 provided the first major private pension catalyst. This act laid the foundation for the basic tax rules governing private pensions in the 1990s. It allowed pension contributions to be deducted from the firm's taxable income, permitted tax-free accumulations within pension funds, and allowed deferral of personal income taxation on pensions until retirement.

The pension movement gained additional strength during World War II, when government wage and salary restrictions caused workers to seek more fringe benefits. A few years later, in 1949, pensions were classified by the court as acceptable tools for union bargaining. This development vastly increased the number of U.S. laborers in pension plans.

Growth of Pension Funds. Despite their origins in the first half of the twentieth century, private and public pension funding did not realize widespread popularity until the 1950s. Prior to 1950, pension plans were largely viewed as a discretionary benefit offered by an employer as a token of appreciation for a worker's efforts. After that time, however, several factors began to reshape society's views toward pensions. Companies began to use pensions as a form of compensation because of the tax advantages associated with them. In addition, an aging population was seeking ways to ensure a stable future.

In 1974 the Employee Retirement Income Security Act allowed for substantially greater diversification of pension fund investments. The act stressed that investments need not be examined individually by regulators, but in the context of an entire portfolio, thus granting

much greater leverage to and placing more emphasis on fund managers.

Between 1950 and the end of the century, the number of people covered by Social Security insurance alone increased from 23 million to more than 175 million. Fund assets for all pension plan types during this period swelled from about \$31 billion to \$8.01 trillion in 1998. During the 1980s alone, pension-fund assets grew by more than 300 percent. The bull market of the mid- and late 1990s also boosted pension-fund assets.

Aside from changing public attitudes and legislation, an aging population is a root cause of the growth in pension fund assets. The percentage of the U.S. population over 65 years of age more than doubled between 1920 and 1980 to about 12 percent. The fantastic growth in the number and percentage of aged persons in the United States reflects birthrate declines, an increase in life expectancies, and the curtailment of immigration.

The 1980s. Pension fund management during the 1980s was affected by several trends and developments that continued to shape the industry in the early 1990s. Two of the most significant trends included an increase in popularity of defined contribution plans in comparison to traditionally popular defined benefit plans, and stricter regulations regarding fund reserves.

The increase in the popularity of defined contribution plans in the private pension market resulted in part from the economic boom of the 1980s, as well as the more appropriate benefit structure of contribution plans in the new business environment. Defined contribution plans also benefited from a comparatively liberal set of regulations and tax laws. As a result, they provided a higher rate of return than defined benefit plans.

Besides increased investment returns, one reason for the popularity of defined contribution plans during the 1980s was that employees had a better feel for exactly what they were getting back from their investment. Workers also felt as if they had more investment control than defined benefit plans offered. Contribution plans were also viewed as more mobile—an important consideration for people who expected to change employers.

Many employers also preferred defined contribution plans because they were easier and less expensive for the company to maintain than traditional defined benefit plans. In addition, employers were able to shift more administrative costs to their employees.

Rapid growth in defined contribution plans began to wane slightly in the late 1980s as the economy slowed and new regulations diminished their benefits. Nevertheless, total investment in contribution plans by fund sponsors exceeded assets in defined benefit plans in the mid-1990s.

A second development that fund managers encountered in the 1980s was stricter federal reserving requirements for their funds. Regulators began to question whether many private pension funds had adequate reserves to meet their future obligations. Amplifying their concerns were company failures in the late 1980s, which placed stress upon PBGC reserves. Furthermore, the stock market crash of 1987 reduced the value of many pension funds. The failures of Pan Am and Eastern Air Lines alone cost the PBGC \$1.6 billion. As a result, several regulations and initiatives were enacted that affected pension funds.

Three efforts, in particular, served to change the industry. The Omnibus Reconciliation Act (OBRA) of 1987 and Financial Accounting Standard (FAS) No. 87 both served to enforce adequate reserves in pension funds. In addition, the Tax Reform Act of 1986 effected changes reducing some of the employer and employee gains derived from both defined contribution and defined benefit plans.

Besides increasing their use of defined contribution plans and having to adapt to new regulations, fund managers also started becoming actively involved in the management of the companies in which they invested. As some pension fund managers became concerned about what they felt were unsound business practices, they began to put pressure on the companies in which they owned significant shares to improve their operations. Typical suggestions for improvements related to better boardroom practices. The California Public Employees' Retirement System (CALPERS), for example, began targeting 12 companies each year for improvements. In 1992, CALPERS published the names of some companies that refused to meet with its representatives regarding changes; the companies subsequently agreed to meet with fund managers. Other trends in the pension fund industry that accelerated in the 1980s included activity by fund managers in alternative investments and foreign assets.

In contrast to solid investment returns realized by fund managers during most of the 1980s, investment performance diminished in the late 1980s and early 1990s as the U.S. economy stagnated. Regulators became concerned that many pension plans were underfunded and might not be able to meet their future obligations. Therefore, legislation was enacted to help ensure the financial stability of private funds. Meanwhile, the future success of the federal social insurance pension fund remained doubtful.

The 1990s. Going into the 1990s, pension fund sponsors and managers were struggling to overcome the stagnating effects of low interest rates combined with lackluster returns on their investment portfolios. They were also striving to improve the ratio of assets to liabilities in their funds in the face of a sluggish world economy. Many of

them were also grappling with increased fund liabilities brought about by premature employee layoffs from downsizing. General Dynamics Corp., for instance, reduced its workforce by almost 67 percent in two years, requiring it to raise at least \$1 billion in payments to companies that purchased some of its divisions. As another example, Texas Utilities Co.'s fund assets plummeted 50 percent, to \$785 million, as its workforce shrank 30 percent and assets were consumed to meet unexpected benefit obligations.

The pension fund industry in the mid-1990s also prepared to manage a rapid influx of capital during the coming decade, a result of aging baby-boomers saving for their retirement. Hotly contested political debates over the future of the Social Security System also portended strong growth in private pension funds. With the help of the bull market in stocks, pension funds enjoyed strong asset growth in the mid-1990s. Assets allocated to foreign investment, real estate equity investments, and alternative investments showed significant growth, while popular alternative investments included private equity and buyouts, venture capital investments, private debt, and non-investment grade bonds. In foreign investments, allocations remained far larger in foreign equities than in foreign bonds.

New legislation promised to change the face of the pension fund industry as the Democratic Clinton administration took office in 1993. By the end of his first term, Clinton had proposed or signed into law more legislation and pushed for more regulatory changes than any administration since the passage of the Employee Retirement Income Security Act of 1974 (ERISA).

Two major pieces of legislation affecting pension plans were the Retirement Protection Act of 1994 (RPA) and the Small Business Job Protection Act of 1996 (SBJPA). The RPA resulted in several new regulations for pension plans covering areas such as minimum funding requirements, liquidity, payouts, and reporting requirements. The SBJPA contained provisions revising the Internal Revenue Code and ERISA that were billed as "pension simplification." These provisions included new tax rules covering individuals, retirement plan distribution rules, and a new tax-favored retirement plan for small businesses called the Savings Incentive Match Plan for Employees (SIMPLE). It was expected that the SIMPLE plan would replace the current SAR/SEP plan being used by small businesses by the end of 1997.

Among the major policy changes embedded in these pieces of legislation was the reduction of the salary cap used for calculating pension benefits. By reducing the salary limitation from \$225,000 to \$150,000, the new law had the effect of reducing the maximum pension benefits for high-paid executives. Another major change concerning Individual Retirement Accounts (IRAs) allowed non-

working spouses to receive favorable tax treatment for contributions of up to \$2,000.

Pension plan sponsors may choose to manage their assets internally or use outside money management services. In 1995, internally managed equity assets surpassed internally managed fixed income investments for defined benefit plans. In 1996, that was reversed, with internally managed bond portfolios surpassing those of stocks. Among the top 200 pension funds, \$1 trillion in assets invested in defined benefit plans were managed internally in 1998; for defined contribution plans, of course, the figure was much lower, at only \$103 billion.

Several factors were at play affecting the choice of internal versus external management. It was generally recognized that it was cheaper to purchase investment services externally than internally. Some funds experienced trouble retaining good money managers, who could find higher salaries at money management firms. Some funds have grown so large that they began to feel it would be more effective to have their funds managed externally. One factor working in favor of internal management was the trend among larger plan sponsors to index their core equity assets rather than have them actively managed.

An estimated 18 percent of private pensions were underfunded in 1999, down from 55 percent in 1980. Moreover, the majority of those pension funds considered fundamentally sound were particularly well insulated to weather potential minor stock-market plunges. Analysts surmised that it would require about a 30 percent decline in the stock market before surplus assets would be depleted among the healthy funds, a cushion that was markedly thicker among the largest funds. As a result, fund managers were likely to see their contributions and expenses decline well into the 2000s. Contributions by the top 200 funds totaled \$38.1 billion in 1999, down from \$44.1 billion in 1997. Meanwhile, assets among the top 200 outpaced liabilities by a margin of 20 percent, a gap not enjoyed since the end of the last economic-boom cycle in 1989. Assets jumped 13.4 percent in 1999, while liabilities dropped 13 percent.

The most pronounced growth among the top 200 funds was due in large part to mergers and acquisitions. High-profile pension-fund mergers occurred between SBC Communications and Ameritech Corporation, resulting in the fifth-largest corporate fund, as well as between BP America and Amoco Corp. The consolidation in the asset-management industry mirrored the increasing concentration of the financial-services sector as a whole, resulting in a tightening supply of institutional investors with burgeoning buying clout. It also intensified the growing international flavor of the pension-fund industry; 54 mergers or acquisitions in 1999 were between domestic funds, while 51 involved international deals.

Pension funds with a social conscience began to establish themselves in the late 1990s. After laws were clarified allowing trustees to offer pension funds the option of employing socially responsible investment (SRI) schemes in their portfolios, the use of SRI criteria jumped 13 percent in 1999, following a 9-percent incline the year before. Overall, approximately \$2.1 trillion in funds run in accordance with SRI principles, which take into account social issues ranging from human rights to environmental friendliness in screening for sound investment options. In the late 1990s, the performance of such portfolios had outpaced the industry average, which, along with heightened popular concern over social issues, was expected to result in even greater SRI application in coming years.

CURRENT CONDITIONS

Throughout the 1990s the leading public funds increased their exposure to equities. A total of 61 percent of these funds' assets were invested in public securities in 1999, up from 22 percent in 1979. Moreover, fund managers were leaning toward more proficient employment of alternative investment exposure by way of real estate and venture capital. Finally, with the fantastically high ratio of assets to liabilities, a strategy that has gained favor with fund managers is the splitting of portfolios into two distinct parts that focus on separate goals. While one-half can focus on covering liabilities, the other can chase immediate returns. Still, amidst the raging economy and bull market, many fund managers were reluctant to forego potentially lucrative short-term gains in favor of shoring up their risk-management schemes, out of fear of losing investors. As a result, the assets of the 200 largest U.S. pension funds eclipsed a record \$4 trillion in 2000. When the stock market crashed, however, this exposure to the stock market caused pensions fund assets to tumble. In 2001, the assets of the 200 largest U.S. pension funds slid 14.4 percent to \$3.5 trillion. Assets of the 1,000 top funds fell 12.7 percent, from more than \$5 trillion in 2000 to \$4.8 trillion in 2001.

Various investment strategies are available to pension plan sponsors. Among the top 200 funds, more than 100 funds utilized such strategies as equity index funds, foreign equities, and real estate in their investment strategies. Defined benefit plans tend to more heavily invest in U.S. equities, which accounted for 43.2 percent of the top 200 defined benefit plans' allocation in 2001. Defined contribution plans focus more on the current performance levels. Thus, the heightened popularity of defined contribution plans in the mid- and late 1990s was in large measure related to the booming financial markets. In 2000, the top 200 defined benefit plans had allocated 64 percent of their assets to equities; this figure dropped to 61 percent in 2001.

The stock market's decline has prompted some pension funds to begin seeking alternative investments. For

example, the Retirement System of Alabama offered \$240 million for a 37.5 percent stake in bankrupt US Airways Group Inc. in September of 2002. According to the Alabama pension fund's CEO David Bronner, the reason for such an offer is simple: "You can't get any decent returns from stocks or bonds, so you can either sit on your cash or find something else."

Another major pension issue potentially affecting all fund managers in the 2000s was the gradual demise of the Social Security pension system. The long-term viability of this system was in serious doubt, as pension analysts predicted that the plan was underfunded to such a degree that it would be insolvent by 2036, leaving private pension funds and individual savings plans to make up the shortfall. Furthermore, the fund will likely require federal reimbursements by the year 2016. Through the early 2000s, debates were raging on Capitol Hill regarding the possible privatization of Social Security.

INDUSTRY LEADERS

The top 10 pension fund sponsors in 2001 were California Public Employees (\$143.8 billion in assets), New York State Common (\$106 billion), California State Teachers (\$95.5 billion), Federal Retirement Thrift (\$93.3 billion), Florida State Board (\$88.5 billion), General Motors (\$82.5 billion), Texas Teachers (\$75.1 billion), New York State Teachers (\$74.9 billion), General Electric (\$68.7 billion), and New Jersey (\$66.7 billion).

Some of the largest fund management consultants that serve many of the larger funds, such as those just mentioned, include the Frank Russell Company, Callan, Wilshire, and Evaluation Associates. These firms offer specialty services to pension fund clients such as real estate investment or index counseling.

The largest trustee company in the pension fund industry was Bankers Trust New York Corporation. Other large trustees include Northern Trust, State Street Bank, Mellon Bank, and J.P. Morgan. These trustees, or custodians, monitor and effectively account for pension funds to ensure that sponsors and managers comply with federal regulations.

WORKFORCE

The pension fund industry workforce is largely comprised of professionals with the financial or legal knowledge necessary to properly oversee and invest fund assets. Seven employment functions within the industry include administrative staff, attorneys, actuaries, investment advisers and money managers, accountants and auditors, custodians or trustees, and performance monitors. Each of these functions also requires support staff. Administrative employees are responsible for keeping track of existing fund assets, current and future obliga-

tions, and future contributions. Positions in this field require financial and accounting skills.

Attorneys help fund managers to follow both federal and state regulations governing fund management and administration. Actuaries are responsible for predicting future pension fund obligations and contributions; they also determine investment return requirements. Actuaries rely on advanced mathematical and statistical techniques to accomplish these tasks and often must train for several years to become fully designated in their profession.

Money managers provide portfolio investment services for fund sponsors and managers. They buy and sell securities and other assets in accordance with prevailing investment strategies and market conditions. Various companies may provide these services, including bank trust departments, money management firms, specialty management firms, and index fund managers. Index fund managers administer funds in which pension fund sponsors and managers can place assets. Index funds, which became popular during the 1980s, derive returns from a broad market portfolio that serves to minimize transactions costs and management fees and to reduce market risks. Pension funds typically pay managers a percentage of the assets managed. Corporate fund managers earned an average annual salary of \$118,632 in the late 1990s. Jobs in money management typically require at least business or economics degree, and often an M.B.A. or other advanced degree.

Accountants and auditors, usually Certified Public Accountants, assist in the financial reporting process. They also provide technical assistance with data processing and financial analysis.

Employment opportunities in most areas of the pension fund industry are expected to grow much faster than average, as assets placed in funds proliferate during the 2000s. Particularly, the demand for specialty consultants who can provide detailed investment advice about alternative investment assets should increase. The demand for services related to defined contribution plans should also grow faster than average.

AMERICA AND THE WORLD

The pension fund industry in the United States is similar to and was originally modeled after the British pension system. While most other industrialized countries have pension systems similar to the United States and Britain, some countries rely more heavily on government-sponsored pension plans.

Besides the fact that the United States has more pension fund assets than any other country in the world, American pension funds also differ from funds in many countries in the way that their assets are allocated. Britain, which has the second largest pension fund industry,

places much more of its assets in both domestic and international equities than in bonds. Pension plan managers in the Netherlands, on the other hand, are far more likely to place more of their assets in bonds and international assets than are U.S. managers.

Foreign Investment. Although U.S. pension managers have been investing internationally since the 1970s, it was not until the 1980s that investment in overseas assets accelerated. In 1980, the largest U.S. pension funds were devoted almost exclusively to U.S. investment. By the late 1990s, more than 69 percent of U.S. companies offered international equity, compared with 39 percent in 1994. In fact, the dollar value of foreign assets held by U.S. pension funds skyrocketed during the 1990s to more than \$300 billion by 1994 and nearly \$960 billion by 1999. Moreover, 6 of the 10 most expensive merger or acquisition deals in 1999 were between U.S. and foreign funds.

Fund managers sought foreign investment assets in the 1990s because they provided higher yields. For instance, since 1971 foreign bond returns have outperformed U.S. bonds by a margin of 5 percent. Foreign investments also increase investment-portfolio diversity, which reduces the risk of losses caused by regional economic downturns.

Part of the reason for the influx of investment into foreign countries has been a reduction in the barriers to entry for fund managers. The development of the European Union and its common currency along with a pan-European investment market in the late 1990s opened up the market to increased foreign investment. Multilateral investment deals negotiated at major world financial institutions have accelerated this process.

Despite reduced investment barriers, many restrictions still exist in most countries that limit pension fund activity. For instance, local and regional restrictions place limits on the amount foreigners can invest in various assets classes. Localities in some nations, such as Spain and Portugal, require that funds invested in their precinct be managed by local organizations.

Public pension systems in all industrialized nations were under increasing strain throughout the 1990s, which was expected to lead to greater emphasis on private pension funds. The nations of continental Europe were likely to experienced the most pronounced privatization boom due to the historically high reliance on state provision in those countries.

While increased returns and diversification have lured U.S. pension managers particularly to industrialized Asian and European countries, the emerging markets in Latin America, the Pacific Rim, and China are beginning to offer some of the greatest opportunities for investors. While these less-developed markets remain riskier,

they offer the potential for comparatively high returns, as well as diversification for many pension fund portfolios.

RESEARCH AND TECHNOLOGY

In the 1990s, pension sponsors were using advanced information systems to reduce their administrative workforces and improve efficiency. Similarly, fund managers implemented systems allowing more efficient reporting and monitoring of investments. These systems were used to integrate the sponsor's general pension fund strategies with the investment activities of its managers and consultants. Consultants were under pressure, as well, to improve their record-keeping systems to compete with larger investment management companies.

Developments in computer technology and software continued to deliver significant advances in the actuarial investments fields. Professionals used new mathematical models and statistical techniques that were previously unavailable.

Pension funds were also scrambling to catch up to banks and stock brokerages in establishing an online presence. The extent of online financial services grew exponentially in the early 2000s, and consumers performed a greater share of their investing via the World Wide Web. As relaxed regulations allowed financial institutions to perform a wider range of activities, analysts expected a growing number of customers would place most or all of their financial business with a single firm. As a result, pension funds rapidly entered the online world to snare potential customers before they developed relationships with other, more Internet-savvy firms.

INSURANCE CARRIERS, NOT ELSEWHERE CLASSIFIED

Establishments providing insurance coverage but not covered by any other insurance category make up the industry classification entitled Insurance Carriers, Not Elsewhere Classified (NEC). Federally-supported organizations providing insurance for financial institution deposits make up most of this industry. Other miscellaneous insurers, however, cover everything from pets and trademarks to body parts and automobile warranties.

NAICS CODE(S)

524128 (Other Direct Insurance Carriers (except Life, Health, and Medical))

The Federal Deposit Insurance Corporation (FDIC) is the largest organization in this industry. Created by the Banking Act of 1933 following the failure of more than 8,000 banks during the depression, the FDIC promotes and preserves public confidence in U.S. financial institutions by insuring bank and thrift deposits up to the legal limit of \$100,000 per account. In 1999, the FDIC insured more than \$3 trillion of U.S. bank and thrift deposits at approximately 11,000 institutions. But the FDIC has other responsibilities besides acting as an insurer. It examines state-chartered banks that are not members of the Federal Reserve System for safety, soundness, and compliance with consumer protection laws. The FDIC may liquidate the assets of failed institutions to reimburse the insurance funds for the cost of failures. It also has the power to set interest rate limits and approve bank mergers.

An independent government agency within the executive branch, the FDIC is run like a private company by a five-member board of directors that includes the Comptroller of Currency, the Director of the Office of Thrift Supervision, and three presidential appointees. The Corporation does not operate on funds appropriated by Congress. Its income is derived from assessments on deposits held by insured banks and from interest on the required investment of its surplus funds in government securities. It also has authority to borrow from the Treasury up to \$30 billion for insurance purposes.

Congress passed the FDIC Improvement Act (FDICIA) in 1991. The law instituted a number of agency reforms and gave the FDIC increased power over foreign banks active in the United States. The agency has also been affected by a number of federal laws relating to the downsizing of the federal government. The FDIC cut \$143 million or 8 percent from budget between 1996 and 1997. Employee compensation was reduced the most during that period, 8.9 percent to \$867 million. The agency's payroll shrunk from more than 17,000 workers in 1995 to just 7,241 in 1998. In 1997, the FDIC approved a budget of \$1.62 billion, down \$221 million or 12 percent from the \$1.84 billion authorized in 1996. In each of the next two years the agency operated on a \$1.2 billion budget.

The Savings Association Insurance Fund (SAIF) is the second major federal depository insurance organization. Administered by the FDIC, SAIF insures deposits at the nation's savings and loan institutions up to \$100,000 per account. Concerned with sagging funds at SAIF in the mid 1990s, Congress passed the Deposit Insurance Funds Act of 1996, which directed the FDIC to take immediate steps to recapitalize SAIF and change the basis on which funds were raised. In response, the FDIC levied a \$4.5 billion special assessment (equal to nearly a year's earnings on SAIF-insured deposits) to fully fund SAIF. As a result of recapitalization, deposit insurance premiums for SAIF-insured thrifts were approximately \$800 million lower in 1997 than in 1996. Meanwhile, SAIF's earnings were on the rise, increasing from \$550 million in 1997 to \$584 million in 1998. Almost all revenue for both years was derived from interest on investments in U.S. Treasury securities and deposit insurance assessments. By 1999, SAIF had an unrestricted fund balance of \$9.2 billion and \$978 million in the restricted Special Reserve.

In 1999, Dun and Bradstreet listed more than 900 insurance carriers doing business within this industrial classification. Other industry leaders included Veterinary Pet Insurance Co., a subsidiary of California Veterinary Services, Inc., which underwrites health insurance for pets. It generated \$5.5 million in revenue during 1997, and employed 55 workers. Warrantech Consumer Product Services Inc., a Connecticut-based insurer of warran-

ties, employed 100 workers in 1997 and reported revenue of \$23 million. General Star Management, a commercial specialty risk insurer based in Stamford, Connecticut, employed 281 workers in 1997 and generated \$14.4 million in revenue. Travel Guard International, Inc., an underwriter of travel insurance based in Stevens Point, Wisconsin, employed 99 workers in 1997 and reported earnings of \$7.8 million.

SIC 6411

INSURANCE AGENTS, BROKERS, AND SERVICE

This industry includes agents primarily representing one or more insurance carriers, or brokers not representing any particular carriers who are primarily engaged as independent contractors in the sale or placement of insurance contracts with carriers, but not employees of the insurance carriers they represent. This industry also includes independent organizations concerned with insurance services. Establishments engaged in searching real estate titles are classified in **SIC 6541: Title Abstract Offices**.

NAICS CODE(S)

524210 (Insurance Agencies and Brokerages)

524291 (Claims Adjusters)

524292 (Third Party Administrators for Insurance and Pension Funds)

524298 (All Other Insurance Related Activities)

INDUSTRY SNAPSHOT

Agency and brokerage firms selling and servicing insurance policies constitute the majority of the insurance agency, brokerage, and service industry. These compa-

nies are primarily engaged in representing one or more insurance carriers as independent contractors in the sale or placement of coverage. The industry also encompasses various specialty entities that offer services to insurance companies and to policyholders, such as independent claims adjusters, information bureaus, pension and retirement planning services, and research organizations.

In the late 1990s, the insurance industry underwent some adjustments itself, which affected the roles of agents and brokers. While most agents and brokers continued to specialize in life insurance, a growing number began selling policies that cover life, property/casualty, and health and disability. Moreover, agents and brokers began using Internet technology to increase their reach and to offer faster and more convenient service to their clients.

The fortunes of insurance brokers and agents reflect larger trends in the industry. Demographic changes, notably the graying of the boomer generation, increased premium sales throughout the late 1990s and into the year 2000. According to the Insurance Information Institute, total industry premiums reached \$956.8 billion by the end of 2000. However, new competition in the insurance industry, by banks and other financial firms, began to put pressure on insurance brokers and agents, who began to lower their prices in an effort to remain competitive. However, when the insurance industry experienced unprecedented losses in the wake of the September 11 terrorist attacks, which exacerbated an already faltering economy, agents and brokers found themselves forced to raise premiums, sometimes by as much as 50 percent in the early 2000s.

ORGANIZATION AND STRUCTURE

Insurance agents and brokers serve the function of bringing insurers and people or companies needing insurance together. They help their clients select the right policy for their particular needs. Although their primary function is to sell policies offering financial protection against loss, agents and brokers may also help their clients plan for personal, family, or business financial security. In addition, they often provide advice about various insurance products, prepare reports and maintain records, and help policyholders settle insurance claims.

Insurance agents typically represent an insurance carrier under a contract arrangement. The agreement furnishes the agent with a small salary, fringe benefits, and commissions. The agent relies primarily on commissions for compensation, which are earned by selling new insurance policies and by renewing and servicing in-force or existing policies. An important characteristic of the agency relationship is that the agent is under the authority of the principal, or insurance carrier, and has the ability to make decisions as a representative of the carrier. Therefore, the

principal can be held legally liable for the agent's business actions. Additionally, the agent is bound to place all business that he or she solicits with the principal.

Brokers, in contrast to agents, do not necessarily work under the authority of an insurance company. Rather, brokers place insurance policies for their clients with the carrier offering the most appropriate rate and coverage. The broker is remunerated by the carrier, though typically at a rate lower than that paid to the carrier's agents. Brokers may also charge clients who purchase insurance fees for services not compensated by the carrier's commission. Brokers serve an especially beneficial role for organizations with large and varied insurance needs requiring professionals to represent their interests. Some brokers also act as agents in certain areas of their business.

Commercial insurance in the United States is organized into four principal parts: insurers, who bear risk and manage surplus capital for their clients; field organizations, including agents and brokers, that maintain public contact, sell policies, and settle claims; intercompany organizations that establish standards, devise rates, and represent the political interests of insurers; and associations, or boards of agents and brokers that influence legislation, conduct research, and establish standards for the agency and brokerage industry. The American Insurance Association (AIA) is an example of an entity representing the interest of the industry and helping to establish professional standards. Many other organizations offer professional designation programs and lobby for agents' and brokers' interests.

Agents and brokers serve four basic types of insurers: national companies, regional insurers, mutual companies, and reinsurers. While many agents represent only one company's products, an increasing number of agents in the 1990s were selling policies for all industry types of insurers or tiers. The first tier, national companies, includes such massive organizations as The Prudential and The Equitable Life Assurance Society. These companies typically offer multiple lines of insurance for both individuals and businesses, and they support hundreds or thousands of agencies in cities throughout the United States. Agents who represent these companies benefit from such factors as public familiarity with the insurer, national advertising programs, and geographic diversity, which strengthens the carrier. The second tier, regional insurers, support agencies in a limited geographic area. Although some regional companies offer multiple lines of insurance, many emphasize one line of coverage, such as auto or home insurance.

The third tier, mutual insurance companies, in contrast to stock corporations, differs from most national and regional firms since mutual insurance's clients own a part of the company. Mutual agents essentially sell a member-

ship to a cooperative, allowing each member to simultaneously become insurer and insured by purchasing a policy. The fourth tier, served mainly by brokers, is the reinsurer. Reinsurers provide coverage for insurance companies against unforeseen losses that could devastate the organization.

Products. Agents and brokers sell various forms of life, health, accident, property, and casualty insurance, each generating approximately equal amounts of annual revenue from premiums. Many of them also market financial instruments that complement their product offerings. Many agents and brokers sell policies in both the life/health and property/casualty divisions, although more agents specialize in selling life policies than any other line of coverage.

Life insurance differs from many other forms of insurance because it is usually considered a long-term investment and offers significant tax advantages. Typical products offered by agents in this market include: whole life products; term products, such as universal, variable, and universal variable life insurance; and annuities, which are effectively tax-deferred investment instruments. In 1999, life insurers faced stiff competition from other financial services firms, making only modest gains in capturing savings dollars. While traditional life insurance products showed flat sales, fee-based products, such as annuities, grew in the late 1990s. But the shifting portfolio has also meant narrower profit margins for insurers, causing them to adopt cost-cutting measures.

Whole life policies combine a death benefit with a forced savings plan. In other words, the insured effectively overpays during the early years of his or her coverage when the risk of death is small. The interest earned on the savings is used to build the policy's cash value so that in the future the insured can borrow against the savings at a low interest rate. The policy also carries a redeemable cash value that can be withdrawn at once or used for retirement income. Term coverage differs from whole life in that the customer can avoid the forced savings plan, thus reducing his or her total investment. Products such as universal life insurance combine term and whole life advantages. Annuities, in contrast, do not provide a death benefit. The agent is essentially selling investment instruments that offer potentially higher returns than are available in whole life products, yet retain tax advantages.

Life insurance can also be divided into group and individual, or ordinary insurance. Group policies offer advantages related to economies of scale and provide greater bargaining power for some organizations through their employees.

Health and accident insurance represents nearly 70 percent of the American population. In contrast to life

insurance, health coverage is not viewed as an investment instrument. It does provide important tax benefits, however—especially for employers.

Property/casualty insurance agents sell coverage to protect businesses, individuals, and other entities against property loss or losses by third parties for which the insured is liable. While much of the coverage is written on homes, automobiles, and business property, other types of insurance include worker's compensation, product liability, and medical malpractice. The business and individual segments of this category of coverage each account for about 50 percent of the total market. Although brokers are more likely to emphasize business property/casualty offerings, overall agency sales stress individual coverage.

In addition to traditional lines of insurance, increasing numbers of agents and brokers in the late 1990s were offering comprehensive financial planning services to their clients including retirement planning and counseling, mutual fund and annuity sales, and other types of securities sales. Compensation for these services is through commissions or an hourly wage paid for consulting services.

Company Structure. Approximately 30 percent of agents and brokers are self-employed, and their companies are typically very small. For an agent to qualify to represent a carrier, he or she must often meet volume and production requirements. For instance, smaller mutual insurers may require agents to produce \$25,000 to \$50,000 worth of sales per year. Large national carriers, on the other hand, generally require agents to commit to \$500,000 to \$1 million in annual sales.

BACKGROUND AND DEVELOPMENT

The nature of the insurance industry of the 1990s emanated from fifteenth-century Italian ports where marine insurance became an effective technique of spreading individual losses over a large number of merchants. The structure of the U.S. industry, however, was derived from the English system that originated in the seventeenth century. The concept slowly spread to North America during industrialization in the nineteenth and twentieth centuries. During these early periods a formalized agency and brokerage system was not established. Most insurance was sold directly by the insurer from the office headquarters. In fact, the first reference made to an informal agent/broker industry was in the British case of *Power v. Butcher* in 1830, where brokers were referred to as "those that arranged policies of insurance."

Establishment of the U.S. agent/brokerage industry lagged far behind the development of the British system. In fact, not until 1949, when Congress permitted sales of coverage across state borders, could a single company in

the United States offer multiple lines of insurance on a wide scale. As insurers became more widely dispersed and began to increase offerings to many market segments, the need for an effective means of joining buyers and sellers became paramount. Furthermore, larger companies found the need to develop local customer services such as claims adjustment and underwriting. Thus emerged the expansive network of sales organizations supported by main or branch offices that shaped the insurance industry of the 1990s and early 2000s.

As the insurance industry experienced rapid expansion in the post World War II era, the insurance agency, brokerage, and service industry flourished. Property/casualty agents prospered as individuals began to accumulate and insure greater amounts of personal wealth and possessions. Likewise, the surge of giant corporations with large and varied property and liability protection needs stimulated the brokerage industry.

Life insurance, too, experienced unprecedented growth. Aided by favorable tax laws and an aging population with dependents, sales skyrocketed from the 1950s through the 1970s, creating a boon for agents. Furthermore, health insurance agents and brokers benefited from massive growth, particularly in the 1970s, as large companies began to offer health insurance as a tax-deductible benefit. Spiraling health care costs fueled industry profit growth as well. For example, throughout the 1970s and early 1980s, agents' revenues from health insurance commissions grew at a rate in excess of 15 percent per year.

The 1980s. Although many companies in the industry languished in a recession during the late 1970s and early 1980s, agents and brokers enjoyed fairly strong sales and increased demand for new products in most lines of coverage during the mid-1980s. The volume of property/casualty premiums written by stock companies, for instance, rose from \$74.5 billion in 1983 to over \$140 billion by 1989. In 1994, the net premiums written for this segment were \$244.9 billion, up from \$217 billion in 1990. Health insurance lines realized bullish growth too, increasing from a volume of \$38 billion in premiums written in 1983 to about \$61 billion by 1991.

Premiums for life insurance agents experienced more steady increases in the 1980s, with the exception of annuities. More customers switched from whole life to less expensive term life insurance in the 1980s. As a result, term life holders were looking for new vehicles in which to invest their money. Agents and brokers responded by marketing a profusion of annuities and other financial products that could lure those dollars. As the volume of whole life insurance premiums written grew steadily from about \$50 billion in 1983 to \$79.3 billion in 1991, annuities sales skyrocketed over 400 percent in the same period, from \$30.5 billion to over \$129 billion. The

consequence was a boon of commissions for agents that rode the financial products wave. In 1994, \$1.1 trillion worth of life insurance was purchased in the United States, while \$11.6 trillion was currently in force. More than one-half of all policies were ordinary, and the average American household in 1994 had \$118,700 worth of life insurance.

Industry Turbulence. Solid growth in many sectors of the agency and brokerage business in the mid-1980s was made bittersweet by changes transforming the overall insurance industry. Increased governmental regulation, rising insurance costs, and escalating public pressure were all constraining insurance company profit margins. Consequently, carriers were looking for ways to cut expenses, including costs related to agents, brokers, and service. At the same time, new entrants to the market such as banks and other financial institutions were competing for agency and brokerage sales dollars.

Although sales remained relatively strong throughout most of the 1980s, problems for property/casualty agents in some areas wreaked havoc. Public pressure, for example, was leading some states to enact laws that suppressed premiums on automobile and workers' compensation insurance. In 1989, for instance, California voters passed Proposition 103, requiring insurers to eventually reduce, or roll back, automobile insurance rates by 20 percent. As a result, many insurers were terminating business in regulated states and abandoning their agencies.

Also burdening property/casualty agents and brokers was insurer insolvency, caused by a combination of mismanagement, fraud, and a more aggressive regulatory environment. As over 370 carriers failed in the mid-1980s and early 1990s, agents representing them were left scrambling to maintain their operations. Although carrier failures had subsided by the early 1990s, the situation created the likelihood of increased federal regulation in the future, which could affect sales professionals.

In the mid-1990s, the 123,998 establishments in the industry employed 661,685 people—nearly 40 percent of the entire insurance-related workforce. The insurance companies served by this industry generated a combined total of about \$500 billion in premiums from customers in 1993. This total represented the culmination of steady growth occurring in the insurance industry since 1982, when approximately \$250 billion in premiums were written.

Demand for insurance grew sluggishly in the early 1990s, but became more robust as the economy recovered in the second half of the decade. Although the economy was improving, agents and brokers in general were experiencing reduced income and profit—a trend that began

in 1989. Reduced margins for most companies were the result of lower commissions, ceding markets in some highly regulated states, increasing operating costs, and escalating competition. In response to the inclement economic environment, agents and brokers started diversifying into new lines of business, working harder to maintain revenues, expanding into overseas markets, and relying on new technology to automate their operations and become more efficient.

Health reform legislation in 1996 provided a boon to health insurance agents. Self-employed people would be able to deduct 40 percent of health premiums from their 1997 taxes; in 1998-2002 the amount would increase to 45 percent and gradually keep rising to 80 percent in 2006. This ruling would encourage the self-employed to purchase health insurance. The 1996 health initiative also encouraged consumers to finance their own long-term health care by including a provision that most of those benefits would not be taxed. In 1995, in anticipation of the health reform bills, 517,000 new long-term care policies were sold, more than any year since records began to be kept in 1987. In total, 4.35 million such policies were sold between 1987 and 1995, with an average growth rate of 23 percent.

A development that was cutting into profits for agents and brokers in all lines was the increased popularity of direct insurance sales, or sales of coverage made directly by the carrier. By advertising and selling insurance themselves, even on a national scale, many carriers were successfully bypassing agents and delivering policies at lower costs to the market. In addition to these and other problems causing turbulence for agents in all lines was increased competition. This challenge meant a reduction in the workforce and consolidation, by merger and acquisition, for many property/casualty companies. In 1997, the Provident Corporation announced that its shareholders approved the merger of the company's insurance operations with AEGON USA, a subsidiary of Netherlands based AEGON, NV, one of the largest listed insurance organizations worldwide.

Insurance giant Aetna sold its Casualty and Surety Company to the Travelers Group for \$4.1 billion in 1997, creating the largest writer of personal automobile insurance through the independent agency system. Sagging industry profits, foreign expansion into the United States, and market segmentation were a few of the factors driving this trend.

Limiting their participation in the industry to specific market segments in which they had developed expertise was one way companies sought to increase their chances of maintaining profitability in the 1990s. Companies wanting to compete effectively also were learning to become more efficient through automation and customer focus. Many companies, especially smaller ones, were

seeking to merge with other companies to strengthen their capital position. In addition, many companies were looking into ways to streamline operations and reduce the size of their workforce. Expansion into foreign markets offered another opportunity for property/casualty insurers to shore up profit margins. "Companies must downsize, consolidate divisions, reduce their employee base, and enhance their capital spending . . . to compete globally," according to Robert M. Demichele, president of the Reinsurance Corporation of New York, in *Best's Review, Property/Casualty Edition*.

One of the largest acquisitions that provided evidence of these trends is General Re Corporation's (GEC's) acquisition of the Swiss reinsurance operations of Allstate Insurance Company in early 1992. This move strengthened GEC's European position. In June of 1997, the American Insurance Association (AIA) urged Congress to support tax legislation that would help make the U.S. property/casualty insurance industry more competitive in the global marketplace. Two tax law changes, H.R. 1783 and S. 843, would treat the active business income of U.S. financial services industries, including insurance, like the active business income of non-financial businesses.

In 1998, the \$82.5 billion merger of Citicorp, a major commercial bank, and Travelers Group, Inc., an insurance firm, sent ripples through the U.S. insurance industry. The move dissolved the traditional wall separating banks and insurers and ushered in a new trend called banc assurance, the distribution of insurance products through banking channels. The merger also hastened the restructuring of the U.S. insurance industry. Congress and state legislatures were considering new laws that would allow banks and other financial services firms to sell insurance. The process began with the Supreme Court's 1996 *Barnet Bank* decision, which allowed banks to begin selling insurance in small towns in the United States. Soon it became a national trend, presaging the giant mergers of the late 1990s. For small independent agents, the consolidations intensified the pressure to join large organizations in order to survive.

Another trend affecting the property-casualty insurance industry in the late 1990s, according to *Standard & Poor's Industry Surveys*, was excess underwriting capacity. The economic boom of the late 1990s placed downward pressure on the insurance industry, driving down the price of premiums—and driving up risks for insurers. The Insurance Services Office (ISO) reported that premiums written-to-surplus ratio as of December 31, 1998 reached a record low of 0.84-to-1. The normal surplus leverage is 2-to-1, meaning that there are \$2 of premiums written for every \$1 of surplus.

The late 1990s also witnessed the rapid growth of distribution channels in the insurance industry. New

companies, such as The Direct Response Insurance Co., allow customers to circumvent traditional agents and brokers. Moreover, the Internet offered customers the opportunity to buy insurance online. In *Best's Review Life/Health Edition*, Mark L. Gardner asserted that independent agents were poised to enter the twenty-first century in an awkward position. "Although the agent may be quite knowledgeable about the insurance products he offers, and he may be located near the policyholder, and he may even be in control of a large clientele," says Gardner, "economic forces over which he has no control will compel him to radically adapt to compete."

CURRENT CONDITIONS

At the turn of the twenty-first century, many life insurance agents and brokers struggled with decreased commissions. This was largely a result of the switch to term life policies, which offered less commission than traditional whole life policies, and the increased popularity of annuities. These changes signaled an industry-wide shift from a commodity-based market to a service-intensive market. At the same time, agents and brokers also found themselves forced to lower prices due to increased competition. Although consolidation in the industry had slowed, industry giants continued to join forces, squeezing out smaller rivals. Roughly 300 insurance related mergers and acquisitions, worth a total of \$41.5 billion, took place in 2001. While this paled in comparison to the 565 deals, worth more than \$165 billion, completed in 1998, consolidation did remain a factor for smaller agents and brokers.

According to an October 2002 press release from the Council of Insurance Agents and Brokers, pricing cuts began to pose serious problems for agents and brokers in the early 2000s. "One of the most significant issues facing the industry, the experts agreed, is lack of reserves to cover the cost of liabilities from coverage written at inadequate prices." The weakened economy, along with the impact of the September 11 terrorist attacks, caused the insurance industry to experience record losses in 2001 and 2002. As a result, agents and brokers had no choice but to begin increasing premiums. Some analysts predicted that insurers would need to continue raising premiums throughout 2003 and possibly throughout 2004 to erase the reserve deficit.

Agents and brokers, already struggling to make sales in the sluggish economy, have begun to seek alternative means for keeping premiums in check. For example, some agents and brokers have started to offer policies with much higher deductibles, which allows them to offer a lower premium because clients are assuming more of the risk.

Environmental liability also posed a potential threat to profitability in the early 2000s as claims related to

asbestos and mold began to mount. Large environmental claims typically are made many years after the cause of the claim occurs, making it difficult for insurers to predict cleanup cost liability. Many analysts believe firms need to consider building reserves of assets to address those future claims. Some have already done this; for example, Chubb Co. upped its reserves by \$700 million in 2002 to help offset increased asbestos claims.

INDUSTRY LEADERS

Of the top 10 companies that write 40 percent of the property/casualty premiums in the United States, The State Farm Group of Illinois was the largest in 2001 with \$37.9 billion in net premiums written. The State Farm Group began in 1922 by providing auto insurance to Illinois farmers. By 2002, the firm employed 79,400 people and enlisted the services of 16,000 agents. One in five cars in America was insured by State Farm, which was also the largest insurer of automobiles, homes, and pleasure boats. In 2002 sales grew 6.4 percent to \$49.7 billion.

Allstate Insurance, also of Illinois, was the nation's largest publicly held property and casualty insurance company. It had over 14,000 agents and 20 million customers in the United States, Canada, and Japan. The company offered multiple lines of insurance, including life and health, and was started in 1931 by Sears Roebuck & Company. In 2001, the company wrote \$21.9 billion in net premiums and held \$39.3 billion in assets. Sales in 2002 totaled \$29.6 billion, an increase of 2.7 percent.

In addition to capturing the lion's share of the property/casualty insurance market, State Farm and Allstate also experienced the greatest exposure to catastrophic losses. State Farm was especially hard hit by the disasters, because it did not carry reinsurance to offset losses, as do many other large carriers. In the late 1990s, State Farm stopped offering unlimited replacement coverage on California home ownership policies and transferred its 1.5 million home ownership insurance customers in the state into a separate policy. State Farm covered one in four insured California homeowners, and this decision spurred opposition from consumer groups who stated that the insurer was reducing its risk and putting more of a burden on the policyholders.

The third largest property underwriter in 2001 was Zurich/Farmers Group with \$17 billion in net premiums written, followed by American International Group, which wrote \$14 billion worth of policies, and Berkshire Hathaway Insurance Group, in fifth place with \$11.6 billion worth of policies written.

WORKFORCE

Insurance agents and brokers comprised a 387,000-strong workforce in 1998. About 30 percent of agents and

brokers were self-employed. Due to intense industry competition, however, the job outlook for insurance agents and brokers was not good. Experts predicted slower-than-average growth through the year 2008, with most new entrants to the field replacing agents and brokers who retire. Opportunities existed in five functional areas, including sales, claims, underwriting, accounting/finance, and professional staff support positions.

Sales. The greatest number of jobs in the insurance industry, by far, are sales positions; this field is also the most accessible for people trying to enter the industry. Sales positions are available by the tens of thousands through local insurance offices scattered throughout the United States and Canada. Each of these offices represents products from a parent company.

People just entering the sales field usually do not receive a salary, but instead depend on commissions. As the salesperson's list of clients grows, he or she benefits from commissions on repeat business from previous sales, in addition to any new business he or she generates.

Although a career in sales involves more risk than many salary positions, it can be one of the most rewarding jobs in the industry, combining personal freedom with an income in excess of over \$100,000 per year. Success in the field typically requires an outgoing, entrepreneurial, and persistent personality. The profession can also be quite demanding, requiring 60 or more hours of time per week during the first few years of selling. Another significant drawback for property/casualty salespeople is industry cycles, which usually mean periods of low income.

Claims. A position in claims in the property/casualty industry involves assessing the dollar value of damage a policyholder has sustained and authorizing payment by the parent company. Claims adjusters combine knowledge with experience to judge how much damage the company will cover. In comparison to sales, claims positions are highly detail-oriented and structured. A claims adjuster position can lead to promotions within the company to a claims examiner, who handles complex claims, or a claims supervisor, who manages claims adjusters and examiners.

Underwriting and Accounting. Underwriters are faced with the task of determining which applicants for insurance the company will reject or accept and how much coverage the applicant may receive. This assignment involves gathering information on applicants, reviewing associated risks, and applying underwriting standards to reach a decision. Underwriters specialize in either personal or business lines of property/casualty insurance, although most underwriters start out in personal lines. Typical career progression is entry-level underwriter, senior underwriter, and finally underwriting manager.

Many underwriting managers progress into general management, which is one reason this is a very popular route for professionals seeking executive level positions within the industry.

Accounting/finance positions can also provide a route to senior level positions within the industry. Insurance accountants are typically charged with auditing functions, examination of policyholders' financial records as part of the underwriting process, or enforcing underwriting guidelines prescribed for underwriters by the parent company. Finance professionals, on the other hand, are usually more involved with financial and investment analysis, marketing research, and sales forecasting.

Professional Staff Support Positions. Property/casualty insurers hire large support staffs to administer important functions that support the revenue producing activities within the company. These disciplines include actuaries, lawyers, marketers, and others. Actuaries use mathematics to determine insurance rates and policies and to establish pricing and investment guidelines, which will increase profits. The actuarial field involves complex mathematical modeling, and most actuaries endure years of examinations before becoming fully designated within their profession. This occupation is also ranked among the highest in worker satisfaction and pay.

Insurance law provides excellent opportunities for attorneys, especially in the litigation arena. Because every insurance policy is a binding legal contract, attorneys receive more emphasis in the industry than they do in most other industries. Although salaries are typically below those found in the top law firms, they are similar to other corporate law positions. Other opportunities exist in public relations, customer service, and loss control. Loss control is a relatively new specialization that involves finding ways to prevent injury, theft, and damage—mostly by educating policyholders.

AMERICA AND THE WORLD

The forces of globalization are transforming the insurance industry. The mergers of the late 1990s, which greatly expanded the international reach of insurance companies and banks, built upon the trend set in the mid-1980s, when a surge in multinational companies and international trade and investment encouraged the growth of many international insurance companies. Insurers, including property/casualty insurers, from the United States, Asia, and Europe expanded internationally through avenues such as branches, subsidiaries, and joint ventures.

From the viewpoint of U.S. insurers, global expansion has two sides—U.S. expansion and investment abroad and foreign expansion and investment in the

United States. U.S. insurers are becoming increasingly active in foreign expansion either through cross-border trade, in which foreign customers are covered by a company in the United States, or subsidiaries, which are located in the country where the customer is located.

Regulatory developments in the European Community (EC) have been directing its members to liberalize their markets for insurance and offered new opportunities for U.S. property/casualty insurers in the 1990s. These developments include countries that were opening their insurance markets to foreign investment for the first time, EC efforts to standardize accounting and reporting practices, and EC directives that made it easier for companies to transact business across country borders. Several EC countries, especially in southern Europe, have opened insurance sectors to foreign investment.

New opportunities also existed in Latin America and Asia. Latin governments were deregulating the insurance industry and allowing foreign investment for the first time. The North American Free Trade Agreement (NAFTA) has opened up the small Mexican property/casualty market, allowing U.S. insurers to operate equally with Mexican insurers. Asian countries offered an even larger potential for U.S. expansion abroad as incomes in this region continued to grow. Taiwan and Korea also continued to be particularly attractive to U.S. insurers.

The newest opportunity exists in the People's Republic of China, where a national insurance law was enacted in 1995. Since then, China has only permitted two foreign firms licenses to sell insurance—first in Shanghai and more recently in Guangzhou. One of those foreign firms was the American International Group. While it waited for a license, the U.S. firm Chubb Insurance committed \$1 million during the latter half of the 1990s to set up a school in Shanghai to train regulators and agents. China's entrance to the World Trade Organization at the turn of the twenty-first century is expected to give U.S. firms further access to this growth market.

RESEARCH AND TECHNOLOGY

Companies in the property/casualty industry have been slower than their U.S. counterparts to integrate advanced research and technology into their operations. However, two of the most important keys to success in the industry during the late 1990s were increased use of market research and customer focus, and integration of advanced automation technologies to reduce costs and improve service.

As they entered the new century, insurers strove to become more customer focused in response to the increasingly competitive property/casualty environment. According to Tim Pease in *National Underwriter*, new technology will level the playing field between insurers.

“With the right technology and strategy,” says Pease, “any company—whether an independent agency, insurer, reinsurer, direct marketer or direct writer—can win in the new game.”

In addition to upgrading their technological capacity, insurers seek to identify customer needs, often fulfilling them with very niche-oriented insurance products. The implementation of automated systems served to improve customer service, reduce errors, improve delivery time, and reduce human intervention in the entire insurance process.

Examples of new technology that property/casualty insurers were integrating into the industry in the late 1990s included open-systems architecture computer systems, network computing, computer-aided software-engineering tools, multimedia training tools, and information management and delivery systems that used satellites. Industry regulators were also using this technology to identify potentially insolvent insurers. Several companies have realized significant cost reductions and improved customer service through comprehensive automation programs.

OPERATORS OF NONRESIDENTIAL BUILDINGS

The commercial real estate operation and leasing industry consists of establishments primarily engaged in the ownership and operation of nonresidential real estate. These companies own and operate properties such as retail establishments, shopping centers, marinas, theaters, and commercial and industrial buildings. The industry does not include owners of hotels, campgrounds, or other establishments that are classified as service operations.

NAICS CODE(S)

711310 (Promoters of Performing Arts, Sports and Similar Events with Facilities)

531120 (Lessors of Nonresidential Buildings (except Miniwarehouses))

INDUSTRY SNAPSHOT

Hammered by a depression in the real estate industry that began in the late 1980s and continued into the early 1990s, commercial property owners and operators were beset with high vacancy rates, a severe shortage of capital, and dismal earnings. Many companies were not able to meet their mortgage obligations and were forced into bankruptcy. Companies that survived the shakeout learned to operate more efficiently and to compete by providing better customer service. (See **SIC 6531: Real Estate Agents and Managers**).

After a continued slump in 1993, the industry bottomed out and vacancy rates in many sectors began to stabilize. The dramatically improved economic climate through 1996 was reflected in an equally dramatic recovery of the office and industrial segments, especially in suburban areas. However, the retail segment was an exception. New construction continued unfettered, so the retail market was oversaturated by 1996. Slow retail sales and numerous retail bankruptcies threatened to worsen the situation.

The unprecedented longevity of the late-1990s economic boom spilled over into the nonresidential real estate market. The unexpected continuing strength of the U.S. economy managed to keep tenant demand relatively strong during this time, particularly in the office and shopping center segments of the market. However, by the early 2000s conditions had changed. Weak economic conditions led to massive layoffs and reduced levels of corporate and consumer spending. Although the entire commercial real estate industry was affected, these conditions impacted some segments more than others. Fortunately, overall investment levels remained strong. By

2002 conditions had begun to gradually improve. However, a number of analysts argued that a full recovery was not likely until the mid-2000s or later.

ORGANIZATION AND STRUCTURE

The entire real estate industry is highly fragmented and has traditionally been characterized by low barriers to entry. Therefore, companies that own, lease, and operate commercial properties range from small mom-and-pop firms to large national corporations. In addition, many of the largest owners and operators of real estate emphasize other business operations and thus are not primarily engaged in the industry. For instance, some of the largest commercial property owners are insurance companies that invest some of their reserves in real estate, which they may or may not actively manage. Other owners and operators include large corporations such as General Motors or IBM, which operate properties that serve their core businesses.

Specialization. Companies that are primarily operators and lessors of commercial properties often specialize either by region or by property function. Those that specialize by property function benefit from an acute understanding of the market segment that they serve. Through experience, they learn how to streamline their operations and reduce costs while generating maximum revenues from a given number of square feet, or dollars invested, in a project. For example, some companies specialize in the operation and leasing of shopping malls, whereas other companies focus on self-storage facilities or office buildings.

Because the real estate industry has traditionally been highly localized, many industry participants specialize in just one geographic region or locale. For a company to own and operate a property that effectively competes for tenants, it must have an intimate understanding of the local market characteristics. These attributes include demographics, location, surrounding facilities, vacancy rates, zoning restrictions, local taxation, and future economic expectations. For this reason, very small firms that concentrate in their own community benefit from a shrewd understanding of their local market. They are also more likely to take advantage of business relationships that give them an edge in their community. Property owners that do not specialize regionally will often contract with third-party management firms that are familiar with the community in which their property is located.

Institutional Investors. Aside from the large and small property owners, operators, and lessors who have traditionally dominated the commercial market, another type of owner/operator includes subsidiaries of large institutional investors. These companies specialize in real estate ownership and operation for their parent investment com-

pany. They typically invest in many properties in various regions, often worth millions of dollars. Asset managers employed by these companies oversee the properties and are ultimately responsible for their financial performance. In many cases the asset managers contract with, and directly supervise, local property management firms that perform on-site maintenance and lease tenant space.

Also falling into this category are lending institutions. Many of these institutions became property owners/operators by default as the developers to which they loaned money during the 1980s failed to meet their debt obligations.

Professional and Trade Organizations. There are several professional and trade organizations involved with this industry. The Building Owners and Managers Association International was founded in 1908 and currently is headquartered in Washington, D.C. Its activities include lobbying on legislative and regulatory issues, conducting training programs for property administrators, and establishing industry standards, such as the Standard Method of Floor Measurement. The International Facility Management Association, located in Houston, Texas, focuses on the management of the work environment. It conducts research, provides educational services such as facility manager certification programs, and sponsors international conferences and networking. The Institute of Real Estate Management, which includes both residential and nonresidential real estate, also provides educational services such as property manager certification and began establishing international partnerships with developing nations in the mid-1990s.

BACKGROUND AND DEVELOPMENT

Commercial real estate ownership in the United States is made possible by real property laws that govern land and property rights and conveyances. These laws were originally based on English property laws that developed between the tenth and the twentieth centuries, and were mimicked in America as early as the seventh century. U.S. real property laws differ from English law, however, in that they vary significantly from state to state and even from city to city.

An important feature of real property laws in the twentieth century has been the emergence of social control, which has limited the freedom of property owners to use and develop land in a manner that does not serve the public good. Social control has manifested itself in eminent domain, zoning laws, and police regulations. The concept of eminent domain implies that an owner's land may be taken away by government decree, against the owner's wishes, for a use that serves the public. Similarly, zoning laws restrict the functions for which owners can use their property. The 1926 case *Village of Euclid v. Ambler Realty Co.* established the first zoning laws. The third form

of social control is police regulation, by which a property owner can be directed by the state to take a specified action regarding his or her property. This concept gained momentum in the case of *Miller v Shoene* in 1928.

Industry Growth. The commercial real estate operation and leasing industry became a force in the American economy beginning in the 1950s. The rapid expansion of the U.S. economy, population, and workforce generated an unprecedented demand for office buildings, retail centers, commercial recreational facilities, and other types of real estate developments. Throughout the 1960s and early 1970s the amount of nonresidential property owned and operated for commercial profits continued to grow at a brisk rate, often averaging more than one billion square feet in new space per year.

Just as important to the industry as the demand for new properties, however, was the availability of capital for new ventures. In fact one distinguishing characteristic of the U.S. real estate industry is that its growth has traditionally been driven by the amount of capital available to fund new projects, rather than by market demand. This phenomenon is largely a result of favorable tax laws that have artificially boosted returns on commercial real estate investments.

The 1980s Boom. The commercial real estate industry realized the greatest expansion in its history in the mid- and late 1980s. Owners and operators of real estate, as a group, rapidly expanded their holdings and attained enormous profits during this period. The total square feet of new commercial space developed, owned, and managed increased from an average of about 700 million per year from 1981 to 1983 to more than 1 billion between 1984 and 1989.

This boom occurred despite only a moderate surge in the market demand for new real estate developments. Several factors accounted for the massive growth. Financial reasons included the deregulation of U.S. savings and loan associations (which ultimately ended in disaster when many of these associations folded after poor investment practices); an absence of bank investment alternatives, tax shelters, pension fund growth, and investment in real estate; and an influx of foreign investment dollars. Nonfinancial factors that encouraged overbuilding in the 1980s included the growth of office-based employment, increasing employment of women outside the home, the growth in office space required per worker, the oil price bust in the mid-1980s, and explosive population growth in several states.

The 1990s Bust. By 1989, investment capital dried up, tax laws had changed, and the U.S. economy had stagnated. Property owners and operators started to suffer from the consequences of overbuilt markets. By 1990 the amount of new real estate developed fell from a six-year

average during 1984 to 1989 of one billion square feet per year to less than 600 million square feet in 1990. High vacancy rates and diminished profits plagued owners and operators who were struggling to meet mortgage payments on their distressed properties. In addition, owners were often unable to sell their properties—even for a moderate loss—because property values had collapsed. As a result of these problems, many owner/operators were forced out of business as lenders took over their bankrupt properties.

Four major implications for the commercial property ownership and operation industry resulted from the 1980s boom and subsequent bust. The first was an increase in the ownership of properties by large institutions and a decrease in ownership by local companies that had a personal interest in management of their property. The second was the emergence of owners who sought short-term investments rather than long-term profitability. A third outcome was overbuilding, especially in office space, and the ensuing fall in effective rent rates. Finally, the collapse of lending institutions strained by nonperforming real estate loans left the industry with reduced access to capital for development and renovation, projects that the market demanded in the early 1990s.

In 1993, commercial real estate remained one of the weakest sectors in the U.S. economy. In 1992, vacancies had reached record highs, averaging more than 19 percent in the nation's business districts. As a result, owners continued to charge less rent. For instance, rent per square foot for Class A office space fell from an average \$21.81 in 1991 to \$21.44 in 1992. In addition, many owners offered large incentives to lure and keep tenants, such as several months of free rent, free parking spaces, and free space renovations. Most large institutional investors continued to receive poor investment returns from their real estate portfolios.

Owners sustained their search for capital to renovate or develop properties. Under a provision of the Federal Deposit Insurance Corporation Improvement Act, which became effective December 19, 1992, many lending institutions were pressured to avoid any loans that could be construed by regulators as risky. Other regulations, such as the risk-based capital standards, were tightened early in 1993, further constricting the flow of capital available to owner/operators.

Property owners also started to recognize the financial implications of the Americans with Disabilities Act, which became effective in 1992. This act mandated that owners of most newer buildings provide reasonable access to their properties for disabled people. The Act included thousands of regulations stipulating such details as elevator button heights, bathroom sink dimensions, door widths, and the type of locks that could be used on door handles.

In response to these and other market forces that were exerting downward pressure on profits in 1993, owner/operators sought ways to reduce operational costs, increase their marketing effectiveness, and improve customer service. They used more advanced financial reporting methods, hired more highly educated and experienced property managers, and developed customer service programs.

By 1997, the overall market for nonresidential real estate had changed drastically. At that point the market could be viewed in three different segments: the office segment, the industrial segment, and the retail segment. Of the three, the office and industrial segments made great strides toward recovery; only the retail segment continued the slump of the early 1990s.

As the U.S. recession began to end in 1992, the economy responded by producing 8.7 million new jobs from 1993 through 1995, many of them in high technology and corporate services firms. As a result, by the beginning of 1997 office space occupancy stood at the highest level in a decade. Financially solid investors (unlike many in the 1980s) began to pour capital into new construction, particularly in suburban areas where costs of operation are lower, traffic and parking are less troublesome, and safety and quality of life are more appealing for many employees. Grubb & Ellis' 1996 Real Estate Forecast estimated that suburban office space accounted for 75 percent of the office demand since 1990. Suburbs around cities like Boston, Atlanta, Houston, and Los Angeles began to blossom with new office construction. Even Phoenix, which was devastated by the savings and loan crashes, increased its office occupancy rate from 70 percent in 1990 to almost 90 percent by the beginning of 1997.

The industrial segment likewise saw a great resurgence by 1997. Industries producing goods experienced a surprising rebirth during the economic upturn of the mid-1990s. As a result, demand for warehouses, research and development facilities, and similar facilities jumped. A new generation of investors emerged, including real estate investment trusts (REITs), which entered this market along with private investors, corporate owners of property, and pension fund investors. Dallas, Portland, and Chicago led in the warehouse market; the "Sunbelt" led the light assembly market; and Boston and Seattle led the research and development market. The trend was toward larger, consolidated facilities, although many existing small facilities were being taken over by start-up companies. Industrial parks also began to grow in both size and number.

The one segment unable to recover in the mid-1990s was the retail segment. Reasons for this depressed condition were numerous: slow retail sales, retail bankruptcies and consolidations, poor management, overly leveraged investments, and a general oversupply of retail proper-

ties. Companies as diverse as Barney's and Caldor's reached a crisis point in 1996, although some chain operations such as Staples and Wal-Mart continued to prosper and plan for expansions. There was an increase in urban retail development because many suburban markets had become overbuilt.

The closing years of the 1990s saw even the retail segment of the nonresidential market sharing in the good times fueled by the long-running economic boom.

Data from the U.S. Bureau of the Census showed that lessors of nonresidential buildings generated revenues of more than \$38.1 billion in 1997. The bureau reported in its 1997 Economic Census that more than 31,000 establishments were actively involved in this market in 1997. They employed a workforce of 145,317 and had a total annual payroll of \$3.8 billion.

The growing popularity of electronic commerce presented the nonresidential real estate market with new challenges as the new millennium dawned. It became increasingly clear that management companies would have to adapt to e-commerce to survive. Analysts predicted that for those who were quick to make the transition, the rewards would likely be stronger growth, increased market share, and new business opportunities. The key to success would be the ability to be more flexible, innovative, and nimble than their competitors.

CURRENT CONDITIONS

During the early 2000s, a weak economy had affected the commercial real estate market. Corporations scaled back employee rosters, cut back on spending, and delayed expansion efforts. As growing numbers of workers were displaced, consumers also delayed purchases as confidence levels fell. Fortunately, the industry did not suffer the severe downturn that occurred during the early 1990s. Investment levels remained strong, as real estate provided better returns than many stocks. According to the April 2003 issue of *Mortgage Banking*, research from the CCIM Institute and Landauer Realty Group, Inc. revealed that commercial property investments reached their second-highest level in eight years during the third quarter of 2002, climbing to \$13.79 billion. The number of transactions also reached near-record levels, climbing 33 percent from the previous year.

Overall, signs of recovery became evident within the last half of 2002, although some real estate segments fared better than others. Hit hardest was the office segment. While some analysts suggest that a vacancy rate of about 8 percent is manageable for this portion of the industry, *Mortgage Banking* reported that vacancies rose from 10.2 percent in third quarter 2001 to 15.1 percent a year later. Estimates from Chicago-based Real Estate Research Corp. (RERC) projected that rates would likely reach 18 percent by the end of 2002, and then remain

between 17 and 18 percent during 2003. The office market was not expected to improve significantly until about 2006. Among the factors contributing to a slow recovery were rising property tax and insurance levels.

The industrial sector fared the best, according to *Mortgage Banking*, and was expected to recover more quickly as general economic conditions improved. Vacancy rates increased from 9.5 percent in the third quarter of 2001 to 11.4 percent a year later. In early 2003 it was estimated that vacancies within the retail sector were approximately 13 percent, up from 9 percent a few years earlier. Because of a weak retail sales forecast, this segment of the industry was expected to improve slowly through 2004 as vacancy rates moved toward the 10 percent mark and rent levels gradually increased.

One major development affecting the industry in the early 2000s was the terrorist attacks against the United States on September 11, 2001. Following the destruction of the World Trade Center in New York, insurance companies largely removed terrorism coverage from the so-called "all-risk" policies that cover commercial buildings. By early 2002, virtually no insurance companies offered coverage for terrorist acts, and those that did charged astronomical rates.

To address concerns within the industry, President George W. Bush signed the Terrorism Risk Insurance Act of 2002 into law on November 26, 2002. According to the U.S. Department of the Treasury, the legislation established "a temporary Federal program that provides for a transparent system of shared public and private compensation for insured losses resulting from acts of terrorism, in order to protect consumers by addressing market disruptions and ensure the continued widespread availability and affordability of property and casualty insurance for terrorism risk. In addition, it will allow for a transitional period for the private markets to stabilize, resume pricing of such insurance, and build capacity to absorb any future losses, while preserving State insurance regulation and consumer protections." In effect, this new law helped to alleviate fears about investing in commercial real estate ventures.

INDUSTRY LEADERS

Among the major players in the nonresidential real estate market in the early 2000s were Simon Property Group, Inc. (formerly known as Simon DeBartolo Group); the Rouse Co.; General Growth Properties, Inc.; Trammell Crow Co.; and Kimco Realty Corp.

Simon, based in Indianapolis, is North America's largest operator of shopping malls, including among its properties the massive Mall of America in Minnesota and the Forum Shops at Caesar's Palace in Las Vegas. With 4,020 employees, Simon posted 2002 revenues of \$2.4 billion. Another major force in the retail real estate market is Rouse Co. of Columbia, Maryland, which has been

responsible for the development of such retail centers as Faneuil Hall Marketplace in Boston and New York's South Street Seaport. As of 2002, Rouse employed 3,453 workers and reported sales of \$1.1 billion.

The nation's second largest owner/operator of shopping malls after Simon Property Group, General Growth Properties, Inc. is headquartered in Chicago. The company, which employs a workforce of more than 3,800, posted 2002 revenues of \$1.1 billion. Dallas-based Trammell Crow Co. is one of the country's most successful commercial real estate management companies. With more than 7,000 employees, Trammell Crow posted 2002 revenues of \$653.6 million. Kimco Realty Corp., headquartered in New Hyde Park, New York, had interests in nearly 500 properties in 41 states as of early 2003. Kimco reported 2002 sales of \$557.1 million.

AMERICA AND THE WORLD

In light of the global slowdown during the 1990s, many American property owners and operators sought to enter potential growth markets in emerging European, Asian, and Central American countries. For instance, Trammell Crow Co., Tishman Speyer, and other large real estate firms pursued new projects in Berlin. Athens and Brussels also offered potential for American investment in European properties. Mexico was another bright spot for American real estate companies early in the decade. Markets in developing economic areas such as the former Soviet Union and China presented great potential during the early 2000s.

The most significant international factor affecting property owners/operators in the United States was the decline of foreign investment in U.S. real estate, which began in 1991. This contributed to plummeting real estate values, which destroyed much of the equity that owners had in their properties. Although foreign investment peaked in 1990 at \$34 billion, it fell to a fraction of that amount in 1991. The Japanese, for instance, invested \$16.5 billion in U.S. real estate in 1988, compared with just \$5 billion in 1991. Even a rise in the dollar against European currencies in 1992 was not enough to buoy the market for foreign capital.

As the decade progressed, foreign investors became more interested in re-entering the U.S. market, particularly in suburban areas. For example, P.P.M. America, Inc., which is associated with Prudential of the United Kingdom, bought a 305,000-square-foot suburban Atlanta office building in 1996 for \$32 million.

The North American Free Trade Agreement (NAFTA) and General Agreement on Tariffs and Trade (GATT) also affected certain U.S. industries. The textile industry in the southeast was adversely affected when companies moved operations outside of the country and closed production facilities in the United States. New

business, however, has been generated in cities bordering Canada and Mexico, such as Detroit and El Paso, thus increasing the need for nonresidential space.

SIC 6513

OPERATORS OF APARTMENT BUILDINGS

This category includes establishments primarily engaged in the operation of apartment buildings. Apartment buildings are defined as those containing five or more housing units.

NAICS CODE(S)

531110 (Lessors of Residential Buildings and Dwellings)

Operators of apartment buildings are responsible for a valuable asset: income-producing real estate. Their goal is to preserve the asset and increase its value over time through proper management techniques, while generating current income. It is a common misconception that operators of apartment buildings merely collect rent, show apartments, and sign leases. In reality, the operation of an apartment building is far more complex. This is why many owners of apartment buildings contract with a

professional property management firm to oversee management of their property and maximize its value.

Property managers act as the agent of the owner of the property and have a wide variety of responsibilities. They market vacant apartments to prospective tenants and establish rental rates in accordance with local conditions. They negotiate and prepare leases, collect rents, hire maintenance personnel, and handle the bookkeeping (taxes, mortgages, insurance) for the property. The property manager must also prepare reports for the owner concerning all aspects of the apartment property. Effective management of apartment buildings, from small buildings to very large apartment complexes, thus requires expertise in business management, real estate, finance, and accounting.

Early Apartment Operators. The demand for effective management of apartment buildings began in the late nineteenth century, in large measure because of two inventions that would change the face of urban real estate. Creation of the steel frame building and the electric elevator made possible the advancement of high rise apartment and office buildings, changing the urban landscape forever. Construction of multi-family apartment buildings certainly contributed to this transformation.

The depression of the 1930s had a profound effect on the evolving property management profession. Numerous failures and foreclosures during this era placed much of the nation's real estate in the hands of institutions: trust companies, insurance companies, banks, and other organizations. A large number of income-producing properties thus fell into the hands of corporations. While some of these corporations formed their own property management firms, many quickly realized that responsibilities involved more than simply collecting rent payments and selecting tenants. As the need for more specialized expertise emerged, the industry gained strength in numbers and stature.

CURRENT CONDITIONS

Today the professional apartment management firm must have a comprehensive understanding of the economic forces at work in the real estate market. Operators must be able to realistically evaluate the property in light of the real estate market, forecast its potential for the future, and construct a management plan to maximize the building's potential market value, while remaining flexible to the demands of the ever-changing real estate market.

Most property managers handle several buildings simultaneously. Managers also negotiate contracts for security, trash removal, landscaping, and janitorial services for common areas. If the building has other facilities, such as a swimming pool, tennis courts, health facilities, parking areas, or a golf course, maintenance and repair contracts for these areas must also be secured. Managers oversee all repairs and maintenance of the property. At a

larger property, they hire personnel to maintain the facility's heating, ventilation, and air-conditioning systems and perform routine maintenance and repair work.

In the late 1990s, investing in apartments was considered low risk. The market was evenly split between those interested in selling and those interested in buying. The relative stability of the apartment marketplace made it an attractive investment for those interested in purchasing real estate. The demographics of the renter's marketplace are shifting towards older couples who want less responsibility than required of a house and more childless couples who do not always need a large house. Also, there is money to be made in ancillary services, such as allowing companies to use rooftops for transmission antennas or making a deal with local cable operators.

In 1999, there were 59,718 establishments in the United States, employing 267,784 employees. Annual sales for this industry was approximately \$36 billion. Prominent companies involved in apartment building operation in the late 1990s included Wilmac Corp, a private company out of Pennsylvania; its annual sales figures were nearly \$1.2 billion. Holding the number two spot was Connecticut-based Avalon Properties Inc., with annual sales at \$1 billion. The third largest company, in sales, was Forest City Enterprises of Cleveland Ohio; in 1999 its sales were \$633 million.

SIC 6514

OPERATORS OF DWELLINGS OTHER THAN APARTMENT BUILDINGS

This industry includes establishments primarily engaged in the operation of dwellings other than apartment buildings. By definition, such dwellings contain four or fewer housing units. This industry does not include hotels, rooming and boarding houses, camps, and other

lodging places for transients. Hotels and motels are classified in **SIC 7011: Hotels and Motels**; rooming and boarding houses are classified in **SIC 7021: Rooming and Boarding Houses**; and camps are covered in **SIC 7032: Sporting and Recreational Camps**.

NAICS CODE(S)

531110 (Lessors of Residential Buildings and Dwellings)

Bixby Ranch Co. of Seal Beach, California, which placed second in the industry with 1998 sales of \$82 million, found itself embattled with residents in its home town who opposed a 218-acre development that started out as a golf course plan and grew into a combined housing and shopping center plan. Residents expressed concern over increased traffic and pollution resulting from the commercialization of its community, preferring a housing-only development. Bixby pointed out several compelling arguments defending its position: first, the Bixby family owned the land since 1875; second, the project passed the scrutiny of a thorough environmental impact review as well as city council approval; and third, that the commercial interests will bring in revenue and create jobs in the depressed economy.

Gertrude Gardner Inc. of Metairie, Louisiana led the industry with sales of \$222 million for its fiscal year ended September 30, 1998. Indianapolis-based Gene B. Glick Company generated 1999 sales of \$74 million, and New York City-based Time Equities Inc. placed fourth in the industry with 1998 sales of \$28 million.

This segment of the real estate industry is small—worth an estimated \$3.5 billion by the mid 1990s—primarily populated by individual owners of rental properties (generally houses). Large chains or companies are a relatively small presence, typically limited to regional influence. As an established, albeit minor, element of the larger real estate industry in the United States, establishments involved in this industry are influenced by the same economic and social factors that impact the largest real estate property management firms. The U.S. Census Bureau estimated some 9,000 establishments in this category in the early 1990s.

As the U.S. economy surged, beginning in 1992 and continuing into the new millennium, rental properties in general became more appealing to small investors, both companies and individuals. Individual investors began to put more capital into investment properties even though federal tax changes in the late 1980s had limited deductions on investment property. Many of these individuals sought small properties in which to invest so that mortgages would be manageable or not necessary.

An example of a company that capitalized on this trend in the late 1990s is the Burnett Financial Group,

headquartered in Edina, Illinois, near Chicago. Burnett was ranked as the country's fourth largest real estate brokerage in 1995. In early 1997, Burnett opened a subsidiary, Burnett Property Management, which had several functions. It handled traditional rental properties, particularly for small investors who did not want to perform all of the management functions such as screening tenants and making emergency repairs. It also provided property management services for people who were temporarily leaving the area or who had to move before they could sell their single-family residences.

income-producing properties and manufactured-home communities throughout the United States and Canada. Of these, approximately 24,000 consist of at least 50 to 75 rental home sites per property.

Increasingly, mobile homes are approaching the average size and amenities of conventional housing units, as the share of mobile homes consisting of multiple sections has grown. Mobile homes are coming into direct competition with conventional units, especially as more double-wide units are built.

The industry remained generally unsophisticated in the 1980s in comparison to other sectors of the housing ownership and operation industry. However, during the 1990s, it underwent a transformation based on its significant affordability advantage over single-family, site-built housing. As a result, the manufactured housing industry accounts for about a 33 percent share of new homes.

ORGANIZATION AND STRUCTURE

Land owners who get permission from local zoning authorities can develop a mobile home park with a relatively small investment. The only significant costs involve bringing utilities—including water, gas, sewerage, and electricity—into each site and developing automobile access within the park. For parks that are unpaved, improvement costs are negligible compared to the costs associated with traditional site-built housing communities. Because there are so few barriers to entry, the mobile home operation industry has traditionally been dominated by small companies. According to the 1996 Allen Report on the Largest Community Owners, 500 major multiple-property portfolio owners control about 15 percent of the total property count and one-third of the investment-grade manufactured-home communities.

How the Industry Operates. Mobile home buyers can choose "singlewide" homes that average 980 square feet in size, or "doublewide" multisectional homes, averaging 1,440 square feet. Some new multisectional homes also allow "triplewide" structures. Although residents usually rent their lots, most buy their dwellings. The standard purchase agreement allows the dealer a markup of 20 percent to 25 percent over the wholesale price of the home. The dealer sometimes arranges financing of the home through the manufacturer, though banks finance most mobile homes. Additionally, the dealer usually assumes responsibility for delivering the home to a community and installing it on a lot.

Many local authorities have used zoning laws to ban mobile home parks, restrict their size, or relegate them to the least desirable parts of a community. With supply constrained, occupancy rates have historically remained above 90 percent, which compares favorably with apartment buildings.

SIC 6515

OPERATORS OF RESIDENTIAL MOBILE HOME SITES

This category covers establishments primarily engaged in the operation of residential mobile home sites. Establishments primarily engaged in the operation of sites for overnight or transient use for travel trailers are classified in **SIC 7033: Recreational Vehicle Parks and Campsites**.

NAICS CODE(S)

531190 (Lessors of Other Real Estate Property)

INDUSTRY SNAPSHOT

Mobile homes account for about 6 percent of the total U.S. housing stock. There are an estimated 50,000

Turnover of mobile home residents is very low — only 5 percent for the actual homes and 10 percent among homeowner-renters who generally sell their homes in place before relocating. Turnover is so low because today's larger single-section and multisectional homes are quite difficult and expensive to move. Rent in manufactured housing communities is typically one-third that of nearby townhouse apartments.

In addition to mortgage payments to the manufacturer of their home, most mobile home park residents pay rent to their community owner/operator. Monthly rent typically ranges from \$100 per month, although high-end developments with amenities usually charge more than \$200 per month. In about 30 percent of communities being developed in the early 1990s, operators also arranged to sell lots to residents as part of a condominium. Some offered 99-year leases on lots, which effectively amounted to buying the parcel.

One reason park owners and operators do not allow residents to buy lots is that they may be able to sell the land for higher prices in the future. In fact, many land owners operate mobile home parks with the specific intent of eventually converting, or selling, the property for a more lucrative purpose as it becomes more valuable.

Regional and Demographic Variations. Profiles of typical mobile home parks differ principally by region and by the age and economic status of its residents. For instance, some communities cater to retirees, offering smaller lots for smaller homes. Other communities cater to families and provide big yards, more parking, and amenities that appeal to children such as swimming pools and playgrounds. Developments designed to appeal to low-income residents offer small lots, few amenities, and unpaved streets. Conversely, most communities aimed at the upscale segment of the market provide paved streets and sidewalks, recreational facilities, large lots with lawns, wooded public areas, off-street parking, and adequate outdoor lighting.

Regional differences result from variations in housing prices, as well as demographics. Parks in the Midwest, Southeast, and Northeast are characteristically traditional. They are usually arranged in grid patterns, are more apt to appeal to low-income residents that are elderly or childless, and charge monthly rents for lots. Mobile home communities in western states and in Florida, on the other hand, are more likely to appeal to families and middle-income residents. These developments also are more likely to have curved, paved, and wooded streets. They also offer more financing options to their tenants, such as condominium or lease-to-buy arrangements.

The migration of population to the Sunbelt has been one of the most significant factors that affect mobile home output and sales. More than 50 percent of mobile homes

sold in the 1990s were in the South. The Midwest and West absorbed 20 percent and 16 percent, respectively, while the Northeast accounted for only 8 percent of home placements. Western states had the highest proportion of multi-wide units as well as the highest average unit price.

BACKGROUND AND DEVELOPMENT

Uniquely American, the mobile home operation industry emanated from the invention of recreational trailer-coaches in the 1930s. During this early stage, mobile home parks were designed to serve temporary guests who needed a place to park their trailer for a short time. By 1940, more than half of all trailers were being built for permanent housing, and parks began serving permanent, as well as overnight, tenants. The industry gained public recognition when the government bought large numbers of mobile homes to house servicemen and defense workers during World War II. This led to mobile homes becoming an acceptable housing alternative in the 1950s when a national housing shortage left many people out of the housing market. As site-built houses caught up with demand in the 1960s, mobile home operators began offering facilities for larger, comparatively luxurious homes.

In the 1970s, two factors spurred growth of mobile home parks. First, productivity advances in manufactured housing technology allowed mobile homes to become increasingly price competitive with other types of housing. For instance, the average price of a manufactured house, including land development costs, increased from \$18,000 in the mid 1970s to \$27,800 by 1990. During the same period, the average cost of a site-built house jumped from \$44,000 to \$150,000. Second, the development of larger, more luxurious homes changed the public perception that mobile homes were temporary housing trailers. Many newer mobile homes in the 1970s offered central air-conditioning, covered parking, and garbage disposals. Also, since 1976, manufactured homes have been required to meet a federal preemptive building code known as the National Manufactured Housing Construction & Safety Standards Act. This code ensures a high level of product quality and allows manufactured housing to cross state lines for siting in almost any locale.

A number of changes have occurred within the manufactured-housing industry during the past two decades. In the early 1970s, nearly 80 percent of manufactured homes were in manufactured home communities. Today, half of the new, larger manufactured homes are placed on privately-owned, scattered building sites and into housing subdivisions. Second, few new manufactured-home communities were developed in the past two decades, and existing ones are nearly full—averaging a 94 percent occupancy in 1995. Furthermore, where vacant rental sites exist, they often can't accommodate today's larger manufactured home.

New manufactured-home production has gone through a boom and bust cycle. In 1973, the industry shipped 579,960 homes. This fell to only 212,690 home shipments in 1975. In 1994, 303,932 homes were shipped—the first year since 1974 to top 300,000 homes. In 1995, 339,601 homes were produced.

The Allure of Mobile Home Communities. The greatest appeal of manufactured housing for most residents is that it offers many of the advantages of home ownership at a cost comparable to renting an apartment. Most residents in manufactured housing communities have their own yard and parking space. They also are allowed to add personal amenities to their property—such as shrubs, covered parking, decks, and storage sheds—that would not be allowed at most apartment complexes.

Mobile homes are comparatively inexpensive in comparison to traditional site-built homes because they are built entirely in factories. With drywall construction, brand-name appliances, and other quality features, multisectional manufactured homes are often indistinguishable from site-built, single-family houses. These multisectional houses have increased from 28 percent of total manufactured home shipments in 1980 to 50 percent in 1996. In 1994, multisectional manufactured housing cost \$27.41 per square foot. The average cost of site-built houses was almost twice as much, \$54.65. Mobile home community residents also benefit from low maintenance, attractive financing terms, and tax advantages. Manufactured homes are usually easy to trade-in, move, or sell.

The traditional residents of mobile home communities are either first-time home buyers, between the ages of 25 and 44, or elderly retired people. While these groups benefit from cost advantages, disadvantages entail limited appreciation in property values and minimal land use rights. Insurance rates for manufactured homes are typically 10 percent to 20 percent higher than those of site-built homes because of increased wind and fire risks. Furthermore, residents of mobile home parks often are alienated from surrounding communities because of the negative image associated with manufactured housing.

By the late 1990s, demand for manufactured housing has been boosted by considerably more favorable public regard for the units, as well as by various economic and demographic factors. After suffering for many years from a poor public image, manufactured home builders have upgraded the quality of their product offerings.

The industry has been focusing on selling manufactured homes and sites as a unit. The Federal National Mortgage Association (Fannie Mae) buys and secures residential mortgages on manufactured housing, as long as the house and land are sold together in a single transaction.

Another factor making manufactured homes a more desirable living alternative has been the long-term trend toward producing larger multisectional units. In the 1980s, 80 percent of new manufactured homes produced were single-section—12 to 14 feet wide by 50 to 60 feet long. At the century's close, only a slight majority were single-section, and even these were larger than they previously were at 16 to 18 feet wide and 70 to 80 feet long.

Rising consumer acceptance, favorable demographics, readily available credit, and a slowdown in low- to middle-income apartment construction should keep demand relatively strong. The relative affordability of manufactured housing is helping the group to build market share versus conventional, site-built homes. Manufactured housing represents almost one-third of all homes built in the United States. Furthermore, the industry has significant growth possibilities due to the replacement of the large number of older manufactured homes coming to the end of their useful lives.

Industry Trends. Although many mobile home operators still catered to traditional buyers in the mid 1990s, most newer developments tried to attract more sophisticated residents. As a result, manufactured housing developments grew larger and more expensive and began to resemble site-built communities, rather than traditional trailer parks.

Trend-setting states, including Washington and California, broke new ground in the industry, and operators in other states hurried to follow their lead. California operators lured residents with larger developments, larger lots, aesthetic neighborhood designs with woods and lakes, and recreational amenities. These changes reflected the fact that in 1990 fewer than 20 percent of Californians could afford site-built housing, compared to 50 percent who could afford manufactured housing in a park.

Between 1980 and 1990, the average density of mobile home communities in California fell from 10 to 6 units per acre and the average lot size nearly doubled to 4,800 square feet. During this same period, the number of larger multisectional units in California housing parks increased 100 percent, to nearly half of the market. Furthermore, 80 percent of new mobile home sites being developed in the 1990s were “family projects.” Most of the homes in these new projects had three or more bedrooms, a site-built two-car garage, a large front lawn and back patio, and used traditional building materials such as roof shingles and aluminum siding.

An important change taking place in trend-setting markets like California has been the profile of the mobile home operator. While most manufactured housing site operators in traditional markets such as the South are small operations, site owner/operators of newer developments are more likely to be larger, traditional tract hous-

ing developers. These developers use manufactured homes to reduce costs and speed product delivery in an effort to lure more traditional, and wealthy, home buyers. These communities differ from traditional mobile home parks because the homes are more permanent and are usually sold on-site.

Financial Markets. One factor which increased the popularity of mobile home communities during the 1990s was financial market activity that provided easier financing for manufactured home buyers, as well as more capital for community owner/operators.

In the 1980s, The Government National Mortgage Association, The Federal National Mortgage Association, and the Federal Home Loan Mortgage Corporation all offered secondary markets where lenders could sell portfolios of mobile home loans. The secondary markets were only available for loans on houses that were permanently attached to their lot and were sold as one transaction. Throughout the 1990s, these secondary markets increased the popularity of larger, more modern mobile home parks that sell homes on-site.

Another source of financing for the mobile home park industry in the capital-starved economic environment of the 1990s was locally sponsored tax-exempt bonds. Recognizing the need for affordable housing and the advantages that properly planned manufactured housing communities could deliver, cities increasingly tried to create a friendly political environment for mobile home operators. One way of doing this was to help owner/operators finance new developments that would serve the local community. Beside issuing tax-exempt bonds to finance new projects, some cities also eased zoning restrictions and created agencies to help residents in buying units and lots in mobile home developments.

A third source was the real estate investment trust (REIT). In 1992, real estate mogul Sam Zell arranged to sell a 64 percent stake in Manufactured Home Communities Inc., a Chicago operator of 40 mobile home parks in 16 states, as part of an REIT. Three other major operators of mobile home parks followed Manufactured Home Communities in forming REITs: ROC Communities Inc. of Englewood, Colorado; Sun Communities of Farmington Hills, Michigan; and Chateau Properties Inc. of Detroit, Michigan.

INDUSTRY LEADERS

Chateau Properties is a self-administered, self-managed real estate investment trust that owns, manages, and leases 47 manufactured-home communities with 20,003 sites in Florida, Michigan, Minnesota, Illinois, and North Dakota. Chateau also owns lands next to some of its communities containing an additional 1,495 expansion sites. Of the 43 properties, 36 have 200 or more sites,

with the largest having 1,423 sites. Occupancy rates average more than 90 percent, with monthly rents averaging about \$265.

In 1996, Chateau merged with ROC, forming the largest company in the manufactured-housing communities industry. Chateau executives said one of the advantages of the merger would be geographic diversity, making the combined company less vulnerable to regional economic shifts. Also, ROC owned a lot of land that could be developed, allowing for expansion of the consolidated company. The merger was approved despite a lawsuit by Manufactured Homes trying to block the deal. Manufactured Homes had earlier bid \$400 million for Chateau.

Sun Communities, Inc., a real estate investment trust, owns and operates 79 manufactured housing communities containing about 28,800 sites in eight states, primarily in the Midwest and Southeast. In addition, the company has nearly 2,000 potential expansion sites. The overall occupancy rate is more than 90 percent, with average rents of about \$220 per site.

Other industry leaders included Ellenburg Capital Corp. of Clearwater, Florida, which generated sales of \$52 million for the fiscal year ending June 30, 1995, according to the most recent information available on Infotrac. Outdoor Resorts of America Inc. of Nashville, Tennessee, generated \$15 million in sales for its fiscal year ending March 31, 1999. Outdoor Resorts created its own niche in the market by catering to mobile vacationers traveling in recreational vehicles. Company president and CEO E. Randall Henderson Jr. predicted in 1996 that motor home resorts would grow 250 percent over the next decade. Outdoor Resorts already operated 16 such resorts, including its premiere \$55 million Outdoor Resorts Palm Springs RV Country Club.

SIC 6517**LESSORS OF RAILROAD PROPERTY**

Establishments in this classification are primarily engaged in leasing railroad property.

NAICS CODE(S)

531190 (Lessors of Other Real Estate Property)

This industry consists of lessors of new and used rail car equipment (both single and double-stack), locomotives, and often, as part of the lease agreement, the refurbishment and maintenance of these items. Rail cars are categorized as grain cars (covered hopper cars most often carrying grain), boxcars, gondolas, and intermodal cars, which carry products in a trailer or container. Three types of leases are common: short (which includes per diem), middle, and long term.

Rail property lessors primarily provide transport of such commodities as grain; farm products; metallic ores; coal; crushed stone; nonmetallic minerals; grain mill products; food and kindred products; primary forest products; lumber and wood products, pulp, paper, and allied products; stone, clay, and glass products; military equipment; and waste and scrap materials.

The railroad industry is subject to complicated safety, environmental, structural, and financial regulations. A deregulation movement in the 1980s resulted in loosened restrictions that had a positive impact on the vigor of the leasing industry. Deregulation permitted negotiated, rather than statutory, freight rates and terms. This trend culminated in the abolition of the Interstate Commerce Commission (ICC) effective January 1, 1996; in the process some regulatory functions were eliminated altogether. Prior to 1996, the ICC was a key regulatory agency overseeing the industry; in its demise the remaining functions—those that were not abolished—reverted to the U.S. Department of Transportation. The Federal Railroad Administration within the Department of Transportation deals with safety issues surrounding the industry, rehabilitation of rail passenger services, consolidation of federal funding, and support of research and development. The Association of American Railroads, a trade organization, represents the interests of the vast majority of Class I railroads, including the leasing of railroad property, through legislative activity and support. The Equipment Leasing Association of America represents the equipment leasing and finance industry in general, including many railroad lessors.

Railroad property leasing is highly competitive, as lease agreements are often sought by several lessors. Competitive pricing strategies, technological advancements in equipment, and issues of the compatibility of

advanced information systems are areas of competition among lessors. At the center of the financial health of railroad property leasing is a lively debate about whether railroads should lease or buy their own railcars and locomotives. Opponents of leasing tout the tax advantages of owning rail property. Lease proponents, however, cite the ability to use equipment without incurring additional long-term debt, as well as the lack of maintenance costs. Valuation issues also influence the industry; end-of-lease and early-buy-out prices determine if lease offerings are competitive against full purchase. A poor economy generally bodes well for railroad property lessors because railroads do not invest capital to buy new equipment in lean times. Primary competition to railroad property lessors comes from direct railroad equipment purchases, as well as from aircraft lessors, who experienced vulnerability to competition at the end of the 1990s because of failures on the part of the airline companies. Additionally, at the turn of the twenty-first century, expansion into foreign markets remained an option not fully explored. The passage of the North American Free Trade Agreement (NAFTA) combined with the privatization of the Mexican railroads presented fresh opportunity for a slumping U.S. railway economy to experience renewed growth.

A cyclical atmosphere propels the economy of the entire railroad industry. Thus, despite NAFTA, poor airline performance, and a vigorous U.S. economy in the late 1990s, a cyclical downturn plagued the railroads. The normal tendency toward slowdown, combined with poor performance at the customer level brought the entire industry to an economic low. Blame for the situation went largely to poor on-time service by all major railroad lines. Yard congestion and disruptions of service attributed to persistent merger activity by the railroad companies, and poorly integrated computer systems contributed to the downturn. Loadings remained stagnant throughout the late 1990s. Only the rail fleet remained stable at 1.17 million cars in 1999, just under the 1996 peak of 1.2 million. Mergers characterized the industry at the turn of the century. Among the industry leaders, Westinghouse Air Brake and Motive Power merged late in 1999. The two corporations combined to offer a diverse assortment of railcar and locomotive component services. Two months later, in mid-January of 2000, The Greenbrier Companies Inc. of Lake Oswego, Oregon, expanded its European operations with the acquisition of the Freight Wagon Division of Daimler Chrysler Rail Systems GmbH of Berlin (Adtranz). The Greenbrier fleet included 33,000 cars, and the addition of Daimler Chrysler introduced an \$82 million (U.S. dollars) catalog of wagons to Greenbrier's European selection.

Other prominent rail car and locomotive lessors include Chicago Freight Car Leasing Company of Rose-

mont, Illinois; First Union Rail, also of Rosemont; and GE Capital Railcar Services of Chicago.

do not engage in the enterprise conducted on their land. More than 12,000 establishments were engaged as lessors of real property in 1997. They employed some 37,620 employees and generated \$5.54 billion in revenue.

Real estate lessors bring together owners of land and people who are looking for property on which to conduct a certain business activity. They benefit their clients by providing expertise about locating, appraising, and conveying legal rights to property. In contrast to real estate brokers, lessors arrange the conveyance of property rights for a limited time rather than permanently transfer ownership; however, lease agreements are often made for as long as 100 years.

Lessors in this industry are typically entrenched in a specific market niche. A company that specializes in leasing timberland, for example, would have knowledge of timber rights, tax codes, logging practices, and other factors specific to that industry. When it matches a land owner with a compatible lessee, the leasing company helps the two parties negotiate terms and secure a legally-binding agreement. Land holding companies often find clients and handle lease arrangements themselves.

In addition to specializing by property function, many real estate lessors focus on one locale or region where they accrue an in-depth knowledge of local zoning codes, demographics, and land values. As a result of geographic and functional diversification, the industry is highly fragmented. In fact, most companies classified in this industry had fewer than 100 employees and sales of less than \$10 million in the mid 1990s.

The real estate leasing industry saw rampant growth during the mid twentieth century. Besides general economic expansion that boosted leasing activity, the emergence of eminent domain and other real property controls vastly increased the complexity of land rights and transactions. Likewise, property lessors enjoyed an unprecedented business boom during the mid 1980s. By the late 1980s, however, a virtual depression in most real estate sectors pummeled many industry participants. Going into the mid 1990s, most segments of the leasing industry were still trying to recover from continued economic malaise.

As the economy rebounded and interest rates remained low from 1993 through 1996, the real estate market in general also improved. Demand for most positions in the real estate industry increased and was expected to rise by 10 to 20 percent between 1994 and 2005, according to the Bureau of Labor Statistics. Demand was expected to be greatest for leasing agents with financial and computer skills. Although salaries varied by region and specialty, experienced property lessors in the mid 1990s typically earned commissions of \$50,000 to \$100,000 per year.

In 1995 and 1996, a series of large-scale leasing transactions reflected the positive economic outlook.

SIC 6519

LESSORS OF REAL PROPERTY, NOT ELSEWHERE CLASSIFIED

This category covers establishments primarily engaged in leasing real property, not elsewhere classified.

NAICS CODE(S)

531190 (Lessors of Other Real Estate Property)

The lessors of real property industry encompasses companies that own and lease, or only lease, to other organizations land used for airports, sports facilities, commercial timber operations, some types of lodging, and natural resource excavation. Industry participants typically

When Denver opened its new \$5 billion international airport, the older Stapleton Airport became the target of redevelopment that included short-term leasing agreements. The airport's 60 existing buildings (including offices, hangars and the terminal itself) were put on the leasing market in 1995, and a third of the 1.5 million square feet of space was quickly rented to new lessees. Incentives by the city, such as options for extensions of the short-term leases (limited to five years) and credits to tenants for making improvements, were a major enticement to potential tenants.

In 1996, the Cross Timbers Oil Company sold its Tyrone gas plant (spanning a field in Oklahoma and Kansas) to Nations Bank Corporation and BancBoston Leasing Investments, Inc. for \$28 million. The leasing companies then leased the plant back to Cross Timbers under an eight-year renewable lease. Cross Timbers seized on this lucrative opportunity in order to reduce the debt level it had accumulated earlier in the decade. Also in that year, Bethlehem Steel Corporation sold a major West Virginia coal mine to A.T. Massey Coal Company of Virginia. The sale to Massey, the fourth-largest U.S. coal producer, included mineral rights to the West Virginia mine as well as the leasing of other mining facilities. Another owner of mining land, United Park City Mines Company of Utah, no longer conducts mining operations itself but instead develops, leases, and sells Utah real estate. Over half of its 8,300 acres of surface land is leased to ski facilities.

A brief run-down of several companies indicates the breadth of the industry in the late 1990s. Airport Group International Inc. of California leases airport real estate and generated \$250 million in operating revenue in 1998. Calcasieu Real Estate and Oil Company Inc. of Louisiana is a lessor of oil and gas mining property that garnered \$897 million in operating revenue in 1998. Real estate leases generated \$397 million in operating revenue for Miller-Valentine Group of Ohio in 1998. Leasing of coal fields generated \$28 million in operating revenue for Pocahontas Land Corp. of West Virginia in 1997. Tulsa Metal Processing Co. of Arizona generated \$15 million in sales in 1998 through the leasing of industrial land and offices.

SIC 6531

REAL ESTATE AGENTS AND MANAGERS

This classification includes establishments primarily engaged in renting, buying, selling, managing, and appraising real estate for others.

NAICS CODE(S)

- 531210 (Offices of Real Estate Agents and Brokers)
- 813990 (Other Similar Organizations)
- 531311 (Residential Property Managers)
- 531312 (Nonresidential Property Managers)
- 531320 (Offices of Real Estate Appraisers)
- 812220 (Cemeteries and Crematories)
- 531390 (Other Activities Related to Real Estate)

INDUSTRY SNAPSHOT

Real estate agents and managers assist people who are purchasing, selling, leasing, financing, and building places to live. The industry also includes agents and managers who work on commercial real estate, including high-rise office buildings, shopping centers, industrial plants, ranches, medical centers, museums, and theaters.

The real estate industry employs hundreds of thousands of full- and part-time workers in the United States, including real estate agents who assist buyers and sellers of property, mortgage brokers who assist with financing, leasing agents who lease residential and commercial real estate, property managers who manage the property of others, appraisers who analyze the fair market value of property, and developers who build new structures. In 2001, there were approximately 2.3 million real estate agents with licenses in the United States.

The overall health of the real estate industry is closely intertwined with swings in the economy. As businesses grow, they generally acquire more real estate to expand their plants and hire more workers. The supply and demand of available homes, office buildings, and other real estate are strongly influenced by the availabil-

ity of financing for developers who develop land into residential and business properties. Thus, during periods of tight credit and declining economic activity, real estate activity is low. Changes in tax laws and interest rates also have a great impact on the real estate industry.

ORGANIZATION AND STRUCTURE

Real estate is a service business involving a variety of professionals who act in concert to bring about the purchase, sale, financing, leasing, or construction of property. It can involve residential real estate, commercial real estate, industrial property, agricultural land, or vacant lots.

Real estate brokers or agents generally earn their income from commissions on the purchase, sale, or leasing of real estate. In most states, a real estate broker holds an advanced license and manages an office of real estate agents. The agents have less experience and work under the supervision of a broker. When the agent earns a commission, it is usually split between the agent and the supervising broker. The term "realtor" is a registered term belonging to the National Association of Realtors, and only brokers and agents who belong to the organization may use the term.

Homeowners usually consult one or more real estate agents when trying to sell a home. The agents discuss with the homeowners the price at which the property might sell, develop their plans for marketing the property, outline the strengths and weaknesses of the property, and determine how the property compares to other homes on the market. The seller then selects one agent to market the property and represent his or her interests when it comes to negotiating a contract of sale. The agent and the seller sign a contract authorizing the agent to act on behalf of the seller and market the property, in exchange for a specified commission upon the sale of the property. If a buyer is not found for the property, the agent does not receive any commission.

Likewise, buyers of residential real estate generally contact one or more agents to scout neighborhoods for homes fitting their requirements in terms of size, price, location, and amenities. The agent then represents the buyer in negotiating a contract and assists in obtaining inspections of the property by experts, such as structural and termite inspectors, and may assist the buyer in obtaining a mortgage loan.

Some real estate agents are relocation specialists and work primarily to assist individuals who are relocating to another geographic area. They must have extensive knowledge of school facilities and other neighborhood attributes in order to properly serve their clients. They are sometimes paid by an employer that is relocating its employees.

Commercial real estate agents work in a similar fashion when the purchase or sale of commercial property is

contemplated. This could include nearly any type of property used in a business. Commercial real estate agents' knowledge must include those factors of special concern to businesses, including available housing for employees, school facilities for employees' children, and the availability of an appropriate labor force.

Leasing commercial real estate is another area in which many real estate agents are employed, particularly in major metropolitan regions. The leasing agent's purpose is to keep the building fully occupied while obtaining the highest possible rental rates. This job requires the agent to have a thorough knowledge of the rental rates in the local market and to keep abreast of anything that may affect the market. Local laws affecting real estate development and rent control laws have significant impact on the real estate market, and agents must also be knowledgeable of any changes in such laws.

Leasing procedures vary, but the agent generally receives a commission based on the total value of the lease. The longer the lease term, the higher the commission. Office leases generally are for longer time periods than residential leases, often having a term of 3 to 15 years. The leasing agent must advertise the property and use every possible sales tool when leasing a brand-new property, as it is important to the owner that the building be rented as quickly as possible without long exposure in the marketplace.

A large branch of the real estate industry involves managing property owned by others. Leasing commercial property is often one of the functions of a property manager. The modern-day property manager acts as an adviser and agent of the owner and is primarily concerned with establishing rental rates, advertising and leasing the property, and negotiating leases. Property managers also collect rents; make sure that mortgages, taxes, insurance premiums, and other bills are paid; act as liaisons to tenants; and make sure the building is maintained in good working order. They supervise and hire the building staff and may contract for janitorial, engineering, security, and refuse services. They often do the bookkeeping for the property and prepare periodic financial reports for the owner. Owners of office buildings, shopping centers, apartments, and other income-producing properties usually hire a real estate firm to manage the property.

The appraisal of real estate values is a specialized segment of the real estate industry. An appraisal might be done to determine the value of a home that an individual wants to sell, or it may be done at the request of a lending institution that is considering providing a mortgage loan to a prospective buyer. Appraisers use accepted methods to determine the value of a piece of property and generally express an opinion on the fair market value, insurable value, or investment value of the property. Real estate appraisers visit the property, search public records, and

interview those with knowledge about the property and the surrounding community, taking into consideration the structural quality and overall condition of the property. Any trends in real estate or imminent changes in the community that could influence the value of the property are also taken into account when appraising the property. Many appraisers specialize in particular types of property, such as residential properties, commercial office buildings, or shopping centers.

The real estate industry experienced strong growth during the last half of the 1990s, spurred by low interest rates for real estate loans. From the beginning of 1997 until the middle of 1998, home sales grew each quarter. However, confidence in both the residential and commercial segments of the market began to drop in the second quarter of 1998. According to a survey by the Federal Deposit Insurance Corporation (FDIC), this change was largely attributed to assessments that conditions were unchanged from the previous quarter, rather than improving, as had been the case throughout the previous year. Expansion in the field responded to these trends, with 13 percent of residential real estate firms opening new offices in 1998, whereas only 3 percent shut down an office.

Like many other industries in the 1990s, the field of real estate saw its share of acquisitions and mergers among the larger firms. Still, small, local establishments remained the norm. In 1999, 83 percent of the firms in the field operated from only one office, and 60 percent of them had five or fewer agents. Only 22 percent of real estate establishments were affiliated with a regional or national franchising operation.

There also has been a strong move toward diversification of business activities, as well as toward providing services beyond those of the traditional agent/broker roles. Many of the largest real estate firms have begun offering their clients title insurance, mortgage loans, and similar extended services. Brokers and agents who represent only buyers of real estate also have been growing in numbers and are represented by the National Association of Exclusive Buyer Agents.

Real estate brokers have also benefited from using the latest in computer technology. Basic information about all of an agency's listings are routinely placed on office computers. In addition, real estate advertisements, complete with photographs and listing information, began to appear routinely on Internet sites in the mid-1990s. About 64 percent of residential real estate agencies had listings on REALTOR.COM, sponsored by the National Association of Realtors, in 1999.

CURRENT CONDITIONS

In 2001 there were approximately 2.3 million licensed real estate agents, an increase of 10 percent from 2000 and the first large increase in 15 years. One reason

for the increase was that the housing market was strong in 2001 and 2002, while others sectors struggled in the weak economy of that time. Continued low interest rates—at one time the lowest in 40 years—combined with housing affordability and a gradual turnaround in the economy were other major factors for this sector's success.

There were a record 5.3 million existing homes sales in 2001—the highest level since 1968, when sales tracking began—while estimates showed that 2002 existing home sales would break that record with 5.31 million. During the economic boom of 2000, existing home sales were 5.15 million and home ownership peaked that year, with 67.7 percent of Americans owning homes. New home sales in 2002 were estimated to decline by 4.4 percent. The median existing home price was forecast to rise 5.1 percent in 2002 to \$155,300, while new home prices were expected to climb 6.1 percent to \$184,700.

Analysts predicted that existing home sales would level off somewhat in 2003, with an estimated 5.34 million home sales, and decline the following year, with a predicted 5.27 million existing homes sales in 2004. Interest rates were a factor in these declining numbers, as they were forecast to gradually rise as the economy improved. Fixed-rate interest rates dipped below 6 percent in 2003 but were expected to climb to nearly 7 percent in 2004.

More consumers are using the Internet as a tool in the home-buying process. According to the National Association of Realtors (NAR), 41 percent of buyers use the Internet to narrow down home choices. One study in California showed that 46 percent of Internet buyers, the largest segment, were non-Hispanic whites who also made up 60 percent of traditional buyers. Asians made up 30 percent of Internet buyers and accounted for 19 percent of traditional buyers. Hispanics made up 18 percent of Internet buyers and 16 percent of traditional buyers. Native Americans and African Americans accounted for 6 percent of Internet and 5 percent of traditional buyers.

INDUSTRY LEADERS

Although real estate agencies tend to be local operations, a few national and multinational firms generate a large volume of business. Cendant Corporation is the largest corporation involved in the field, owning both Century 21 and Coldwell Banker, the number one and number three agencies in the field. Century 21 operates more than 6,500 offices worldwide, whereas Coldwell Banker has more than 3,200 franchised brokerages. Cendant generated more than \$14 billion in total revenue in 2002. RE/MAX Realty, based in Denver, also has a large presence, with more than 4,500 offices in more than 40 countries worldwide.

WORKFORCE

Every state and the District of Columbia require that real estate brokers and agents be licensed. They must

complete educational courses in the fundamentals of real estate and pass a written examination. Appraisers of property financed by federally regulated lenders must be certified within their states.

The real estate industry employed 408,000 agents, brokers, and appraisers nationwide in full- and part-time employment in 1996. Most of these people worked on a commission or fee basis rather than as employees. Many real estate agents begin working part-time because of the intermittent income the work provides. Though agents are essentially independent contractors, most are affiliated with a nationally known or local brokerage firm. By 2001, there were a record 2.3 million agents holding licenses, up 10 percent from 2000 and the first major increase in 15 years.

As sales commissions can be high on many properties, successful real estate agents can earn large amounts of money. However, only a small percentage of agents actually do so. The median annual income for full-time agents, brokers, and appraisers was \$31,500 in 1996. Half of these workers received between \$20,500 and \$49,700. The number of agents, brokers, and appraisers employed was expected to grow more slowly than other occupations through 2006. Still, 778,500 people were expected to be working in the field by then, an increase of nearly 90,000 from 1997. Opportunities also exist in this area due to the high turnover characteristic of the profession.

There were approximately 271,000 real estate managers in 1996, most working for property management firms, development companies, banks, government agencies, and other entities. There also was a large group of self-employed developers, owner-managers of buildings, and operators of building management firms. Approximately 40 percent of property managers were self-employed in 1996. No formal certification or licensing was required except for managers of federally subsidized housing, who had to be state-certified. Many other managers completed training programs that included certification by the sponsoring organization, such as the Institute of Real Estate Management (IREM).

The National Association of Realtors reported that the average associate earned \$41,000 as of 2002. Although growth in the field was booming in 2001 and 2002, growth in this field was expected to be average through 2006, partly because of the rise in Internet use among homebuyers. Increased demand for managers is expected in commercial and residential real estate, as trade continues to expand and new housing construction continues the trend of creating homeowner associations for residents. Employers of real estate managers are expected to increasingly turn to hiring college graduates with degrees in business administration and fields related to real estate.

AMERICA AND THE WORLD

The U.S. real estate industry taps the market within the former Communist countries of eastern Europe, such as Russia and Hungary, where ownership of private property is now legal. Beginning in 1993, the IREM began to enter into partnerships with real estate associations in those countries to help in the training of real estate personnel and the adoption of national standards. By mid-1996, there were 28 such partnerships in effect. The IREM also had partnership arrangements in Canada, Mexico, Singapore, and Spain. The National Association of Realtors was conducting similar activities in eastern Europe and entered into agreements with five countries—Bulgaria, the Czech Republic, Hungary, Poland, and Russia—at its annual convention in 1996. In addition to industry-wide efforts such as these, individual firms are entering the real estate markets of other countries. In 1998 Coldwell Banker began entering into franchise arrangements with brokers and agencies in Mexico.

SIC 6541

TITLE ABSTRACT OFFICES

This category covers establishments primarily engaged in searching real estate titles. This industry does not include title insurance companies, which are classified in **SIC 6361: Title Insurance**.

NAICS CODE(S)

541191 (Title Abstract and Settlement Offices)

Title examiners, also known as title abstractors, are responsible for researching, analyzing, and evaluating the legal ownership or title to real property. Whenever real estate is bought, sold, or financed, a search of title records is required to ascertain all persons who may claim legal ownership in the property. A title search may also be required to fulfill the terms of a will in distributing property, to subdivide land into smaller parcels, or to obtain a building permit. Persons who acquire land generally want to purchase property that is free from competing claims of ownership, delinquent taxes, and other legal headaches that can devalue the investment. Even buyers who purchase land despite such potential problems generally want to be made aware of any defects in the chain of title when making a bid. Title examiners review the chain of title for a number of defects, including liens on the property, easements, rights of way, water and mineral rights, and other encumbrances. Title examiners are typically employed by title insurance companies, land development companies, and state and local governments.

The common practice of recording real estate transactions with an official recorder or registrar began in colonial Massachusetts and quickly spread across the country. Every state now keeps some form of public record that identifies formally-documented property rights. In some states county governments are charged with the duty of maintaining official property records, while in other states municipal governments have been given the responsibility. But almost every locality categorizes and indexes the information in a slightly different fashion. Title abstracts are prepared to reflect these public records, often by the examiner himself. Title examiners then usually search the chain of title from the most recent owners to the oldest. When there is a gap in the public records, examiners must do additional investigative work to complete the chain of title.

Additional investigation may include a search through miscellaneous public filings that could cloud title to land, including records relating to marriage, divorce, birth, adoption, and other legal proceedings. Plat drawings, metes and bounds descriptions, land books, and zoning ordinances may also help title examiners in completing a chain of title and removing possible defects. After the search has been completed and all documents reviewed, title examiners prepare a title report that describes the property's legal title and lists any existing encumbrances, competing rights, or conflicting claims. Title examiners occasionally assist in preparing a legal description for property as well.

The total number of title examiners and searchers was approximately 28,000 in the mid 1990s. The employment outlook for title examiners is expected to experi-

ence little change through the year 2005. The number of real estate sales and increasingly complex real estate transactions is also expected to fuel an increased demand for practitioners. Training is typically acquired on the job, and lasts between one and two months. Despite this seemingly short apprenticeship, the industry has been under pressure to improve standardization.

The American Land Title Association (ALTA) is the primary professional organization in the industry, with more than 2,400 members, sales of approximately \$3.7 million, and a net worth of \$6.2 million in 1997. ALTA members include title insurance agencies, title examiners, and attorneys. Based in Washington, D.C., ALTA and its members are also involved in numerous other aspects of the residential real estate business. They provide credit reports, escrow services, flood certifications, and relocation services.

All four of the nation's leading title insurance companies have created title examination divisions: First American Title Insurance Co., Land America Financial Group, Chicago Title Corp., and Fidelity National Title each reported profitable title examination operations in the late 1990s, which contributed to the strength of the industry as a whole as it entered the new millennium. These title companies were also searching for other ways to expand their businesses, developing profit centers for a better bottom line, adding appraisal services, and increasing automation.

But not all expansion in the industry has been encouraged by the government. Certain proposed mergers and acquisitions have raised federal antitrust concerns. In 1996, Commonwealth Land Title Insurance Company proposed to consolidate its title plant operations in the District of Columbia with those of First American Title Insurance, its only competitor in the market. The next year Commonwealth terminated existing contracts with customers and required them to sign interim deals under which they would pay higher prices for title services. In 1998, the Federal Trade Commission (FTC) issued an order in response to the proposed joint venture. The FTC compelled Commonwealth to rescind all the interim deals, make refunds to customers who were overcharged, and provide services to customers based on the prices, terms, and conditions available before November 1997. Commonwealth was also required to relocate its operations and maintain them as a fully functional title plant in competition with First American.

SIC 6552

LAND SUBDIVIDERS AND DEVELOPERS, EXCEPT CEMETERIES

This category includes establishments primarily engaged in subdividing real property into lots, except cemetery lots, and in developing it for resale on their own account.

NAICS CODE(S)

233110 (Land Subdivision and Land Development)

INDUSTRY SNAPSHOT

Real estate development is a multifaceted industry. It includes the purchase of vacant or raw land, its subdivision into small parcels, and the construction of residential single-family houses, condominiums, or apartment buildings. It includes construction of retail shopping centers, industrial plants and warehouses, office buildings, schools, prisons, hospitals, and almost any type of structure. Additionally, it includes the renovation or restoration of warehouses to loft apartments or offices and the construction of parking garages. Generally land development and subdivision falls into three categories: rural, urban, and suburban.

The value of new construction put in place in 2001 totaled \$842.5 billion, of which \$650 billion was used for private construction. Of that total, \$388.7 billion was directed toward residential buildings, and \$201.1 billion was used for nonresidential purposes, including commercial, office, and industrial buildings. Although almost all non-commercial sectors showed growth over a five-year period, expenditures on new office space more than doubled between 1995 and 2001, from \$23 billion to \$49.6 billion.

The beginning of the twenty-first century was marked by low interest rates that provided an historically strong housing market. New-home sales totaled nearly 950,000 in 2002, down slightly from a record of just over 975,000 in 2001. Housing starts in 2002 stood at 1.71 million, with the same expected for 2003. An unsettled political situation with Iraq in early 2003 threatened to impact the U.S. economy and investors worried about the economic impact of prolonged U.S. involvement that might lead to higher interest rates and slow the growth in the real estate market.

ORGANIZATION AND STRUCTURE

In the twenty-first century, land developers coordinate a battery of activities necessary to carry out the development of land into useable space. Developers typically purchase a tract of land, devise a building program, obtain government approvals and financing, and then set about to have the structures built. After the building is complete, the developer may sell all or part of the property, or keep it on account and manage the property by leasing space to tenants. There are nearly as many different scenarios as there are developers.

Successful development firms operate under a variety of paradigms, including that of niche developer, such as Francesco Galesi of the Galesi Group. Galesi, a global corporation, developed 900 million square feet of space in the twentieth century. Galesi purchased the land from the General Service Administration (GSA) of the United States government and developed the acreage into strategically located distribution centers for military supply depots, some capable of holding 20 or more railroad cars. The company's operating cash flow exceeded \$12 million annually by the end of the 1990s. Likewise, industry leader Simon Property Group led the real estate industry in North America by the end of the twentieth century through extensive investment in the shopping mall arena.

Among the leading developers' associations, the 15,000-member Urban Land Institute encourages effective urban planning and studies new area development.

BACKGROUND AND DEVELOPMENT

Real estate development in the 1990s underwent a dramatic change from previous decades. Several factors spurred long-range change in the real estate development industry, including a severe economic recession in the early 1990s that affected many geographic regions of the United States. In 1991 a Census Bureau study found that 57 percent of all families were unable to afford a median-priced home in their community, a circumstance that led developers to increase construction of apartments and other multiple dwellings over single-family residences. Beginning in 1993 an overall surge in the American economy and growth in housing starts enabled develop-

ers to obtain financing and accomplish this purpose. Also at issue were the overbuilding of office and commercial space in many U.S. markets and tax changes stemming from the Tax Reform Act of 1986 affecting the desirability of real estate as an investment vehicle. A crisis in the savings and loan industry, associated with a record number of bank failures, aggravated the situation. Restrictive lending policies emerged as a result of government intervention. New policies and increased government regulation affected the time and cost involved in obtaining government approvals.

Thus, land subdivision and development is a highly speculative industry involving complex processes. Subdividers and developers incur both fixed and variable costs in the process of creating single-property lots for individual sale from large parcels of acreage. It is the ability of the developer to absorb all costs within a reasonable margin that determines the success of each venture. Developers fund not only the variable development costs to prepare the individual lots for retail sale, but also the many fixed costs associated with the building of streets, sewage conduits, and other elements critical to the infrastructure of the development. Additionally there are government levies for extended infrastructure costs. These assessments, called development contributions or “impact fees,” contribute further to the cost of development.

For assistance with crucial cost determinations, subdividers turn to professional appraisers, yet the element of risk cannot be underestimated. Through careful analysis of the total costs of development in comparison to the potential retail value per lot, development firms speculate on an amount of land to purchase—based on salability—and develop accordingly, in order to maximize profit. Market survey results often provide indicators of the potential retail sale price of each. Surveys and investigations provide additional data regarding the existence of competing projects in the immediate geographical area, along with the potential impact of such projects. Overall, the timeliness of a proposed construction project figures keenly into the risk assessment, as does the creativity of the developer in designing a salable residential or business community. After comprehensive appraisal of risk and cost factors, the subdevelopment process moves into the hands of lenders. With appropriate financing, the subdivision project becomes a matter of civic and legal issues, and the process of obtaining approvals and licensing ensues before construction begins.

Construction and Sale as a Function of Property Development. The actual construction of the subdivided lots is crucial to the development process. Subdividers and land developers commonly include home and office construction within the scope of their respective business operations. Likewise many developers support sales,

leasing, and property management services for convenience and to expedite the development process. In a report in *Appraisal Journal*, Robert Owens of Southeast Missouri State University in Springfield intimated that the developer’s ability to pre-sell lots and to build a significant proportion of the developed lots might be a crucial factor contributing to the success of a development. Marketing is a key aspect of the development process. Most states do not require developers to hold real estate licenses, but marketing of the property, particularly to out-of-state buyers, must conform to state guidelines. According to Owens, convenient access to a sales force frequently enhances the developer’s potential for success on a venture.

Syndication. Some development arrangements, called syndication, involve groups of individual investors who pool their money. Investors sometimes contribute to a development venture in exchange for part ownership of the developed property, while others act strictly as lenders. A real estate specialist, called a *syndicator*, sponsors or manages the syndicate and maintains an active role in overseeing the development of the project. The function of syndication commonly overlaps with the role of the developer.

Causes for Concern. In the late 1990s, ongoing expansion by developers into rural areas raised concerns about the rapid conversion of rich farmland into “tar and cement,” especially in the American Northeast where American Farmland Trust, an activist group, attracted media attention to the circumstance. Also of concern was the alleged destruction of historic Iroquois villages in order to claim land for residential subdivisions in New York and Canada. In defense of developers, the Ohio Home Builders Association refuted such claims, noting that the amount of land taxed at agricultural rates actually increased for four years during the 1990s. A mounting crisis condition, called urban sprawl, nonetheless plagued communities and developers alike. Such growth was typified at Sioux Falls, South Dakota, which experienced rapid growth during the late twentieth century. The population increased from 72,000 in 1970 to 116,000 in 1996. During the same period the total urban area increased from 27 square miles to 50 square miles, and by the year 2015 projections held that the community would grow to support a population of 156,000.

Increasingly commonplace as a means to combat the rapid encroachment of urbanization on farmland was the implementation of urban growth boundaries (UGB) that confined developers to operate within strict geographical boundaries. The UGB system, originally supported by the National Association of Home Builders (NAHB), lost favor in time, as the practice led to tight housing markets, with skyrocketing costs for new homes. As land prices tripled in some urban areas, while UGB restrictions re-

mained firm, buyers moved into outlying areas, exacerbating rather than alleviating the condition of sprawl, and generating long-range traffic congestion in the process. The development community responded to the crisis with smaller lot sizes, increased pressure to expedite boundary expansion, and increased cooperation toward devising new solutions. Also active in the ongoing efforts to find new solutions are the California Building Industry Association (CBIA) and American Planning Association (APA). Areas of particular concern to NAHB in the late 1990s as a result of UGB restrictions included Portland, Oregon; Washington, D.C.; and Boulder, Colorado. Likewise, in California, builders reported that only 130,000 homes could be built each year in a market capable of supporting 250,000.

Also of concern was significant overdevelopment of property, both commercial and residential, throughout the 1990s. Of greatest concern were specific situations in Texas, Georgia, and Illinois. In Dallas, Texas, developers continued with new expansion, despite rising office vacancies that approached 20 percent in mid-1999 along the Dallas North Tollway, up from 9 percent in the prior year. Also, in Illinois, one Chicago suburb reported new construction vacancy rates as high as 15 percent. Analysts expressed similar apprehension regarding specific locations in Atlanta, Georgia, and Houston, Texas. Concerns in Atlanta focused on a reported 17 percent office vacancy rate along a major highway corridor near the northern suburb of Buckhead. Additionally, the Houston, Texas, district known as the “energy corridor” suffered from waning demand for office space through the end of the 1990s, as an ongoing reaction to the earlier oil bust in the 1980s.

Optimistic Prognosis. Ongoing issues notwithstanding, building conditions in the 1990s and at the turn of the twenty-first century were improved over conditions in the 1980s. Based on U.S. Bureau of the Census statistics on housing starts, January of 2000—with 1,775,000 starts—was the third highest month in over 20 years, when the monthly average for the year was 2,020,000 in 1978. The Housing Market Index (HMI), which reflects the confidence of the home-building profession in the long-term market, increased steadily from 38 in January of 1995, to 71 in January of 2000, with only minor slowdowns along the way.

CURRENT CONDITIONS

Low interest rates during the first years of the twenty-first century allowed many Americans to become homeowners, driving the real estate market. This, in turn, caused a slow down in multifamily housing occupancy, such as apartments. The decline in interest rates has particularly affected the high-end rental units as more renters became owners. Yet, investors, unable to resist the low

interest rates themselves, continued to build apartment complexes even though existing complexes were well below capacity, hoping to fill units with young adults, traditionally the highest demographic of apartment dwellers. Vacancy rates as high as 8 to 10 percent (compared to just 3.8 percent during 2000) are not out of range before the economic slowdown in the United States is reversed. Yet multifamily dwellings are still in high demand in some areas of the country as the overall long-term economic outlook remains strong.

During the first nine months of 2002, Atlanta had the most new apartments with 13,095 new units. Dallas/Fort Worth was second in the nation with 9,045 new units. Yet, areas hit by the downfall of the technology and telecom industries in the late 1990s and early 2000s—including Atlanta—also suffered from the highest rates of occupancy decline.

A new trend in industry and warehouse building was to move outside the nation’s five distribution hub of Los Angeles, Chicago, New Jersey, Dallas and Atlanta to take advantage of lower land and labor costs and attractive economic incentive packages offered by outlying communities. Land developers have been attracted to these high-quality properties in less populated markets to avoid the flood of investors competing in the major markets over limited land, which has been come highly valued as a more secure investment during a period of market instability.

Because real estate is valued as a relatively stable investment, compared to the stock market, the industry has become more attractive to investors during the period of uncertainty and apprehension in the U.S. economy, post-September 11, 2001 terrorist attacks and in the midst of military conflict with Iraq.

INDUSTRY LEADERS

Simon Property Group of Indianapolis, Indiana, the largest mall owner in the United States as well as one of the nation’s largest publicly traded real estate companies, manages over 240 properties, equaling some 18 million square feet, in 36 states. Assets total more than \$14.9 billion. In 2002 the company posted a net profit of \$561.6 million on revenues of \$2.4 billion. The majority of Simon Property holdings are shopping malls, including the largest mall in the United States, Minnesota’s Mall of America. Simon purchased Corporate Property Investors in 1998 for 33.5 percent growth and that year reported revenues of \$1.4 billion.

Another major force in real estate development, with 11 percent ownership of Simon Property Group, is the Edward J. DeBartolo Corporation. This firm, started in 1948 by Edward DeBartolo in Youngstown, Ohio, is a leading builder and operator of enclosed shopping malls across the nation. DeBartolo’s 76 million square feet of

mall space makes up nearly 10 percent of all mall space in the country and is visited by 40 million customers each week. In addition, the company develops and operates office buildings, hotels, and office parks. Other holdings include the San Francisco 49ers football team, the Pittsburgh Penguins hockey team, and horse racing tracks in Ohio, Oklahoma, and Louisiana. DeBartolo had a keen foresight with regard to real estate trends. He foresaw the exodus to the suburbs in the 1950s and capitalized on it by developing suburban shopping centers. In the 1960s he anticipated the coming real estate boom in Florida and purchased large tracts of land there. When the boom hit, the company had one-third of its holdings in Florida. DeBartolo Realty pursued a strategy of developing one mall every year, diversified further into entertainment ventures, and went public with its real estate investment trust (REIT) in 1994. Upon his death in December of 1995, founder Edward J. DeBartolo Sr. left a diversified corporation of malls, racetracks, riverboat casinos, and sports teams, although future growth was temporarily stymied over matters of probate that endured into the twenty-first century.

Trammell Crow Company, based in Dallas, Texas, is one of the nation's largest real estate developers. Its \$14 billion portfolio of owned and managed properties approaches 500 million square feet of commercial properties in the United States, with 350 office buildings in 50 cities; 90,000 residential units; 35 hotels; and 160 shopping centers. Crow began his illustrious real estate career in Dallas shortly after World War II. An accountant who earned his degree in night school, he became successful when he joined with the Stemmons brothers, and together they built more than 50 warehouses in Dallas in the 1940s. Crow had a knack for anticipating the needs of the market and adding building amenities that appealed to his tenants. He formed partnerships with other developers and shared incentives and rewards generously with his partners. In fact, the Trammell Crow Company built a reputation both as a skilled developer and as an incubator for smaller developers. Nonetheless, in the early 1990s the depressed real estate market affected even Trammell Crow Company. Problems in the Southwest forced the company to refinance 150 properties in 1990, and new construction totaled only \$500 million in 1991, down from \$2.2 billion in 1985. By 1999 the company rebounded, maintaining 158 offices worldwide, including Canada, Europe, Asia, and South America. With 7,100 employees in 2002, Trammell Crow Company posted revenues totaling \$653.6 million for a net income of \$16.9 million.

Catellus Development Corporation headquartered in San Francisco, California, is the largest private landholder in that state. Catellus's holdings are spread throughout the western United States. The company oversees its holdings

under its property management firm, Catellus Commercial Group, and separately operates the Catellus Residential Group as a development corporation, under the auspices of a REIT. Catellus holds an estimated 15.5 million square feet of income property; 5,400 acres of land leases; and 854,000 acres of land. In 2001 Catellus reported \$480.7 million in sales, for a net income of \$96.5 million.

WORKFORCE

Land subdivision and development requires complex entrepreneurial skills and a solid knowledge base in many disciplines. Developers work with experts in many fields, including architects, builders, planners, financiers, attorneys, urban government and inspection personnel, community representatives, and investment partners. Developers must additionally acquire a thorough knowledge of every local community associated with a development venture, including the local political machinery, local economy, and local real estate markets. Local policy shifts and economy swings might affect any development project to a dramatic degree; successful developers respond with flexibility, shifting strategies abruptly in order to insure the ultimate viability of any project. Successful developers must be skilled at problem solving, which is the essence of development. They must have a clear vision and a penchant for minute details—the omission of appropriate soil tests or the wrong clause in a title insurance policy can devastate an undertaking. As master planners, developers absorb ultimate responsibility for any mistakes associated with a development project.

According to the U.S. Department of Labor Bureau of Labor Statistics, land subdivision and development industry employed 128,570 people in 2001. Management positions accounted for over 14 percent of the total industry jobs. Property, real estate, and community association managers reported a mean annual salary of \$63,010; general and operations managers, \$81,400; chief executives, \$111,010; and construction managers, \$74,200. Over 22 percent of the industry's jobs were in building and grounds cleaning and maintenance occupations. Landscapers and groundskeepers reported a mean annual salary of \$20,830. Sales-related occupations totaled nearly 12 percent. Real estate brokers' mean annual salary was \$82,490, and real estate agents' mean annual salary was \$46,170. Office and administrative support occupations accounted for over 23 percent of the industry's jobs and had a mean average salary of \$28,670.

AMERICA AND THE WORLD

Foreign real estate investment in the United States in the late 1990s was partly to blame for the overbuilding of commercial office space. Experts agreed that the U.S. economy might be several years in absorbing the many vacant office buildings in U.S. metropolitan areas, a situation further aggravated by the increasing number of U.S.

companies that shifted manufacturing operations overseas, further reducing demand for domestic facilities.

Elsewhere in the world, global real estate development occurred rapidly. Currency, regulatory, and logistics—as opposed to market demand—comprised the most significant obstacles for developers, as market risk virtually vanished. Sites in North Africa and Asia were among the more lucrative markets for land development at the turn of the twenty-first century, with the Asian nations among the most accommodating to foreign investment. In Hong Kong, residential prices rose 25 percent in the late 1990s, causing the government to seek promises from developers to concentrate on residential development over commercial sites. In the Philippines, a rapidly expanding economy resulted in a proliferation of U.S.-style residences in a near risk-free market. Capital infusions from the International Monetary Fund (IMF) to alleviate financial crises on the Asian continent further contributed to a growing interest in the Far Eastern economies on the part of astute developers. Continued restrictions meanwhile prevailed in the Arabian countries in the form of strict licensing controls on the construction and engineering trades, a condition that served to enhance the appeal of the less restrictive Asian sector.

South Korea, which revitalized its economy during the second half of the twentieth century, grew to constitute the eleventh largest economy worldwide but subsequently fell prey to the vestiges of a monetary crisis in nearby Asian countries at the end of 1996 and throughout 1997. In an effort to encourage long-term capital flow into the country and to revitalize the waning won, South Korea, like other Asian nations, embraced liberal trade policies and opened development arenas to foreign investment. Early in 1998 the seaport city of Incheon, near Seoul, announced its intent to establish an international free-trade city, open to foreign development, for the purpose of increasing industrial and distribution complexes. Also the ancient city of Taegu in South Korea's North Kyongsang Province announced in mid-1998 a plan to encourage foreign development at industrial sites within the city limits. The program permitted foreign investors to purchase and develop land for subsequent sale or lease. Taegu further proffered subsidy guarantees to foreign investors who might undertake tollways and highway bridge-construction projects.

Also hit hard by the financial crisis of the late 1990s, Malaysia rebounded late in 1999 and into the year 2000 with an upsurge in development on a variety of fronts. Sunway Masalam Sdn Berhad, a subsidiary of Sunway Holdings Incorporated, signed an agreement on December 30, 1999, to build an expansive golf resort in Selangor, including both residential and commercial property developments, to be known as the Serendah Golf Resort. The planned development, to be surrounded

by condominiums and commercial areas, was scheduled for completion in 2007. Rapid growth in nearby Kuala Selangor on the Strait of Malacca led that town to adopt a program of planned progress, in order to ensure that new development in that arena might proceed over a widespread area, and in particular to abate imminent overdevelopment in the valley town of Kelang. The city's planned growth allowed development to proceed throughout various locations in Kuala Selangor, Bukit Belimbing, Puncak Alam, and other locales. SAP Holdings Berhad and Golden Hope Berhad were among the prominent developers named as participants in the project. Also scheduled for controlled development were certain locations in the vicinity of Penang. In nonurban development, Kwantas Corporation announced an undertaking early in 2000 in conjunction with Indonesian PT Agronesia Makmur Sentosa, to develop oil-palm plantations from existing timberland on both the Indonesian and Malaysian sections of the large island.

RESEARCH AND TECHNOLOGY

In Houston, Texas, the Land Tejas Company, in collaboration with IBM Corporation, made bold strides into the age of computers by creating “intelligent neighborhoods.” In developing new communities such as its Stone Gate development, Land Tejas and IBM took technology one step farther than simple prewired Internet access for the new homes. Instead, the development partners designed the building specifications to include the installation of Category 5 telephone wire and RG6 cabling at the subdivision, in order to connect the homes via a professionally architected community intranet. The intranet at Stone Gate, scheduled to go live early in 1999, provides homebuyers with on-line access to immediate traffic conditions for their neighborhood, as well as with weather and communications links to local school administrations. After work and school, and during inclement weather, Stone Gate residents “camp in” with video-on-demand and Internet access through their neighborhood backbone cable. Home owners at Stone Gate make restaurant reservations online, collect electronic coupons for use at local retailers, and enjoy other conveniences at an estimated cost of \$1,000 per home for the cabling, plus an additional \$1,000 per home for the IBM Internet connector center.

According to industry estimates, there are 75,000 to 100,000 cemeteries in the United States. These vary in size from small plots in churchyards to huge national military cemeteries. Cemeteries may be run on a profit or not-for-profit basis. Traditional cemeteries have upright monuments, usually made of stone, and may also include private mausoleums for above-ground interment. Memorial parks, in contrast, have no tombstones, but rather bronze memorials placed level to the ground; they often have fountains, sculpture, or memorial architecture.

Natural preserve cemeteries protect and restore land, and offer natural burials also known as "green" burials. According to Memorial Ecosystems, Inc., they established their first nature preserve cemetery, Ramsey Creek Preserve, in South Carolina in 1998. According to Pam Kelley of the *Charlotte Observer*, Memorial Ecosystems offers "green" burials and only allows biodegradable caskets made of wood or cardboard and does not allow embalming.

In 1997, a small but growing percentage of cemeteries were run by large, publicly-traded firms known as "consolidators," which have operations in many states and several countries. These firms benefit from economies of scale that result from owning several funeral homes and cemeteries in a single area—a central embalming location, a limousine motorpool, and a team of personnel that can serve facilities in a given region. The companies have also built some funeral homes in or near cemeteries, which offer customers greater convenience.

The largest of the consolidators is Service Corporation International (SCI), which in 1996 had 331 cemeteries and 2,832 funeral homes, with total revenues of \$1.6 billion. The second largest, Loewen Group, Inc., had 265 cemeteries and 814 funeral homes, and total revenue of \$600 million. Both firms have been the target of strong criticism by some consumer groups, who question their prices and business practices. The companies claim that errors are no more likely to be made by consolidators than other funeral operations, and that their prices are reasonable.

The financial community views the industry more favorably. As Susan R. Little, an analyst with Raymond James & Associates, told *National Real Estate Investor* in 1996, "There's amazing opportunity in death care because it is very fragmented, and there are sufficient barriers to entry." She added that the industry is recession resistant, and that death rates are expected to climb with the aging of the "Baby Boomers." Since the six largest death care facilities own fewer than 20 percent of the funeral homes and cemeteries in the United States, the opportunity to acquire businesses that have been typically family-owned and operated is substantial.

Much of the growth of the large firms has come from the sale of "pre-need" contracts, where customers make

SIC 6553

CEMETERY SUBDIVIDERS AND DEVELOPERS

This industry includes establishments primarily engaged in subdividing real property into cemetery lots, and developing it for resale on their own account.

funeral and burial arrangements for themselves. At the end of 1995, SCI alone had \$2.3 billion in contracts for prearranged funerals. In some states, pre-need policies were tax-exempt, and thus practically served as tax shelters. Cemetery owners were also becoming more aggressive in their marketing of cemetery plots, with campaigns like the “buy one plot, get a second one for a penny,” mounted by one owner.

OFFICES OF BANK HOLDING COMPANIES

Offices of bank holding companies are primarily engaged in holding or owning the securities of banks for the sole purpose of exercising partial or complete control over the activities of those organizations. Companies holding securities of banks, but which are predominantly operating the banks, are classified according to the kind of bank operated.

NAICS CODE(S)

551111 (Offices of Bank Holding Companies)

INDUSTRY SNAPSHOT

Holding companies have played a relatively minor role in the U.S. banking industry throughout most of the twentieth century. During the 1980s and early 1990s, however, the bank holding industry experienced rapid growth and became a force in the country’s financial markets. According to the U.S. Census Bureau’s *Statistical Abstract of the United States*, bank holding companies’ financial assets tripled between 1990 and 2000.

Bank holding companies in the 1990s took advantage of their size and invested in new lines of business,

expanded nationally, and increased income from service fees. They also relied on favorable legislation, implementation of new technology, and foreign markets to increase profits. Online banking influenced the industry, allowing customers new and quick access to markets. During the 2000s, the line between banking services and investment services has been substantially blurred as banks became increasingly involved in investment-related activities.

ORGANIZATION AND STRUCTURE

Bank holding companies are essentially corporations whose assets are comprised of controlling shares of stock in one or more banks. The two principal types of companies are “one-bank” and “multibank” holding companies, which together encompass nearly all large banks. Although the majority of bank holding companies in the United States are classified as “one-bank” holding companies, most of these companies were organized to directly operate a bank, and are not, therefore, included in the bank holding company industry. The multibank corporations that make up the industry exercise varying degrees of control over the subsidiaries they own.

MBHCs earn money by increasing the scope, diversity, and efficiency of banks and bank branches. Banks and their branches, in turn, earn money by paying interest at rates lower than that charged on loans. Banks also generate revenue from such services as asset management, investment sales, and mortgage loan maintenance. Because of regulatory constraints, banks not associated with holding companies must operate under restrictions that often put them at a disadvantage compared to other financial institutions.

To overcome regulatory restraints, banks often use holding companies to circumvent legal restrictions and to raise capital by otherwise unavailable means. For instance, many banks can indirectly operate branches in other states by organizing their entity as a holding company. Banks are also able to enter and often effectively compete in related industries through holding company subsidiaries. In addition, holding companies are able to raise capital using methods that banks are restricted from practicing, such as issuing commercial paper.

Another important advantage that MBHCs have over individual banks is economies of scale. Many subsidiary banks benefit from operational efficiencies such as centralized and computerized bookkeeping, auditing, advertising, marketing, purchasing of supplies, research, personnel recruitment, group insurance and retirement programs, tax guidance, investment counseling, and other advisory services. In addition to greater access to capital, holding companies also facilitate mobility of money among their subsidiaries and allow them to spread gains and losses over all members of the holding corporation.

BACKGROUND AND DEVELOPMENT

MBHCs first appeared in the United States around 1900, when they were used to develop banking networks that were otherwise prohibited by law and custom. Most of the organizations were relatively small Midwestern operations. During the 1920s and 1930s the number of holding corporations increased as the population shifted to urban areas and rural banks sought to pool their resources. At the same time, banks in the Midwest, West, and South increased the use of holding companies to combat the threat of eastern and western banks that were expanding nationally. By 1929 bank holding companies and a few chains that resembled holding companies controlled about 8 percent, or 2,103, of all U.S. banks. They also held more than 12 percent, or \$11 billion, of all loans and investments.

Regulation Defines the Industry. After the Great Depression, the banking and bank holding industries came under intense scrutiny. Initially, the federal government regulated both industries in an effort to create a division between banking and investment activities. Later, however, regulations were used to influence the competitive structure of financial markets. In general, regulatory measures that shaped banking activities were responses to financial crises rather than the result of constructive economic planning.

Loose government regulation of holding banks ended with the Banking Act of 1933. In response to thousands of bank failures during the Great Depression, this act led to increased legislation between 1930 and 1960 that limited bank holding activity and expansion. The Bank Holding Company Act of 1956 required bank holding companies to refrain from all nonbanking related operations. It also required companies to seek state permission before acquiring banks in other states. In 1956 a total of 53 MBHCs represented 428 banks with 783 branches. They controlled about \$14.8 billion in deposits. By 1965 the number of companies participating in the industry remained at 53, although total deposit assets had nearly doubled to \$27.5 billion.

Prompted by the Federal Reserve Board, Congress enacted laws in 1966 that were designed to revive the bank holding industry by eliminating many of the restrictions enacted in 1933. These laws resulted in favorable tax provisions as well as massive industry growth between 1965 and 1970. During this period, the number of MBHCs rose to 121 and deposits in holding company banks skyrocketed to more than \$78 billion, or 16.2 percent of all U.S. bank deposits.

In 1970 new legislation was enacted that established a list of permissible activities in which holding companies could participate. One facet of these amendments to the 1956 act gave multibank companies an avenue for

significantly broadening their operations. It allowed industry participants to operate nonbanking subsidiaries across state lines even though those subsidiaries engaged in some of the prescribed bank related activities. The result was that by 1974 about 275 MBHCs controlled approximately \$359 billion in assets.

The Late 1970s and 1980s. Before the 1970s, most bank holding companies were competing against organizations within the banking industry—all of which were subject to the same legal restrictions. However, the dynamics of banking began to change in the 1970s in three principal ways that had a profound effect on the multibank holding industry: monetary policy shifted, new industries and products competed for traditional banking dollars, and new technology changed the way banks conducted business.

The shift in monetary policy was partly a result of failed regulatory policies of the 1950s and 1970s. Because the government limited rates that banks could pay depositors, banks were placed at a competitive disadvantage in relation to government securities and instruments offered by financial institutions. New investment vehicles that offered higher rates than bank deposits, such as Merrill Lynch's Cash Management Account, began acquiring deposits that would have been made to banks.

Certificates of deposit became a popular way for banks to attract more money, though at a higher cost. As the cost of money increased for banks, profit margins narrowed. To offset increased costs, banks were forced to charge higher interest rates on loans, which meant that they were assuming more risk. Furthermore, in 1979 the Federal Reserve reacted to rising inflation rates by keeping the money supply stable and allowing interest rates to vary. The net result of this move was that many banks experienced higher costs of money, or deposits, than they could earn on their loans.

The 1980s was a decade of rapid foreign expansion for U.S. and foreign banking industries. Between 1980 and 1990 the number of foreign-owned banks on U.S. soil increased from less than 400 to more than 700, including branch banks. The number reached 747 in 1992, falling slightly to 720 in 1993. Foreign banking assets in the United States also climbed during that period, from \$198 billion to about \$850 billion, accounting for approximately 25 percent of total U.S. banking assets by 1990. The majority of this expansion was concentrated in New York, California, Illinois, and Florida, and was principally conducted by Japan, Canada, France, and the United Kingdom. U.S. expansion abroad mimicked the pace set by foreign banks throughout much of the 1980s. In 1992, 120 Federal Reserve member banks were operating 774 branches in foreign countries and overseas areas of the United States, a decline from the 916 branches at

the end of 1985. Of the 120 banks, 88 were national banks operating 660 branches and 32 were state banks operating the remaining 114 branches.

In the late 1980s and early 1990s, a sluggish world economy and an ailing global banking industry slowed expansion of most holding companies. Beginning in 1988, expansion by foreign banks slowed and continued to lag into the 1990s. Many U.S. banks, in contrast, deliberately reduced activity abroad. By 1991 the number of U.S. branch banks operating abroad had fallen to 793. Of the 123 banks operating those branches, 92 were national banks that represented 674 branches; the other 120 branches were owned by 31 state banks.

The overall slowdown in global expansion by MBHCs reflected slim profit margins typically offered by overseas markets. Companies that tried to compete outside of their national borders saw lower profit margins and stiffer competition for a variety of reasons. In 1991, for instance, MBHCs in the largest industrialized nations generated domestic interest margins (net interest income as a percentage of average interest-earning assets) of 4 percent, compared to interest margins of only 2.1 percent in foreign markets. While some banks tried to improve international margins by investing in technology and consolidating operations, other competitors retrenched.

Another way in which the banking environment began to change in the 1980s was through the increase in the number of products and industries competing with banks. For economic and regulatory reasons, banks suddenly found themselves competing with pension funds, insurance companies, mutual funds, and private finance companies. Manufacturing companies with finance subsidiaries, such as General Electric and Ford Motor Company, were also vying for traditional banking dollars. These new competitors often enjoyed many of the advantages that bank holding companies offered to individual banks, such as the ability to engage in interstate activities.

New technology changed the face of banking forever in the 1980s. Electronic fund transfer systems, automatic teller machines, and computerized home banking services all transformed the way in which banks conduct business. These advances, in addition to increased automation of normal operations, reduced labor demands and hastened the trend toward larger and more centralized banking organizations. They also diminished the role that banks had traditionally played as personal financial service organizations.

Changes in monetary policy, increased competition, and new technology resulted in the general decline of the banking industry. At the same time, insurance companies increased their percentage of assets to nearly 18 percent, and pension fund holdings jumped from 13 percent to more than 20 percent of all U.S. assets. Most strikingly,

mutual funds increased their share from about 2 percent to more than 10 percent.

As competition in financial markets heated up, bank holding companies became an increasingly important factor because of the regulatory advantages favoring individual banks. Also driving MBHC growth was the erosion of restrictions on interstate banking in 1985. Legislation in that year allowed states to decide whether to allow interstate banking. By 1992, 950 MBHCs controlled more than 90 percent of all bank assets. Furthermore, the total number of individual banks declined 30 percent from 1983 to 1992 to about 10,000. In the mid-1990s, with deregulation, the largest national banks were able to move into any state and buy smaller banks to establish their presence. This trend added to the shrinkage of individual banks. In a 1994 survey of European banks by Gemini Consulting, it was predicted that within the next decade, 15 to 20 retail banks would dominate Europe. Edward Crutchfield Jr., chairman and CEO of First Union Corporation, predicted 8 to 10 institutions eventually would account for 50 to 80 percent of the nation's banking business.

In addition to consolidating operations through MBHCs, banks also began exposing themselves to more risk to maintain traditional profit margins. Although the Depository Institutions Deregulation and Monetary Control Act of 1980 (DIDMCA) and other legislation was enacted to correct many of the restrictions that limited the industry's freedom, banks continued to increase their exposure to risk throughout the 1980s.

Deregulation of banks in the early 1980s through DIDMCA and other legislative measures, in combination with higher lending risks assumed by many banks, culminated in a banking crisis in the late 1980s and early 1990s. In 1989, 206 banks failed, and another 168 failed the following year as the U.S. economy sank into recession. In response to troubles within the industry, legislators passed laws designed to impose more vigilant government monitoring of bank activities. The Federal Deposit Insurance Corporation Improvement Act (FDICIA) of 1991 was one example of this legislation.

A poor economy increased the acute profit pressures most banks faced. Holding companies became the focus of the banking industry. Many smaller and mid-sized banks found they simply could not compete in the financial environment that had developed by the early 1990s. Commercial bank loans fell slightly from \$2.3 billion in 1990 to \$2.28 billion in 1991, and dropped by 20 percent in 1995 to corporate clients. Although deposits and assets continued to increase slightly throughout the early 1990s, rising costs were placing downward pressure on profit margins. The percentage of U.S. assets held by the banking industry continued to decline to 24.5 percent by 1993. As a result, increasing numbers of banks were

merging with, or being acquired by, MBHCs to compete effectively.

Analysts suspected that relaxed federal regulation of bank-brokerage companies would lead to more traditional bank mergers in 1997. According to Michael Ancell, a financial services industry analyst at Edward D. Jones & Co., a St. Louis brokerage firm, bank mergers would be fueled “by the need to compete and the difficulty in growing earnings and investing for the future at the same time.” The 1933 Glass-Steagall Act restricted banks’ ownership of brokerages, but under the latest revision of the act, banks could derive up to 25 percent of their revenues from brokerages, up from 10 percent.

MBHCs’ Competitive Response. MBHCs were taking measures aimed at allowing their members to compete more effectively in financial markets. Some of these measures included orchestrating cost-cutting programs, centralizing and automating operations, exploring new markets, emphasizing fees from services, and trying to initiate legislation that was more favorable to their industry.

Perhaps the most important change that MBHCs brought to the industry in the early 1990s was centralized organizational control and consolidation of assets. Two-thirds to three-quarters of the banks that had merged with holding companies in 1990 and 1991 had already consolidated some or all of their systems, operations, and technical management by 1992. MBHCs were finding that they could reduce operating costs of the individual banks they had acquired by an average of 30 percent.

Much of the consolidation activity occurred among mid-sized and larger banks. It involved the transfer of a significant amount of the industry’s cumulative technology base to bigger corporations, which resulted in a major shift of management and asset control from banks in the \$250 million to \$2 billion deposit range to MBHCs with more than \$4 billion in deposits. By mid-1992 the top 150 MBHCs controlled 15 percent of all banks, 30 percent of all branch offices, and 50 percent of all deposits in the banking industry.

In addition to consolidation of assets and management, MBHCs took advantage of increased asset bases to invest in labor saving technology and to increase customer service. As banks became more consolidated, especially during the 1980s and early 1990s, the number of employees shrank. For instance, despite an increase in the dollar value of assets, loans, and investments held by banks, the number of employees in the banking industry declined from 1.54 million in 1987 to 1.5 million by 1993.

MBHCs also allowed increased activity by member banks and subsidiaries into new markets and financial products, many of which were off limits to individual

banks. Partial deregulation of MBHCs and reduction of some interstate trade restrictions were largely responsible for the new activities. Many banks positioned themselves for future success by replacing income from interest streams with fee income streams. For instance, some banks were expanding fee-based financial advisory services related to underwriting debt and equity, loan securitization, underwriting commercial paper, and treasury management. Banks also entered mortgage banking, asset management, and investment sales—activities traditionally relegated to other financial sectors.

One of the greatest areas of growth in new markets in the early 1990s was in mutual and money market fund sales, which became a viable market for banks following legislation enacted in 1987. By 1993 more than 90 percent of all banks with more than \$1 billion in assets offered mutual funds, and all banks combined accounted for 30 percent of all money market fund sales. In 1995 \$2.2 trillion was held in American mutual funds, nearly as large as the amount held in bank deposits. Few MBHCs managed funds, instead deriving fee income through leasing arrangements with broker-dealers operating on a bank’s premises. An increasing number of larger MBHCs, however, were managing their own funds—allowing them to also earn custodial, transfer agent, and advisory fees.

Despite generally favorable legislation implemented in the late 1980s and early 1990s, MBHCs still sought to remove competitive barriers many industry participants felt were outdated holdovers from the Depression era. Furthermore, some analysts believed that new federal legislation handicapped MBHCs.

Although holding companies played a relatively minor role in the U.S. banking industry throughout most of the twentieth century, during the 1980s and early 1990s the bank holding industry experienced rapid growth and became a force in the country’s financial markets. In fact, the number of MBHCs in the industry jumped from 284 in 1980 to more than 950 by 1992, with total employment surpassing 1.3 million for the top 100 companies alone. As a testament to the significance of the industry, the top 300 companies had assets of \$2.8 trillion in 1992—nearly 90 percent of the assets of the entire banking industry. In 1996, the top 10 companies employed over half a million people and had combined assets of \$1.7 trillion.

The emerging dominance of MBHCs reflects serious problems in the overall banking industry, however, as well as a basic restructuring of U.S. financial markets. Increased competition from less regulated financial services firms, stagnant growth in loans and deposits, and general shifts in monetary policy have contributed to the decline of banks. In fact, the percentage of U.S. assets held by commercial banks declined from nearly 40 per-

cent in 1970 to 24.5 percent by 1993. In 1994, federally insured depository institutions held \$5 trillion in assets, up slightly from the previous year. In 1995, \$2.7 trillion was held in American bank deposits, but the future still remained uncertain for commercial banks. Depositors realized they could get better returns than those offered by low-interest savings accounts. Nonbank lenders such as GE Capital offered cheaper credit than banks, for example. Bank loans have dropped from 50 percent of all corporate debt to less than 30 percent, from 75 percent of banks' total business to less than 60 percent. According to the 1997 Federal Reserve Bank bulletins, commercial banks had a good year in 1996, with reported strong growth, preserving high levels on return of equity and return on assets. There was strong growth of interest earning assets and delinquency, and charge-off rates stayed low for business loans but climbed throughout the year for consumer loans.

In response to an increasingly threatening environment, bank holding companies in the 1990s took advantage of their size and invested in new lines of business, expanded nationally, and increased income from service fees. They also relied on favorable legislation, implementation of new technology, and foreign markets to increase profits. Online banking influenced the industry, allowing customers new and quick access to markets. The United States banking industry in the late 1990s was estimated to be worth \$520 billion.

Restructuring Strengthens Industry. Industry consolidation and subsequent efforts by MBHCs to strengthen the banking industry began to pay off in 1991. According to one survey of the top 300 MBHCs, the banking industry was healthier than it had been in several years. MBHCs in particular showed signs of renewed strength and stability. Banking industry profits captured by the top 300 of the 950 MBHCs jumped from 63 percent in 1991 to 76 percent in 1992. During the same period the total assets of these companies increased from \$2.6 trillion to \$2.8 trillion. Moreover, these MBHCs controlled nearly 90 percent of all industry assets. Profits, too, were up. In 1996 the top five MBHCs alone had assets of \$1 trillion.

Importantly, the survey indicated that increased earnings and financial performance were the result of cost-cutting measures and market positioning, rather than the effect of temporary economic factors. Some of the nation's largest MBHCs, for instance, had jettisoned hundreds of millions of dollars worth of real estate and other nonperforming assets. Improved margins were largely a result of strengthened capital positions, geographic expansion, increases in fee-based income, and heavy investments in technology. The survey showed, for instance, that 9 of the 20 highest rated MBHCs derived at least 40 percent of their income from fees—a trend that was gaining momentum.

Future Expectations. In addition to strengthened market conditions, MBHCs in the mid-1990s were expected to benefit from a moderate rebound in overall residential and commercial lending, and increased competition, particularly from nonfinancial corporations entering the banking field through subsidiaries. The most successful MBHCs were expected to be those with innovative products and delivery systems, creating new securities by converting assets into marketable certificates, and expanding into foreign markets.

Although it was unclear what effect the Clinton administration would have on MBHCs, some companies expressed concern over specific administration policies. For example, President Bill Clinton advocated reducing or eliminating the role that private banks played in the student loan program. On the other hand, he was likely to seek a reduction in barriers to small business lending by banks and was pursuing a favorable regulatory reform package in early 1993. In 1995 the Riegle-Neal Interstate Banking and Branching Act gave national banks authority to open interstate branches by merging with existing banks or opening offices.

In the late 1990s, past deregulation initiatives continued to spur mergers and a drive by MBHCs to offer more one-stop shopping services to customers. Industry giants such as Nationsbank and BankAmerica merged in 1998, creating a new BankAmerica that exceeded Chase Manhattan in size and revenues. In the late 1990s, the banking industry had a value of \$520 billion and included 9,100 commercial banks and 1,800 thrift institutions. Though actual numbers of banks and thrifts had declined during the 1990s (due in part to consolidation and mergers), the rising prevalence of large national banking chains spurred competition in the industry to meet the needs of customers who disliked the impersonal feel of the new mega banks. Banks continued to forge ventures and to offer formerly untraditional services such as brokerage, securities underwriting, and insurance.

In 1997, changes to the 1993 Glass-Steagall legislation allowed MBHCs to own securities subsidiaries, which could contribute as much as 25 percent of sales revenue. The opportunity created more mergers; including those between Sun Trust Banks and Equitable Securities, Fleet Financial and Quick and Ready, and Bankers Trust and Alex Brown.

Online banking developments also promised to influence the industry. In 1997 it was estimated that 4.5 million households would have access to online banking. By the late 1990s, 66 percent of the top 50 banks in the United States offered computer banking from home and electronic bill paying services. The advent and increasing popularity of online banking caused one industry expert (*Knight-Ridder/Tribune News Service*, 22 April 1998) to speculate whether the megamergers so characteristic of

the industry in the 1990s were really in the public's best interest. According to this expert, the heralded "one-stop shopping" advantage of these mergers (according to the banks doing the merging) was rendered moot by the fact that customers could achieve instant access to many markets, via online home access.

CURRENT CONDITIONS

In 2003, three holding companies dominated the industry: Citigroup, Inc., Bank of America, and J.P. Morgan Chase. These companies, and their lesser counterparts, were significantly affected by the repeal of the Glass-Steagall Act, which led to the acceleration of commercial and investment banking's commingled existence. The banks were highly interested in their new ability to leverage low-margin lending into the much more profitable fee-based businesses, such as underwriting shares. According to the *Economist (U.S.)*, "For the most part, the industry leaders today are no longer banks, but financial-services companies. Their activities extend far beyond traditional commercial-banking tasks such as taking in savings and making loans. Many now engage in investment-banking activities such as underwriting bond and equity issues, advising on mergers and acquisitions and, crucially, selling on loans to other investors (by organising syndicates, buying credit derivatives that pay out in the event of a default or issuing securities bundling loans together)."

The plunge by U.S. banking institutions into investment-based services was not without pitfalls, with giants Citigroup and J.P. Morgan Chase both stumbling. In 2003 Citigroup announced charge-offs of more than \$1 billion related to allegations of irregularities in the pricing of initial public offerings. J.P. Morgan Chase also reported a charge-off in excess of \$1 billion related to the company's dealings with the bankruptcy of energy-giant Enron in late 2001. The bust of the dot-com industry also adversely affected the industry.

The general ill health of the U.S. economy darkened the skies for the banking industry in the early 2000s. A mild recession began in March 2001, but was catapulted into major economic worries by the terrorist attacks of September 11. According to the Federal Reserve, commercial and industrial loans dropped by 10 percent—\$113 billion—between March 2001 and August 2002. The economic turndown led to job layoffs, stock market degradation, and a slew of bad debts. Many of the banking industry's adventures into investment services were, in hindsight, ill advised.

Despite weak economic conditions, the moribund stock exchange, and a long list of bankrupt clients, the banking industry still remained solid on the foundations of its deposit-taking and lending services. Margins were strong during 2002, with banks charging more for its loan

services than the costs incurred to fund the loans. Earnings for 2002 were on pace to top a record \$80 billion, with many banking companies posting double-digit gains.

INDUSTRY LEADERS

Citibank, a subsidiary of Citigroup—the world's second largest financial services institution (behind Japan's Mizuho Financial) and the first U.S. bank to surpass \$1 trillion in assets—is itself the world's second largest consumer and corporate banking institution. Citibank has about 1,700 office in 40 countries, with approximately 700 located in the United States. In 2002, parent Citigroup reported a net income of \$15.3 billion on revenues of \$92.6 billion.

J.P. Morgan Chase, the nation's second largest banking system, is the result of a 2001 merger of Chase Manhattan, a retail banking powerhouse, and J.P. Morgan, an investment bank. J.P. Morgan Chase reported total assets of \$712.5 billion in 2001. In 2002 the company reported a net income of \$1.7 billion on \$43.4 billion in revenues.

After a \$43 billion merger in 1998, Bank of America Corporation (resulting from the combination of Bank-America and NationsBank) emerged as the industry leader. Bank of America was, as a result of the merger, situated in locations nationwide. The company included 11,500 branches in almost all of the 50 states and in 40 countries. In 2002 Bank of America had sales of \$46.4 billion, resulting in a net income of \$9.2 billion. Bank of America came in behind Citigroup and J.P. Morgan Chase with total assets of \$619.9 trillion.

WORKFORCE

In 2001, according to the U.S. Department of Labor, Bureau of Labor Statistics, holding offices employed 103,960. Of that total, 20 percent of the workforce held management level positions. Chief executives earned a mean annual salary of \$129,032; general and operations managers earned \$98,320; and financial managers earned \$92,390. Business and financial occupations accounted for another 20 percent of the industry's workforce. Accountants and auditors earned a mean annual salary of \$54,350; financial analysts, \$54,320; and credit analysts, \$42,370. Over 32 percent of the industry's jobs are related to office and administrative support, which had an overall mean annual salary of \$30,250.

Growth opportunities with MBHCs will likely be in such technical areas as information systems and data processing, and for securities sales representatives. Growth for this specialty is forecast as excellent through 2005. The top 10 percent of securities sales representatives earn \$120,700 or more. Positions may increase for financial professionals who can bring expertise relating to financial products and investment vehicles that are new to

the banking industry. Bank information systems professionals with C++ and object-oriented programming skills are in big demand in the banking industry.

AMERICA AND THE WORLD

Long-term growth markets for U.S. banks will likely include the Pacific Rim and Europe. Western Europe's evolution toward unified financial markets is expected to eliminate many of the trade barriers faced by North American competitors in the mid-1990s. Although many MBHCs are avoiding European markets, Citicorp already maintained an extensive network throughout Europe and hoped to gain from unification. Unfortunately for U.S. MBHCs, the large Japanese banking market remained impenetrable in 1993, despite relatively open U.S. financial markets and strategic alliances attempted by a number of U.S. firms with Japanese counterparts.

Competitive Structure of Global Markets. In 1996 the largest bank in the world was the Tokyo-Mitsubishi bank, with 19,300 employees and \$19.6 billion in sales. The world's second largest bank, Sumitomo Bank, is also based in Japan. In 1996 it had assets in excess of \$500 billion, with 360 offices in Japan and 74 branches overseas. Their American subsidiary, the Sumitomo Bank of California, is the fifth largest in the state. Other large Japanese banks include the Dai-Ichi Kangyo, the fifth largest bank in the world, with assets of \$500 billion, 400 offices in Japan, and 77 branches in 31 countries; the Fuji Bank; and Sanwa Bank. Despite the size and strength of the many banks in Japan, the industry there was not immune to the global slowdown in the early 1990s. In fact, the Japanese banking industry was especially hard hit by a sinking stock market, falling property values, and bad loans incurred during the 1980s.

Other large multinationals include Credit Agricole of Paris, the number one commercial bank in France, with 1995 sales of \$32.34 billion and 72,607 employees; the Credit Suisse, the largest bank in Switzerland, with most of its business conducted outside the country (American subsidiary is Credit Suisse First of Boston); and the Union Bank of Switzerland, the second largest in the country, with two-thirds of its assets coming from overseas operations.

Because they play different roles in different countries, a true comparison of banks throughout the world is difficult. For instance, although no U.S. banks placed in the top 25 in terms of capital, the U.S. MBHC industry accounted for 200 of the 1,000 largest banks in the world. In comparison, Japan had the second largest number of banks, with 100. Italy, which has a diversified banking industry similar to Japan's, also had about 100 establishments in the top 1,000. Furthermore, some countries, like the United States, still maintain highly fragmented banking industries with thousands of banks serving the market.

Japan, by contrast, has 150 banks, while Canada and the United Kingdom have 65 and 550 banks, respectively.

Regulation. The Foreign Bank Supervision Enhancement Act of 1991 (FBSEA) established federal standards for the entry and expansion of foreign banks in the United States. The act also increased the role of the Federal Reserve System in the supervision and regulation of foreign banking operations in the United States. The act requires foreign banks competing in U.S. markets to engage directly in the business of banking outside the country and to be subject to comprehensive supervision or regulation on a consolidated basis by its own domestic authorities. The act also requires that the banks furnish information to U.S. authorities, allowing the latter to assess the bank's application filed under the Bank Holding Company Act.

RESEARCH AND TECHNOLOGY

Although most financial payments are still being made with cash, checks, and credit cards, electronic funds transfer (EFT)—including transactions made with automated teller machines (ATMs)—is an important aspect of MBHC branch operations. By 1995, 9.7 billion transactions were processed at 123,000 ATM terminals in the United States. Although ATM growth had slowed in the United States, expansion of that technology in world markets was increasing at a rapid pace. (About 200,000 ATMs were serving customers in Japan and Europe.)

In addition to ATMs, debit cards are becoming an important part of electronic banking. Debit cards are used for withdrawals from ATM machines as well as for transactions made at point-of-sale (POS) terminals. The POS allowed for the transfer of money from a buyer's account to a seller's account through either an online transaction or through an automated clearinghouse (offline transaction). For instance, consumers could buy groceries using debit cards that removed money from their personal accounts and transferred them to the store.

Another advance in technology that was slowly gaining stature in U.S. markets was the 'smart card.' Widely used in France and Japan, the smart card contained a microprocessing chip, rather than the standard magnetic stripe on most credit and ATM cards. The chip was more difficult to counterfeit—an advantage to MBHCs battling a \$1 billion a year fraud problem. Until late 1995, the smart cards had only been tested in specific regions and test market groups. NationsBank started offering smart cards to Atlanta consumers in preparation for the 1996 summer Olympics. It was predicted that by 2000, there would be 100 million smart cards in the United States.

Home banking also became more popular in the United States, as more advanced home computer technology allowed consumers more complete and less expen-

sive access to their money. Also, about one-third of all American households conducted a banking transaction over the telephone at least once a month. The latest trend is Internet banking, and U.S. banks are competing with each other to provide content via online services. More than 100 banks have created home pages on the Web, and spending on electronic banking has grown at a compound annual rate of 150 percent in recent years.

Some of the greatest growth in electronic services was in the corporate customer market. Banks located a growing number of end-user banking devices on the premises of banks' corporate customers, increasing the number of wholesale banking customers who have online access. A survey by Ernst & Young and *American Banker* found that banks expected to continue to invest in technology to cut costs, reduce labor, and increase customer service.

An important technological development that affected the internal operations of MBHCs and their members in the early 1990s was image technology and CD-ROM storage devices. This technology allowed banks to electronically scan incoming paper and route information to the appropriate department or bank location. Technological advances also allowed banks to electronically capture and route telephone conversations and faxes.

OFFICES OF HOLDING COMPANIES, NOT ELSEWHERE CLASSIFIED

Offices of holding companies, not elsewhere classified, include firms that primarily hold or own securities of other companies to exercise control over the activities of those organizations. This industry classification excludes bank holding companies, but includes investment, personal, and public utility holding companies. Corporations that operate the entities whose securities they hold are classified in their respective industry.

NAICS CODE(S)

551112 (Offices of Other Holding Companies)

Holding companies have several functions. They may be used to achieve financing goals or to circumvent certain federal or state regulations. Most often, however, a holding company allows a corporation to achieve economies of scale as well as geographic or market diversification. The holding company also allows a corporation, through its subsidiaries, to integrate both horizontally and vertically. For instance, an automaker may vertically integrate by buying a steel mill that can make steel for its cars without a mark-up in price. The same automaker might also integrate horizontally by acquiring or merging with another automaker, thereby providing new manufacturing technologies, a broader market, or complimentary product lines.

The first U.S. holding companies were in New Jersey, after that state passed the New Jersey Holding Company Act. This allowed corporations to bring previously independent firms under unified control. Holding companies were an alternative to trust organizations, which often allowed monopolies to form. Although the goal of the Public Utility Holding Company Act of 1935 was also passed to prevent such monopolies in the electric power industry, electric companies serving a group of states or a single state still operated in such a manner.

The New Jersey Act generated so much tax revenue that other states soon followed its lead. The rise of holding companies allowed many corporations to reach national markets. Intense U.S. merger activity occurred periodically, from 1898 to 1902, during the 1920s, from 1951 to 1955, in the 1960s, and during the mid 1980s.

Mergers and acquisitions fell during the late 1980s and early 1990s, as heavy debt, the late 1980s recession, and a lack of capital slowed holding company growth. Furthermore, many industries dominated by large holding companies had lackluster revenues in the early 1990s.

By the end of the 1990s, however, mergers and acquisitions were on the rise, especially in the public utilities area, as electric and natural gas companies merged. The percent of utilities that owned natural gas distribution companies increased from 40 percent to 55 percent by the end of 1998. Since then, 11 mergers have united companies involved predominantly in electricity with natural gas companies. For instance, SCANA Corporation of Columbia, South Carolina, an energy-based holding company, announced it was merging with Public Service Company of North Carolina, Inc. (a natural gas utility) in that same year.

From 1996 to 1998, gas distribution assets and revenues grew by 59 and 29 percent, respectively, for electric utility holding companies; however, international assets still exceed those of gas distribution as the leading form of diversification. These increased a whopping 173 percent the same period, with revenues doubling. Another huge growth was seen in telecommunications assets, which rose 658 percent with a similar increase in revenues.

The amount of oil and gas exploration and processing assets rose by 51 percent for the same period, whereas pipeline assets jumped by 89 percent. Electric utility holding companies are also acquiring trading organizations, with revenues growing from \$7.6 billion in 1996 to \$47.7 billion in 1998.

Other utility companies are either reorganizing into a holding company structure or acquiring competitors. In 1999, for example, one natural gas holding company, Southern Union Co. of Austin Texas, acquired its rival, Valley Resources Inc. Public Service Company of New Mexico, an electric and gas utility, split its business into two subsidiaries under a new holding company that same year. Washington Gas Light Company also announced it was forming WGL Holdings, Inc., so that it and its subsidiaries could operate separately under the holding company.

Other types of holding companies, both foreign and domestic, were expected to diversify internationally throughout the 1990s. Analysts thought horizontal and vertical integration would allow more firms to reach new markets and to produce goods and services more effi-

ciently. Many holding corporations should also benefit from advanced information systems that allow more efficient centralized control of their enterprises.

MANAGEMENT INVESTMENT OFFICES— OPEN-END

The open-end management investment industry is comprised of investment companies that sell shares in open-end mutual funds. Open-end funds require the issuing company to redeem the shares upon request by the security holder. Often referred to as the mutual fund industry, the open-end fund industry comprises about 95 percent of the mutual fund market. Unit investment trusts, face-amount certificates, and closed-end mutual funds are excluded from this classification. Mutual fund management firms that work for investment companies are part of the investment advice industry **SIC 6282: Investment Advice**.

NAICS CODE(S)

525910 (Open-End Investment Funds)

INDUSTRY SNAPSHOT

The mutual fund industry experienced explosive growth in the 1980s and early 1990s, as investors transferred assets from other financial sectors into mutual funds, and investments in general increased. U.S. open-end mutual funds controlled more than \$1.7 trillion in assets by 1993, making them a major force in the country's economy. In 1992, 27 percent of all U.S. households owned shares in mutual funds—up from 6 percent in 1980. In 1993, assets in funds continued to grow at a rate of more than \$1 billion per day. More than 2,700 such open-ended funds are in existence. According to 1997

statistics, there were 1,489 establishments engaged in this industry. The industry reported 1997 revenues of \$16.6 billion.

Following unprecedented industry growth throughout much of the 1980s, mutual fund assets continued to increase rapidly in 1996. A strong securities market, as well as an influx of new dollars from other financial sectors, contributed to the surge. Although mutual funds nourished the U.S. economy in many ways, such as providing capital to some thinly traded securities markets, the growing industry was also cited by some observers as a leading cause of stock market volatility.

ORGANIZATION AND STRUCTURE

A mutual fund is a corporation chartered by a state to operate as an open-end investment company. The company invests in a portfolio of assets and obtains capital by selling shares in its own securities. Capital is, in turn, reinvested in the portfolio. Income from investments is disbursed to shareholders or is used to compensate fund managers and expenses. The price investors pay for a share of the company is based primarily on the market value of the securities in the portfolio. The distinguishing characteristic of an open-end fund, in relation to a closed-end fund, is that the investment company must redeem an investor's shares upon his or her request. Mutual fund investors also benefit from professional management of their money which they might otherwise be unable to afford. One disadvantage of mutual fund investing is that mutual funds are not tailored to the specific investment needs or tax status of individual shareholders. The shares in the fund are valued at their net asset value (NAV), and share prices fluctuate every day.

Many mutual funds provide investors with many services. Shareholders may elect to have money automatically withdrawn from their accounts on a periodic basis for investment in a mutual fund. Many funds also offer check-writing privileges and automatic reinvestment programs that pour dividends and capital gains back into new shares. The reinvestment option has proven to be very popular due to the tax saving advantages of not withdrawing dividends.

Types of Funds. The two primary types of mutual funds are "no-load" and "load" funds. No-load funds do not require investors to pay fees or sales commission, and the price of a share in a no-load fund is identical to its net asset value. The investment company typically acts as the distributor for its funds, and therefore bypasses brokerage fees and commissions. Investors in no-load funds do, however, usually incur some indirect costs related to marketing and other advertising expenses.

Shares in load funds, on the other hand, are usually sold through separate distributorships. The distributors

sell fund shares through dealers and brokers, such as banks, insurance companies, or financial planners. The front-end load, or commission, is often about 8.5 percent, of which the distributor keeps 1.5 percent, and the dealer and broker receive the remaining 7 percent. Therefore, of \$1,000 invested in an 8.5 percent load fund, \$915 would actually be invested in the fund—resulting in an effective fee of 9.3 percent.

Commissions are often scaled down as the size of the purchase increases, and although investment performance on average is the same for no-load and load funds, total returns are usually higher on no-load funds because of their lack of fees. During the 1990s, about 30 percent of all funds were considered true no-load funds, although many "low-load" funds charged commissions as low as 2 percent or 3 percent.

Mutual funds can also be categorized according to the contents of their portfolios or their investment objectives. Although a plethora of funds serve diverse market segments, the three major categories of funds are common stock, bond, and money market.

Aggressive growth funds, also known as capital appreciation, seek to maximize capital gains, rather than current income. This type of fund is considered relatively risky and more volatile than many other funds because it typically focuses on securities of companies or industries with unproven potential for strong growth. Managers of aggressive funds may also make use of options or short-term speculative trading techniques. In the 1990s, more than 200 aggressive growth funds were available on the U.S. market.

On the other hand, the objective of a balanced fund is to conserve the investor's principal, pay a high level of income, and promote long-term growth. Assets in this type of fund are usually invested in a combination of conservative bonds, preferred stock, and common stock. Corporate bond funds try to achieve a similar objective by investing in a combination of corporate debt, U.S. treasury bonds, or other federal bonds. In 1999, there were approximately 100 balanced and corporate bond funds each.

Money market funds are low-risk investment vehicles holding short-term, high-grade securities such as treasury bills, certificates of deposit, and commercial paper. This type of fund is popular because it maintains a very stable net asset value. Tax-exempt money market funds differ in that they invest in municipal securities with short maturities. In the late 1990s, nearly 1,000 money market funds were available to investors.

Global equity and bond funds maintain a portfolio of securities and debt instruments traded worldwide. These funds offer American investors access to diverse financial markets and companies that would otherwise be difficult,

or impossible, to capitalize on. The investment of the fund is in stocks of U.S. and foreign companies. Other popular open-end mutual funds include income-mixed, municipal bond, high-yield bond, precious metal, and income-equity funds.

Mutual Fund Owners. Although mutual funds are usually initiated and often indirectly managed by investment companies, shareholders own the funds. Shareholders include large numbers of individual investors with financial backgrounds ranging from modest to wealthy. In addition, many pension plans, profit-sharing funds, and other institutional investors also place portions of their assets into mutual funds. As Americans embraced mutual funds during the 1980s, the diversity of shareholders increased. For instance, in 1980 only 6 percent of all American households held shares in mutual funds. This jumped to nearly one-third by 1997.

Of the households that owned funds, 72 percent owned equity funds, 41 percent held bond and income funds, and 50 percent were shareholders of money market funds. The average household held shares in two funds. Eighty-four percent of these customers bought their shares through a sales force of some type, such as a financial planner, bank, brokerage firm, or insurance agent. Thirty-seven percent of the households invested directly through the investment company. The median mutual fund owner was 46 and earned \$50,000 per year in the early 1990s. Fifty-six percent of all shareholders were male, 50 percent had college degrees, and 72 percent were married. Employed investors represented 72 percent, while 24 percent were retired.

The Industry's Role in Financial Markets. Because of its popularity with investors, the mutual fund industry is a major means of financial intermediation in the U.S. economy and has a decisive impact on formation of domestic capital markets. During the 1990s, money market funds regularly controlled more open-market paper in the United States than any other industry segment. Furthermore, mutual funds provided an efficient tool to help finance everything from corporations and start-up companies to mortgages and governments.

Mutual fund companies were also the largest institutional purchasers of corporate equities, buying approximately one-quarter of all corporate bonds that were issued. Moreover, the amount of discretionary assets that U.S. households invest in mutual funds was estimated at nearly 16 percent in the mid 1990s.

In comparison to other U.S. financial institutions, mutual fund investment companies have become serious contenders in terms of controlling assets. All mutual funds combined contained more than \$1.6 trillion in assets in 1992. Insurance companies, by comparison, con-

trolled about \$1.6 trillion, and commercial banks held more than \$2.4 trillion.

Regulation. Investment companies operating mutual funds are regulated by the Securities and Exchange Act of 1934 and the Investment Company Act of 1940. The 1934 act was established to maintain fair and honest securities markets, and it also enforces other laws requiring investors to have access to information about the underlying condition of companies in which they invest. The Securities and Exchange Commission (SEC) administers federal regulation of the industry. The 1940 act provides for the registration and regulation of companies that are primarily engaged in the business of investing in securities.

Among many other requirements, the 1940 act stipulates: A company must redeem shares duly offered by shareholders within seven calendar days at per-share net asset value; the maximum load cannot exceed 9 percent of the share's offering price; and shareholders must be sent complete financial reports at least semiannually. Furthermore, a fund must have at least 75 percent of its funds invested such that: Not more than 5 percent are invested in any one issue and not more than 10 percent of the voting securities of any corporation are held by the fund. Mutual funds must also comply with regulations of each state in which its shares are held.

BACKGROUND AND DEVELOPMENT

Mutual funds, in one form or another, have been functioning in financial markets since the nineteenth century. Funds in Great Britain, for instance, helped to finance reconstruction of the post Civil War U.S. economy by investing in farms, railroads, and businesses. British mutual funds heavily influenced the U.S. industry's development, and the first American open-end mutual fund, Massachusetts Investors Trust, was started in 1924.

The Great Depression and World War II hampered asset growth in mutual funds. The period from 1929-40 did, however, serve to establish the regulatory infrastructure that would influence the industry throughout the twentieth century. For instance, in 1940 the Investment Company Institute (originally called the National Association of Investment Companies) was established to develop industry standards and to influence mutual fund legislation.

Fewer than 300,000 shareholders, representing about \$450 million in accounts, were participating in the industry in 1940. By 1945, however, mutual funds held more than \$1 billion. The industry continued to realize vibrant growth throughout the postwar expansion as a surplus of investment dollars flowed from all sectors of the financial markets. In 1951, mutual funds represented more than 1 million accounts. This amount grew to about \$17.4 billion in 1960.

Before 1960, mutual funds were viewed as a relatively conservative and placid investment instrument—much like trusts and endowment funds. In the late 1960s, however, a new breed of mutual fund company began to develop. Focusing on investment performance, these new companies offered maximum capital appreciation and high risk. Several of the new funds also practiced speculative trading techniques, such as short selling and options, in the hope of raising profits. Sophisticated investors began to find the new breed of aggressive funds attractive, and many people felt these funds offered the hands-on investment management they were seeking. In fact, 96 new “maximum capital gains” funds were launched in 1968 and 1969 alone. By 1970, about 400 funds of all types held more than \$50 billion. Although the new aggressive funds took a beating in the 1970 bear market, they helped to expand the role of mutual funds and increase public awareness of mutual funds.

Until 1970, mutual funds were viewed as an efficient means of investing primarily in the stock market. The industry was transformed by the advent of the first money market mutual fund (MMMF) in 1971, called the Reserve Fund. This product allowed small investors to participate in high short-term interest rates in the money market that had previously been accessible only to the relatively wealthy. People suddenly had a viable alternative to bank deposits with substandard government-regulated interest rates. Municipal bond funds followed MMMFs in 1977, and tax-exempt MMMFs debuted in 1979.

As interest rates surged past 17 percent in the 1970s and early 1980s, massive amounts of funds shifted from bank deposits to higher paying MMMFs. As a result, the mutual fund industry controlled about \$300 billion in assets by the early 1980s. Furthermore, nearly 75 percent of all mutual fund assets were held by money funds in 1982. Nevertheless, the 1980s would be the industry’s most pivotal decade for change and growth.

Since 1982, several factors have induced a major shift in the allocation of assets within the mutual fund industry. Falling interest rates reduced the popularity of money funds in comparison to other types of mutual funds. Strong securities markets brought more money into bond and equity funds. Also, a general increase in public familiarity with mutual funds, combined with the deregulation and metamorphosis of U.S. financial markets, increased the amount of money invested in mutual funds. By the early 1990s, the percentage of industry assets held by MMMFs had fallen to about 34 percent. Equity and bond funds each held about 36 percent and 30 percent, respectively.

While the composition of the industry was shifting, mutual funds continued to realize dynamic asset growth throughout the 1980s. Many new funds and investment vehicles brought more investors into mutual funds. The

public’s awareness and familiarity with mutual funds was another factor that boosted industry assets. Even many institutional investors, such as pension funds and bank trust departments, were investing increasing amounts in mutual funds to cut costs and increase returns on their portfolios.

Basic fund categories that were experiencing the greatest proliferation of new entrants in the late 1980s and early 1990s included taxable MMMFs, growth, state municipal bond, and international funds. Expansion of new funds had slowed, however, for income-mixed, high-yield bond, precious metal, and aggressive growth funds.

By 1990, 3,105 different mutual funds held more than \$1 trillion in assets and represented more than 60 million shareholder accounts. These figures represented steady, stunning growth throughout the decade. While in 1980 only about 12 million shareholders participated in 564 accounts controlling \$300 billion in assets, five years later the industry encompassed about \$500 billion in assets, 35 million shareholders, and 1,528 different funds.

Mutual fund growth continued at a rapid pace throughout the 1990s, increasing from more than \$1 trillion in fund assets in 1990 to more than \$1.7 trillion by mid 1993. An influx of bank and pension assets into mutual funds was responsible for much of the growth. Other trends taking place in the industry in 1993 included an increase in the popularity of specialized mutual funds, shifts in the distribution channels used to sell shares, and escalating international activity.

Fund asset growth in the 1990s was largely a result of strong securities markets combined with an infusion of new investment dollars. Despite economic recession, the Dow Jones Industrial Average shot up past a record high 3,500 in 1993, resulting in a boon for equity funds. At the same time, new money was shifting to the mutual fund industry from other financial institutions. Although maturing certificates of deposit were sending assets from banks to fund companies, a diversion of retirement savings from traditional pension management institutions—banks, trusts, and insurance companies—was the greatest reason for the deluge of cash.

Various social and economic changes in the 1970s and 1980s had created an environment that was leading growing numbers of pension plan sponsors and participants toward mutual funds. By investing 401(k) and other pension assets into mutual funds, sponsors and participants were realizing greater diversification of assets and participation in retirement plans. Furthermore, many participants favored mutual funds over other investment vehicles because they felt they had more control over their savings and a better understanding of how their funds were being invested. Although the share of U.S. assets

held by pension funds was nearly double that held by mutual funds in 1992, mutuals were gaining quickly.

The impact of mutual fund growth was also evidenced in the stock market. In the early 1990s, for the first time, mutual funds bought more stock market equity than pension funds. Mutual fund dominance of equity markets was causing some observers to question whether the trend was a positive one for the stock market, which was increasingly susceptible to fund-induced volatility. Mutual fund equity purchases shot up 87 percent in 1992, to \$80.5 billion — beating the 1991 record high of \$43 billion in equity purchases. Indeed, in 1991 and 1992 mutual funds bought more equities than all private pension funds combined had bought between 1960 and 1989.

Long-term mutual funds, which invest for long-term gains, were responsible for much of the industry growth in the early 1990s. As the percentage of industry assets invested in short-term funds fell to less than 35 percent by 1993, long-term fund assets grew to more than 65 percent.

Other Trends. Contributing to the growth and competitiveness of the mutual fund industry were new distribution routes. To survive in a more competitive economic environment, caused in part by the strength of the mutual fund industry, banks and other financial institutions were selling mutual fund shares to generate fee income.

The banking industry, in particular, plunged into mutual fund sales in 1987 — the year that banks were deregulated to act as full-service brokers. By 1992, more than 3,500 banks had entered the mutual fund fray and were selling 30 percent of all shares. James Shelton, executive director of the Bank Securities Association, commented in a June 1993 article in *ABA Banking Journal*, “Banks will soon become the major source of distribution for mutual fund products.” In addition to selling shares, 700 banks managed proprietary funds in 1993, accounting for about 10 percent of the mutual fund market.

Prospects for regulatory changes in the early 1990s boded well for the industry’s future in general. The SEC’s Division of Investment Management recommended numerous changes in 1992 that would potentially affect the industry, such as deregulation of sales fees and commissions, registration exemptions for transactions involving sophisticated investors, and provisions for the globalization of mutual fund sales. A notable proposal advocated cross-border marketing of fund shares with countries that have safeguards similar to those in the United States.

In addition to new distribution routes, an abundance of new specialty funds were appealing to investors with unique needs in the mid 1990s. At this time, the number of categories into which mutual funds were divided had grown to 21, up from seven in 1975. Furthermore, at the

end of 1996, there were more than 2,700 funds operating. This category had expanded to include funds emphasizing securities in utilities, biotechnology, aviation, telecommunications, real estate, and other niche markets.

In the long run, analysts speculated that demographic changes should boost industry assets, as aging baby-boomers save for retirement and investor-directed retirement programs continue to shift to mutual funds. Distribution channels and new products were expected to continue to evolve and increase the efficiency of the industry. Banks were expected to increase their sales role, and the division between load and no-load funds could eventually become obscured. As the industry matured, companies were expected to seek cost-efficiency through labor-saving automation, by streamlining marketing programs, and by merging with, or acquiring other mutual fund companies.

CURRENT CONDITIONS

By the late 1990s, it was estimated that 40 percent of households in the United States had stock investments. The overall favorable market conditions in the 1990s for the United States resulted in an average growth in fees and commissions for securities companies of up to 30 percent annually. Online stock trading resulted in consumers who could trade in real time, and in over only a few years time during the late 1990s, the financial services industry rose to a value of about \$6 billion. The flurry of activity and increase in interested individual investors caused many financial services to offer new mutual funds at an increasing rate. Some of these funds grew so large that it impaired their ability to post outstanding returns.

The continued globalization of the world economy also affected the financial market and mutual fund offerings and performance. In a 1998 industry periodical article, experts suggested that investors take advantage of world market volatility by trading United States open-ended mutual funds. The authors outlined a strategy that included buying open ended, international mutual funds when the S&P index rose by a substantial amount; and switching back to a U.S. index fund on the day that the S&P declined significantly. Apparently, the strategy had proven effective because of foreign markets’ tendency to show correlation among returns, and because this correlation appeared to travel from the United States to foreign markets.

INDUSTRY LEADERS

Because open-end investment companies are actually owned by the shareholders that belong to the mutual fund, the shareholders elect board members and approve various operating policies, such as selection of the investment advisor and the basic contents of the portfolio.

Because of the way that funds are structured, the day-to-day management and operation of mutual funds is typically handled by a separate fund management company (see **SIC 6282: Investment Advice**). In fact, most funds are established by members of the board of directors, which owns a management company. Indeed, the purpose of starting a fund is often to allow those members' management company to earn fees as the investment advisor for the fund.

Leading companies typically manage a family of funds representing various investment focuses. Fidelity Investments, led by its flagship Magellan fund, was the leading fund management company by 1997 asset size. Its fund assets—representing nearly 200 individual funds—totaled more than \$360 billion in 1997. Magellan alone commanded more than \$105 billion in net assets by the year 2000. Fidelity was ranked the number one mutual fund at the beginning of 2000. It closed to new investment in 1997. The fund featured stock from domestic companies operating in the United States and overseas.

Vanguard managed the second-largest asset base, with \$238 billion, followed by Capital Group/American Funds (\$191 billion), Putnam Mutual Funds (\$122 billion), and Franklin Templeton Funds (\$119 billion). Vanguard's Index Trust 500 Portfolio fund was ranked the second best mutual fund at the beginning of 2000 for performance. In early 2000, the number three mutual fund was PX Washington Mutual Investors Fund, a fund managed for principal growth.

The mutual funds delivering the highest returns throughout the late 1980s and early 1990s were also some of the riskiest funds in which to invest. A \$10,000 investment in 1988 in the Kaufmann Fund, for instance, would have grown to \$43,658 by 1992. Similarly, a \$10,000 investment in the Financial Strategic Health Sciences fund would have delivered \$38,513. The same investment in the Fidelity Select Biotechnology mutual fund would have jumped to \$37,155 during the same period. Few mutual funds delivered the performance offered by these successful high risk funds. Nevertheless, a \$10,000 investment in 1983 in the American Capital Bond fund would have grown to \$28,758 by 1992—a relatively healthy return for that sector of the industry.

WORKFORCE

Most of the jobs created by the open-end investment industry are with investment advisement firms, insurance companies, and other institutions that handle the daily management of funds and develop portfolio investment strategies. Management firms employ large numbers of portfolio managers, financial analysts, and other investment professionals. In 1997, a total of 35,271 people were employed in this industry. Further information may be found under **SIC 6282: Investment Advice**.

AMERICA AND THE WORLD

U.S. mutual funds conduct negligible cross-border sales of their shares because of domestic and foreign regulations. In fact, foreign ownership of U.S. funds is estimated at less than 1 percent. Rather than combat barriers to cross-border sales, many mutual fund companies were expanding their sales to other countries in the 1990s by opening foreign subsidiaries that operated and advised overseas mutual funds. This tactic allowed companies to tailor their funds to meet regulatory, tax, and investment needs of the shareholders in a particular country.

International financial markets, furthermore, were steadily becoming a more important aspect of fund management. Fund managers were finding that they could increase their diversification and often boost investment returns by buying securities in foreign markets—despite risks inherent in overseas investing. In the early 1990s, there were more than 130 global bond and equity funds with combined U.S. and foreign assets of \$48.7 billion. In addition, about 140 international funds, which invested solely in foreign securities, boasted growing assets of \$23.1 billion. These figures were up significantly from 1989, for example, when the combined total of global and international funds was about \$26.5 billion. In 1985, moreover, both types of funds held less than \$8 billion in overseas assets.

Foreign Mutual Funds. As in the United States, mutual fund industries in many other industrialized countries were realizing rapid growth rates. Mutual fund assets in nine foreign countries studied in 1987, for instance, grew more than 55 percent by 1992, to \$1.2 trillion. Total assets of 18 countries that had mutual fund industries totaled \$1.5 trillion in the early 1990s. Worldwide, it was estimated that all non-U.S. mutual funds had grown to the approximate equivalent of assets held by U.S. funds.

As the middle class continues to expand, particularly in emerging industrial nations, the amount of foreign assets invested in mutual funds will likely accelerate. Furthermore, as financial markets become more globalized and integrated, opportunities for cross-border sales by U.S. companies could skyrocket. Although the large Japanese financial market remained closed to U.S. competitors, European and South American markets were showing promise. The passage of the North American Free Trade Agreement (NAFTA), for instance, will likely boost opportunities in Mexico for U.S. firms.

The European Community (EC) was striving to implement Undertakings for Collective Investment in Transferable Securities (UCITS) in the mid 1990s. This directive would effectively facilitate cross-border marketing of mutual fund shares within the EC. Several holes existed in the plan, however. For example, many tax

issues and questions about marketing and distribution needed work. Nevertheless, the plan does take significant steps toward integrated investment policies, public disclosure guidelines, and other industry controls. When U.S. companies gained access to European consumers, they would gain access to mutual fund markets that topped \$1 trillion in the late 1990s.

The U.S. mutual fund industry and the SEC were cooperating to liberalize fund sales during the 1990s. The SEC advocated a proposal that would allow foreign funds to sell shares in the U.S. market if they abided by certain guidelines. The objective of this strategy was to lead other nations into allowing U.S. companies to conduct sales on their soil. The SEC, along with U.S. mutual fund industry representatives, eventually sought to adopt a global system that mimicked the EC initiative.

RESEARCH AND TECHNOLOGY

Technological advances in information systems and computer automation were having a significant impact on open-end investment companies throughout the 1990s. By implementing state-of-the-art systems, mutual funds and their management companies were achieving more efficient customer service, reducing errors in record-keeping and reporting, and reducing labor costs. As the industry becomes increasingly price competitive, automation will offer a critical edge for industry leaders. The proliferation of computers in households makes tracking mutual funds an easy task, since computers have made information on mutual funds and the stock market available on demand.

Mutual fund companies were also benefiting from technological advances affecting foreign and domestic securities markets. With advanced satellite communications networks and on-line trading systems, investment companies were increasing their access to up-to-the-minute investment information from markets around the world. At the close of the 1990s, for instance, it was possible to track, and to buy or sell, securities on several Asian markets. Mutual funds were also using these computer advances to integrate and synthesize their reporting and investment operations.

Interestingly, larger mutual fund companies were experiencing stiffer competition from smaller competitors that were using the new technology to level the playing field. By forming alliances with fellow companies that offered complimentary services, specialty investment and consulting companies were delivering high quality packaged services for prices at or below those commanded by the large "one-stop-shop" mutual funds.

Information technology that allowed allied companies to integrate their reporting and investing data provided the crucial link necessary to fuse their services. The alliances had been especially successful at capturing and

managing investment dollars from retirement plans that would have otherwise been invested with large mutual funds. The trend toward alliances proliferated in the mid 1990s.

UNIT INVESTMENT TRUSTS, FACE AMOUNT CERTIFICATE OFFICES, AND CLOSED-END MANAGEMENT INVESTMENT TRUSTS

The closed-end investment industry consists of investment offices primarily engaged in issuing closed-end funds, unit investment trusts, or face amount certificates. For related information on investment industries, see **SIC 6722: Management Investment Offices, Open-End** and **SIC 6282: Investment Advice**.

NAICS CODE(S)

525990 (Other Financial Vehicles)

INDUSTRY SNAPSHOT

Unit investment trust (UIT) and closed-end fund (CEF) companies sell shares in securities portfolios. These shares must be purchased when they are initially issued—or afterwards on the open market—and are not redeemable before a designated date. Face amount certificates are essentially obligations of the issuing company to pay a fixed sum at a specified maturity date, and often require periodic payments by the purchaser.

Because shares in this industry's portfolios must be held until a set date, they are not as popular as open-end, or mutual, funds, although they may generate greater earnings. With a stable pool of money, portfolio managers can take more risks in search of profits, often investing in volatile countries and emerging markets. In 1999, there were 85 CEFs specializing in regions of specific countries. Many closed-end funds, which are traded on stock exchanges, are bargains, since they sell for less than the value of the stocks or other investments that they hold. Funds may also sell for more than their value. UITs do better than CEFs in garnering new assets. In 1998, UITs added 60 percent in assets and held \$94.6 billion. On the other hand, CEF assets increased 1 percent to \$151.6 billion. Fund managers included major brokerage houses as well as investment companies.

ORGANIZATION AND STRUCTURE

CEFs. Closed-end fund companies are similar to open-end mutual companies in that they both sell shares in a portfolio of actively-managed securities. Shareholders benefit from efficient access to professional investment management and from portfolio diversification that they likely would be unable to achieve on their own. Unlike open-end funds, however, CEFs issue a fixed number of shares, which are sold through initial public offerings (IPOs). The money collected through this initial offering is invested in securities. After the IPO, shares may not be redeemed until a predetermined date. They must be sold and purchased through a broker on an exchange or through over-the-counter markets.

An important characteristic of a CEF share is that its price is determined by market demand and supply, rather than by the net asset value of the securities represented by the share. CEFs usually trade at a discount to their net asset value, which can vary widely for several reasons. While most CEF shares are traded on the New York Stock Exchange (NYSE), the American Stock Exchange (AMEX), and the National Association of Securities Dealers Automated Quotation (NASDAQ) systems trade CEFs as well.

After an investment company initiates a CEF, it employs a fund adviser to manage the investment of the shareholders' assets, to conduct research, and to handle administrative tasks. The fund advisory firm is often a subsidiary of the investment company. In fact, the CEF is often established for the purpose of allowing the investment company's directors to earn fees from managing the fund. The adviser's management fee is usually based on the amount of assets in the fund and is commonly set on a sliding scale that declines as total assets increase. Fees of 0.3 to 1.0 percent of fund assets are common, although some funds offer incentives that are linked to performance. When combined with other fund management

costs, operating expenses can consume 10 percent or more of a fund's total income.

Several types of CEFs are offered by investment companies, including equity, bond, and specialty funds. Some portfolios are highly diversified while others emphasize a particular industry or security type. In the early 1990s, about 70 percent of all CEF assets were invested in bond funds. That percentage decreased slightly, to 66 percent, by the end of 1997, when \$97.9 billion of the total \$149 billion invested in closed-end funds was invested in bond funds. While the primary objective of a CEF that emphasizes bonds is to produce high yields, stock fund advisers seek capital gains. Specialty funds include non diversified CEFs that focus on precious metals, venture capital, utilities, single or multiple countries, single industries, or other investments.

UITs. Like CEF companies, UIT investment firms issue shares in a fixed portfolio of assets that cannot be redeemed until a specified date, which is usually between 20 and 30 years after issuance. The shares are traded in the open market until their redemption. Unlike CEFs, however, UITs represent an undivided interest in a unit of specific securities—usually bonds. The trust does not have a board of directors and the pool of assets is fixed. The portfolio is, therefore, left mostly unmanaged for the trust's duration. The trust distributes the bonds' interest to shareholders until all the bonds mature or are called. UITs are often called defined or focused portfolios.

Because most UIT assets are invested in bonds, UIT participants purchase shares with the expectation of earning a steady, monthly income and then receiving most of their principal back when the shares expire. Investors theoretically get the benefit of holding bonds until maturation without the volatility and risks inherent in short-term trading. Unlike CEFs, or mutual funds for that matter, UIT shareholders know exactly what they are buying. One drawback, however, is that UIT portfolios are unresponsive to changing market conditions. In addition, many UIT holders find that their shares are difficult to liquidate in the open market.

BACKGROUND AND DEVELOPMENT

In Belgium, 1822, the first closed-end fund was created by King William I. In the 1860s, similar investment trusts were formed in Great Britain. In fact, the Foreign and Colonial Investment Trust, formed in London in 1868, was still operating in the early 1990s. In the 1880s, British CEFs began investing in the United States to achieve higher returns and diversification. These funds were instrumental in providing capital to finance Civil War reconstruction and to build railroads.

British CEFs led to the development, in 1893, of the Boston Personal Property Trust, the first American CEF.

Excess capital generated during the 1920s caused a boom in CEFs, or investment trusts as they were referred to at that time. Several hundred new funds were formed, including the oldest CEF still in existence today—General American Investors, founded in 1927. Some 265 new funds were established in 1929 alone, many of which invested in stocks, and were highly leveraged.

When the stock market crash of October 1929 rocked financial markets, CEF investors took a beating. One dollar invested in a leveraged CEF index fund fell to a value of about five cents overnight. A positive outcome of the Great Depression for CEFs, however, was critical legislation that served to shape and promote the industry throughout much of the 1900s. The Securities Exchange Act of 1934 and the Investment Company Act of 1940 became the basis for regulation of both open- and closed-end funds.

Although asset growth in CEFs waned during the 1940s and 1950s, investors began to steadily reinvest during the 1960s and 1970s. Furthermore, the industry began to diversify its offerings. The Japan Fund, for example, became the first American CEF investing in a foreign country in 1962. Convertible funds and corporate bond funds also originated in the 1960s and early 1970s. By 1960, CEFs held about \$2 billion — compared to only \$613 million in 1940. However, by 1970, the industry had expanded its holdings to more than \$4 billion. Total assets doubled again during the 1970s, reaching more than \$8 billion by 1980.

Even though they were not introduced to U.S. markets until 1961, UITs enjoyed a growth pattern similar to that experienced by CEF companies during the 1960s and 1970s. The first UIT was a municipal securities fund. The industry expanded to include corporate and debt funds in 1972, and government securities funds in 1978. As investors increasingly sought the benefits touted by the UIT industry, assets poured into funds.

The 1980s. The boom in most financial markets during the 1980s contributed to growth for the closed-end investment industry. At the same time that securities and financial markets were benefiting from increased investment capital, investors were shifting their assets from government regulated bank deposits in an effort to garner higher returns. Often, these assets ended up in closed-end instruments or face-amount certificates.

Also contributing to the growth of the industry was a variety of new fund offerings that lured new investors. For instance, “personality funds,” developed in the mid 1980s, maintained CEF portfolios that reflected the distinctive investment style of the portfolio manager. Gabelli Equity Trust, the Zweig Fund, and Z-Seven (Barry Ziskin’s funds) were all popular personality funds in the 1980s and were still in existence in the late 1990s.

Single-country funds also proliferated in the 1980s. Funds that specialized in investing in Mexico, Korea, Australia, Indonesia, Germany, Turkey, and other countries experienced solid asset growth. The number of convertible bond funds also increased. UITs expanded into new financial vehicles as well, investing in junk bonds, zero-coupon bonds, and real estate.

Industry growth was evidenced by the number of public offerings for new CEFs in the late 1980s. Many of these IPOs were made following the stock market crash of 1987, when weak securities markets pushed many investors into bond funds. Although in 1980 there were no IPOs, and the following year there was only one, there were 26 in 1986, as well as 35 and 62 new issues in 1987 and 1988, respectively. Furthermore, total assets held in CEFs soared from less than \$8 billion in 1985 to more than \$55 billion by 1990. The number of CEFs grew from just 54 in 1985 to 209 by the end of the decade. UITs grew at a similar pace, encompassing about \$130 billion in assets by 1989.

To the Mid 1990s. Many closed-end investment offices experienced steady asset growth in the early 1990s. The amount of money invested in CEFs, for instance, increased nearly 25 percent between 1991 and 1992. Weakened equity markets in the late 1980s, as well as an influx of assets from other financial institutions and investment instruments, were partly responsible for overall industry growth. Despite the success of CEFs and UITs, many investment professionals cautioned against them due to their difficulty to liquidate, lackluster returns, and the high risk involved. However, by the mid 1990s, 18 of the 150 CEFs available had returns on investment of 100 percent or greater.

Although open-end investment offices eclipsed the popularity of closed-end investment instruments, a significant portion of U.S. assets were held by UITs and CEFs in the mid 1990s. For instance, more than \$85 billion was invested in CEFs, and about \$200 billion in UITs had been sold. The 268 establishments in the United States selling UITs and CEFs were drawing in \$388.3 million in revenue and employing 1,104 workers.

But the industry experienced a slowdown in asset growth during the same period. The saturation of CEF and UIT markets, stronger securities markets that were pushing investments into equity instruments, and the growing popularity of open-end mutual funds all contributed to the slowdown. For instance, UIT deposits fell in January 1993 to \$819 million, down 12 percent from January 1992. Furthermore, while CEF assets climbed a healthy 35 percent between 1990 and 1992, this was well below the 70 percent growth experienced between 1987 and 1989.

The growing popularity of open-end mutual funds was seen as a threat to many closed-end investments.

Many analysts felt that open-end funds, particularly no-loads, offered better returns. In addition, investors' open-end funds benefited from greater liquidity and more active portfolio management than with UITs. Indeed, assets in open-end funds had grown about 92 percent between 1980 and 1993, to more than \$1.7 trillion—compared to the approximately \$285 billion held by UITs and CEFs combined.

In the mid 1990s, the largest company in the industry was Meditrust SBI, of Massachusetts. This company had assets of \$820 million and employed fewer than 100 people. The second largest company was RYMAC Mortgage Investment Corp. based in Maryland. RYMAC had assets of \$564 million in 1992. Likewise, Source Capital Inc., the third largest based on its assets, had no employees and maintained capital of \$286 million. The top 10 companies in the industry, in fact, employed fewer than 200 people in 1992.

CURRENT CONDITIONS

In the late 1990s, the industry was seeing only modest growth in new assets deposited. Closed-end fund assets increased 5 percent between 1996 and 1997, from \$142.3 billion to \$150.1 billion, but only 1 percent in 1998, to \$151.6 billion. Assets were held by 476 U.S. funds. In 1999, 532 closed-end funds traded on U.S. stock exchanges held \$123 billion in assets.

According to the Investment Company Institute, 2.3 percent of all U.S. households owned CEFs in 1998; 80 percent of them also owned open-end funds. The typical investor had \$12,000 in two closed-end funds. Domestic equity and high-yield bond funds were the most popular types. In 1998, for the first time since 1994, investments in foreign securities declined to 18 percent of all CEF assets from 21 percent the previous year.

The value of unit investment trusts fared somewhat better than CEFs, increasing 10 percent per year in the late 1990s. Outstanding UITs had a market value of \$78 billion in 1996, \$86 billion in 1997, and \$94.6 billion in 1998. Between 1997 and 1998, UITs added 60 percent in assets, while mutual fund assets dropped 12 percent. In the late 1990s, some UIT companies were extending their product lines by joining with insurance companies to offer defined portfolios with the advantages of tax-free annuities. For example, in 1999, Nike Securities and Ohio National Life Insurance Company began offering Nike's Dow 10 UIT as part of Ohio National's ONcore Series of variable annuities.

INDUSTRY LEADERS

Familiar names in the financial services industry offer UITs and CEFs. Among those firms are Morgan Stanley, Paine Webber, Prudential Securities, Smith Barney, and Van Kampen. In addition, numerous invest-

ment companies offer the products. Tri-Continental Corporation, with more than \$4 billion in assets, is the largest publicly traded, diversified closed-end investment company in the United States. Petroleum and Resources Corporation has approximately \$475 million invested in some 80 stocks in the only closed-end fund specializing in oil and gas and other natural resource stocks. Adams Express Company, with \$1.69 billion in total assets, and General American Investors Company, with \$1.02 billion in total assets, also are major closed-end fund companies. The John Nuveen Company, which sells UITs as well as other investments, had 1999 sales of \$349 billion.

EDUCATIONAL AND RELIGIOUS TRUSTS

The charitable trust industry is comprised of companies that manage educational, religious, and charitable trust funds and foundations. The industry also encompasses the trust operations of not-for-profit research institutes.

NAICS CODE(S)

813211 (Grantmaking Foundations)

INDUSTRY SNAPSHOT

Charitable giving is closely tied to the economy, with giving falling between 1 percent and 5 percent during six of the eight recession years since 1971. Despite a poor economic climate in 2001, giving remained little changed, with Americans donating \$212 billion to charity, up 0.5 percent from \$210.9 billion in 2000. Giv-

ing \$160.7 billion, or 75.8 percent of the total amount given in 2001, individuals were by far the largest percentage of givers. Individual giving was up 1.1 percent from 2000. Foundation grants also rose in 2001, up 5.4 percent to \$25.9 billion. Corporate giving, however, declined 12.1 percent during the same period, to approximately \$9.1 billion. Bequests, another category in giving, also fell by 4.5 percent to \$16.3 billion. Giving related to the relief and recovery involved in the September 11th terrorist attacks totaled \$1.9 billion, just under 1 percent of total giving in 2001. Individuals contributed the most to 9/11 causes, with \$1.3 billion, followed by corporations, with \$410 million, and foundations, with \$195 million.

Although banks provided most of the management services for charitable trusts, other institutions were competing with banks in the 1990s and 2000s for control of the endowment management industry. In addition, trust departments at all financial institutions were facing rising management costs, the threat of federal tax laws, which could potentially diminish some benefits associated with charitable trusts, and decreased investment returns resulting from economic recession.

ORGANIZATION AND STRUCTURE

A trust is defined as a legal relationship in which one party holds title to property for the benefit of another. The arrangement involves the transfer of property by a “trustor” to a “trustee,” who manages the property and issues benefits to the “beneficiaries.” Although some companies, or trustees, specialize in trust management, most trustees are banks. Beneficiaries of a charitable trust may include any not-for-profit concern, such as churches, research institutes, schools, museums, governments, social or professional associations, and charity organizations.

In addition to cash, beneficiaries may receive such gifts as income-producing property, business inventory or equipment, securities, life insurance, works of art, real estate, or jewelry. Although the trustor typically donates property out of a sense of altruism, the trustee relationship may also provide a trustor with a reduction in tax liabilities. Charitable contributions are also sometimes used as an indirect means of transferring wealth among the trustor’s family members, as well as to the beneficiary. A critical advantage that most trusts offer the contributor over other means of gift giving is the control a trustor can retain over the use of the donated property.

Trustee Responsibilities. A financial institution or trust company acting as a trustee for a charitable contribution assumes many legal duties. A trustee is expected to exhibit skill and care in administration and management of property. It is also expected to be loyal to the beneficiaries and to protect the trust property from outside attack. Other responsibilities include keeping accurate records and reporting to the beneficiary when required to

do so by the trustor. Most importantly, the trustee is obliged to carry out the wishes of the trustor in good faith.

Unlike all other forms of trusts, the conditions placed on a charitable trust are usually enforced by the federal government on behalf of U.S. citizens. In fact, the entire trust industry is closely regulated by the federal government. If the trustee violates his trust, by making an unlawful investment for instance, the beneficiary may reclaim the property.

In return for assuming responsibilities associated with trusteeship, the bank or trust company retains compensation from the property based on the amount of assets under management. For many banks, fees from trust services are of vital importance.

Types of Charitable Trusts. Donors used a variety of trusts to transfer their wealth to nonprofit causes in the 1990s. Each type of trust offered different advantages pertaining to the amount of control that the trustor could exercise over the gift, various tax benefits that could accrue to the trustor, and the method of compensation bestowed on the beneficiary.

In the charitable remainder annuity trust (CRAT), a fixed amount of property is periodically distributed to noncharitable parties, often including the grantor of the trust. After a recipient dies, the remainder of the CRAT then goes to a charitable organization. Among other advantages, the CRAT allows the grantor to receive charitable income tax deductions equal to the present value of the remainder interest ultimately received by the charity. These deductions are used to offset income from the trust during the grantor’s life.

The wealth replacement trust is used in conjunction with a charitable gift. This complex type of trust is used to replace assets given to a charity while at the same time benefiting specific noncharitable parties—often family members of the grantor. The grantor may receive valuable tax benefits related to capital gains, gift, and estate taxes. Furthermore, survivors of the grantor’s estate often benefit from reduced inheritance taxes.

Charitable lead trusts distribute income to charitable entities for a fixed term. At the end of the term the remainder of the trust is transferred to a noncharitable beneficiary, such as a spouse or child. One benefit of the charitable lead trust is that the grantor avoids estate taxes on the value of assets that defaults to the beneficiaries.

A pooled income fund is a trust maintained by a charitable organization. Each donor that transfers income to the pool may be eligible to receive significant income tax and gift tax deductions, as well as estate tax benefits. Charitable gift annuities, which became popular in the 1980s, bestow similar benefits on donors. This type of trust, however, is arranged so that the grantor receives a

specified sum of money each year for the remainder of the donor's life.

Other charitable trusts include "bargain sales," in which a donor sells property to charities for below-market prices, and "charitable stock bailouts," in which a donor contributes closely held stock to a charity and derives various tax and business benefits.

BACKGROUND AND DEVELOPMENT

Trust officers, or their equivalent, have been holding, managing, and caring for the property of others since around 4000 B.C., when the practice was common in Egypt. Various prototypes of trust institutions were later developed in second-century Rome, some of which involved the use of property for charitable purposes. The industry began evolving into its present form in eighth-century England, where clergymen served as executors of wills and trusts. Throughout the Middle Ages and the sixteenth and seventeenth centuries, trusts developed under English common law into a semblance of their present form.

The trust business in the United States can be traced back about 150 years, when trusts began to serve the estates of wealthy businessmen and were used to transfer the wealth of some farmers. The first institution chartered to engage in the trust business was Farmer's Fire Insurance and Loan Company, founded in 1822. By 1840, several life insurance companies and financial institutions were involved in the industry. In 1906, Congress elected to allow banks to enter the trust business, and, by 1920, about 1,300 banks offered trust services.

After the Great Depression, federal laws began to have a significant impact on the trust industry. The amount of money in trusts during this time escalated, despite the initial inconsistency of U.S. regulations pertaining to trusts. Also affecting trusts in the twentieth century were periods of inflation. For instance, a long period of inflation during the 1970s produced demand for higher returns on trust funds by beneficiaries and donors. As a result, many trustees began investing funds in riskier and shorter-term investment vehicles in an effort to remain competitive with other financial products and services.

The 1980s. The greatest growth in charitable trusts occurred during the early and mid-1980s, when assets in nonemployee benefit trust accounts jumped from \$342 billion in 1980 to more than \$614 billion by 1986. During much of this period, higher returns on market investments as well as tax advantages made trusts more attractive. The Tax Reform Act of 1986, however, proved a pivotal piece of legislation for trustees. The act created increased paperwork for many trustees, resulting in greater confusion and management expenses.

The increase in the number of available investment products also increased management expenses. Although trustee revenues climbed during the 1980s as charitable assets grew, increased costs outpaced income growth for many companies. Even a massive industry investment in computer automation during the 1970s and 1980s did not allow many trustees to maintain traditional profit margins.

To make matters worse, many banks began to experience severe financial distress in the late 1980s as economic recess and general mismanagement culminated in reduced profits from lending activities. Banks increasingly relied on income from services, such as trust management, to buoy income. As the industry became more competitive, profit margins on trust services were reduced for many companies. Trust managers knew that if they could not deliver competitive investment returns and deliver good service, they risked losing valuable trust clients to more efficient investment vehicles and tax shelters.

The 1990s. In the early 1990s the charitable trust industry was benefiting primarily from two circumstances. First, Americans began donating more money than ever before to charitable causes. Whereas 1987 saw donations of more than \$93 billion to charities, donations in the 1990s were estimated at well over \$100 billion per year. This level of spending continued into the new millennium, with a growing portion of this spending directed to science-oriented projects, according to the American Association for the Advancement of Science (AAAS). The organization estimated that U.S. private foundations poured about \$20 billion into charitable trusts in 1999.

Second, increases in taxes on the wealthy and a reduction in tax loopholes, a result of the Tax Reform Act of 1986, caused many people to consider charitable contributions as tax shelters. The results of growth in the industry following the Tax Reform Act of 1986 are reflected in employment by firms that specialize in managing charitable trusts. Despite hefty company investments in labor-saving automation, the number of people employed in the industry rose from about 22,000 in 1986 to about 40,000 by 1990. Similarly, the annual payroll of these firms increased from about \$383 million to more than \$726 million—a 90 percent increase.

Although greater amounts of money flowing into charitable trusts created a boon for many firms in the industry, trustees in the 1990s also faced potential obstacles. For instance, charitable trusts were threatened by such legislation as the generation-skipping transfer tax (GST). Although the GST had been in existence since the early 1980s, its impact was not realized until the 1990s, when families trying to transfer wealth through charities were penalized. Among other effects, the GST increased taxes on wealth passed to nonprofit beneficiaries through charitable trusts. Furthermore, in 1996 certain sections of

the Income Tax Assessment Act 1936 were amended to restrict distribution of funds outside the United States. The amendment was applied to charitable trusts established after August 1996 and became effective after the 1996 to 1997 income year. Apparently, this was a move by the government to prevent charitable trusts from being used as a means to recycle funds back to the trustor's beneficiary without tax penalty. Therefore, it was expected to have little impact on genuine charities.

In addition to a variety of legislative issues, some trustees were also fighting beneficiaries, who began to contest the traditional fee structure employed by most managers. Plaintiffs in lawsuits alleged that banks charging fees of 0.5 to 1 percent were receiving excessive compensation for what amounted to a few administrative duties. Beneficiaries of larger accounts, in particular, were suffering, and, according to the plaintiffs, the trustees were not acting in the interest of the beneficiary. Indeed, many heirs and beneficiaries of charitable trusts favored a free and competitive trust marketplace where accounts could be switched to trustees of their preference—a practice forbidden by federal regulations in the early 1990s.

In an effort to combat downward pressures on profit margins, trustees applied several tactics going into the mid-1990s. In addition to reducing labor costs through automation, trustees stepped up their marketing efforts. Many also combined accounts to achieve economies of scale and to reduce transaction fees related to purchasing securities. Also, many companies experimented for the first time with tying trust officers' compensation to portfolio and department performance.

CURRENT CONDITIONS

Charitable giving remained strong into the new millennium, despite the poor economy. Indeed, the events of September 11, 2001, spurred charitable giving as Americans donated money to help victims of the attacks. Total charitable giving for 2001 totaled \$212 billion, up 0.5 percent from 2000. Individuals accounted for 75.8 percent of that total; foundations, 12.2 percent; bequests, 7.7 percent; and corporations, 4.3 percent.

In 2001, donations largely went to religious organizations, which received \$80.96 billion, up 4.5 percent from the previous year; education received \$25.55 billion, up 0.5 percent; foundations and unallocated giving received \$25.55 billion, down 15.8 percent; human services, \$20.71 billion, up 15.1 percent; health, \$18.43 billion, down 2.1 percent; arts and culture, \$12.14 billion, up 5.6 percent; public society, \$11.82 billion, up 2 percent; environment/animals, \$6.41 billion, up 4 percent; and international affairs, \$4.14 billion, up 13 percent. Giving related to the attacks of 9/11 stood at \$1.88 billion, or just under 1 percent of all giving that year, led

overwhelmingly by individuals, who contributed \$1.25 billion. Leading recipients of endowments were Harvard University, with \$18.8 billion; Yale University, with \$10.1 billion; and the University of Texas System, with \$10 billion. In 2000, 78 percent of adults made donations, which rose to 80 percent in 2001. The average amount donated in 2000 was \$886, compared to \$1,097 in 2001.

The top charitable foundation at the end of 2001 was the Lilly Endowment Inc., which had about \$15.6 billion in assets. Rounding out the top five were the Bill & Melinda Gates Foundation, with \$15.5 billion in assets; the Ford Foundation, with \$14.6 billion; the David and Lucile Packard Foundation, with \$13.1 billion; and the J. Paul Getty Trust, with \$10.9 billion.

With an increasing number of Americans becoming millionaires and billionaires at a relatively young age, philanthropy is seeing a surge from that demographic. Many of these newly wealthy are also establishing family foundations. Family foundations gave away \$11.3 billion in 2000, which represented half of all foundation grant-making and controlled about half of all independent foundation assets, with \$197.7 billion. Private foundations tripled in the last decade to a record 48,000 in the United States. An article published by the *New York Times* on April 27, 2002, reported that the newly rich were responsible for a large amount of giving, which could total \$40 to \$136 trillion over the next 50 years. The estimates, provided by Professor Paul G. Schervish and John J. Havens at Boston College's Social Welfare Research Institute, also stated that by 2052 philanthropic spending could total between \$19.2 and \$50.2 trillion. Professor Schervish further predicted that up to \$6.7 trillion will be donated to charities over the next 16 years. Although possibly good news for charities, the professor speculated that much of that money would go to new philanthropic enterprises as opposed to established charities.

INDUSTRY LEADERS

Throughout the 1990s, Bankers Trust New York Corporation was one of the largest providers of trust services in the nation. The corporation managed more than \$200 billion of nonemployee benefit trust assets for more than 350 clients. The company's trust department offered a wide range of services, including performance measurement; portfolio management, analysis, and review; record keeping and benefit disbursement; tax accounting; and international investment services. At the end of the decade, this major New York banking institution was acquired by Germany's Deutsche Bank A.G. in a move that made the latter the largest bank in the world.

Chemical Bank of New York was another major trustee in the 1990s. It managed nonemployee benefit trust assets of more than \$65 billion for 469 clients. Later in the decade, Chemical Bank purchased the Chase Man-

hattan Bank Corporation, which managed some \$62 billion in nonemployee benefit trust assets, and took the Chase name as its own. Other large trustees included Citicorp of New York, which managed \$38 billion in nonemployee benefit trust assets, Comerica of Detroit (\$41 billion), State Street Bank and Trust Company of Boston (\$160 billion), and Northern Trust Company of Chicago (\$148 billion).

WORKFORCE

During the 1980s, most of the firms that specialized in managing trusts for religious, educational, and other nonprofit trusts were small companies; in the early 1990s, more than 3,000 of the 4,000 companies that served the industry had fewer than 20 employees. However, as companies in the industry followed a pattern of consolidation through mergers and acquisition, the number of large companies began to increase in the 1990s as the percentage of smaller companies declined.

Jobs in the charitable trust industry exist primarily with banks and trust companies. Trust departments hire trust officers and support staff to manage investments, handle reporting and record-keeping activities, market trust services to potential grantors, and distribute benefits. In the 1990s, trust officers at large banks earned \$35,000 to \$45,000 on average, whereas their counterparts at small and midsize banks earned about \$28,000 to \$38,000. Trust support staff earned \$20,000 to \$30,000 on average. Senior trust officers averaged approximately \$100,000 per year, and trust investment officers averaged about \$47,000.

Positions in the charitable trust industry are expected to increase faster than the average for all U.S. industries through the year 2005. Although new tax laws may diminish advantages associated with transferring wealth to nonprofit beneficiaries through charities, a generally inhospitable tax environment will likely keep charitable trusts attractive. The general increase in charitable giving should also expand the industry. Growth should occur in computer programming and information systems jobs, which are projected to increase more than 100 percent by 2005. Sales and marketing positions for trust services should also realize disproportionate increases.

RESEARCH AND TECHNOLOGY

As the cost of managing charitable trusts has grown with increased regulation and investment requirements, trust managers have turned to automation and advanced information systems to hold profit margins steady. In the late 1970s and 1980s companies reduced costs related to such labor as data entry and basic accounting tasks. By the late 1980s and going into the 1990s, advanced systems were automating more detailed tasks, such as maintaining asset inventories, making disbursements to bene-

ficiaries, calculating dividend payments and printing checks, trading securities, and filing tax information.

New image technology was beginning to be used in banks and trust departments in the 1990s. Using these advancements, trust administrators were able to reduce paperwork and reporting tasks by scanning forms and reports into their computers. The images were then automatically filed and processed by the computer system and made available for easy access at a later date.

The events of September 11 caused a huge surge in online donations and thus inspired America Online Inc., Cisco Systems, Yahoo Inc., and others to back a new Web site, Network for Good (www.networkforgood.org), launched in late 2001 and designed to be a central-point online portal to encourage charitable giving to numerous causes. Online donations related to 9/11 made up 15 to 20 percent of all donations, with a significant number of individuals using the Internet to give for the first time.

TRUSTS, EXCEPT EDUCATIONAL, RELIGIOUS, AND CHARITABLE

The trust industry is comprised of companies that manage trust funds and foundations, excluding those

whose beneficiaries are educational, religious, and charitable organizations.

NAICS CODE(S)

523920 (Portfolio Management)
 523991 (Trust, Fiduciary, and Custody Services)
 525190 (Other Insurance and Employee Benefit Funds)
 525920 (Trusts, Estates, and Agency Accounts)

INDUSTRY SNAPSHOT

In the late 1990s, approximately 6,000 organizations, employing more than 30,000 people, managed noncharitable trusts. Approximately 4,000 banks that competed in the industry, however, provided the bulk of trust administration services in the United States.

The decline in the growth of funds invested in trusts reflected a recessed economy in the late 1980s that persisted into the early 1990s. Contributing to the decline was competition for U.S. investment dollars between banks, trust companies, and other financial institutions. In addition, trust departments at all financial institutions were facing rising management costs, the threat of federal tax laws that could potentially diminish some benefits associated with trust funds, and decreased investment returns caused by the recession. Although employment in the industry remained below its peak levels of the late 1980s, the flow of money into noncharitable trusts showed an increase in the mid to late 1990s as the U.S. economy experienced unprecedented growth. By the close of the century, the economy had strengthened and so had growth of trust funds.

ORGANIZATION AND STRUCTURE

A trust is a tool that an individual or institution uses to transfer property to a beneficiary. The entity that grants the property is called the trustor. The trustor gives the property to the trustee, which is charged with the task of disbursing the property to a beneficiary according to the instructions of the trustor. One advantage that a trust has over a simple gift is that the trustor can exercise control over the disposition of the property over time, providing stipulations that must be adhered to even after an individual trustor has died or an institution acting as trustor has dissolved. A second and perhaps more important advantage is that trusts can often be used to minimize tax burdens incurred when transferring wealth.

Trustee Duties and Benefits. Although trust companies and banks expect to make a profit by acting as trustees, they have a legal responsibility to act in the best interest of the beneficiary and the trustor and to conduct their activities with skill and care. Responsibilities include: protecting trust assets from attack by outside parties; dispensing property to beneficiaries; investing trust assets in a prudent manner; keeping accurate rec-

ords; and accounting to the beneficiary as specified by the trustor.

In return for their services, trustees are compensated by one of several methods. One pricing schedule delegates a percentage of the market value of assets under management to a trust account. Under this arrangement, trustees typically charge from 0.1 to 0.5 percent, and in some cases as much as 1 percent per year of the total value of assets in the trust. For example, a \$2 million trust fund might yield \$5,000, or 0.25 percent, in annual fees.

Similarly, some trustees charge a “gross income receipts fee,” which is a percentage of income collected from interest and dividends on the account. For instance, if the trustee earned interest and dividends of \$50,000 by investing account assets for a period of one year, the trustee might receive 5 percent of those proceeds—or \$2,500. In addition to these charges, some trustees charge minimum annual management fees and activity fees for special services.

Types of Trusts. Noncharitable trust accounts managed by banks and trust companies are categorized as either individual or institutional accounts. Individual accounts can be further classified into personal agencies or trusts. Personal agency accounts are different from ordinary trust accounts in that property does not actually change hands. Instead, the trust company simply manages assets under the direction of its client, often acting as a safe-keeping agent, custodian, manager, or escrow agent. The company may provide complete investment management and reporting services as well.

Individual trust accounts involve a beneficiary. The trustor establishes an account with a trustee that manages, invests, and distributes the property. Income from the assets is then used to benefit dependents, organizations, children, or other people or entities. The trust may also be used to benefit the trustor. A multitude of trust structures exist allowing a trustor to achieve various tax benefits and to retain varying degrees of control over account assets.

Two types of individual trusts are guardianships and estate settlement accounts. Under a guardianship arrangement, the trustee acts as a guardian of a minor or mental incompetent, caring for the property that benefits that person. Estate settlements, on the other hand, involve securing and valuing a client’s assets, distributing assets in accordance with a will, and otherwise representing the client’s wishes at death. Individual trusts are also classified as either revocable or irrevocable. Revocable trusts are used to distribute wealth while the grantor is still living and can be amended at any time. In an irrevocable trust, the trustor relinquishes all control over account assets.

Like individual trusts, institutional trusts can also be broken down into agency and trust accounts. Institutional

trusts, however, exist to raise capital for businesses, to reward employees, or to provide income for retired employees. The two most common types of corporate agencies are transfer agencies and registrarships. Trustees in these agency relationships serve to transfer and register stocks and bonds.

Under a corporate trust, the trust company acts as a trustee for a group of people that lends money to a corporation through bonds or other obligatory instruments. Employee benefit accounts are another form of corporate trust. These trusts provide full custody services, compliance reporting, investment management, and special record keeping of each participating employee's interest in pension, profit-sharing, and other benefit accounts.

BACKGROUND AND DEVELOPMENT

In the United States, the trust business got its start in 1822. That year, Farmer's Fire Insurance and Loan Company of New York became the first institution chartered to engage in the trust business. Besides serving the needs of wealthy individuals, the company pioneered the concept of corporate trusts in 1830, to help raise money for business ventures. Over the next 50 years, the number and types of institutions engaged in the trust business rose rapidly. Most of these entities maintained a separate department that was devoted exclusively to trust services, which was removed from the firm's other business concerns.

In 1906, Congress elected to allow banks to begin engaging in the trust industry. As a result, about 1,300 national banks were offering trust services by 1920. After the Great Depression, the industry was rattled by legislation that essentially restricted institutions other than banks and trust companies from serving as trustees. Legislation also established what became known as the "Chinese Wall"—referring to measures that forbade commercial and trust departments of a bank from sharing customer credit or investment information.

Furthermore, as a result of the ways in which the Depression brought about new attitudes toward saving and investing for the future, the industry began to encompass more diverse segments of the American population. Employee benefit trusts, for example, became popular in the 1940s. Since that time, employee benefit trusts proliferated so rapidly that Congress enacted the Employee Retirement Income Security Act (ERISA) in 1974 to define the responsibilities of trustees managing those funds. By 1986, employee benefit trusts represented more than 40 percent of all U.S. trust assets.

Investments in individual trusts also escalated after the Depression. Wealthy individuals, in particular, increasingly used trusts as a way to invest their savings and to transfer wealth. Increases in tax benefits that allowed trustors to avoid estate and gift taxes also boosted the trust industry.

The 1970s and 1980s. In the late 1970s and early 1980s the trust industry began to undergo changes caused by a number of economic and regulatory influences. For instance, high interest rates and deregulation of certain sectors of the financial markets prompted trust departments to invest their assets in new instruments. Instead of traditional T-bills and commercial paper, trustees began putting money into certificates of deposit, money market funds, variable-rate notes, and other more risky investments. In addition, a strong economy in the mid 1980s generated an influx of investment dollars, much of which went into trust funds. Between 1980 and 1986, the total amount of money invested in trusts jumped from \$571 billion to \$1.065 trillion.

Although industry assets under management continued to climb throughout 1987, trustees began to suffer in the late 1980s. The Tax Reform Act (TRA) of 1986, for instance, increased paperwork for trustees and created some confusion, serving to discourage the use of trusts and estates as devices to accumulate wealth. The act's provisions also added to the already rising costs associated with managing trusts.

The TRA and other regulatory measures, in addition to the recession of the late 1980s, began exerting downward pressure on trust department profit margins. Investment in trust funds slowed in the late 1980s at the same time that investment returns were shrinking. Even a massive industry investment in labor-saving technology during the 1980s was not enough to buoy profits for many companies. Between 1987 and 1989, the number of trust companies dropped from 6,285 to 4,283, and total employment fell from 32,491 to 25,853. The total payroll of those companies also fell—from \$666 million to \$574 million. At this time, approximately \$229 billion in employee benefit trusts and \$342 billion in other types of trusts were being managed by trust companies.

CURRENT CONDITIONS

In the 1990s, the trust industry was facing the promise of asset growth throughout the decade. The most important reason was the increased amount of personal savings by aging baby boomers and their need to arrange means to transfer wealth was likely to elevate opportunities available to trust companies and banks. The trust industry had grown in importance in the late 1980s and 1990s, as well, because service fees from trusts had become an important stream of revenue for many banks that were suffering losses on loan portfolios.

Despite the expectation of a recovery in the industry, trustees were still struggling to maintain profits in an increasingly competitive marketplace. Mutual funds, defined-benefit contribution plans like the 401(k), and other investment vehicles were competing for investment dollars that might otherwise go to banks and trust companies. Trust

departments were also battling rising costs associated with reporting, accounting, and investment activities.

However, Congress passed the Taxpayer Relief Act of 1997 that raised the amount of total assets permitted in a trust without tax penalty to \$1 million by 2006. The passage of this legislation was expected to cause some to use trusts more in estate planning.

Cutting Costs. To remain competitive and sustain profit margins, most banks and trust departments continued their efforts to reduce administrative costs, improve investment performance, and improve service in the 1990s. The most potent weapon to cut costs was new technology. In addition, many trustees were actively marketing their services for the first time, rather than waiting for business to come to them. Some banks, for instance, were giving their trust officers specific client-contact goals that encouraged them to initiate new business.

Another important change that many trust departments were experimenting with was performance-based incentives for investment personnel. Indeed, some trust departments were realizing productivity gains by linking the performance of their investments to portfolio managers' compensation. Trustees were also achieving savings by grouping accounts with similar investment objectives, allowing them to operate more efficiently and to obtain leverage in their investment purchases and sales.

Cost-cutting efforts were likely paying off, according to at least one study conducted by the American Bankers' Association. The study indicated that commercial bank trust departments outperformed nonbank investment managers over a 10-year period ending in 1992. The study showed that bank trusts produced higher yields than mutual funds, insurance companies, and equity fund advisors. Furthermore, bank trusts exhibited more consistent results, according to the study, because they had lower risk profiles.

In 1997, the trust, fiduciary, and custody services section of the industry was composed of 2,286 establishments and generated \$6.9 billion. This subsection employed 47,843 people.

INDUSTRY LEADERS

Although banks provide most of the trust services in the United States, the non-bank trust industry is dominated by small firms. In the early 1990s, for instance, 94 percent of the 4,283 trust companies that served the market employed fewer than 20 people. Furthermore, only five companies had more than 250 employees. The largest trust company in 1992, according to the amount of total company assets, was Continental Auxiliary Company of San Francisco. Although it employed fewer than 100 people, Continental had more than \$90 million in assets. Detroit Heritage Fund Limited Partnership of Michigan was a distant second, with approximately \$3 billion in assets.

One of the largest bank trust departments in the United States in the 1990s was Bankers Trust Company of New York, which in mid 1999 was acquired by Germany's Deutsche Bank A.G. This acquisition made the German bank the largest banking institution in the world. Late in the 1990s, this company managed more than \$750 billion in trust assets. Another major player among the banks managing trust assets during the 1990s was State Street Bank and Trust Company of Boston.

RESEARCH AND TECHNOLOGY

Advanced computer systems and information technology had become a vital link to survival for many trustees by the 1990s. By implementing labor-saving information systems, trustees were reducing costs, eliminating errors, and improving the efficiency of their reporting operations. The systems were used to maintain inventories of account assets, determine when and to whom disbursements should be paid, calculate dividend payments, print checks, and handle tax accounting and reporting tasks.

For trust departments that wanted the advantages of high technology without having to manage the investment and implementation, outsourcing became a popular option in the 1990s. By outsourcing many of their trust operations to third party vendors, trustees reaped the benefits of automated accounting, control, and reporting systems that were completely integrated with their investment and customer service activities. Many trust departments were quickly reducing operations costs by 15 percent to 40 percent, while at the same time having more predictable and less-risky cost outlays that would be required by in-house automation.

OIL ROYALTY TRADERS

This industry classification includes establishments primarily engaged in investing in oil and gas royalties or leases, or fractional interest therein.

NAICS CODE(S)

523999 (Miscellaneous)

533110 (Owners and Lessors of Other Non-Financial Assets)

Companies in the oil royalty trading industry invest in oil and gas royalties and leases. Besides investing for third parties, they may also buy and sell interests for themselves. In the mid 1990s, there were 746 establishments engaged in this activity, but the number has increased, hitting 973 by 1997, according to *Dun's Census of American Business*. These are mostly small operations—78 percent (or 767) of these operations had less than five employees. Thirty of these establishments, however, posted revenues over \$5 million each in 1997.

An oil and gas lease is a contract between a mineral owner and the company that wants to extract oil and gas deposits. The lease specifies the length of time that the company is allowed to mine the mineral owner's deposits, rental payments, advance compensation for exclusive drilling rights, and other terms of the agreement. A typical rental payment is usually a relatively small amount, ranging from \$1 to \$10 annually per acre. This rental payment, which is also called a deferred drilling payment, serves to legally maintain the lease contract when the company is not actively drilling. This rental payment is not what generates high income for the mineral owner. The big money comes if oil or gas is actually found on the land.

The mineral lease also specifies royalties. The royalty is the percentage of revenues that the company pays to the mineral owner in the event that gas and petroleum is actually extracted from the land. Royalties vary from 10 percent to as high as 25 percent of total oil and gas revenues before any associated drilling expenses are subtracted.

Because the true value of a royalty interest is unknown before the company drills for oil and gas, investing in royalties and leases can be a highly speculative endeavor. Royalty owners often sell part of their interests to reduce their exposure to risk or to generate cash. Royalty investment companies that buy and sell such royalties are trying to either gain a return on their investment or generate commissions by investing for their clients.

Investors have been trading oil and gas rights in the United States since the early 1800s. Between 1859 and 1870 more than 10,500 new oil and gas wells were drilled. Between 1871 and 1900, an additional 135,000 wells sprang up. It was during first two decades of the twentieth century, however, that investments in oil and gas ventures started to boom. More than 400,000 new wells were drilled during that period. The number of new wells drilled annually continued to rise through the 1950s to more than 50,000 by 1959.

The royalty investment industry, which is largely driven by drilling activity, sagged between 1960 and 1979 in comparison to the first half of the century. Skyrocketing foreign oil prices in the late 1970s and early 1980s, however, spurred renewed U.S. drilling. The number of new wells drilled jumped past 90,000 per year, and U.S. oil production surged to nearly 9 million barrels per day in the early and mid 1980s. Growth was short-lived, however, as falling crude and gas prices plummeted in the late 1980s. By 1990 the United States was producing about 7 million barrels of oil per day. That number has declined in the 1990s. In December 1999, the U.S. produced 5.9 million barrels a day, down slightly from a year earlier when production stood at 6 million barrels per day. During this same time, liquid natural gas production stood at 1.8 million barrels per day, up from 1.6 million the previous December.

Oil and gas drilling in the United States, however, ended the 1990s on a strong note. According to *Petroleum Finance Week*, during the fourth quarter of 1999, completions of oil and gas wells and dry holes hit 5,442, a 5 percent increase from 5,188 completions during 1998's fourth quarter. The number of U.S. drilling permits increased in 31.2 percent in December 1999 to 2,445, as compared to 1,864 a year earlier. There was, however, a 32 percent decrease in the total footage drilled, from 139.5 million feet in 1998's fourth quarter, to 19.5 million feet in 1999.

Going into the mid 1990s, royalty investment firms were still suffering from the effects of low energy prices and reduced drilling activity. Revenues dropped more than 13 percent to around \$70 million. Likewise, the number of royalty trading companies slipped from 600 to 550. The industry continued its decline in the early 1990s as the number of active U.S. oil wells continued to drop. Contributing to the continued lull in U.S. oil and gas royalty trading activity was an increase in drilling overseas, particularly in South America and Australia.

U.S. oil and natural gas drilling expenditures, however, have increased in the late 1990s and in 1998 hit the highest level they had been since 1985. In 1998, total drilling expenditures rose 9.6 percent from 1997 and were estimated at \$17.6 billion, up from \$16.0 billion the previous year, according to the "1998 Joint Association Survey on Drilling Costs".

Despite a slowdown in the 1980s and 1990s, the long-term prospects for the oil and gas royalty investment industry are bright. Crude and gas prices, which are rising as a result of multiple factors, should boost investment activity and profits. Industry employment was expected to jump significantly between 1990 and 2005, according to the U.S. Bureau of Labor Statistics. Jobs for executives, which make up 10 percent of the industry work force, should climb by more than 50 percent. Manage-

ment support positions should rise similarly, and sales and legal positions will likely leap more than 70 percent.

PATENT OWNERS AND LESSORS

This classification includes establishments primarily engaged in owning or leasing franchises, patents, and copyrights that they in turn license others to use.

NAICS CODE(S)

533110 (Owners and Lessors of Other Non-Financial Assets)

The patent owners and lessors industry deals with the sale of intangible rights in property. This business has often become controversial, as it is sometimes difficult to determine who created the property, and thus who is entitled to transfer rights in it. Another problem has been making a distinction between similar examples of intangible property, like two similar songs or books, for instance.

This industry covers three forms of intangible property: copyright, franchise, and patent. Copyright generally refers to literary or artistic products of an intangible nature; franchise deals with the trademark and goodwill of a business enterprise; and patents concern products and industrial processes.

In general, licensing entails granting permission to perform a specified activity. In the case of this industry, it constitutes permission to use someone else's intellectual property. Copyright, patents, rights in music, and performance rights are all aspects of intellectual property. Rights in these forms of intangible property are protected by law to a similar extent as rights in real property. These licenses are personal to the licensee and thus are not transferable or assignable except by express agreement. They are also generally revocable at any time.

Franchising entails granting rights to operate a business of a uniform type to a franchisee by permission of the franchiser. In general, the franchiser grants an individual, the franchisee, the right to operate a business under its name. In exchange for a substantial portion of the individual business' revenues and support from the franchiser, the franchisee pays an up-front fee and a portion of revenues and agrees to use specified products and procedures in the operation of the business. According to the U.S. Department of Commerce, 40 percent of all retail sales are from franchise businesses. Predictions place that figure up to more than 50 percent by the turn of the twenty-first century. In 1995, there were 540,000 franchise businesses in the United States, employing more than 8 million people. The franchise industry generated \$758 billion in sales in 1995 alone.

The major components of the patent owners and lessors industry include: copyright buying and licensing; franchise selling and licensing; music licensing to radio stations; sheet and record music royalties; patent buying and licensing; and performance rights licensing. Each of the various entities that constitute this industry have different organizations and structures.

Copyright Buying and Licensing. Under copyright law, the writer or originator of literary or artistic productions receive sole and exclusive privilege of the making and sale of copies for a prescribed statutory period. This right could be bought, sold, and licensed, just as any other rights in property. For example, the rights to copy and sell the recording of a song could be sold by the writer to another party. This party might license the rights to the song to a third party, allowing this party to produce and sell copies of the recording in a specified area, such as another country.

Franchise Selling or Licensing. Under a franchising arrangement, the franchisee receives the exclusive right to use brand names, trademarks, patents, as well as the right to engage in the manufacture, sale, or provision of products or services owned by the franchiser in a specified area for a fee. After the business begins operation, the franchiser continues to provide support in the form of supplies, advertising, and managerial aid in exchange for an operational fee based on the franchisee's revenue. This relationship allows the franchiser to expand its operation quickly without directly investing large amounts of capital. It also allows the franchisee to start a business under the sponsorship of an established firm, capitalizing on its business goodwill, product line, and operating ideas and methods.

This form of enterprise first became popular in the 1960s and was especially important in the growth of the fast food industry. In 1998, McDonald's Corporation had the greatest total annual sales at \$12.4 billion and the

second largest number of units at 25,000 — 80 percent of which are franchised. TRICON Global Restaurants, which owns KFC (formerly Kentucky Fried Chicken), Pizza Hut, and Taco Bell, was second in sales at \$8.4 billion and first in number of units at 29,700 combined.

The 1980s and 1990s saw a proliferation of the types of industries utilizing the franchise structure. Some examples include video rental outlets, private postal services, early childhood education facilities, and health food stores. Despite this trend toward a wider range of franchised business, most of the market has still been in fast food.

Music Licensing to Radio Stations. The owner of a copyright in music has the exclusive right to perform the work. However, it would be very difficult for an individual owner to police and enforce this right against the numerous radio stations, nightclubs, and other music sources in the United States. Similarly, it would be very difficult for an individual radio station to negotiate directly with the several hundred copyright owners whose works they use each day. These difficulties have been overcome by performing rights societies, which act as clearinghouses for performance rights on behalf of many copyright owners. Thus, the individual stations could buy a blanket license for all of the music represented by a given society for a fixed fee. The society then pays the music creators.

The three most important societies in the United States were the American Society of Composers, Authors, and Publishers (ASCAP); Broadcast Music, Inc. (BMI); and SESAC, Inc., formerly the Society of European Stage Authors and Composers. These organizations together represented more than 90,000 writers and 50,000 publishers in 1999.

Sheet and Record Music Royalties. A royalty describes the payment made to the holder of the right to use patented or copyrighted property. Royalties are calculated as a percentage of income arising from the commercialization of the owner's rights or property. For each copy of printed or recorded music sold, the copyright owner receives a fixed percentage of the revenues.

Patent Buying and Licensing. A patent entails granting an individual the privilege of exclusive rights to make and sell an invention for a term of years. The difference between a patent and a copyright is that the former protected the right to exploit a particular process or design in making a physical product and was usually industrial in nature. The latter pertains to ideas and purely intangible creations of the mind and is usually artistic in nature.

As with other property rights, patents can be sold or licensed. For example, an inventor could patent the de-

sign of a transmission system and then sell the right to produce the system to a major automobile manufacturer. The manufacturer could in turn allow one of its suppliers to produce the system for a limited time or for limited purposes by granting it a license. Just as patent rights could be bought, sold, and licensed, they could also be leased — given for use for a fixed period for a fixed sum. In 1998, the United States granted 260,889 total patents. Of that amount, 93 percent were utility patents (those for the invention of a new or improved item).

Performance Rights Publishing and Licensing. Certain performances of copyrighted material are exempt from copyright protection. For example, performance of copyrighted work without any commercial purpose and without the payment of any fee—as long as there is no admission charge or such revenues are donated for educational, religious, or charitable purposes—are exempt. All other performances require permission of the creator. This permission is obtained by requesting a license—the right to perform the work for certain purposes and with certain restrictions. Similarly, printed material could not be copied and used by any party, except the creator, unless a license is granted allowing the use of the material for specified purposes.

Copyright and patent were well-established concepts, tracing their history to the common law of Great Britain. The explosive development of technology and popular culture in the mid 1900s led to the increased importance of this field. Franchising was relatively new, but flowed logically from the concepts of intangible property embodied in copyright and patent. This field grew steadily beginning in the 1960s and was significant in the development of certain consumer-related industries, especially fast food.

REAL ESTATE INVESTMENT TRUSTS

This industry covers establishments primarily engaged in closed-end investments in real estate or related mortgage assets operating so that they could meet the

requirements of the Real Estate Investment Trust Act of 1960 as amended. Such trusts include mortgage investment trusts, mortgage trusts, realty investment trusts, and realty trusts. This act exempts trusts from corporate income and capital gains taxation, provided they invest primarily in specified assets, pay out most of their income to shareholders, and meet certain requirements regarding the dispersion of trust ownership.

NAICS CODE(S)

525930 (Real Estate Investment Trusts)

INDUSTRY SNAPSHOT

After coming of age in the early 1990s and flourishing in the mid 1990s, the investor-driven REIT (pronounced “reet”) industry languished at decade’s end. Dragged down by tightened credit and waning investor interest, publicly-traded REITs coped with falling share prices by selling properties and buying back shares. Despite these measures, total market capitalization of U.S. REITs sank \$16 billion between 1997 and 1999, according to statistics published by the National Association of Real Estate Investment Trusts (NAREIT), the industry’s leading trade organization. Figures from NAREIT showed that industry market capitalization fell from \$141 billion in 1997, the industry’s best year, to \$124 billion for the 203 REITs on record at year-end 1999.

The industry’s troubles stemmed from a few sources. Since REITs depend heavily on investor goodwill to raise capital for real estate acquisitions and development, the industry suffered when investors poured money into Internet and other technology stocks that offered higher returns than REITs. The problems for REITs were only compounded by a mid 1990s run-up in real estate prices, signaling to some investors that REITs were paying too much for their properties and that a downward correction was imminent. Historically the real estate sector has gone through boom cycles with heavy development and escalating prices, followed by bust cycles notorious for oversupply and falling prices. In addition, international economic crises in 1997 and 1998 led to credit tightening at many banks, and as a result, less money available to REITs to finance new growth.

By the beginning of the twenty-first century, some analysts believed that the industry was poised for recovery, arguing that it had hit bottom in 1999. Indeed, by the turn of the century, indices of REIT shares staged somewhat of a comeback, although the average share price was still well below its 1999 peak, let alone historical highs. Still, these analysts were encouraged by the industry’s underlying value—REITs’ assets were worth more than their market capitalization—and by the overall health in the U.S. real estate market. Other observers remained wary, though, and predicted a round of REIT

consolidation and privatization as a remedy for the industry’s market woes.

ORGANIZATION AND STRUCTURE

REITs are corporations, trusts, or associations that pool investor money to purchase and manage real estate and sometimes related investments such as mortgages. A corporation or trust that qualifies as a REIT generally is not required to pay federal income tax. In most states, REITs are also exempt from state income taxes.

U.S. tax laws specify exacting standards for what qualifies as a REIT. Among other requirements, a REIT must have:

- a board of directors or trustees
- at least 100 shareholders
- at least 75 percent of its total assets in real property
- at least 75 percent of its gross income from real estate operations
- no more than 30 percent of gross income from the sale of real property held for less than four years or from securities held for less than six months
- shareholder dividends equal to at least 95 percent of its taxable income

Most REITs issue shares that are traded publicly on an exchange such as the New York Stock Exchange (NYSE), the American Exchange (AMEX), or the NASDAQ. The NYSE is home to about three-quarters of all REITs. These vehicles pool investors’ money, using professional managers to supervise a portfolio of properties, mortgages, or both, depending on the business objective. REITs thus provide liquidity to investors wishing to participate in the real estate market, while providing capital for real estate managers and developers to develop new revenue streams from real estate holdings.

REITs characteristically have high dividend yields, which recently have been about the same as yields on 10-year Treasury notes. High yields make REITs interest-rate sensitive like utility stocks and other financial companies, since high-yielding equity investments compete with fixed-income securities for investor money.

Types of REITs. There are three basic types of REITs: equity trusts, mortgage trusts, and hybrids. Most REITs belong to the equity category. These REITs invest directly in real property; they receive rental income and lease payments and occasionally realize capital gains from selling properties. Equity trusts are typically organized as blind pools for the purpose of investing in several unspecified rental income-producing properties to be held for an indefinite period to produce cash flow from rents, which could be distributed as dividends to shareowners.

A fully specified REIT invests in properties or in mortgages detailed in its offering statement; these invest-

ments do not change over time. As a result, investors can attempt to evaluate the quality of the underlying real estate prior to investing in the REIT. A blind-pool trust, in contrast, raises capital initially and then searches for real estate properties or mortgages in which to invest the proceeds raised from the offering.

Some equity trusts are organized as specified funds or specified trusts. Sale-leaseback trusts, in contrast to blind-pool trusts, invest in nondepreciable land underlying buildings and then lease the land back to the sellers from which they were purchased. Because these trusts offered tax advantages to the seller-lessee, they typically attempt to obtain higher rental returns by sharing in the gross receipts of the lessees or the proceeds from refinancing the respective buildings.

Mortgage REITs are established to invest the proceeds from the sale of their shares in mortgages secured by real estate holdings or mortgage-backed pass-through certificates. These trusts are sensitive to the credit quality of the borrower. Some mortgage trusts limit their investments to construction and other short-term mortgages; others invest only in long-term or permanent mortgages, and some invest in both types of mortgages.

Another type of mortgage trust—a dedicated trust—is organized to provide mortgage financing to a particular real estate developer for a given project. Hybrid trusts are organized to invest in both equity properties and mortgages. In recent years, several mortgage trusts have started issuing collateralized mortgage obligations (CMOs) at interest rates below the interest rates received on the mortgages, or the mortgage-backed pass-through certificates, acquired by the REIT and pledged to the respective CMOs. In the late 1980s, REITs were organized to invest in mortgage securities called “CMO residuals”—real estate mortgages offering potentially high risks and yields.

Within these categories, REITs may be classified by other characteristics, such as closed-end or open-end. Under a closed-end REIT, the number of shares issued to the public at the initial offering are limited in order to protect shareholders from future dilution of their equity interests. This practice results in more predictable projected returns and reduces the price volatility of the shares themselves. Open-end REITs, in contrast, create and sell new shares as they discover new opportunities for investment. Although the new shares dilute the interests of existing shareholders, management representatives and shareholders believe that the total value of each share will ultimately be increased by the additional investments.

Term. REITs may also be distinguished on the basis of whether they are finite. A finite life trust is established as a self-liquidating investment vehicle; it must dispose of

its assets and distribute the proceeds to shareholders by a specified date. In such cases, properties will be acquired for various periods, usually between 4 and 15 years, after which the properties will be sold and the proceeds distributed to the shareholders when the trust is liquidated. In theory, the advantage of a specified investment lifetime is that REIT's share prices should closely match its current asset values because investors can presumably make fairly accurate estimates of the residual values of the respective properties. Non-finite life REITs have a perpetual life and typically reinvest any sale or financing proceeds in new or existing properties. To retain their status as real estate investment trusts, perpetual REITs must distribute most of the cash flow from rental or interest payments to shareholders.

Leverage. REITs may be further distinguished on the basis of leveraging. When a leveraged REIT acquires properties, it seeks mortgage financing to fund the acquisition. In general, the financing may pay up to 90 percent of the value of the purchased assets. Unleveraged REITs do not utilize debt financing in their acquisitions, but they instead purchase properties for cash or invest their funds in mortgages.

BACKGROUND AND DEVELOPMENT

Contemporary REITs are an outgrowth of the so-called Massachusetts Trusts—early business trusts formed by nineteenth-century corporations to avoid certain legal constraints imposed by states on corporate holdings of real estate. Under the standard form of real estate trust organization, investors were permitted to pool their funds and obtain equity interests in real estate with centralized management and the safety of diversification without incurring the personal liability associated with partnership interests. Funds established through the trust form of organization were largely responsible for the development of Boston in the nineteenth and early twentieth century, as well as for the early development of such cities as Detroit, Chicago, Minneapolis, St. Paul, Kansas City, Omaha, Duluth, and Seattle.

From 1913 to 1935, common law business trusts, as distinguished from corporations, were not taxed on trust income distributed to owners. However, in 1935, the U.S. Supreme Court held that business trusts should be taxed as corporations in *Morrissey v. Commissioner*. In the aftermath of World War II, fueled by large amounts of capital and heavy demand for new construction, real estate syndicates began to expand, primarily in the larger Eastern cities. To reduce the impact of the corporate tax, many of these syndicates were formed as “thin” corporations, whereby the investor would invest as little as 20 percent of funds as capital, with the remaining 20 percent of the total investment being accounted for in bonds or debentures signifying the corporation's debt.

In the decades following the *Morrissey v. Commissioner* decision, no new substantial REITs were formed as common law business trusts. Instead, pooling of real estate investments was undertaken under either the corporate or partnership form of business organization.

In 1960, President Eisenhower signed into law the Real Estate Investment Trust Act of 1960, which granted special tax concessions to REITs and qualified REITs for tax-exempt status. The law limited the tax benefits of REITs to common law business trusts; corporations could not qualify. It sought to extend to REIT owners substantially the same type of tax treatment they would receive if they invested directly in the real estate equities and mortgages held by the trust.

The law also aimed to encourage the growth of such investment trusts and to increase the funds available for financing real estate developments. This equated the treatment of investors in REITs with that accorded investors in regulated investment companies (such as mutual funds). In both REITs and investment companies, small investors can enjoy advantages that before were available only to institutions or the wealthy. These advantages include spreading the risk of loss by the greater pooling of investments, sharing the opportunity to obtain the benefits of management by real estate experts, and sharing in projects that the investors could not undertake individually. The special tax status provided by the law was intended to be limited to passive investors in real estate, not to entities that actively operated a real estate business.

After a few other technical changes to the tax code, REITs grew rapidly in the late 1960s, raising through public offerings significantly more capital than did traditional sources of real estate financing. However, as the volume of capital increased, REIT managers found it increasingly difficult to find real estate projects in which to invest those funds. According to analyst Menachem Rosenberg, as the supply of funds began to exceed the number of quality projects available, property prices increased dramatically, and many REITs paid too much for projects, particularly development projects. A number of REITs invested their funds into high-risk construction and development loans, and REITs that specialized in mortgage lending tended to become careless in their underwriting practices. For 24 consecutive months beginning in April 1973, REITs posted negative total returns.

When the 1974–75 recession caused many real estate projects to fail, the REIT industry suffered a severe downturn. In 1975, provisions were amended to provide for the treatment of property acquired by a REIT through foreclosure on a mortgage or as a result of a default on a lease, and in 1976 the requirements for qualifying as a REIT were modified and penalties in lieu of disqualification were enacted. In 1978, safe harbor rules for determining when sales of property of a REIT would not be

taxed as a “prohibited transaction” were added, and the grace period on foreclosure property was extended. The Tax Reform Act of 1986, as amended by the Technical and Miscellaneous Revenue Act of 1986, made further changes to federal tax law affecting REITs.

During the 1980s, equity REITs outperformed the Standard & Poor’s 500—with fewer vicissitudes in returns. In 1985, investors began to take a renewed interest in REITs when it appeared as though the limited partnerships would lose most of their tax shelter under proposed tax reforms. The Tax Reform Act of 1986 significantly limited the tax advantages associated with real estate limited partnerships, providing a boost to the REIT industry. Overall, 33 REITs were established in 1985.

During the 1980s, the rapid increase in the supply of new commercial real estate space greatly exceeded the growth of aggregate space demand. This, in turn, resulted in market imbalances and downward pressure on rental rates and real estate asset values. As a result, real estate developers came under significant financial pressures.

Major changes were also occurring in the real estate capital structure. Previously, real estate investment was dominated by institutional investors such as banks, savings and loans, insurance companies, pension funds, and foreign investors that supplied private capital for both equity and mortgage investments. Around 1990, these institutional investors faced higher costs of capital, more conservative investment guidelines, and reductions in portfolio allocations to real estate. The result was a vacuum in the capital market, which could potentially be filled by real estate investment trusts.

However, the U.S. tax code still made it difficult for large investors like pension funds to participate in REITs. The law, designed to prevent individuals from sheltering private real estate holdings under a corporation to avoid taxes, meant that a large investment by a U.S. pension fund could force a REIT to pay corporate taxes. This, in turn, would diminish investors’ returns and make the REIT a less efficient and less profitable investment channel. The problem was solved in 1992 by the creation of the Umbrella Partnership REIT (UPREIT) structure. In an UPREIT, the investors don’t own the REIT’s properties directly. Instead, they hold shares in the umbrella partnership, which in turn owns the company’s real estate.

During the mid 1990s, investors poured money into REITs at an unprecedented pace. Based on NAREIT statistics, REIT market capitalization soared from less than \$16 billion in 1992 to more than \$140 billion by the end of 1997. The number of REITs tracked by NAREIT also surged nearly 50 percent, from 142 to 211. REITs achieved such growth in part because of strong interest in REITs as lower-risk, higher-yield investments in the traditionally volatile real estate sector. Investors’ percep-

tions of REITs were also boosted by favorable market trends in real estate, including rising property values and relatively high occupancy rates.

But by 1998, the REIT industry's fortunes reversed. Investors worried that REITs were bidding up real estate prices too fast, potentially setting the stage for a downturn. Currency and debt crises in Asia, Russia, and Latin America left major international banks reeling from bad loans and caused many to tighten their lending policies, making it harder and more expensive for REITs to borrow. Meanwhile, skyrocketing technology stocks lured investors away from real estate. To make matters worse, a glut of new REIT shares were issued in late 1997 and the first half of 1998. As these pressures converged, investors began to pull out of REITs and share prices tumbled. By the end of 1998, REITs had collectively shed 18 percent of their share value for the year. In 1999 the picture was largely the same, although average declines weren't as bad as in the year before.

CURRENT CONDITIONS

Although, by the turn of the twenty-first century, REITs were worth \$122 billion in market capitalization, they held less than 10 percent of all commercial real estate in the United States. The largest REIT segment at that point was office and industrial properties, representing nearly a third of the industry in terms of market capitalization. Second were retail REITs (ones that own shopping centers), which accounted for more than one-fifth of REIT capitalization. Other large segments included residential REITs, which mostly own apartment buildings, and diversified REITs, which have significant holdings in multiple segments.

In spite of REITs' poor showing in the late 1990s and early 2000s, a number of analysts believed that the underlying picture wasn't as bleak as it seemed. Unlike during the 1980s, they argued, there was no building spree creating an overabundance of commercial real estate. Indeed, the economic fundamentals of the real estate business appeared quite sound with a growing economy, low inflation, moderate interest rates, and high occupancy rates. Moreover, with REIT shares trading so low, in many cases the trusts' properties were worth more than their capitalization reflected. In other words, if a typical REIT sold all of its assets, the proceeds would be worth more than its stock valuation. Uncommon in other stock investments, this hidden value could make REITs attractive to investors seeking quality.

At the turn of the twenty-first century, the most vulnerable REIT segment was hotels and resorts. Among other troubles, the lodging business suffered from oversupply and tepid revenue growth. However, the 15 U.S. hotel REITs amounted to just 5 to 6 percent of the industry in terms of market capitalization.

INDUSTRY LEADERS

The largest U.S. REIT is Equity Office Properties Trust. In 2000, this Chicago-based trust owned some 291 office buildings totaling 76.6 million square feet. Headed by billionaire real estate tycoon Sam Zell, Equity Office owns property in most major U.S. metropolitan areas and, as of January 2000, had a market capitalization of \$6.4 billion. Early in the twenty-first century, the firm announced plans to acquire Cornerstone Properties Inc., a New York-based REIT, in a transaction that would add 90 properties and almost 20 million square feet to Equity Office's portfolio. The merger was seen by some as a precursor to further consolidation among REITs. Equity Office's sister company, Equity Residential Properties Trust, also controlled by Zell, is one of the largest owners and lessors of apartments, with more than 1,000 properties throughout the country.

Another leading REIT is Simon Property Group, Inc. The largest of the retail REITs, Simon Property specializes in regional malls and other types of shopping centers primarily in suburban settings. The Indianapolis-headquartered REIT has a 50 percent interest in Minneapolis' Mall of America, one of its best-known holdings. All together, in 1999 the company had an interest in 259 sites with 184 million square feet of gross leasable area. Its market capitalization in January, 2000 stood at \$4.2 billion.

SIC 6799

INVESTORS, NOT ELSEWHERE CLASSIFIED

This classification covers establishments primarily engaged in investing, not elsewhere classified. Businesses covered in this industry include investment clubs,

commodity contract pool operators and trading companies, and venture capital companies.

NAICS CODE(S)

523910 (Miscellaneous Intermediation)
 523920 (Portfolio Management)
 523130 (Commodity Contracts Dealing)
 523999 (Miscellaneous Financial Investment Activities)

Investment Clubs. An investment club is a group of individuals who meet regularly, usually once or twice a month, and pool their money, time, knowledge, and efforts to discuss and invest in securities. The investment club is a method whereby individuals are able to gain experience and acquire knowledge about stocks, financial statements, and securities markets. It is a proven means of learning and profiting by doing with others what an individual cannot accomplish alone. The primary goals of an investment club are: to educate the individual members; to make a profit on the money invested; and to encourage social harmony among the members for greater productivity. Investment clubs also serve a vital national function in that they create many new investors trained in successful investment techniques, and in so doing, provide a substantial and regular flow of capital for the needs of growing industries.

The purpose of the National Association of Investment Clubs (NAIC)—a division of the National Association of Investors Corporation, a nonprofit organization owned by its membership—is to encourage the creation of investment clubs for the purpose of becoming successful operations. Founded in 1951, the NAIC has grown to a level wherein the total new monthly money invested through NAIC membership investment exceeds \$14 million. The total holdings of NAIC members' portfolios exceed \$466 million. According to National Association of Investors Corporation statistics, there are nearly 25,400 investment clubs worldwide with an estimated 500,000 members.

An investment club must file tax returns like any other business entity. When the club adopts the partnership format, the individual members pay taxes on dividends and realized capital gains even though the members leave their money in the club for many years. The partnership must also file the partnership information return form, which informs the Internal Revenue Service of the financial distributions made to individual partners. The investment club may request an exemption from filing this form by writing to the U.S. Treasury Department. If an exemption is granted, the partners must still file their share of club income on their personal tax forms. If the club is a corporation, it must pay taxes on its earnings, with no tax liability accruing to the members until a distribution is made. In 2000, investment club members were required to file a Form 1065 (U.S. Partner-

ship Return of Income) and a Schedule K-1 (Partners Share of Income, Credits, and Deductions) on individual tax returns. While the club does not have to pay federal income taxes, it must report to the IRS the portfolio results, including each member's share of the account.

Commodities Markets. While stocks, bonds, and mutual funds are the most common investment vehicles for individual investors, they are by no means the only ones. Two other types of investments, futures and options, have become increasingly popular for the individual investor. In the futures market, investors trade futures contracts, which are agreements for the future delivery of designated quantities of given products for specified prices. Until 1972, this market was linked exclusively with commodities, such as soybeans, cocoa, silver, or pork bellies. Since that time, the fastest growing part of the futures market has been that of futures contracts on financial instruments, such as treasury bonds or stock indexes. While traditional commodities still trade actively, the divergence between the two branches has grown increasingly wide in recent years. In 1999, for instance, there were 390 million contracts traded concerning financial instruments, while there were only 32.7 million grain contracts traded.

In many ways futures trading is simpler than securities trading. For one thing, there are less than 100 actively-traded American commodities, compared with many thousands of different common stocks. Margins, short sales, and tax considerations are far less complicated than in securities trading. Accordingly, a futures trader chooses investment opportunities from a very small sample and trades are affected with generally more simple mechanics than those associated with securities. It is also considerably easier to follow news and market developments that might have an impact upon a given commodity (such as wheat prices) than it is to follow the complex details that surround any individual stock, such as dividends, earnings, the competition, interest rates, the overall market, and other national and international factors.

A futures contract is a standardized, exchange-traded contract calling for the delivery of a specified amount of a specified commodity in a specified month in a specified location. Unlike a securities transaction, no transfer of property is involved unless and until delivery actually occurs. In fact, analysts estimate that fewer than 5 percent of all contracts actually result in a delivery of the actual commodity. Money does not change hands between the buyer and seller of a futures contract, although each is required to post a margin deposit to ensure responsibility for the entire contract in the delivery month. Unlike an options contract, if a futures contract is held through the last trading day in the delivery month, the holder of the contract must accept delivery and the seller must deliver.

Also, futures contracts never result in a delivery prior to the appointed month, whereas an option on a security may normally be exercised and delivery demanded at any time from the trade date to the expiration date.

While most futures contracts used to be agricultural in nature, now people trade futures contracts for a variety of items, including interest rates, stock indexes, manufactured and processed products, nonstorable commodities, precious metals, and foreign currency. Proposals for new kinds of contracts are made all the time.

Futures Exchanges. There are nine major future exchanges in the United States. Trading is conducted by open outcry in "pits" or "rings." The former term is commonly used in Chicago, which is by far the world's leading commodities market. While trading futures bear a number of similarities to stock trading, there are notable differences. For example, futures exchanges put a limit on the maximum daily price changes, a practice not undertaken by stock exchanges. Futures trading is regulated by the Commodity Futures Trading Commission (CFTC), an independent federal regulatory commission established by Congress in 1974. The CFTC regulates the industry and the industry's employees. The Commission was set up to prevent abuse, neglect, fraud, and to promote competition.

The CFTC is Based in Washington, D.C. According to its 1999 annual report, it regulates the activities of 45,593 sales people, 9,482 floor brokers, 1,409 floor traders, 1,534 commodity pool operators, 2,806 commodity trading advisors, 211 futures commission merchants, and 1,609 introducing brokers.

There were a total of 614.2 million contracts traded in 1999, down 1.7 percent from 1998's fiscal year volume. The leading American commodity exchanges and their trading volume for 1999 included: the Chicago Board of Trade, which posted 254.5 million contracts; the Chicago Mercantile Exchange, with 200.7 million contracts; the New York Mercantile Exchange, with 109.5 million; the New York Board of Trade, New York Cotton Exchange, New York Futures Exchange, the Coffee, Sugar and Cocoa Exchange, and the Cantor Exchange, 21.2 million; the Kansas City Board of Trade, with 2.5 million contracts; the Minneapolis Grain Exchange, with 1.2 million contracts; and the Mid America Commodity Exchange, with 31,262 contracts.

The Chicago Board of Trade (CBOT) continues to be the world leader, posting more than 200 million contracts in the six consecutive years ending in 1999. The Chicago dominance results not only from its original agricultural preeminence, but also from its innovations in the realm of financial futures. It should be noted that not all commodities contracts succeed, and that once-popular contracts often fall out of favor.

At the dawn of the twenty-first century, technology played a major role in boosting total trading volume as more investors began trading electronically. In January 2000, electronic trading on the Chicago Mercantile Exchange's GLOBEX2 system increased more than 94 percent from the previous year, topping 2 million contracts. Likewise, at the Chicago Board of Trade, customers sent more than 2.1 million electronic orders to brokers in 1999. Of those, more than 660,000 were filled. In that same period, the volume of electronically routed orders rose 300 percent from 1998.

Managed Futures Industry. The traditional way to play the commodities market has been to open an account with a broker and let that person trade your account. Brokers are compensated by trading commissions and have no financial interest in the outcome of your trading transaction. Discount brokers execute your trades at a lower cost than full-service brokers, but don't generally offer trading advice or other services to the individual investor. As a result, a host of advisory services, quotation and data services, and trading systems have emerged to provide the investor with the information and ability to trade commodities.

Trading for your own account is a risky proposition, and a significant proportion of investors and traders lose money trading commodities. Fixed costs are high (quote screens, commissions, office equipment, etc.), and so is the risk. Rather than opening an account with a broker and dabbling in commodities, many individuals are allowing professional managers to trade futures for them. Managed futures offer individuals several choices: individual managed accounts, private futures funds, and public futures funds. Many new programs that were launched throughout the 1990s entice people to trade their own commodities from home. With personal computer ownership and usage at an all-time high, it is more conceivable that individuals may begin to become their own brokers.

Hiring an advisor to manage an individual trading account is similar to using a broker, but with one key difference: the commodity trading advisor (CTA) isn't usually compensated on commissions. Rather, advisors most often participate in the profits of the money they manage through management fees and profit incentive fees. Management fees are charged as a percentage of the equity in the account. Profit incentive fees vary per CTA, but are calculated as a percentage of new trading profits. If the advisor does not make money trading the investor's money, then no fees are charged. At beginning of the twenty-first century, there were 2,806 CTAs, according to the CFTC.

CTA's organize client trading in two ways: individual client accounts or a single, pooled account from which all client money is traded. A CTA who does the

latter is a Commodity Pool Operator (CPO). From 1980 to 1996, the number of commodity pool operators registered with the Commodity Futures Trading Commission grew from 1,055 to 1,350. By 2000, the CFTC was regulating 1,534 commodity pool operators.

According to International Traders Research Inc., the top-ranked managed futures program fund manager for the 12 months ending in December 1999 was Mangin Capital Management, based in Basking Ridge, New Jersey, with a compounded rate of return of 121.89 percent and \$1.4 million in equity.

Venture Capital. Venture capital is a private source of financing for high-risk business endeavors. It is one financing alternative among many sources of capital that are available to growing companies. Venture capital is generally invested in equity ownership of a company or new venture. The investment is usually in the form of stock, or sometimes in the form of convertible debt, which is a loan that becomes a stock holding at some point. Offsetting the high risk the investor takes is the promise of a very high return on investment.

Between 1992 and 1994, 417 venture-backed companies went public. In 1993, venture capital-backed companies raised \$4.2 billion, up 19 percent from 1992. The number of venture capital entities, however, has dwindled in recent years. During the third quarter of 1998, for instance, only 19 companies funded principally with venture capital went public, raising \$1.13 billion, bringing to 68 the total number of IPOs. Their offering size was \$3.38 billion. During the same period in 1997, however, 98 companies raised \$3.35 billion. The average

offering size, though, increased from \$34.2 million in 1997 to \$49.7 million in 1998. During this time, the software and services industries had the most number of IPOs. The telephone and data communications industry came in second. The lead underwriter for this time period was Bank Boston.

SERVICE INDUSTRIES

SIC 7011

HOTELS AND MOTELS

This industry comprises commercial establishments known to the public as hotels, motor hotels, motels, or tourist courts, primarily engaged in providing lodging, or lodging and meals, for the general public. Hotels that are operated by membership organizations and open to the general public are included in this industry. Hotels operated by organizations for their members only are classified in **SIC 7041: Organization Hotels and Lodging Houses, on Membership basis**. Apartment hotels are classified in **SIC 6513: Operators of Apartment Buildings**; rooming and boarding houses are classified in **SIC 7021: Rooming and Boarding Houses**; and sporting and recreational camps are classified in **SIC 7032: Sporting and Recreational Camps**.

NAICS CODE(S)

721110 (Hotels (except Casino Hotels) and Motels)

721120 (Casino Hotels)

721191 (Bed and Breakfast Inns)

721199 (All Other Traveler Accommodations)

INDUSTRY SNAPSHOT

The hotel and motel industry played a vital role in the development of trade, commerce, and travel in the United States. In supplying everything from a cheap night's accommodation on the road, to meeting and convention spaces and coordination for large corporate events, the remarkably diverse services that American hotels provide have made the hotel industry significant. According to the American Hotel & Lodging Association (AH&LA), the industry's revenues total about \$103.6 billion annually.

In the United States, there are 4.2 million rooms at approximately 41,400 properties, or roughly one hotel room for every 74 U.S. citizens. About one-third of these are at suburban locations, and another 42 percent are situated along highways. The rest are located in cities (11 percent), alongside airport strips (8 percent), and at resort sites (5 percent). The room supply is rising most significantly in suburban areas, and new construction is focused primarily on limited-service facilities—an increasingly popular option for cost-conscious travelers not inclined to frequent more elaborate full-service properties.

The AH&LA reports that some 60 percent of all properties are occupied on any given night. About 24 percent of lodging industry customers are leisure travelers, and another 20 percent are staying in a hotel for personal or family reasons. Among leisure travelers, 47 percent spend one night, 27 percent stay for two nights, and the remainder spend three or more nights. The typical leisure-related visit is by two adults (51 percent) who are traveling by auto (74 percent), and who pay about \$87 per room night. The typical business-related visit is by a male (70 percent) who is a white-collar worker (53 percent), paying \$95 per room night.

In recent years, modest gains in occupancy and the average room rate have resulted in higher revenues and profits for all types of hotels. According to the AH&LA, the industry reached record profitability in 1998, grossing \$20.9 billion in pretax profits, up from a loss of \$5.7 billion in 1990. Likewise, industry revenues increased from \$62.8 billion in 1990 to \$93.1 billion in 1998. In 2000 the industry recorded its most profitable year ever, as profit levels reached \$24 billion. However, in 2001 economic conditions took a turn for the worse, and the terrorist attacks of September 11 that year severely affected both leisure and business travel. Profits fell drastically, declining 33 percent to \$16.1 billion. Amidst these

conditions, new hotel construction declined considerably. By late 2002 levels remained strongest in the limited- and full-service ends of the mid-market class.

ORGANIZATION AND STRUCTURE

Most analysts classify the industry into full- and limited-service enterprises. Full-service hotels constitute the majority of all properties, although this ratio is dwindling. Typically, they are large properties—averaging about 280 rooms—that often generate about 30 percent of their operating income from food, beverage, and such services as restaurants, room service, and meeting spaces. Limited-service hotels, by contrast, are smaller establishments—averaging about 130 rooms—that do not offer food and beverage services or extra facilities. They rely on room sales for nearly 95 percent of their revenue base.

Vast differences exist in the expenditures that each type of hotel incurs for various services, including room maintenance, food and beverages, and telephones. These costs can diminish profit margins considerably in years with low occupancy rates, especially given that hotels must also keep room rates low in such years to compete for a reduced number of customers. Full-service hotels with significant departmental expenses have, in general, been hurt far more by the oversupply of the industry. Their occupancy rates have not been markedly different from those of limited-service hotels, but room rates have been kept far too low to pay for the cost of servicing them.

All-suite hotels came to prominence in the late-1980s and, because their segment's demand for growth remains healthy, continue to capture attention. Such hotels—most of which are branches of specific brand chains—conventionally offer consumers both a living and a bedroom area. While most all-suites offer both food and beverage services, this is not always the case. Indeed, limited-service all-suites often report substantially more attractive profit margins—again, as a result of much lower departmental expenses—and have subsequently attracted increasing interest. Their occupancy rates have been higher than those of their full-service counterparts, relative to the rest of the industry, without a tremendous drop-off in room rates.

Resorts, hotels with gambling facilities, and conference/convention center hotels represent three smaller but important industry categories. Like all-suites, their demand growth and occupancy rates have generally been higher than the average and will probably remain so, simply because they are so capital intensive to build and maintain. Casino hotels have grown in popularity due to the expansion of legalized gambling, and the convention center has become a popular component of efforts to reinvigorate urban infrastructure.

The casino segment of the hotel industry currently remains clustered in Las Vegas and Atlantic City. In Las Vegas several new spectacular destination resorts, such as the Luxor and the Bellagio, were constructed in the 1990s. In contrast to convention center hotels and resort hotels, most hotels with gambling ventures tend to offer low room rates; the gambling activity of the hotel patrons is thus central to the establishment's success. In recent years, the gaming industry has attempted to market its lodging to entire families.

The resort phenomenon is also highly regional and, inasmuch as they have had to become more price competitive, resort hotels perhaps rely more on overall regional promotion than anything else. The South Atlantic (primarily Florida) has grown into the country's most lively resort region. Even after a number of years of steady growth, its occupancy rates are still the highest of any region in the country, regularly upwards of 75 percent. The second largest resort market in revenue, the Mountain and Pacific region, has steadily lost market share in recent years.

Industry Strategies. There are essentially three forms of participation in the hotel and motel industry: straight ownership of properties, management agreements, and franchising or licensing a brand name. Most large hotel companies are active in all three categories, keeping themselves flexible to utilize varied strategies as the market dictates. Owning a hotel is a capital-intensive endeavor, yet it imparts control and can be very lucrative in an expanding market, when asset values show sizable appreciation. Since the 1980s, managing other people's hotels has become a widespread activity.

The trend away from straight ownership, and its inherent risks, has given franchising a greater appeal. Large franchise chains are first and foremost based on the benefits of brand name recognition, for which an operator either pays a straight fee or gives up a percentage of revenue. The name represents a specific concept and standard, consistent at every location. This familiarity appeals to many consumers. It also provides the company a greater efficiency in the use of resources, especially as the chain grows. Through license or franchise agreements, hotel companies can generate revenues from limited capital investments and can market their product more pointedly. In an attempt to segment the market, some companies have successfully developed a variety of chains that are advertised aggressively and provide varying levels of service.

Eager to expand their lodging chains, many companies have turned to conversions of existing hotels rather than new construction in an already bloated market. The scope of industry conversions has more than doubled since 1988, with approximately half of these involving the switching of chain affiliations.

Affiliations and Partnerships. As the travel industry became increasingly sophisticated and global in nature, hotel operators have developed competitive advantages through agreements of various kinds with other industries that serve travelers. Frequent-flyer/guest/renter programs have been developed in cooperation with airline and car rental companies. These programs offer “points” for air travel, hotel visits, and car rentals that can be redeemed for upgrades and awards through any of the three partners. These programs are geared towards fostering brand loyalty, both in the individual leisure traveler, who receives regular statements, and in the corporate traveler who, through side agreements with certain companies, is often given corporate rates or some other preferred-customer benefits.

Relationships with travel agencies and tour operators are also an integral element in the success of many hotels. Agencies, which book approximately 40 percent of the hotel rooms in the United States, are a crucial sales mechanism for the industry, and many hotels operate centralized commission payment systems to make agents more confident about prompt and accurate payments of commissions—generally between 5 to 10 percent. Many hotels also feature toll-free travel agent help-desks to answer questions about commissions and to assist in solving reservation system problems. Agreements with tour operators to offer substantial room discounts on bulk bookings are ubiquitous in the hotel and motel industry, as properties benefit not only from the added business but also by the free publicity from appearances in tour operator brochures.

Associations. The American Hotel and Lodging Association (AH&LA), formerly known as the American Hotel and Motel Association, is the major trade association of the industry. It works in partnership with 51 member state associations representing more than 13,000 member properties. The AH&LA conducts surveys and industry analysis, and keeps its members up to date on industry trends through newsletters and educational conferences. Primarily, however, it serves as a promotional mechanism for the industry, both in publicity campaigns and in lobby efforts aimed at national and regional governments. AH&LA member properties account for a large percentage of total industry revenues.

BACKGROUND AND DEVELOPMENT

The earliest versions of hotels were tiny, single-room dwellings that traveling merchants used in the sixth century B.C. The first such American lodging was the colonial inn, counterpart of the English inn, which flourished during the late 1700s. Colonial inns and taverns dotted the seaport towns and stagecoach roads. They became popular not only with travelers but also with locals, who came to use them as public gathering places for town meetings, schools, and even courts of law.

Hotels as we know them today arose quickly as the major cities grew. The very first, the 73-room City Hotel at 115 Broadway in New York City, was completed in 1794, and similar establishments were soon constructed in Philadelphia, Boston, and Baltimore. The number of hotels increased dramatically in the 1800s, as hotels moved westward. With each new hotel, it seemed, some new service was added, thereby forcing existing hotels to change or face obsolescence. The City Hotel became so outdated that it was converted into an office building only 38 years after it opened. Behind many of the transformations of the industry was a trend towards luxury accommodations that was sparked by the Tremont House in Boston, which was the first to offer such amenities as private guest rooms, locks on doors, a washbowl with free soap, bellboys, French cuisine, and an annunciator that enabled the front desk to communicate with guests in their rooms. Ironically, the Tremont House itself later fell prey to the very trend it had initiated, as it closed for major renovations after just 20 years and was regarded as an outdated establishment toward the end of its 65-year history.

In the mid-1800s, hotels followed the railroads further west, and the properties became increasingly lavish in such cities as Chicago, St. Louis, and San Francisco. Often the hotels' capacities far exceeded potential demand. Curiously, the industry continues in its third century to suffer from many of the same ills that these early development tendencies demonstrated: propensity towards overdevelopment and rapid obsolescence as a result of constant changes in transportation patterns, customer preferences, and new competition.

The First Boom and Bust. Many nineteenth-century American travelers, unable to afford accommodations at the luxury hotels, were forced to lodge in threadbare rooming houses. Medium-range accommodations were rare, but with the growth of the middle class and the increasing affordability of rail travel, a sizable market for comfortable yet affordable lodging emerged. The first to recognize and serve this market was E. M. Statler, who built the country's first truly modern commercial hotel. The revolutionary Buffalo Statler opened in Buffalo, New York, in 1908 with such conveniences as circulating ice water and a free morning newspaper. Its slogan was “A room and a bath for a dollar and a half” and, in making cleanliness and comfort accessible to so many, the Statler, and its imitators, contributed greatly to the middle-class travel bug.

As the American economy flourished in the 1920s, the hotel industry was poised for its first major boom. Occupancy rates were close to 90 percent as the decade opened, and hoteliers were encouraged to expand existing properties and build many new, larger ones. At the height of the activity, in 1927, Chicago's Hotel

Stevens—now the Conrad Hilton—was hailed as the world's largest hotel and remained so until the 1960s. The Depression brought an abrupt halt to the industry's expansion and sent many hotels into foreclosure or receivership, as occupancy rates fell to around 50 percent. At the same time, however, the economic crisis provided the initial impetus to develop hotel chains because it allowed those hoteliers who survived the collapse to increase their holdings inexpensively.

World War II rewarded the aggressive buyers of the 1930s by refilling the existing hotels with transient defense industry workers and military personnel. Occupancy rates approached 90 percent. The 1950s witnessed the beginnings of a complete transformation of the industry. Hotels increasingly catered to a more affluent and mobile society. Americans embraced the convenience of highways and airplanes, making the railway system a less important factor in travel.

Motels, Budgets, and Another Boom. The early “no-frills” motels were put up quickly and cheaply on large plots along highways. These enterprises, which appealed to lower-income vacation travelers, salesmen, and middle-management businessmen, competed effectively with hotels in the 1950s. The initially significant differences between the two types of lodging—size, start-up costs, operating ratios, and management needs—began to diminish in the 1960s, as motels franchised, grew in size, and started offering more amenities and services. At the same time, a sector of the hotel industry modified itself to compete with motels. Eventually, these hybrid properties came to be known as motor hotels.

Lodging at motor hotels was priced somewhat higher than at the original motels, once again creating a void at the low end of the rate scale. This was soon filled by so-called budget motels. Budget motels were essentially larger, more standardized motels that operated on the same principles as their predecessors—lower initial investments and fewer frills—but were more consciously part of an overall plan to profit by fitting more beds in less space and filling them.

The commotion over the introduction of budget motels to the market coincided with the creation of the real estate investment trust (REIT), which enabled small investors to hold real estate mortgages and equities. This resulted in an unprecedented availability of financing for ambitious builders. Large hotel chains had also started to pursue further expansion through franchise agreements. As a result, the industry became overextended and fell into disarray in the mid-1970s amid the oil crisis, which reduced travel overall; deepening inflation, which caused construction costs and interest rates to soar; and the recession, which forced businesses to cut back on travel and convention spending.

In the 1980s, the hotel industry completed yet another full cycle of growth and retrenchment. As room occupancies reached record levels by the end of the 1970s as a result of an improving economy, the usual losses by attrition, and the suspension of building activity, the industry was poised for a new phase of construction in 1979. The subsequent postponement of expansion, the result of the Federal Reserve's tightening of the money supply, only made the expansion more dramatic, when the Reagan administration began easing these lending constraints and creating tax incentives for developers. In total, the extraordinary building activity added about 7,000 hotels and 900,000 rooms to the industry, priming the industry for yet another oversupply condition.

While the growth during this period was remarkable in itself, transformation of the industry's structure remains its more enduring legacy. Although the market had undergone some segmentation previously with the introductions of motels and budgets, the proliferation of such new lodging concepts as all-suites in the 1980s is unparalleled. The acquisitions that companies made were often diversification measures, which provided their customer base with an assortment of property-types from which they could choose. Segmentation also allowed companies to plan more specifically and apply their resources more efficiently.

During the 1990s, the industry had finally absorbed the overcapacity created by the phenomenal building activity of the 1980s. Lodging industry profits have improved dramatically in recent years, boosted by stronger consumer demands and the absence of significant new capacity. According to the AH&LA, the industry's pretax profits reached \$20.9 billion in 1998, a 23 percent increase over the previous year and nearly twice the profitability of 1996. This represents a dramatic turnaround from the \$5.7 billion loss suffered by the industry as recently as 1990.

A number of noticeable trends occurred during the 1990s. Construction increased, as companies increasingly looked to develop new chains by building new facilities. Increased automation of labor-intensive functions, such as hotel check-in and checkout, reduced long-term operating costs and increased customer satisfaction. An emphasis on business-related amenities, such as voice mail, fax, and computer services, appealed to business travelers. Involvement by hotel companies in time-sharing projects provided a means to leverage their expertise in real estate and financing. Finally, extended-stay enterprises, which offered such amenities as separate living room areas and kitchen facilities, enjoyed growing popularity.

CURRENT CONDITIONS

The U.S. hotel and motel industry experienced a period of remarkable growth in the mid- to late 1990s and achieved its most profitable year on record in 2000. How-

ever, conditions changed the following year. In 2001 economic conditions weakened, and terrorist attacks against the United States on September 11 had a devastating effect on business and leisure travel levels. Citing data from Smith Travel Research, *Hotel & Motel Management* reported that in 2001 the industry lost some 400 hotels and between \$7-\$8 billion in room revenue. When related businesses like food and beverages are factored into the equation, this total was estimated to be much higher. Overall, revenues fell from \$108.5 billion in 2000 to \$103.6 billion in 2001. New hotel construction activity also fell considerably.

In the third quarter of 2002, Deutsche Bank reported that hotel construction levels were down more than 17 percent from the previous year, according to *Hotel & Motel Management*. At that time, total room counts were down 22 percent from the previous year's levels. By late 2002, the publication reported that many of the industry's indicators—including average daily rate, revenue per available room, and occupancy levels—were down in comparison to 2001. This was partially attributable to sluggish business travel activity, which had not recovered, as well as the leisure travel segment. Overall, travel expenditures remained weak in 2002, according to the Travel Industry Association of America (TIA). TIA indicated that both domestic and international travel expenditures were expected to fall almost \$2 billion in 2002. According to different reports, industry analysts expected conditions to improve gradually and reach pre-2001 levels sometime in 2003 or 2004.

INDUSTRY LEADERS

In the early 2000s, Marriott International, Inc. was the world leader in the lodging industry, with more than 2,500 hotels and annual revenues of approximately \$10.2 billion. The company's product line included Marriott Hotels, Resorts, and Suites and Ritz Carlton (full-service); Courtyard hotels (moderate price); Residence Inn (extended stay); Fairfield Inn (economy segment); as well as Renaissance Hotels and Resorts/Ramada International; TownePlace Suites by Marriott; Spring Hill Suites by Marriott; and Marriott Conference Centers. Marriott International was formed in October 1993, when Marriott Corp. was divided into two companies. Host Marriott Corporation was established to concentrate on real estate and airport concessions, while Marriott International focused on the lodging industry.

Cendant Corporation was formed through the December 1997 merger of CUC International and HFS Inc. With more than 6,600 properties, Cendant is the world's largest hotel franchiser. CUC International, founded in 1973, was a direct marketer and provider of home shopping and discount wholesaling clubs; it later acquired operations in online apartment rental, value-added tax

refunds, and software publishing. HFS was founded in 1992 as the holding company of the Howard Johnson, Ramada, and Days Inn hotel chains. Several years later, HFS diversified into real estate through the acquisitions of Century 21, Coldwell Banker, and Electronic Realty Associates; into car rental through the purchase of Avis; and into tax preparation through the acquisition of Jackson Hewitt. In 2001 Cendant posted revenues of \$8.8 billion. The company operates approximately 555,000 rooms, or some 13.5 percent of all U.S. lodging facilities, and is home to such well-known brands as Days Inn, Howard Johnson, Knights Inn, Super 8, Travelodge, Ramada, Wingate Inns, Villager, and AmeriHost.

Six Continents Hotels Inc., formerly known as Bass Hotels & Resorts, Inc., ranked as the second leading hotel company in the early 2000s. The company was part of Bass PLC until the parent company sold its brewing interests and changed its name to Six Continents. The subsidiary was home to more than 3,200 hotels in more than 100 countries in the early 2000s, some 73 percent of which were located in the United States. Among the company's brands are Holiday Inn, Holiday Inn Express, Crowne Plaza, Inter-Continental Hotels & Resorts, Holiday Inn Select, Holiday Inn Garden Court, Holiday Inn SunSpree Resort, Forum Hotels & Resorts, and Staybridge Suites by Holiday Inn. Six Continents had sales of \$2.8 billion in 2001, at which time it employed more than 35,500 workers.

WORKFORCE

The AH&LA reports that the hotel and motel industry employs more than 1.9 million workers. Its workforce is highly diverse. It often includes minimum-wage restaurant staff, room and building maintenance workers, middle-income administrative and marketing positions, and high-salary upper management personnel. The primary union in the industry is the Hotel Employees and Restaurant Employees International Union, based in New York City.

AMERICA AND THE WORLD

Since increasing numbers of U.S. travelers are leaving the country for both business and leisure, many U.S. chains are expanding overseas. Most of the major U.S. hotel companies have already expanded into Europe and are likely to continue to increase their global presence to accommodate the growth of international travel. The opening of Eastern Europe, coupled with the relaxation of trade barriers between European countries, has given further momentum to the enthusiasm for developing international operations.

SIC 7021

ROOMING AND BOARDING HOUSES

This category covers establishments primarily engaged in renting rooms, with or without board, on a fee basis. Rental of apartments, apartment hotels, and other housing units are classified in Real Estate Operators (Except Developers) and Lessors industries. Rooming and boarding houses operated by membership organizations for their members only are classified in **SIC 7041: Organization Hotels and Lodging Houses, on Membership Basis**. Homes for the aged, children, and the handicapped that also provide additional services, other than nursing care, are classified in **SIC 8361: Residential Care**, and homes that provide nursing care are classified in Nursing and Personal Care Facilities industries.

NAICS CODE(S)

721310 (Rooming and Boarding Houses)

INDUSTRY SNAPSHOT

Rooming and boarding houses provide generally low-cost lodging on either a temporary or long-term basis. Although the distinction between rooming, boarding, and lodging houses is not always clear, a rooming house is typically an establishment that provides only for the rental of rooms, while a boarding house provides meals and may offer such amenities as maid service and laundry service. At one time, rooming and boarding houses were a common, and often desirable, form of housing that catered to members of a wide range of social classes and professional occupations, but this sector of the lodging industry has generally been in decline. A 1985 *Engineering News-Record* report on a housing alternatives symposium characterized rooming and boarding houses as "bygone housing styles." Commercial rooming and boarding house establishments, while not "bygone," have undeniably become associated with the less fortunate classes. Nonetheless, rooming and boarding houses play an important role within the lodging industry and, as New Jersey architect Michael Mostoller argued in the course of the *Engineering News-Record* symposium, "the boarding house and rooming house . . . must be reconsidered" as an economical and potentially convivial form of commercial congregate housing.

ORGANIZATION AND STRUCTURE

The rooming and boarding house sector of the lodging industry includes non-organizational rooming houses, lodging houses, boarding houses, and dormitories that do not provide for such special services as nursing or personal care. Rooming and boarding houses can offer single rooms, shared double rooms, efficiencies, or suites; private, shared, or communal living and eating areas; and private, shared, or communal bathrooms. Approximately two-thirds of commercial rooming and boarding house establishments are owned by sole proprietors or partnerships, rather than by corporations. Most rooming and boarding houses are relatively small-scale operations. The average establishment had only five employees and an annual revenue of only \$181,849.

Rooming and boarding house establishments are subject to Department of Housing and Urban Development, Federal Housing Administration, and other federal or local building codes and standards, which effectively limit design options for new establishments, plus state and/or local licensing and inspection. A related concern for rooming and boarding house owners is insurance, which can be difficult to obtain for multi-family dwellings.

BACKGROUND AND DEVELOPMENT

In a study published in the *Journal of Marriage and the Family*, John Modell and Tamara K. Hareven as-

sessed the nineteenth century heyday of lodging in both domestic and commercial establishments, noting that “these two categories (from the point of view of the lodger) essentially competed within a single market.” Modell and Hareven found that the nineteenth century prevalence of rooming and boarding can be associated with rapid industrialization, urbanization, and population growth, coupled with increases in the number of manufacturing employees, of young, unmarried working men and women in the cities, and of foreign-born urban residents — though the authors stressed that lodging was far more characteristic of American and migrant cultures than of foreign cultures, who generally turned to lodging only as an expedient. Modell and Hareven proposed that “in an industrializing, rapidly urbanizing society,” rooming and boarding “was so widespread as to be reasonably considered indispensable.”

Mark Peel, in an article published in the Winter 1992 *Journal of American History*, focused on the lodging house in Boston in the second half of the nineteenth century. Peel elaborated on the cultural distinctions between the often genteel boarding house and the generally working- or lower-class rooming house, which was less socially structured and less supervised by landlords or hosts. Peel concluded that the rooming house “was not just a place where thousands of migrants and immigrants first met the American city,” but a potentially radical housing alternative where “some urban dwellers explored a very different social trajectory from those who entered through the boardinghouse, the tenement, or the suburban home.”

Commercial rooming and boarding house establishments could readily adapt to such variant and shifting “social trajectories.” Lisa F. Fine, in a study published in the *Journal of Social History*, described five particular boarding houses in Chicago that catered to women. These boarding houses, in the first three decades of the twentieth century, “provided safe, respectable, home-like, low cost housing, and a vast array of social services that allowed white-collar women to lead relatively independent lives.” In 1915, among the residents of these boarding houses, 233 were classified as stenographers, clerks, bookkeepers, or secretaries; 132 were listed as students; and 32 were teachers.

During the course of the twentieth century, however, the rooming and boarding house sector of the lodging industry has gradually been eroded. In an article published in the Winter 1992 *Journal of Social History*, Richard Harris summarized the scholarly consensus on the factors that led to the “social marginalization of lodging.” By the late nineteenth century, increasing levels of prosperity, along with essentially middle-class concerns about a lack of space and privacy in congregate housing, gradually made boarding or lodging in private

residences less common, although it persisted as a source of supplemental household income well into the twentieth century. As the economic tie between homeowners and lodgers was broken, and single-family housing became entrenched as a cultural ideal, lodging became less respectable. This led to the decline of boarding arrangements for the economically prosperous, whether in domestic or commercial establishments. Inexpensive rooming houses, with lodgers eating, socializing, and securing such services as laundry outside of the rooming establishments, became the predominant form of lodging house. Beginning in the 1920s, a boom in urban housing construction and the proliferation of inexpensive apartment blocs undermined the already narrowed market for rooming houses. In addition, beginning in the 1930s, the gradual establishment of the welfare state further lessened some of the economic bases of the rooming and boarding house sector of the lodging industry.

By the second half of the twentieth century, commercial rooming and boarding house establishments had become associated with housing for new workers or for the transient, poor, aged, or disabled. Of particular note was a 1977 incident in Sea Bright, New Jersey, in which four mentally retarded boarding house lodgers were killed in a fire that may have been set off by hostile neighbors. This incident created a national scandal and triggered congressional initiatives for the licensing and regulation of rooming and boarding house establishments.

The above developments contributed to a steady drop in the number and profitability of these establishments through the 1990s. Nonetheless, rooming and boarding houses have proven their flexibility in the past. Still, the fate of this segment of the lodging industry remains subject to fluctuations in cultural, political, economic, demographic, and regional factors.

CURRENT CONDITIONS

The total number of commercial rooming and boarding houses nationwide was 1,620, down from 1,781 in 1987. The states with the highest number of rooming and boarding house establishments continued to be large states with high numbers of transient residents, such as California (280 establishments), New York (175 establishments), Florida (83 establishments), and Pennsylvania (79 establishments). Many states (Alaska, Arkansas, Delaware, Hawaii, Idaho, Kentucky, Louisiana, Montana, Nebraska, Nevada, New Hampshire, New Mexico, North Dakota, Rhode Island, South Dakota, Utah, West Virginia, and Wyoming) had 10 or fewer commercial rooming and boarding house establishments.

The national revenues for the rooming and boarding house sector of the lodging industry amounted to approximately \$294.6 million. This figure represented an increase of 19.6 percent over 1987, but it was far less than

the average 56 percent increase in revenues during that period for taxable service industries in general.

During the 1990s, the industry experienced negative publicity that focused on initiatives for the inspection, regulation, and reform of substandard or illegal rooming establishments. The *New York Times* reported on the “growing number of one-family homes illegally converted to single-room occupancy.” In such cities as Chicago, neighborhood associations were organized to combat illegal conversions in areas zoned for one-family or two-family homes. These neighborhood associations protested the loss of neighborhood integrity and the decline of property values. They also feared — both for themselves and for the occupants of illegal rooming houses — problems related to congestion, security, fire, pollution, sanitation, and noise. Further, some establishments also became centers of drug activity, as allegedly happened in the case of Peck’s Row, a historic row house in Milwaukee that had been converted into a rooming house and became the subject of controversy over its preservation.

As in the past, many illegal rooming establishments are inhabited by recently immigrated populations, whose vulnerability to exploitation may be aggravated by a lack of language and cultural skills and/or by illegal immigration status. The *New York Times* article quoted Bill Apgar of the Harvard University Joint Center for Housing Studies on this specific problem: “There are a lot of illegal conversions where . . . people are being allowed to live in unsafe conditions while paying rent which is disproportionate to the service they receive. . . . The fear of being deported is the leverage that the landlord holds over the tenant.” Even so, city inspectors are often reluctant to take action against illegal rooming establishments. The landlords may be subject to only limited and temporary penalties that provide little deterrent, while the socially and economically disadvantaged tenants might suffer greatly from attempts at governmental intervention or control. Some municipalities have taken a more positive approach to this problem by considering conversion of rooming houses into low- and moderate-income housing units.

Despite this generally gloomy outlook, the industry does offer some positive aspects. Located in New York City, the Katherine House, one of the last surviving traditional boarding houses for women, has a waiting list of 18- to 25-year-old women who wish to obtain a private room with two daily meals for a mere \$135 per week. A hybrid form of housing, “extended-stay lodging,” provides hotel-like accommodations for traveling businesspeople for periods of weeks or months, sometimes with meals included, and became increasingly popular in the mid 1990s.

WORKFORCE

The rooming and boarding house sector of the lodging industry created only a limited number of employ-

ment opportunities. Rooming and boarding house employees included janitorial and housekeeping staff and food service, laundry, and maintenance workers. The total number of people employed in the industry was approximately 8,000, with an average of five employees per establishment.

SIC 7032

SPORTING AND RECREATIONAL CAMPS

This industry consists of establishments primarily engaged in operating sporting and recreational camps, such as boys’ and girls’ camps, and fishing and hunting camps. Establishments primarily engaged in operating sports instructional camps, such as baseball, basketball, football, or karate camps, and those operating day camps are classified in **SIC 7999: Amusement and Recreation Services, Not Elsewhere Classified**.

NAICS CODE(S)

721214 (Recreational and Vacation Camps)

INDUSTRY SNAPSHOT

In 1999, nearly 9 million people attended one of the nation’s 8,500 camps, according to the American Camping Association (ACA). About 5,500 of those camps were resident camps, 2,200 were day camps, and the remaining 750 offered both day and overnight programs. Although the majority of camps were of the conventional summer camp variety, specialty camps that operated year-round and focused on one of a diverse range of subjects (such as accounting or space travel) were appearing in growing numbers. Camps catering to adult participants were on the rise as well and ranged from

dude ranches to nudist camps. The camp industry employed 500,000 primarily full-time seasonal workers, usually college students, teachers, and health care professionals. The cost of attendance varied greatly from one facility to the next. Day camps typically cost between \$10 and \$50 per day, while the daily rate for resident camps ranged from \$15 to \$120.

ORGANIZATION AND STRUCTURE

About 75 percent of the 8,500 camps in the United States are operated by nonprofit groups or agencies. These include religious institutions, scouting organizations, and such well-known groups as Camp Fire, Inc., YMCA, and Boys and Girls Clubs of America. The remaining 2,125 camps are operated privately by families or individuals. In the United States there aren't any companies that operate large chains of commercial camps.

Establishment Size and Distribution. Nearly 40 percent of the establishments in the sporting and recreational camp industry are tax-exempt, a figure that is considerably higher than the 9.6 percent across all service industries. The tax-exempt segment of the industry accounts for only about 35 percent of the revenue generated by the industry, while employing 41 percent of its workers. Whether tax-exempt or not, camps are generally small operations in comparison to the rest of the service sector. Nonprofit camps employ, on average, only six people per establishment compared to 39 per establishment in other nonprofit operations in the service sector.

Geographically, camps are usually found where one finds the two necessary ingredients — people and space. New York and California, which have plenty of both, have the most sporting and recreational camps, with well over 200 ACA-accredited establishments each. States in the northern part of the Midwest, particularly Michigan, Minnesota, and Wisconsin, are also strongly represented in this industry, as are Pennsylvania and Texas.

Accreditation. A voluntary accreditation program has been administered by the American Camping Association (ACA) since the late 1940s. By the end of the twentieth century, roughly 2,200 U.S. camps were accredited by the ACA. Accreditation of a camp is established through an evaluation process based on up to 300 national standards. Trained volunteers visit the camp and, using a set of established guidelines, grade the facility in a variety of areas, including site and facility, administration, transportation, personnel, programs, health care, and activities. Site and facility criteria cover such basics as sanitary arrangements and food service. Standards for administration include safety regulations and emergency procedures. Vehicle safety and maintenance are examined for compliance with transportation standards. Personnel standards apply to the training, qualifications, and

supervision of staff members. Qualifications of activity leaders are among the topics covered by program standards. Health care standards include the availability of first aid care and emergency transportation.

The list of standards used in the ACA's accreditation program has evolved over the course of several decades, beginning as the "Suggested Tentative Standards" adopted in 1935. The first set of official camp standards was adopted at the ACA's National Convention in 1948, after several years of study and debate and with financial support from the Chrysler and Kellogg foundations. In the 1950s, the standards for camp personnel and programs were adopted, as well as the methods by which conformity to these standards could be ascertained. Further research and development of the standards took place in the 1960s, including the formation of a Standards Rewrite Committee. In the 1970s and 1980s, standards were adopted that incorporated the needs of campers with disabilities and special medical conditions, such as diabetes. In 1990, a new set of standards was adopted that emphasized health and safety issues over the business-related issues that had been emphasized in the past.

BACKGROUND AND DEVELOPMENT

The roots of the camping movement are often traced to the second half of the nineteenth century. In the summer of 1861, Frederick William Gunn, a Connecticut schoolmaster, took his class of 40 boys for a two-week campout to Long Island Sound, where they simulated the lifestyle of Civil War soldiers. The outing was so successful that it became an annual event known as Gunnery Camp. The next notable camp experiment was begun in 1881 by Ernest Balch, an undergraduate at Dartmouth. Seeking a summer alternative for children of wealthy families, Balch founded Camp Chocorua in New Hampshire. At Chocorua, boys from 12 to 16 years of age received a taste of wilderness, which Balch theorized was a healthier way to spend the summer than accompanying their parents to the swanky resorts of the day. In the following years, new camps were founded on the Chocorua model.

Fresh Air and Other Programs. Late in the nineteenth century the Fresh Air movement arose out of concern for the needs of poor children in urban areas. Camps were established near cities where growing immigrant populations were living in overcrowded conditions, which were perceived as unhealthy and conducive to delinquency. Some camps that were founded in the early days of the Fresh Air movement are still in existence, including Camp Algonquin, founded by Chicago's United Charities in 1907, and Incarnation Camp, Inc., an Episcopal center that began as early as 1886. Around 1875, Country Week programs were established in Philadelphia and Boston. The Philadelphia program was started by Eliza Turner,

who invited 12 girls to spend two weeks at her farm; by 1910, 3,000 children were participating. In New Jersey the publisher of *Life Magazine* founded what became known as Trail Blazer Camps in 1887; by 1918, 40,000 children had participated in two-week sessions at the camp.

Private girls' camps began to appear in greater numbers around 1902. That year, three such camps opened: Kehonka in New Hampshire; Pinelands of Centre Harbor, Maine; and Wyonegonic Camps in Bridgton, Maine. Another camp, Camp Arey, which was founded years earlier as a natural science camp for boys, also became a girls' camp. By 1915, 100 private girls' camps were in operation. These camps offered girls from sheltered backgrounds a chance to wear comfortable clothing and engage in activities that were more rugged than those in which they were usually allowed to participate.

YMCA and YWCA. The Young Women's Christian Association (YWCA) was first formed in Philadelphia as a sort of resource center for women employed in industrial occupations. The first YWCA camp, called Sea Rest, was set up in 1874 in Asbury Park, New Jersey. Its purpose was to enable overworked young women to take a low-cost vacation from their 60-hour-per-week jobs. It received an enormous amount of publicity from the start, including a dedication speech by President Ulysses S. Grant.

The Young Men's Christian Association (YMCA) appeared in the 1850s as a support program for teenaged boys and young men who lived on their own. The YMCA's camping program was founded by Sumner Dudley in 1885. That year, Dudley took seven YMCA boys camping at Pine Point on Orange Lake, only six miles from their home in Newburgh, New York. The program grew rapidly over the next few summers. The camp that Dudley founded was still operating 100 years later and now bears his name.

Camps operated by nonprofit organizations began to proliferate in the early part of the twentieth century. Among the groups that joined this trend were the Boy Scouts and Girl Scouts of America, Camp Fire Girls, and a wide variety of religious, labor union, and other types of organizations. Like their predecessors, these camps were mainly concentrated in the northeastern portion of the nation.

Government Involvement. Historically, government agencies have not played an important role in the development of the camp industry, at least not in the sense of operating camps of their own. It is estimated that the percentage of camps operated by public agencies at any given time has never exceeded five percent. Government agencies have contributed to the growth of camps in other ways, however. During the 1930s, the National Park

Service, which was established in 1916, developed a number of organized camping facilities for lease to camping groups that did not possess their own camping areas.

State parks have also been a source of camping facilities for a variety of groups since the early 1900s. New York, for example, established a camping department as early as 1917. By 1950, there were 296 organized camping facilities in state parks throughout the United States. City parks and recreation departments began setting up camp programs around the same time. Los Angeles, Detroit, and Kansas City had municipal camping programs by 1920.

Emergence of the American Camping Association. In 1910, the directors of several private boys' camps got together to form the Camp Directors Association of America (CDAA). The CDAA merged in 1924 with the National Association of Directors of Girls' Camps, which had formed in 1916. The combined group was called the Camp Directors Association (CDA). With an organization in place that could establish communication among camp administrations and articulate the goals of the industry, new areas were found on which to place emphasis. In particular, facilities for people with disabilities began to multiply in the 1930s and 1940s. Industry-wide publications such as *Camping* (the official CDA journal) and *Camp News* (a commercial venture) began to appear. In 1935 the CDA evolved into the American Camping Association (ACA), which remains the most widely recognized voice of the camp industry.

CURRENT CONDITIONS

According to the ACA, enrollment in the U.S. camping industry grew nine percent in 1998. Females accounted for 55 percent of the nation's total enrollees. This was the seventh consecutive year that enrollment increased by eight to ten percent.

An ACA survey conducted in the late 1990s discovered that parents and campers desired shorter camping sessions, a view that contributed to the popularity of the one-week camp over the two-week or one-month sessions. This desire was likely to be fueled further by the concept of year-round schooling. This emergent trend, which was opposed by the ACA, had implications for the camping industry nationwide and was the subject of study among educators and other interested parties. Dr. Peter Scales of the Search Institute, a Minneapolis-based institution that conducted research on youth development, was quoted by the ACA: "The biggest plus of camp is that camps help young people discover and explore their talents, interests, and values. Most schools don't satisfy all these needs. Kids who have had these kinds of (camp) experiences end up being healthier and have less problems." In July, 1998, the New York City Board of Education launched a pilot program to

provide an alternative to 12-month schooling. *Break-Aways: Partnership for Year-Round Learning* combined a nine-month school session with up to 28 additional days in a camp environment in which campers were exposed to both traditional academic lessons and camp activities.

A number of popular activities had been added to many camping programs by the late 1990s. These new areas of interest included adventure activities, such as mountain biking, rock climbing, and boating; fine arts, including performing arts, photography, and jewelry making; and organized sports, such as in-line skating, gymnastics, soccer, volleyball, and golf.

At the same time, various special purpose camps had also arisen. Some of these were instructional sports camps, which are classified under **SIC 7999: Amusement and Recreation Services, Not Elsewhere Classified**. In addition to these, recent entries have included NASA's U.S. Space Camp, ornithology camps, adult band camps, Breakers Etiquette Camp for teenagers, a circus camp called Circus Smirkus, and a host of camps with environmental themes.

Despite the trends of increased enrollment and the inclusion of popular activities, some 2,500 camps have closed since the mid 1970s. A disproportionate number of these had been run by nonprofit agencies. One of the chief reasons for these closures was that camps located near urban areas, especially those on the water, had become extremely attractive to real estate developers. Moreover, the prohibitive cost of liability insurance had become a problem for small camps that lacked significant financial resources.

WORKFORCE

Summer youth camps account for about 500,000 full-time jobs in the United States. However, most of these jobs are seasonal. The ACA reports that the typical salary for a camp counselor is between \$1,000 and \$3,000 for the camp season. Counselors with special skills, such as trained lifeguards, are often paid as much as \$4,000 for the same period. Most camps also provide their employees with room and board, and health care and laundry services are often available. A large percentage of camp counselors are college students on summer break. In some programs, college credit can be earned for camp experience.

In addition to counselors, camps also employ clerical workers, administrators, cooks, drivers, and other specialists. The vast majority of these workers are not represented by unions. In general, salaries for camp workers are fairly low compared to those of their counterparts in other service industries. Private camps usually pay higher wages than camps operated by nonprofit agencies. One unique characteristic of the sporting and recreational

camp work force is its international composition. Each year, about 75 nations are represented on the staffs of American camps, accounting for as many as 18,000 foreign counselors in the 1990s.

AMERICA AND THE WORLD

Organized camping, particularly of the summer camp variety, is very much an American phenomenon. One possible reason for this is the relative abundance of open landscape close to large cities. The United Kingdom, however, experienced a dramatic upswing in the popularity of summer camps in the 1980s. Between 1983 and 1988, the number of children attending "multi-activity holidays for children" doubled to 75,000. Unlike in the United States, the industry in the United Kingdom is highly concentrated, with a handful of companies accounting for a large share of the market. PGL Travel Ltd., for example, was the United Kingdom's leading operator of youth summer camps by the late 1990s, hiring more than 2,000 workers annually.

SIC 7033

RECREATIONAL VEHICLE PARKS AND CAMPSITES

This industry classification includes establishments primarily engaged in providing overnight or short-term camping sites for recreational vehicles, trailers, campers, or tents.

NAICS CODE(S)

721211 (RV (Recreational Vehicle) Parks and Campgrounds)

INDUSTRY SNAPSHOT

In the late 1990s, more than 40 million Americans went camping every year. Additionally, 30 million recreational vehicle (RV) enthusiasts were in possession of 9.3 million recreational vehicles (a general designation for motorized or towable vehicles that provide temporary living quarters). According to the Recreational Vehicle Industry Association (RVIA), nearly 10 percent, or 8.6 million, of vehicle-owning households in the United States owned at least one RV. By the year 2010, the number of RV-owning households was expected to reach 10.4 million. The average RV owner was 48 years old with a household income of \$47,000. RV trips were less expensive—20 to 80 percent cheaper — than comparable vacations based on other forms of transportation and lodging.

Commercial recreational vehicle parks and campsite establishments (i.e., campgrounds) typically provide RV owners and campers with inexpensive outdoor, recreation-oriented accommodations located near scenic and water recreation areas, national parks and forests, historic sites, theme parks, or major travel routes. The basic features of campgrounds are RV sites (ranging from rustic clearings to “pull-thru” concrete pads with utility hookups for water, sewage, electricity, and propane gas), tent sites, rest rooms, and shower facilities. Other typical amenities include cabins to rent, convenience stores or snack bars, picnic areas and grills, coin-operated laundry facilities, garbage and sewage disposal stations, swimming pools or natural swimming areas, fishing and boating facilities, recreation halls, playgrounds, sports facilities, nature and biking trails, movies, cable TV hookups, telephones, and motorcycle accommodations. Moderately expensive resort and membership establishments also feature such “country club” amenities as 18-hole golf courses, tennis courts, and spa facilities.

Recreational vehicle parks and campsites are frequented by a wide range of the population, including middle-aged or senior citizen couples, often on prolonged trips with wide-ranging travel itineraries; families with young children; and young people or couples. Establishments may cater exclusively to such demographic groups.

Individual campgrounds may contain anywhere from one dozen to several hundred RV pads and/or tent sites. Establishments may be open seasonally or year-round, depending on climate and the nature of the surrounding tourist attractions. Rates may vary by season. Senior citizen, RV club member, and other discounts are typically available, and longer-stay rates may also be discounted.

By the 1990s, the RV and campgrounds industries had given rise to a wide array of affiliated businesses and services. Companies such as Cruise America and the Canadian-based Go Vacations International furnished motor homes and travel trailers on a rental basis to both domestic and international tourists. Various international, national, regional, and state directories (including computerized databases) were being marketed, along with such “lifestyle” magazines as *RV Times* and *Trailer Life*. Specialty RV storage facilities, RV equipment and accessories retailers, and RV emergency road services were also available.

ORGANIZATION AND STRUCTURE

By the late 1990s, there were approximately 16,000 campgrounds and RV parks in the United States, of which approximately two-thirds were commercially owned. Public camping facilities were also operated by the National Park Service (440 campgrounds), the USDA National Forest Service (4,000 campgrounds), the Bureau of Land Management, the U.S. Army Corps of Engineers (53,000 campsites), the U.S. Fish & Wildlife Service (504 National Wildlife Refuges), state park and forest systems, and county and city governmental bodies. These public campgrounds typically offered few amenities and some did not accept reservations, or did so only on a limited basis. Public campgrounds were free of charge or very economical; typical rates ranged from free-of-charge to \$12 per night for tent sites and \$10 to \$20 per night for RV sites with hookups.

In comparison to public campgrounds, commercial campgrounds were more easily accessible, more predominantly oriented to RV camping, and more concentrated in the East and the upper Midwest. These commercial campgrounds, numbering approximately 8,500 in the late 1990s, typically offered more amenities (including reservation services) and were slightly less economical, although rates were still inexpensive in relation to the lodging industry as a whole.

The National Association of RV Parks and Campgrounds (ARVC), founded in 1967 as the National Campground Owners Association, has provided networking, advocacy, convention, and information services for commercial campground owners. The ARVC, with approximately 3,500 members in the late 1990s, sponsored the Go Camping America Committee to promote campground tourism, as well as the RV Park & Campground Industry Education Foundation to provide educational programs and publications to commercial campground owners. Many states established campground associations affiliated with the national ARVC. Government bodies that have promoted campground tourism include the U.S. Travel and Tourism Administration and the

Rural Tourism Development Foundation, which was established in 1993.

Chain Campgrounds. Chain campgrounds, despite the connotations of this label, are often distinctive, independently-owned businesses that are affiliated under varying arrangements with commercial campground organizations in order to take advantage of national or international marketing and reservation services. In the late 1990s, the largest chain was Kampgrounds of America (KOA), based in Billings, Montana. KOA held a network of more than 550 franchised campgrounds in the United States and Canada. While many of these establishments were roadside facilities with few amenities, others were destination resorts. Best Holiday Trav-L-Park Association, a non-franchise chain founded in 1982, included 71 independent parks that shared a central reservation service. Yogi Bear's Jellystone Park Camp Resorts, established in 1969 and geared to families with children, consisted of 72 member campgrounds with a theme based on "Yogi Bear," the Hanna-Barbera cartoon character. Chain campgrounds typically offer rate discounts for repeat customers within the campground network.

Independent Campgrounds. In the 1990s, establishments in the independent campgrounds category varied widely in size and quality, ranging from small-scale, modest operations to such destination resorts as Disney's Fort Wilderness Resort in Florida. Many independent campgrounds were registered with the nation's leading RV owners' club, the Good Sam Club, as Good Sam Parks. Other independent campgrounds were older facilities that weren't equipped to handle the parking and hookup requirements of the newer, larger, and more luxurious recreational vehicles.

Membership Campgrounds. In the 1980s and 1990s, membership campgrounds were destination resorts typically operated on one of two membership bases. One form of membership campground offered RV pads and campsites free of charge to members who paid a membership fee and annual dues. A second form of membership campground offered access to RV pads and campsites on a time-share basis. Both forms of membership campgrounds often belonged to networks, whereby members could extend their privileges to affiliated membership campgrounds for nominal fees. Membership campgrounds were often oriented toward golf, tennis, water-recreation and/or boating, and provided clubhouses and restaurants. Initiation fees for membership campgrounds started at \$5,000 (although memberships were often resold at discounted rates), with annual fees starting at \$100 or more.

BACKGROUND AND DEVELOPMENT

Several cultural forces provided the impetus for the commercial recreational vehicle parks and campsites in-

dustry. The central factors, of course, are the national enthusiasm for camping, which has been ranked by the U.S. Census Bureau's *Statistical Abstract of the United States* as the fourth most popular participatory sport/activity in the country, and the American passion for automobiles and recreational vehicles. America's camping tradition can be traced to the desire for an affordable form of travel and tourism, particularly given the geographical expanse of the United States; the nation's scenic diversity and natural endowments, which give weight to such tourism slogans as "See America First" and "Discover America;" a national ambivalence about city life, with its crowds, pollution, and noise (conditions, unfortunately, sometimes reproduced within busy campgrounds); an idealization of nature and the "frontier," and a corresponding adoption of Native American traditions; the conservation and ecological awareness movements; the country's outstanding interstate highway system; and the development, dating from the last quarter of the nineteenth century, of the national park and forest systems. The prestige and popularity of national parks at the Grand Canyon, Yellowstone, Yosemite, and California's redwood forest have played no small role in making camping one of the most popular leisure activities in the country.

"Sagebrushing," as the first wave of automobile- or RV-based camping was called, became a cultural phenomenon in the 1920s and 1930s, continuing even throughout the Depression. Such camping became even more popular after World War II, particularly among the burgeoning suburbanite population, and it utilized wartime technology such as four-wheel drive. By the 1960s, recreational vehicles became increasingly prominent on the camping scene, spurring the development of private campgrounds featuring utility hookups and a new level of amenities. The 1970s and 1980s marked the development, initially in the Pacific Northwest, of membership campgrounds. In the 1980s, record crowds at the most popular public campgrounds, in conjunction with Reagan-era federal budget cutbacks, created further growth opportunities for the commercial campground industry.

CURRENT CONDITIONS

According to the RVIA, the RV industry hit a 20-year high in 1998, as measured in shipments of RVs to dealers nationally. That year's total of 292,700 RVs represented a 15 percent increase over 1997. Results for the first three quarters of 1999 suggested a continuance of the upward trend, as the 251,000 in shipments was a 9.5 percent increase over the same period in 1998. "These robust numbers confirm that RV travel has entered a new era of growth," said David J. Humphreys, president of the RVIA, in a press release. "The industry is now benefiting from an influx of baby boomers into the RV ownership ranks, long projected by market analysts."

Demographic studies confirm the industry's positive outlook. The University of Michigan Survey Research Center predicted that the number of RV-owning households in the United States would rise to 10.4 million by the year 2010, a 21 percent increase over the 8.6 million such households in the late 1990s.

This study also found that RVs were increasingly appealing to younger consumers. Although Americans aged 55 and older owned approximately one-third of the total RVs on the road in the late 1990s, the segment experiencing the most growth in the industry was baby boomers. RV ownership by Americans aged 45 to 54 increased 25 percent in the mid 1990s. By the end of the decade, approximately 45 percent of the nation's RVs were owned by boomers between the ages of 35 and 54, compared to the 40 percent owned by those aged 55 and older. The University of Michigan study also determined that nearly 25 percent of boomers intended to purchase an RV sometime in the future. A study by Louis Harris and Associates found a similar buying pattern — more than half of all likely RV buyers fell in the 30- to 49-year-old range.

This demographic trend indicates a positive outlook for leisure activities, such as RV camping, that are favored by middle-aged and older populations. As *Business America* noted, "The progression from tent camping to RV camping as campers grow older is evident." Therefore, the aging of baby boomers should ensure a phase of renewed growth for an industry that achieved peak profits in the late 1980s, but experienced a slight downturn at the beginning of the 1990s.

A separate trend affecting the campground industry in the 1990s was the growing ecological and environmental awareness that was reflected in the international tourism industry by the advent of "ecotourism." Some campers and campground owners, increasingly concerned about minimizing their negative impact on natural and wildlife environments, had turned to environmentally sensitive camping methods and products, including the recycling or careful disposal of garbage, food waste, and sewage. The *New York Times* reported that "operators of private campgrounds, while still eager to draw customers and make profits, are more aware that the lure of the outdoors means preserving the outdoors." Public campgrounds also responded to this trend; in 1993, Yosemite became the first national park to develop a comprehensive garbage and food waste reduction strategy.

INDUSTRY LEADERS

Thousand Trails, Inc., founded in 1969, had \$67.9 million in revenues in 1999. That year, the firm's 106,000 members had access to a network of 53 private campgrounds in 17 states and British Columbia. Its subsidiary,

Resort Parks International, is a network of affiliated, private RV and condominium resorts.

Kampgrounds of America, Inc., (KOA) is the world's largest system of franchised campgrounds. Established in 1962 to offer overnight amenities for cross-country travelers, KOA was comprised of about 550 locations in the United States, Canada, Mexico, and Japan by the late 1990s. About 90 percent of the campgrounds were franchised, with the remaining 10 percent company-owned. KOA recorded revenues of \$26.6 million in 1998.

WORKFORCE

Traditionally, many commercial campgrounds were modest, owner- or family-operated establishments. Therefore, only a limited number of seasonal or permanent positions were created by the industry. These positions were typically for registration clerks, convenience store clerks, janitors, groundskeepers, and recreation-related employees.

AMERICA AND THE WORLD

The United States has historically been dominant in the recreational vehicle parks and campsites industry, and American RV owners and campers have fueled the commercial campground industries in Canada, Mexico, and other popular international camping destinations. By the late 1990s, Kampgrounds of America had established several franchises in Canada, Japan, and Mexico. International visitors to the United States comprise a significant percentage of KOA's customers, and vacationers from Japan, Australia, New Zealand, Germany, and the United Kingdom, in particular, have increased the U.S. RV rental market.

Vacationing in "caravans," as recreational vehicles are generally called abroad, is popular in Australia, New Zealand, and Europe, notably, in Germany, Switzerland, Austria, Scandinavia, and the United Kingdom. As in the United States, campgrounds abroad have been established by both government bodies and commercial interests. In the 1990s, international campground operators included EuroCamp and Eurosites. National campground operators included Big 4 Tourist Parks (Australia), Azur Camping (Germany), The Best of British (Great Britain), Top 10 Holiday Parks (New Zealand), Club Caraville (South Africa), and DomanTuristAB (Sweden).

SIC 7041

ORGANIZATION HOTELS AND LODGING HOUSES, ON MEMBERSHIP BASIS

This category covers lodging houses and hotels operated by membership organizations for the benefit of their constituents, and not open to the general public. Commercial hotels operated by such organizations are classified in **SIC 7011: Hotels and Motels** and commercial rooming and boarding houses are classified in **SIC 7021: Rooming and Boarding Houses**. Residential homes for the aged and handicapped are classified in **SIC 8361: Residential Care**.

NAICS CODE(S)

721110 (Hotels (except Casino Hotels) and Motels)

721310 (Rooming and Boarding Houses)

The organization hotels and lodging houses industry included establishments such as: boarding houses for members of organizations; fraternity and sorority houses; residence clubs; and rooming houses operated by private clubs. Commercial hotels, public boarding houses, and residential homes for the aged were classified elsewhere.

Membership lodging establishments existed in the United States from the founding of the nation. For exam-

ple, the first fraternity, Phi Beta Kappa, was founded in 1776 at William and Mary College. The first sorority, Kappa Alpha Theta, was instituted in 1870 at Depauw University. A plethora of other not-for-profit organizations that offered boarding facilities emerged during the twentieth century. The Young Men's Christian Association (YMCA), for instance, started its U.S. chapter in 1851 and grew to more than 13 million members by the early 1990s. Likewise, Youth Hostels Inc. of America, which provided inexpensive travel lodging nationwide to its members, had over 100,000 members. With the population aging, organizations like Elderhostel have also become popular. Here people 55 or older pay a fee to join, then take advantage of numerous study trips around the United States and the world. Most of these trips involve a classroom or field trip environment.

In addition to not-for-profit membership lodging facilities, the fastest growing sector of this industry during the 1980s was commercial vacation travel clubs. Members of these organizations often paid an annual fee and received access to private vacation facilities or special travel packages. A proliferation of travel and vacation membership clubs during the 1980s boosted the number of industry participants to about 2,500 by the late 1980s with revenues reached about \$350 million. The industry suffered during the recession of the late 1980s and early 1990s, however, as vacation and travel industry revenues plummeted. Several companies folded and industry profitability withered.

In 1998, There were an estimated 1655 establishments in this industry with 10,200 employees. In 1999, \$490 million in revenue was reported, an almost 9 percent increase from the previous year.

Timeshares were developed in Florida in the mid 1970s. Investors buy a week's time at a particular resort, then pay extra to join an “exchange” club. The ability to exchange vacation time with other affiliated resorts heightened the appeal of the timeshare concept. In 1998, the largest timeshare club was Fairfield Communities of Orlando, with \$407.9 million in sales, 4,700 employees, and 270,000 owners. Second was Santeria Corp., also of Orlando, with \$359.4 million in sales, 6500 employees, and 260,000 owners. Third was Trendiest Resorts of Redmond, Washington, with sales of \$197.9 million, 1,549 employees, and 50,000 owners. Another leader was Silverleaf Resorts, Inc., of Dallas, Texas, with \$138.4 million in sales, 2,347 employees, and 78,000 owners.

Despite setbacks during the recession of the early 1990s, hotel and lodging industry job opportunities were expected to increase significantly between 1990 and 2005, according to the Bureau of Labor Statistics, with most occupations growing in number by 20-40 percent by 2005. Although most of the growth would likely occur in low-paying labor jobs, such as those for janitors and

waitresses, positions for trained hotel managers should leap by more than 50 percent.

SIC 7211

POWER LAUNDRIES, FAMILY AND COMMERCIAL

This category includes firms that primarily operate mechanical laundries powered with steam or other means. Companies that primarily supply laundered work clothing on a contract or fee basis are classified in **SIC 7218: Industrial Launderers**.

NAICS CODE(S)

812321 (Power Laundries, Family and Commercial)

Projections based on U.S. Bureau of the Census County Business Patterns show a decline in the industry over the course of the late 1990s, with 1,422 establishments remaining by 1998, down from a peak of 1,853 in 1992. The industry grossed a high of \$932 million and employed 26,700 workers in 1995, with a decline of \$5.5 million projected by the end of the decade. Most of these businesses were sole proprietorships or family-operated. Employment averaged 13 workers per establishment.

The laundry industry grew steadily from 1990-1992 as it underwent significant change. New technology altered the way clothes were laundered, dried, and finished, and laundry automation made for greater speed, efficiency, and productivity. Two major industry areas currently getting attention are automation and environmental issues. The latter concerns the use of certain detergents deemed damaging to the environment—such as those containing phosphates—and the safe disposal of waste products. Phosphates, considered to be the most effective laundering compound, may accelerate algae growth in water and deprive it of oxygen. Attempts were made to restrict their use. The impetus came from within and outside the industry. Some laundry managers turned to

alternative products, anticipating future regulations against phosphates.

As power laundries grew more automated, industry observers anticipated a reduction in labor requirements, and despite a 7 percent surge in the labor force in 1992 a pattern of workforce reduction persisted throughout the end the decade. Industry projections for 1998 indicated that employment levels would continue to decrease to 81 percent of 1992 figures, despite payroll and revenue growth. Automation increased productivity and reduced the need for workers by cutting down on the number of manual tasks. For instance, networking washers, dryers, and finishing machines eliminated manual handling of loads between different laundering phases. Computerization also reduced labor requirements for office tasks, such as data entry. According to *Laundry News*, "Computer systems and automated machinery allow laundries which might have previously operated two shifts with 100 people to operate one shift with 70 people." Automation may also reduce the number of accidents in power laundries and alleviate employees' health concerns. Laundry workers commonly suffer back injuries from heavy lifting, muscle strains from stretching, carpal tunnel syndrome from repetitive motions, skin diseases from contact with heavy duty detergents and chemicals, and heat stress conditions.

In the late 1990s, the leading family and commercial power laundry business in the United States was Unifirst Corporation of Wilmington, Massachusetts, a public company with annual sales of \$419 million and an estimated 7,000 employees. Pride Cleaners Incorporated of Kansas City, Missouri was second, with \$37 million in sales.

SIC 7212

GARMENT PRESSING, AND AGENTS FOR LAUNDRIES AND DRYCLEANERS

This industry category includes establishments that primarily serve as agents for launderers and drycleaners. Companies in this industry may do their own pressing or finishing work but have the laundry and dry cleaning work done by others. Businesses operating their own laundry plants are classified in **SIC 7211: Power**

Laundries, Family and Commercial, and those operating their own dry cleaning plants are classified in **SIC 7216: Dry cleaning Plants, Except Rug-Cleaning.**

NAICS CODE(S)

812391 (Garment Pressing and Agents for Laundries)

The average work force for industry firms consisted of 13 employees; most companies were privately owned, according to U.S. census figures. The *Journal of Commerce and Commercial* noted the total dry cleaning industry was “dominated by immigrant small-business owners and families with limited means.” According to U.S. government statistics, there were 3,159 establishments in this category in the mid 1990s, with negligible fluctuation expected through the end of the decade. The industry was otherwise projected to grow in the late 1990s, with revenues exceeding \$606 million, employment of approximately 13,900 workers, and anticipated total payroll of \$148.7 million. The garment pressing and cleaners’ agents industry is concentrated most heavily in the Midwestern United States, with a secondary concentration in the New England states.

Environmental Regulations. In 1993, the Environmental Protection Agency (EPA) amended the Clean Air Act of 1990, adding new rules to reduce atmospheric levels of the most common dry cleaning chemical, perchloroethylene. *Journal of Commerce and Commercial* noted the chemical was “the most effective cleaning agent” in the industry, “but the government has identified it as a probable human carcinogen.” The EPA estimated about 30 percent of U.S. drycleaners would be affected by the new regulations. Industry observers said drycleaners would have to invest at least \$7,000 to meet the necessary standards, a heavy burden for many small operations.

Anticipating the implementation of the new EPA standards, chemical producers set out to find replacement substances for perchloroethylene, including solvents based in carbon dioxide and silicone. Yet, by 1999 an estimated 85 percent of drycleaners continued to use the chemical, with cost and cleaning quality of major concern. Other methods of chemical vapor reduction were devised. Five states — Illinois, Kansas, North Carolina, Oregon, and Wisconsin — have adopted legislation to mandate closed-loop delivery systems for the substance. Conversion to closed-loop required installation of a valve — at an estimated cost of less than \$50 per system in 1999 — and typically resulted in cost reduction in equipment maintenance and solution refill costs. The closed-loop systems enhanced worker safety by minimizing human exposure to the chemical.

SIC 7213

LINEN SUPPLY

This industry classification covers businesses that primarily supply or rent to commercial establishments or household users the following laundered items: uniforms, gowns, and coats used by doctors, nurses, barbers, beauticians, and waitresses; table linens, bed linens, towels and toweling; and similar various items. Companies included in this industry may or may not operate their own laundry facilities. Companies that primarily provide diaper service are in **SIC 7219: Laundry and Garment Services, Not Elsewhere Classified.**

NAICS CODE(S)

812331 (Linen Supply)

According to U.S. government statistics, there were 1,267 establishments in this category in the late 1990s, down from 1,338 in 1987. A continued decline in number of businesses was anticipated into the start of the new century. Industry sales, in contrast, were expected to increase by the late 1990s to reach a projected \$2.86 billion, compared with \$2.39 billion in 1990. Industry employment held steady throughout the last half of the

1990s, with around 54,000 workers estimated in the industry and a total payroll slightly more than \$1 billion.

Among the dominant corporations in the industry, Aratex Services Incorporated and National Linen and Uniform Company reported more than \$500 million in sales for 1998. Uniform giant, Cintas Corporation, based in Mason, Ohio, also designs, manufactures, and rents work uniforms, in addition to its dry cleaning services. The company serves businesses ranging from small shops to large corporations. Cintas's clientele exceeded 150,000 business customers in 1996. The company acquired Unitog in 1999, and, largely as a result of the merger, Cintas doubled its 1996 customer base. Cintas reported \$1.75 billion in sales in 1999, a growth of 46 percent over a 12-month period.

Other industry leaders included: privately held Steiner Corp. of Salt Lake City, Utah, with 6,900 employees and reported sales of \$370 million in 1998; American Linen Supply Co. of Minneapolis, Minnesota, also privately held and with 5,500 employees, reported sales of \$290 million in 1998.

U.S. Department of Commerce. *1992 Census of Service Industries Geographic Area Series*. Washington, DC: Bureau of the Census, 1995.

SIC 7215

LAUNDRIES AND DRY CLEANING, COIN OPERATED

This industry classification covers establishments primarily engaged in the operation of coin-operated or other self-service laundry and dry cleaning equipment either for use on the premises, or in apartments, dormitories, and similar locations. These include establishments known as laundromats, launderettes, and self-service dry cleaners. It also includes establishments primarily engaged in installing and operating coin-operated laundry equipment in apartments, dormitories, and similar locations.

NAICS CODE(S)

812310 (Coin-Operated Laundries and Dry Cleaners)

The number of coin-operated laundries and dry cleaning establishments in the United States declined and leveled off to approximately 12,500 for much of the 1990s. This followed a one-year peak of 13,002 establishments in 1992, according to U.S. Census Bureau figures. Prior to 1992, the number of establishments hovered between 11,000 and 12,000. Of these, the overwhelming majority were primarily engaged in the operation of coin-operated or similar self-service laundry and/or dry cleaning equipment on their own premises; less than 1,000 were estimated as primarily engaged in installing and operating coin-operated laundry equipment in apartments, dormitories, and similar locations. These establishments employed more than 50,000 workers and had total revenues of \$3.5 billion and higher as the century drew to a close. Revenue projections showed a consistent increase through the end of the decade, reaching 3.9 billion in 1998.

Although the coin-operated laundry and dry cleaning industry is highly fragmented, the clear industry leader is Roslyn, New York-based Coinmach Laundry Corporation, with more than 760,000 machines in the United States. In April of 1995, Coinmach acquired its former competitor and industry giant Solon Automated Services, Incorporated; and, in January of 1997, Coinmach acquired Dallas-based Kwik Wash Laundries, Incorporated, one of the largest companies in the industry. The 1997 combination of Kwik Wash and Coinmach earned total revenues of \$248 million for the twelve months ending September 27, 1996. Prior to its acquisition of Kwik Wash, Coinmach's market share — with 245,000 units — was less than 10 percent; in fiscal year 1999, the company grew at a rate of 55.5 percent, with sales of \$505.3 million, and 2,045 employees, which represented a growth of 10.5 percent.

This industry has been quick to embrace technological innovations. The former Solon Automated Services, Incorporated pioneered the use of IBM's Application System/400 Model B50 to link each of its sites to a centralized data bank. The system slashed accounting errors with the use of a bar-coding system that tracked the number of coins taken in by each machine and provided useful information about the machines — including usage and maintenance records.

Other new technologies include machine-readable cards that operate laundromat washers and dryers in lieu of coins. The cards, produced at Arthur D. Little, Incorporated's Center for Technology and Product Development, hold magnetically encoded data with patrons' monetary balances. Patrons use the cards to operate laundry machines, and the machines automatically read and deduct the charges from the card balance.

SIC 7216

DRY CLEANING PLANTS, EXCEPT RUG CLEANING

This category includes establishments primarily engaged in dry cleaning or dyeing apparel and household fabrics other than rugs. Press shops and agents for dry cleaners are classified in **SIC 7212: Garment Pressing, and Agents for Laundries and Dry Cleaners**. Establishments primarily engaged in cleaning rugs are classified in **SIC 7217: Carpet and Upholstery Cleaning**.

NAICS CODE(S)

812322 (Drycleaning Plants)

INDUSTRY SNAPSHOT

Most companies in this industry provide general dry cleaning, although some specialize in treating drapery, carpeting, or fire-damaged materials. The majority of dry cleaning plants are single-proprietor firms that gross an average of less than \$200,000 annually. Based on a U.S. Bureau of the Census report, an estimated 20,794 plants were expected to be in operation in the United States during 1998. This figure, however, indicated a decline in the number of firms in this industry, following a peak in 1995 when 20,856 establishments were in operation. Revenues, on the other hand, maintained a steady upward trend.

BACKGROUND AND DEVELOPMENT

Regarded as a mature industry, dry cleaning has proven resilient in difficult economic times, benefiting from the tendency of patrons to care for old clothes rather than purchase new ones in such periods.

The later decades of the 1900s witnessed the introduction of legislation that shaped the industry. The Care Labeling Rule, instituted by the Federal Trade Commission in 1972, made it easier for dry cleaning establishments to determine the proper mode of clothing care. Additionally, in September of 1993, the U.S. Environmental Protection Agency issued national regulations to control possibly harmful air emissions from dry cleaners due to perchloroethylene, a dry-cleaning chemical sus-

pected to cause ill health effects to those with which it came in contact. As a result, the industry was forced to change the traditional dry cleaning method known as the transfer system — washing clothes in perchloroethylene inside a machine and then transferring them to a separate dryer. In response, chemical companies raced to develop new, less toxic cleaning formulas. Meanwhile, five states instituted regulations that outlawed all but closed-loop perchloroethylene systems for dry cleaning. Conversion to closed-loop systems was both environmentally safer and relatively inexpensive, at approximately \$45 per machine in 1999.

WORKFORCE

Employment in the industry, which does not have a meaningful union presence, fluctuates. The industry employed an estimated 169,500 workers in 1998. The annual turnover rate, according to the International Fabricare Institute, ranges from 20 to 40 percent. Annual industry payroll increased from \$1.49 million in 1987 to an estimated \$2.17 million in 1998. About 17 percent of employees in the dry cleaning industry worked as counter and rental clerks in the mid 1990s. Laundry and dry cleaning machine operators accounted for 14 percent of employees while pressing machine operators accounted for 13 percent. Counter and rental clerk positions were expected to increase by more than 15 percent from the mid 1990s to the year 2006. Positions for both laundry and dry cleaning machine operator and pressing machine operator were also expected to increase through the year 2006, by 5 and 15 percent respectively.

INDUSTRY LEADERS

Among the largest dry cleaners in 1999 was Johnson Group Management of Cincinnati, Ohio, with sales of \$160 million and 3,000 employees. Dryclean U.S.A., Incorporated, also of Cincinnati and a subsidiary of the Johnson Group, had a nationwide market and employed approximately 550 workers in 1998. Established in 1976, the company had \$25 million in sales in 1998.

Other major companies in the industry included Pride Cleaners, Incorporated of Kansas City, Missouri, with sales of \$37 million and 700 employees in 1998; and Swan Cleaners Inc. of Columbus, Ohio, with sales of \$26 million and approximately 500 employees.

SIC 7217

CARPET AND UPHOLSTERY CLEANING

This category includes establishments primarily engaged in cleaning carpets and upholstered furniture either at a plant or on customers' premises. Establishments primarily engaged in rug repair are classified in **SIC 7699: Repair Shops and Related Services, Not Elsewhere Classified**, while those primarily involved in reupholstering and repairing furniture are classified in **SIC 7641: Reupholstery and Furniture Repair**.

NAICS CODE(S)

561740 (Carpet and Upholstery Cleaning Services)

The advent of nailed-down (wall-to-wall) carpets in the 1950s fueled growth in the industry after a period of economic stagnation during World War II. Previously, people rolled up their carpets and took them to the dry cleaners or to other facilities. The shift to in-home services enabled new businesses to establish themselves more easily. Instead of maintaining a commercial location with a public counter for transacting sales, prospective dry cleaners needed only transportation and the necessary equipment and chemicals to get started in business. Consequently, the number of service providers swelled during this time. By the late 1990s, there were an estimated 9,112 estimated carpet and upholstery cleaning establishments in operation in the United States, employing 45,900 workers and earning total revenues of \$2.85 billion. These figures reflected the decade's continual upward trend, which, overall, represented an increase of more than 68 percent from 1990, when 5,629 carpet and upholstery cleaning establishments constituted a \$1.69 billion industry.

In the late 1990s, the industry was dominated by small businesses, with approximately one-third of the total industry establishments and one-quarter of employees operating under the representation of the Institute of Inspection, Cleaning, and Restoration Certification (IICRC). Most firms in the industry appeared in metropolitan areas, employed an average of five people, and offered cleaning services exclusively, according to Cleaning Management Institute. Increased demand for additional services characterized the carpet cleaning industry in the 1990s, according to professional rug cleaner, Larry Cooper. He was quoted in the industry journal, *Cleanfax*, stating that "Companies [in the 1990s]

. . . are expected to be experts in many areas in addition to the normal carpet and upholstery cleaning services, including: water damage restoration, fire damage restoration, odor control, carpet installation, and repairs etc. . . . [reflecting a change from the past when] . . . carpet cleaning companies cleaned mostly carpet and occasionally upholstery." Very few of the larger companies, however, offered carpet and upholstery cleaning as part of a range of disconnected services in the 1990s, during which time residential cleaning accounted for the majority of revenue. Throughout those years, commercial customers constituted the fastest growing segment of clientele in the carpet and upholstery cleaning industry. Increasingly, schools, stores, restaurants, and offices switched from hard, washable flooring to soft floor coverings that required professional cleaning services. Additionally, concern with "sick building syndrome" fueled increased business on the commercial side.

In 1999, *Service Industries USA* listed Hagopian and Sons, Incorporated of Oak Park, Michigan as the industry leader in carpet and upholstery cleaning, with estimated revenues of \$21 million in 1998. The second largest firm, BMS Enterprises, Incorporated of Fort Worth Texas, earned \$7 million.

SIC 7218

INDUSTRIAL LAUNDERERS

This industry category includes establishments that primarily provide laundered or drycleaned industrial work uniforms and related work clothing, such as protective apparel (flame and heat resistant) and clean room apparel; laundered mats and rugs; dust control items, such as treated mops, rugs, mats, dust tool covers, and cloths; laundered wiping towels; and other selected items to industrial, commercial, and government users. These items often belong to the industrial launderer who rented them to users—who may or may not have operated their own laundry or drycleaning facilities.

NAICS CODE(S)

812332 (Industrial Launderers)

According to U.S. government statistics, the number of industrial laundering businesses fell from 1,435 businesses in 1992 to an estimated 1,368 in 1998. Total industry sales for 1998 were \$5.1 billion, which was a 41 percent increase over the 1992 figure of \$3.6 billion. Industry employment forecasters estimated a total of 71,900 workers, with a combined industry payroll of \$1.5 billion. Although many firms in this industry are small-scale operations, the majority of these companies employed ten or more workers. Not surprisingly, industrial laundering businesses were most prevalent in densely populated states. California had the most, with 165 firms; followed by Texas, with 124; then Ohio and Pennsylvania, with 79 and 63 firms respectively.

As of 1999, the foremost industrial laundering company in the United States was the Cintas Corporation of Cincinnati, Ohio. The company earned \$840 million in sales' revenues for 1998, and employed a workforce of 12,000. Cintas had a 15 percent share of the market for industrial uniform rentals, and boasted a clientele of 150,000 customer firms. More than 1.7 million uniformed employees wear apparel serviced by Cintas. Another prominent industrial launderer was Aratex Services, Incorporated of Burbank, California. Aratex, a privately-owned firm, had 10,000 employees and reported sales of \$550 million in 1998. National Linen and Uniform, headquartered in Atlanta, Georgia, ranked as the third largest firm in this arena, with 1998 sales totaling \$540 million and a staff of 11,200 employees.

SIC 7219**LAUNDRY AND GARMENT SERVICES,
NOT ELSEWHERE CLASSIFIED**

This industry category includes establishments that perform laundry and garment services, not elsewhere classified, such as the repair, alteration, and storage of clothes for individuals and for the operation of hand

laundries. Custom tailors and dressmakers classified in **SIC 5699: Miscellaneous Apparel and Accessory Stores**; fur shops making fur apparel to custom order are classified in **SIC 5632: Women's Accessory and Specialty Stores**; and press shops are classified in **SIC 7212: Garment Pressing, and Agents for Laundries and Drycleaners**.

NAICS CODE(S)

812331 (Linen Supply)

811490 (Other Personal and Household Goods Repair and Maintenance)

812399 (All Other Laundry Services)

Establishments in this category provide diverse services, ranging from diaper laundering to pillow cleaning and renovation to general tailor shops (except custom or merchant tailors) to textile mending services. Of these miscellaneous services, the diaper services are most common and have the biggest economic impact in the United States. Due to rising birth rates and environmental concerns over disposable diapers, the diaper laundry segment remained a healthy one through the 1990s.

Forecasts based on U.S. government statistics estimated that 4,462 establishments existed in this industry in 1998, nearly double the number of firms in 1988. Total industry revenues doubled to \$652.8 million between 1987 and 1992, and in 1998 the top five companies in the industry earned a total of \$703 million collectively.

The industry employed an estimated 26,600 workers in 1998, with total payroll costs of \$325 million. Laundry and drycleaning machine operators, and pressing machine operators combined totaled 28.2 percent of the industry workforce, while 17.4 percent of employees in this industry worked as counter and rental clerks.

Diaper services dominated the leading companies in this category. Additionally, major firms such as Angelica Corp. and Kahler Corp. had a significant presence in the industry, although they were better known for their services in other areas of the laundry industry. Other leading moneymakers in this category in 1998 included Enterprise L.L.C. of Detroit, Michigan; Rezex Corp., of Los Angeles, California; and Baby Diaper Service, Inc. of Greensboro, North Carolina.

SIC 7221**PHOTOGRAPHIC STUDIOS, PORTRAIT**

This category covers establishments primarily engaged in still or video portrait photography for the general public. Establishments primarily engaged in commercial photography are classified in **SIC 7335: Commercial Photography**; those engaged in video tape production other than portrait are classified in **SIC 7812: Motion Picture and Video Tape Production**; and those engaged in film developing or print processing for the trade or the general public are classified in **SIC 7384: Photofinishing Laboratories**. Establishments primarily engaged in processing film for the motion picture production industry are classified in **SIC 7819: Services Allied to Motion Picture Production**; and those engaged in computer photography are classified in **SIC 7299: Miscellaneous Personal Services, Not Elsewhere Classified**.

NAICS CODE(S)

541921 (Photographic Studios, Portrait)

The photographic portrait studio industry serves the general public with a range of portrait services. The industry includes portrait photographers, school photographers, home photographers, passport photographers, and video photographers. Specific portrait services include family portraits, wedding photos, passport photos, glamour photos, school photos, and team photos.

There were 12,436 portrait studio establishments in operation in the mid 1990s, according to the U.S. Census Bureau. These establishments employed roughly 75,000 people and earned nearly \$3.2 billion in revenues.

The professional portrait industry is segmented into two major categories and numerous subcategories of portraits. The first group is school portraits, which are further divided among kindergarten to grade 11 students, high school seniors, high school prom, and college. The second group, non-school, encompasses wedding, family, adult, daycare/nursery school, sports/team, children outside of school, glamour, class/family reunion, pet, hospital baby, church directory, and executive.

The general portrait studio provides services ranging from passport photos to family portraits. The studio offers these services at rates according to the size of the prints or the number of photographic print copies sold in a package. The studio keeps the negatives because, by law, they own the copyright, although proofs may be given to the purchaser for reordering purposes. Because of many studios' reliance on the school market, the industry is often a cyclical one, with peaks in the fall (yearly student pictures) and the spring (prom and graduation portraits).

Professional portraits may be taken in a variety of locations including a professional studio, a chain studio, a department store, a school, a church, an outdoor setting, a day care center, or an individual's home.

History of the Portrait Studio. The camera has been used as an artist's instrument for portraiture since its invention (the earliest known form of camera was originated by Leonardo da Vinci in 1482) and the subsequent advances made in the early 1800s. A French inventor named Louis J.M. Daguerre made improvements on another French inventor's work to create the earliest examples of portrait photography. Known as daguerreotypes, these photographs were dark and grainy, with little or no background.

It was an American, Samuel F.B. Morse, inventor of the telegraph, who opened one of the first portrait photography studios in America. Because Morse was a portrait painter, the primary purpose of this first studio was to make portrait studies for his paintings. Later, armed with an increasingly sophisticated process, Morse opened a second studio (in New York) devoted primarily to taking daguerreotype portraits. Other studios soon followed.

There were many problems facing these early studios, one of which was the fact that the process of taking a subject's portrait was a time-consuming one. There was not enough light available in the studios, and exposures sometimes took 30 minutes or longer to be completed. As time progressed, portrait photographers utilized new methodologies to bring additional light into the studio, resulting in reduced exposure time.

Soon, the photographic portrait studio business was on its way to becoming a profitable industry. Portrait studios developed in cities across America while photographers set up their operations, including somewhat crude studios in the rural areas of the West. Studios were usually located on the top of buildings in order to make the best use of available sunlight. Many of these new portrait studios were ornate and large, with several rooms for portrait taking.

Discoveries in the 1850s enabled photographers to eradicate some of their lighting problems, thus reducing the amount of time a portrait subject was required to sit while the picture was being taken. The most prominent discovery that led to these advances was the positive-negative system of photography. Other advances enabled the backgrounds in the portraits to become more detailed. Lush, detailed paintings were often used as backdrops behind the subject being photographed.

In 1851, the wet-plate process was introduced, enabling photographers to further reduce exposure time, and thus, the subject's sitting time. In 1871, a dry-plate process was developed, which eventually reduced exposure time to a fraction of a second. As a result, cameras

could now be held in the hand, giving the photographer greater mobility and creativity. The dry-plate process also produced higher-quality prints.

Professional portrait studios matured and diversified in the 1920s. As the advertising industry grew and began to use more photographs, portrait studios began to cater to commercial needs. Soon, many studios were devoting their time entirely to commercial enterprises like advertising, while others concentrated exclusively on glamour portraits, passport photographs, and other specialized portraits. The general portrait studio that provides all of these portrait services continues to exist.

According to the Photo Marketing Association International (PMA), overall, the photographic portrait studio industry was profitable in the mid 1990s, with more than one-half of all portrait services reporting an increase in sales. The survey indicated that in 1995, by portrait type, K-11 schools had the best sales performance, followed by wedding, sports/team, high school prom, high school seniors, and reunion photos. According to the *PMA 1996 U.S. Consumer Photo Buying Report*, 40 percent of all U.S. households had a professional portrait photo taken in 1995, a slight decrease from 1994. Of these households, 19.8 percent were K-11 school photos; 10.4 percent were non-school photos of a child or children; 9.3 percent were family portraits; 7.5 percent were sports/team photos; 5.5 percent were church directory photos; 3.7 percent were nursery/day care photos; 3.9 percent were high school senior photos; 2.9 percent were wedding photos; 2.5 percent were glamour (image salon) photos; 2.2 percent were class/family reunion photos; and 4.9 percent fell into another category of professional photos (hospital baby, pet, or executive).

A study in the *PMA 1996 U.S. Consumer Photo Buying Report* indicated that in 1995, 19.5 percent of all portraits were taken at a school, 11.6 percent at a department store, 5.3 percent at a chain portrait studio, 6.6 percent at a church, 6.1 percent at a professional studio, 5.2 percent in an outdoor setting, 2.4 percent in a day care center, and 1.2 percent at an individual's home.

In 1995, K-11 school photos, sports/team photos, church directory photos, high school senior photos, wedding photos, and class/family reunion photos saw an increase in portrait sitting shares. Conversely, child/children (non-school), family portrait, nursery/day care photos, and glamour photos saw a decline in sitting shares.

In the most lucrative industry segment, K-11 portraits, the PSPA 1995 School Photography Survey showed that despite an increasing annual number of enrolled students, the percentage of parents purchasing portrait packages has been declining at an overall average rate of 1.4 percent per year. Thus, without an increase in package prices, school photo revenue would decline (an

average package price in 1995 was \$17.19, compared to \$16.20 in 1994). Studies also indicated that although school photos are convenient in terms of location and methods of payment, compared with department or professional studio photos, school photos are disadvantaged in terms of package flexibility, number of poses taken, types of poses, number and type of backdrops, quality, proofs, and speed of delivery. According to the Photo Marketing Association International, to achieve success in the sales of all types of portraits, photographers need to implement marketing strategies.

Established in 1932 in Selma, Alabama, and named after its founder, Olan Mills Inc. is the world's leading producer of family portraits. Through more than 700 studios in the United States, Canada, and the United Kingdom, Olan Mills provides portraits to individuals, families, churches, clubs, and businesses. Since the mid 1990s, the firm had been forced to close hundreds of studios due to increased competition from studios operated by retail stores. At the same time, however, it began installing Olan Mills studios in Kmart retail locations. The company also discontinued serving the school portrait market in order to focus on other business areas.

Lifetouch Inc. is one of the leading school portrait photographers in the United States, producing some 16 million school portraits each year. Founded in 1936 as National Schools Studios, Lifetouch also operates studios in such retail establishments as JCPenney and Target throughout the United States and Puerto Rico. It also produces family portraits, yearbooks, church directories, and identification cards, and offers such services as event imaging and video production.

SIC 7231

BEAUTY SHOPS

This category encompasses establishments primarily engaged in offering beauty or hairdressing services. It

includes unisex salons as well as combination beauty and barber shops. Beauty and cosmetology schools are also covered in this category. Information concerning only barber shops can be found under **SIC 7241: Barber Shops**.

NAICS CODE(S)

812112 (Beauty Salons)

812113 (Nail Salons)

611511 (Cosmetology and Barber Schools)

INDUSTRY SNAPSHOT

The service industry that has developed around hair care has long been dominated by small, single-owner neighborhood establishments. Only in more recent decades has this industry seen the growth of chain salons, which are usually part of larger, diversified parent corporations. Such corporate entities often operate outlets on a franchise basis. These chain- and franchise-based hairdressing establishments are most often located in shopping malls.

There were 82,768 establishments in this industry, generating \$9.9 billion in revenues, according to 1992 U.S. Census Bureau statistics. These beauty shops employed 387,249 cosmetologists and other workers. In 1997, there were 1,805 cosmetology and barber schools employing a total workforce of 10,289 and generating revenues of nearly \$454 million.

For several years, Glemby International and Es-sanelle dominated the national chain-operated salon industry. Such outlets were commonly found in major American department stores under a variety of other names. In the late 1980s, however, such companies as Supercuts gained a significant foothold in this industry segment by offering discounted, no-frills services. The industry as a whole saw growth rates ranging between 15 and 20 percent during the late 1980s, as smaller salons targeted working women and larger companies opened numerous outlets that provided fast and low-budget hairstyling services.

Since the 1980s, the industry has diversified to target specific consumer trends, and companies filling these niche markets have grown considerably. A prime example is the Hair Club for Men, which offers non-surgical hair replacement.

ORGANIZATION AND STRUCTURE

In a beauty salon run as a sole proprietorship, the principal is most likely female and is often an active hairdresser in the establishment. Such salons are typically geared exclusively toward women and offer a range of additional services, including manicures, facials, and massages. These auxiliary services provide an important part of the income generated by the smaller salons. Both

owners and employees of these beauty shops are usually licensed cosmetologists who have attended state-certified cosmetology schools and passed standardized exams before receiving their licenses. Stylists are typically compensated on a commission-only basis or through a salary-plus-incentive plan.

Hair salon chains generally market their services toward families; consequently, they report a larger number of men and children among their clientele. These salons staff a larger number of stylists and primarily offer only the basic services of cutting, perming, and coloring. Stylists in these establishments generally receive a straight salary without any further compensation.

Franchised salons, which are commonly found in such high-traffic areas as strip malls, may be started up by a single entrepreneur or by a group. The franchisee pays the franchise holder an up-front fee, typically between \$10,000 and \$25,000, and continues to pay a 10 percent royalty on sales. In turn, the franchise holder pays for advertising costs and avails other resources to the franchise unit.

BACKGROUND AND DEVELOPMENT

The service industry of hairstyling dates back to ancient Egypt, Rome, and Greece. Not until the late nineteenth century, however, did establishments geared toward the public begin to flourish. Their popularity was aided by the development of technological innovations that created new demands for hairstyles. These novelties included the use of synthetic and organic haircoloring products in 1883 and the invention of a chemical method of permanent waving around 1927.

Schools of cosmetology were first established in the late 1890s to train students, primarily women, for the burgeoning profession. For many years, small sole proprietorships were standard in the industry. As the purchasing power of working women rose rapidly during the 1970s and 1980s, the industry began to expand and the number of corporate-owned salons increased dramatically.

CURRENT CONDITIONS

Hairdressing services have proven to be virtually recession-proof, as consumers traditionally cut back on other discretionary expenses before decreasing their spending on personal grooming. The industry experienced a promising annual growth rate that ranged between 10 and 20 percent until the early 1990s, when it fell drastically to only three percent. Since then smaller, privately-owned salons and no-frills unisex establishments have focused on filling specific niches in the market rather than competing against one another. Some corporate-owned salons focus on providing fast service at inexpensive prices. These entities have concentrated on capturing market share through a large number of outlets

spread among densely populated communities. The older and more established sole proprietorships often market their fuller range of personal care services not as luxuries, but rather as accompaniments to a more healthy and vivacious lifestyle. These salons offer their clients such services as tanning facilities, relaxation massages, and seaweed bodywraps. Industry analysts have theorized that an aging class of baby-boomers will freely spend extra income on such services that make them feel youthful, and they forecast success for salons offering these amenities in addition to traditional beauty services.

INDUSTRY LEADERS

Regis Corporation is the world's largest owner and franchiser of hair salons, with more than 5,000 salons in the United States, Canada, Puerto Rico, and the United Kingdom. It operates the chains Regis Hairstylists, Supercuts, MasterCuts, Trade Secret, and Smart Style (located in Wal-Mart stores). Despite its position as world leader, the firm holds only a two-percent share of the highly fragmented U.S. salon market. Regis traces its roots to a single barbershop founded in 1922, which grew to an enterprise of 60 shops over the next three decades. During the 1960s, it began establishing salons in shopping malls, a strategy that fueled rapid growth. It also began acquiring competitors, including its purchase in 1999 of the 980-salon chain The Barbers, Hairstyling for Men & Women. Regis' revenues that year exceeded \$927 million.

Opal Concepts, Inc., is the nation's second-largest salon company, with 1,660 salons in more than 40 states. Its largest chain is Fantastic Sams, which operates more than 1,300 salons in five countries. Opal's other salons operate under such names as Jose Eber Salons, Pro-Cuts, Carlton Hair International, Linear Hair, American Hair Force, and Haircuts Plus. Founded in 1990, the firm is owned by Japan-based Shiseido Company, several investment firms, and a management group.

The Hair Club for Men serves the market niche of men's hair replacement. Founded in 1976, the firm had 80 locations throughout the United States and Canada by 1999. Hair Club specializes in adding a customized, human hair blend to a client's existing hair, and then offers the client hairstyling services in the months and years following the procedure.

WORKFORCE

Women are generally the owners of and principal stylists in privately-owned and -operated salons. Smaller salons have an average staff of five employees, most of whom are fully-licensed cosmetologists. Often these stylists work full-time, but many salons also hire part-time employees. Larger firms often employ a receptionist, a greater number of stylists, and a shampoo crew. Employ-

ees in a salon's shampoo crew are usually students in cosmetology programs who work in salons on an apprenticeship basis.

According to the *1998-99 Occupational Outlook Handbook*, approximately 586,000 hairdressers, hairstylists, and cosmetologists were employed in the United States in 1996, with another 43,000 jobs held by manicurists and 13,000 by shampooers. About 40 percent of cosmetologists were self-employed, working in a privately-owned and -operated salon. The remaining 60 percent leased workspace from the owners of such salons, with their income coming from either commissions or wages. The median weekly income for cosmetologists was \$290 in 1996, far below the national median of \$490 across all industries. Factors that contribute to income include size and location of the salon, the number of hours worked, and the ability to attract and maintain clientele.

All states require the licensing of cosmetologists, a process that typically entails graduation from an accredited cosmetology school and successful completion of written and practical examinations. Licensed cosmetologists are often required to attend additional classes to keep abreast of new styles and techniques.

The *Occupational Outlook Handbook* expects employment in the cosmetology industry to increase as fast as the national average for all professions through 2006. Manicurists are expected to experience the fastest growth, as are other such specialists as estheticians, who provide skin treatments, and electrologists, who remove unwanted hair through electrolysis.

SIC 7241

BARBER SHOPS

This category covers establishments primarily engaged in providing barber and men's styling services. It also includes barber colleges.

NAICS CODE(S)

812111 (Barber Shops)

611511 (Cosmetology and Barber Schools)

This industry is primarily focused on furnishing hair care services for men and has undergone dramatic changes in the latter half of the twentieth century. In 1996, there were 41,340 barber shops in the United States, a drop of 14 percent from 1991. By comparison there were more than 210,000 beauty salons, an 8 percent increase over the same period. Many of those salons cut men's hair as well. Barber shops earned an estimated \$1.8 billion in revenues in 1996 and employed about 12,800 barbers and other workers. The majority of the establishments in this industry are sole or joint proprietorships that hark back to a bygone era when most consumer's needs were met by shops in the town square. As the new millennium approached, barber shops faced stiff competition from a growing number of no-frills unisex facilities whose sales continue to increase annually.

Most barber shops are located in older commercial districts of both urban areas and small towns. They serve an almost exclusively male clientele and are generally owned by a single person, the proprietor, who is usually a middle-aged male. All barbers must attend a barber college for a specified training period that varies from state to state, and they must pass a state licensing examination.

The service of providing men's grooming is more than 2,000 years old. The practice of trimming men's hair and beards began in the Macedonian area around 400 B.C. and then spread to Egypt and other countries. The word "barber" is derived from the Latin word for beard, "barba." The first persons to hold themselves out as experts in the trade appeared in Rome about 296 B.C. However, in both ancient Greece and Rome, barber shops were seen as places of ill repute because men from the upper classes were groomed privately by servants. Throughout the centuries, men's beards were seen as symbols of intelligence and strength and were sometimes cared for quite meticulously. In Elizabethan times, for example, they were often dyed various hues and trimmed into unusual shapes.

For centuries barbers were highly skilled in the unusual adjunct profession of medical surgery, which they learned from monks during the Middle Ages. Barbers performed work that surgeons refused, such as bloodletting, leech attaching, and teeth extracting. After a papal decree in 1163 forbade clergy from letting blood while engaging in surgical tasks, barber shops gained a monopoly over the service. Organizations that regulated the profession first appeared in France in 1096 and later in England in the thirteenth century. The traditional red-, white-, and blue-striped pole outside modern barber shops is a remnant from this era — the red stripes represented blood, the blue stripes represented veins, the white stripes represented

clean bandages, and the spiral pattern represented washed bandages twisting in the breeze to dry. By the nineteenth century, however, the two professions of barbering and surgery had become completely separated.

The modern barber shop industry in the United States was established in the early twentieth century. In the 1920s, two organizations — the Associated Master Barbers of America and the National Association of Barber Schools — were formed to regulate the profession. A barber's speed and efficiency have been improved by technological advances, including the use of appliances such as electric hair clippers and blowdryers.

Single proprietor barber shops providing personalized service to a family of clients have become increasingly rare. Larger shares of young men are patronizing a new breed of corporate-owned unisex hairstyling establishments. These no-frills salons offer a quick haircut as well as access to the latest styling tools and hair care products. They are often targeted at busy families and are located in such high-traffic areas as malls and strip retail centers, offering convenience to a wide range of price-conscious consumers. Additionally, full-service salons that traditionally only provide hair care services to women have been attracting more male customers. This development has been attributed to a heightened style consciousness among men and a greater social acceptance for men to patronize traditional bastions of femininity.

In the late 1990s, the two biggest providers of retail hair cutting services for men were two Minnesota-based companies, Regis Corp. and The Barbers. Regis generated about \$800 million in sales nationwide from approximately 3,600 unisex hair salons, including franchises operating under the names City Looks, We Care Hair, Cost Cutters, and Supercuts. The Barbers operated about 980 salons across the country, generating about \$26 million in sales. The two competitors merged in 1999, when Regis acquired The Barbers for \$58.7 million. Executives from the two companies said that the newly merged business would continue to expand. Prior to the deal, The Barbers had 190 Wal-Mart salons and was adding about 40 a year, while Regis had 320 Wal-Mart salons and was adding about 80 a year. Regis predicted that revenue for 2000 would exceed \$1.5 billion. Minnesota-based Great Clips Inc. is now in second place among national unisex hair salons, with more than 1,100 establishments that generated about \$200 million in 1998.

SIC 7251

SHOE REPAIR SHOPS AND SHOESHINE PARLORS

This category covers establishments primarily engaged in repairing footwear or shining shoes. Also included are establishments engaged in cleaning and blocking hats.

NAICS CODE(S)

811430 (Footwear and Leather Goods Repair)

INDUSTRY SNAPSHOT

Shoe repair and shoe shining is a small industry that provides a moderate living for the craftsperson/entrepreneur. The shoe repairman has survived for many years in a constantly changing marketplace, but is struggling to find ways to maintain a profitable business in the modern era. Those business owners who have been able to adapt to the changes in the industry brought on by improved technology, manufacturers' emphasis on disposable goods, and changing consumer expectations have survived. Those who have not adapted or who have maintained old methods of business operation have slowly vanished. Many shoe repair and shoe shining establishments are small retail stores usually owned and/or operated by a craftsperson who, with the help of skilled employees, performs services for a certain rate. U.S. Bureau of Labor Statistics (BLS) figures indicated that shoe repair workers held approximately one-half of the approximately 21,000 jobs in the leather goods industry at the end of the twentieth century, although increasingly, traditional services offered by the industry have been combined with other modern amenities. Additionally, some shoe repair companies are part of a larger franchise, and shoe repair shops appeared with greater frequency in retail malls and in shopping centers — locations deemed essential to the survival of the industry. Among the largest establishments in operation at the turn of the twenty-first century, Shoe Doctor Incorporated of Dover, New Hampshire, had sales as high as \$7 million during the previous decade and employed approximately 100 workers.

BACKGROUND AND DEVELOPMENT

The business of repairing shoes has been in existence as long as the shoe itself. Until advancements made in the twentieth century, shoes were expensive and difficult to manufacture, most times taking the shoemaker the better part of a day to create one pair. Therefore, it made

economic sense to have shoes repaired when necessary, rather than purchase new ones.

The evolution of the shoe repairman can be traced back to the Middle Ages, with craftsmen called cobblers. Cobblers bought old, worn shoes, repaired them, and resold them. Eventually cobblers stopped selling repaired shoes and concentrated entirely on repair as a business. Meanwhile, many shoemakers stopped repairing shoes and concentrated exclusively on manufacturing.

In the early part of the twentieth century, the Industrial Revolution in the United States put an emphasis on manufacturing. Shoe styles changed quickly, and the consumer, in an effort to remain fashionable, began to ignore the benefits of shoe repair. But other circumstances began to harm the shoe repair industry as well. According to the journal *Shoe Service*, widespread economic hardships led to do-it-yourself repairs that became prevalent in the 1930s. Also, many unskilled shoe repairmen would fix and sell shoes at lower prices to retailers outside of the industry. Dissatisfaction with the level of craftsmanship was also cited as a reason for the industry's difficulties.

World War II had a significant effect on the shoe industry. Manufacturers and repairers found raw materials increasingly harder to come by, and the government urged the public to take better care of their shoes. After World War II, industrial advances made shoes cheaper. As shoes wore out, it was easier for the consumer to buy a new pair than to have an old pair repaired. Manufacturers were also increasingly using nonrepairable materials such as rubber and plastic in their products. The introduction of these innovations has continually challenged the shoe repair industry.

The number of shoe repair shops plummeted by 40 percent in the 1960s. Since that time the shoe repair industry has constantly tried to find ways to combat the effects of mass shoe production, nonrepairable materials, and ever-changing fashion trends. Overall the industry experienced a continued slow decline for several decades leading into the twenty-first century. The number of establishments decreased by approximately 16 percent, and the number of employees dropped about 11 percent during the 1990s alone.

CURRENT CONDITIONS

In the 1990s, with the average payroll per establishment at \$26,811 and average revenue per establishment at approximately \$102,000, many shoe repair shops and shoeshine parlors remained very small, employing an average of just two people. BLS reported minimum wage conditions for new workers in the late 1990s, along with projected declining employment for the industry through the year 2006. The consensus among experienced industry members was that the key elements to the survival and growth of the industry included the ability to guarantee

quality and convenience (the speed with which repairs are made). Shoemakers, when queried about conditions at the turn of the twenty-first century, concurred that the evolution of shoe styles throughout the final decades of the twentieth century resulted in designs that were effectively irreparable, because of a molded all-in-one structure that precluded heel or sole replacement. One craftsman in Grand Prairie, Texas, who was quoted in *Arlington Morning News*, suggested that by the year 2000 approximately 75 percent of new shoes were of the molded design. Another shoemaker in Colorado made similar comments and added that the high cost of service proved a further deterrent to repairs, in that replacement often provided the more cost-effective solution.

In the midst of diminished demand for shoe repair, one promising technology for insole replacement emerged late in 1999. The method employs a computerized fitting system, which utilizes a computerized scanner to record sole measurements, including pressure points where the footstep makes the heaviest contact with the ground. The technology enabled shoe repair personnel to fit custom insoles easily through the use of the digital measuring system, at a cost of under \$50 per pair. The ability of some shoemakers to adapt to such new techniques lies at the basis of the continued existence of this industry. Other factors for survival involve combining shoe repair service with other services and products, relocating shops into high-traffic areas such as retail mall outlets, and changing the consumer's traditional notions of the shoe repair store by means of aggressive advertising.

SIC 7261

FUNERAL SERVICE AND CREMATORIES

This classification includes establishments primarily engaged in preparing the dead for burial, conducting funerals, and cremating the dead.

NAICS CODE(S)

812210 (Funeral Homes)

812220 (Cemeteries and Crematories)

INDUSTRY SNAPSHOT

The U.S. Bureau of Census projects deaths to grow at the approximate rate of 1 percent per year from 1990 to 2010. Gains in industry revenue have slowed, with some stock prices dropping, despite continued consolidation by corporations and improved business practices by independent funeral homes. The steady rise in the cremation rate, as well as a trend toward personalization, continues to influence the industry to find creative ways to market its services.

ORGANIZATION AND STRUCTURE

More than 22,200 funeral homes exist in the United States. Of this number, almost 87 percent are family owned and operated. Funeral homes in the United States average 47 years in business; however, it is not uncommon to find firms that have been in operation for 100 years or more.

Since intervention and subsequent regulation by the Federal Trade Commission (FTC) in 1984, there have been major shifts in the way that funeral homes deal with the general public. Consumers are no longer kept in the dark concerning funeral cost. The FTC requires all funeral homes in the United States to provide consumers with a copy of their general price list upon request, so it is possible for the consumer to make cost comparisons for like services among competitors. The price list includes the various services that the funeral home provides, a description of those services, and the cost of each individual service. By presenting these items in an itemized fashion, the consumer may select and pay for only those services desired. Prior to the FTC ruling, it was common practice among funeral homes to use unit pricing. The cost shown on the casket selected generally included all the services requested by the consumer. Most funeral homes, however, did not allow for reductions in services.

The general price list, although possibly the most important consumer tool, is not the only requirement that directly affected the funeral purchaser. Telephone disclosure of prices is also required, as well as disclosures concerning local laws and cemetery regulations concerning the practice of embalming and cemetery merchandise.

BACKGROUND AND DEVELOPMENT

The practice of preparing the dead for burial has been recorded throughout human history, with the ancient Egyptians as the most famous example. Funeral services, as they are known in the United States today, originated in the late nineteenth century. Prior to that

time, responsibility for the burial of the dead was assumed by the family of the deceased. The preparation and viewing of the body was usually done at home, a practice that continued into the 1960s. Funeral services were generally held in the community church with the burial following in a grave prepared by friends and family. Caskets were obtained from local carpenters and, later, from local furniture merchants.

In no other country in the world is the practice of embalming bodies as widespread as it is in the United States. Embalming gained popularity during the Civil War when arrangements were made with the families of soldiers killed in battle to embalm the bodies and return them home for burial. Eventually, the practice gained such popularity that it became the basis for the funeral industry.

Embalming was usually performed at home using crude hand pumps. These pumps were used to introduce the embalming fluid into the arterial system of the body, thereby temporarily preserving it. These same pumps were used in reverse to remove any unwanted fluids or gases from the body. It eventually became impractical for families to use their homes for the preparation of the body and the funeral service; these practices moved away from the home and came to be performed at the undertaker's establishment, the funeral parlor.

Sensing an opportunity for additional income, furniture merchants began to set aside space in their stores for the display of caskets and other funeral merchandise. From this arrangement, the modern funeral home industry was born, as merchants took over the role of coordinating the various aspects of the funeral service, such as scheduling funerals, preparing newspaper notices, arranging for transportation of the body, preparing the grave, and preparing the body.

Initially the practice of funeral directing and embalming was virtually unregulated. To become an undertaker, all that was required was the desire to do so. Embalmers generally acquired an embalmer's "certificate" after attending a short seminar on embalming and, in some cases, purchasing a required amount of fluid. This part of American tradition evolved into the funeral industry. The professional title of "undertaker" later became "funeral director."

By 1957, the average cost of a funeral service was \$646. Although the average funeral cost has increased around 3 percent a year, profit margins have declined as a result of higher merchandise cost to the funeral home and an increase in the cost of providing services. Funeral homes have been slow to pass these cost increases on to consumers, resulting in a decrease of 4.8 percent in the profit margin from the years 1980 to 1998.

In the summer of 1999, the FTC's Funeral Industry Practices came up for review. The Funeral & Memorial Societies of America (FAMSA) requested that the regulations be broadened to include third-party sellers, cemeteries, and other providers of funeral goods and services. The change was supported by the National Funeral Directors Association (NFDA) and the American Association of Retired Persons (AARP), but opposed by the International Cemetery & Funeral Association (ICFA).

According to the Federated Funeral Directors of America (FFDA), the average funeral in the United States cost \$4,605 in 1999, and the average number of funerals per establishment per year was approximately 182. This estimated cost included nondeclinable professional service charges, embalming, other preparation of remains, visitation, the funeral service itself at the funeral home, the funeral car, a service car, acknowledgment cards, and a midrange casket. Cost of the funeral service increased with the addition of items such as family limousines and outer burial containers.

The concept of preplanning or prefunding funerals in advance of need became popular due to the rising cost of funeral services. Various programs existed for this purpose. The most popular programs offered consumer protection against cost increases over time. In 1998, the NFDA conducted a state-by-state survey of preneed regulations. They found that preneed funds were primarily placed into trusts with nearly 50 percent of the states requiring 100 percent trusting level. In addition, funds must be deposited in a time specified by the state, and all parties must be notified when a withdrawal occurs. There must be a mechanism to revoke a preneed contract, and some states require a fee paid to a state guaranty fund, whereas others require bonds to be posted.

Nontraditional Alternatives. Various alternative groups exist throughout the United States to provide consumers with options to reduce their funeral costs. These groups, generally referred to as memorial societies, attempt to offer their members savings over the cost of using traditional funeral establishments. In some cases, they negotiate with funeral directors to provide discounted costs to members. By not having the higher overhead associated with operating a full-service funeral establishment, these organizations are generally able to provide lower costs to the consumer. However, in most cases this results in a reduction of attendant services normally associated with a traditional funeral.

Cremation has seen a steady rise in acceptance in the United States. Even areas such as the tradition-minded South saw an increase in cremations. In 1998, cremation was selected in 24 percent of deaths nationally, and it was projected to reach 36 percent by 2010. Regional cremation projections for the year 2010 vary from 10

percent in the central southeastern United States (Alabama, Kentucky, Mississippi, and Tennessee) to a high of 65 percent in the mountain region (Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming), an increase of more than 20 percent over 1997 levels.

In 1998 the average cost of a direct cremation by a funeral home was \$1,200, using a container for the body provided by the funeral home. Cremation societies, similar to memorial societies in mission, tend to offer their members a less expensive alternative to traditional funeral homes. Again, the lack of overhead facilitated the lesser cost. The rising cost of traditional funeral services and merchandise, coupled with the consumer's desire to save money, greatly contributed to the increase in acceptance of cremation. A less economically associated factor, but still one of great importance, was societal education regarding cremation. Many consumers also looked for a more simplistic way to dispose of the body. A simple cremation met this desire. Funeral homes offered more cremation-related services, such as urn niches and alternative memorials.

In addition to the rising cremation rate, another obstacle challenging the funeral home operator is the appearance of the retail casket store. Although common in Europe, these stores only began appearing in the United States in the 1990s due to an FTC ruling preventing funeral homes from charging special handling fees to consumers for providing their own caskets. Most retail casket suppliers advertise their goods at 40 to 60 percent below funeral home cost. They offer caskets in showrooms and catalogs, and some even take advantage of the World Wide Web and offer their caskets on the Internet. The retail casket suppliers forced the industry to rethink the way funerals traditionally were priced, with the casket making up the bulk of the service cost. The industry moved toward itemized pricing, which reflected the cost of each item or service. Package discounts also minimized any cost differential between the casket store and the funeral home.

CURRENT CONDITIONS

The aging of America has given a boost to the funeral business, which brings in an estimated \$20 billion each year. As of 2003, there were 22,000 funeral homes in the United States, 115,000 crematoriums, and about 300 casket stores. The death rate stood at 2.3 million per year in the United States. The largest five funeral homes held an 18 percent share of the market and claimed about 20 percent of all the revenue earned by the industry. The number of funeral service businesses has increased significantly in recent years, increasing competition and cutting into profits. Although still a quite lucrative business, profits have declined greatly in recent years, accord-

ing to the Federated Funeral Directors of America, averaging \$408 per funeral for funeral homes, 8.08 percent of annual sales.

Prices of funerals were increasing dramatically in the 2000s, which led more consumers to shop around for bargains on the Internet, where competition to traditional funeral homes has recently sprung up. At Funeral Depot, which began its Web site in 2000, consumers can shop for caskets, urns, vaults, grave markers, and other supplies and have them delivered to the funeral home, usually by the next day. Although a viable, FTC-mandated alternative, online sales are still a very small portion of the funeral business, with the Funeral Depot estimating its market share as an eighth of 1 percent of the total market. Traditional funeral homes are turning to the Internet for other reasons, however. About a dozen funeral homes offered live webcasts of funeral services by 2001. Other funeral homes have offered online remembrance registries that allow relatives and friends outside the area to read obituaries, make donations, participate in a private planning area, or post comments about the departed.

With funeral prices at record highs, cremations, which gained popularity in the 1990s, continued to rise into the new millennium. The Cremation Society expected that trend to only increase throughout the decade. The leading U.S. state by percentage of cremations was Hawaii, with 58.6 percent in 1998, an estimated 61.1 percent in 2000, and a predicted 65 or more percent in 2010. Nevada followed, with 56.6 percent in 1998, an estimated 59.1 percent in 2000, and 65 or more percent in 2010. Washington, Alaska, and Arizona rounded out the top states by percentage of cremations, all currently over the 50 percent cremation mark and expected to reach 65 or more percent in 2010.

INDUSTRY LEADERS

The family-operated funeral home is still the most common form of ownership. However, citing changes in tax laws and the increase in federal regulations and monitoring, not to mention inflated offers to purchase, a growing number of independent funeral homes have begun to sell to corporations. These corporations specialize in the operation of funeral homes, crematoriums, and cemeteries. In 1998 the top seven U.S./Canadian companies owned 14 percent of the funeral homes and accounted for 25 to 30 percent of the volume. Industry analyst Susan Little saw future consolidations dealing with facilities rather than administration, with consolidation continuing at a slower pace as less capital became available due to lower stock prices.

The largest corporate operator of funeral homes in the United States is Service Corporation International, headquartered in Dallas, Texas. In 2002 SCI operated 3,080 funeral homes, cemeteries, flower shops, and

crematoria in eight countries worldwide. In 1998, SCI acquired 308 funeral homes, 47 cemeteries, and 118 crematoria. SCI sales in 2002 stood at \$2.27 billion, a 9.5 percent decrease from 2001, with a total of 28,924 employees. SCI continued to expand into Europe, with Paris as its largest cluster worldwide with 6 percent of total company profits. Steve Saltzman, industry analyst, expected SCI to expand into Western Europe.

The Alderwoods Group, formerly the Loewen Group, based in Toronto, Canada, is the second-largest provider of funeral services worldwide. Alderwoods operates 920 funeral homes and 275 cemeteries in the United States, Canada, and the United Kingdom. Sales reached \$833.5 million in 2002, a decrease of .3 percent from 2001. After filing for Chapter 11 in 1999, Alderwoods planned to place all its efforts into its funeral homes and larger cemetery operations.

A third industry leader, Stewart Enterprises, Incorporated, is based in Metairie, Louisiana. In early 1999 Stewart operated 300 funeral homes and 150 cemeteries in about 30 states and Puerto Rico. Revenues for 2002 were \$581.3 million, a decrease of 12.8 percent over 2001. Approximately 50 percent of domestic revenues come from the company's cemeteries, with 70 percent of revenue reported as preneed.

On a much smaller corporate scale is Carriage Services, Inc., based in Houston, Texas. Carriage Services operated 145 funeral homes and 30 cemeteries in 29 states in 2002. Revenues for Carriage Services in 2002 were \$154.2 million, a 5.1 percent decrease for the year.

A common theme among funeral corporations is to bring the benefits of corporate knowledge and practices to generally small business operations while maintaining a feeling of local flavor. Using this formula, corporations hope to become the dominant force in the funeral industry.

By incorporating a practice called cloistering, the corporations seek to increase revenues by decreasing operating cost. Cloistering is a practice that allows funeral homes in the same area, owned by the same corporation, to use the same people and same equipment in their daily operations. By utilizing the buying power of several different cloisters, the corporations also decrease cost by buying in bulk. In theory, this works well, but in actual practice it has been known to create difficulties. Personnel are sometimes required to travel great distances between assignments and, often, the need for rolling stock exceeds the inventory. A large number of these firms generally operate with a minimal number of employees to increase profits, sometimes resulting in a situation in which the employees struggle to handle their assigned caseloads.

Personnel expenses made up 48 percent of total industry expenses; facilities, 28.8 percent; various business expenses, 6.9 percent; automotive equipment, 8.2 percent; promotions, 5.5 percent; and supplies, 2.9 percent.

WORKFORCE

Although not unique to corporate funeral homes, poor working conditions such as a lack of benefits, poor pay, and demanding schedules have resulted in increased turnover of funeral home employees.

In 1998, the funeral industry employed approximately 35,000 licensed professionals and 89,000 unlicensed workers. Licensed positions include apprentices, embalmers, and funeral directors. Nonlicensed staff includes secretaries, bookkeepers, hostesses, and maintenance workers. The occupational growth rate is expected to remain constant through 2005. The average funeral home employs four full-time and four part-time employees.

Presently almost all states have some type of educational requirement for funeral directors and embalmers. Examinations for licensing are usually administered by a state board. Apprenticeships and continuing education requirements vary from state to state. There are more than 40 schools specializing in funeral service education throughout the United States. Some of these are stand-alone facilities, some are located on community college campuses, and a small number are part of university curriculums. Educational awards include diplomas certifying completion of educational requirements, associate's degrees, and bachelor's degrees in funeral service.

SIC 7291

TAX RETURN PREPARATION SERVICES

This category covers establishments that primarily provide tax return preparation services without also providing accounting, auditing, or bookkeeping services. Establishments engaged in providing income tax return preparation services that also provide accounting, auditing, or bookkeeping services are classified in **SIC 8721: Accounting, Auditing, and Bookkeeping Services**.

NAICS CODE(S)

541213 (Tax Preparation Services)

INDUSTRY SNAPSHOT

Tax return preparation services primarily operate during the first four months of the calendar year, since April 15 is the standard due date for federal tax return filings. According to a survey conducted by Tiburon Strategic Advisors, along with several other research and survey groups, in 2002 there were 450,000 certified public accountants (CPAs) in the United States, as well as 40,000 enrolled agents (EAs). Of these, nearly all EAs and 170,000 CPAs were in private practice, with tax planning and tax return preparation as the primary revenue source.

ORGANIZATION AND STRUCTURE

According to *Tax Return Preparer's Liability*, a number of Internal Revenue Service (IRS) regulations govern the preparation of tax returns that must be followed by members of this industry. All tax preparers are required to sign their clients' returns and provide additional identifying information, including the names of all persons assisting sufficiently in return preparation to qualify as preparers themselves. Because the IRS might contest only a portion of a complex return, it requires exact identification of the preparers responsible for each portion. In addition to furnishing clients with copies of their returns, preparers are required to keep copies on file for subsequent inspection. They are not, however, allowed to disclose personal information kept on file to other parties.

Preparers are penalized for negotiating the amount of a refund on a return or for accepting a refund as payment. This regulation arose because of unscrupulous preparers who had accepted refund checks as their preparation fees and then, without the clients' knowledge, increased the

amount of the refund and pocketed the extra income. This form of abuse cheated customers and put these tax payers at risk of IRS penalty.

Any falsification of the tax amount owed or to be refunded is unacceptable, although tax return preparation services are not expected to make independent verification of the truth of a client's claims. Preparers are, however, expected to raise questions about uncertainties or apparent irregularities and cannot ignore a suspected mistake or falsehood.

False reporting and knowingly understating a client's true tax liability can result in penalties by the IRS. The government, however, assumes innocence in the case of certain errors, such as clerical or mathematical mistakes. The incorrect handling of elements of tax law does not incur penalty if the IRS judges those elements sufficiently technical or uncommon as to excuse the preparer.

BACKGROUND AND DEVELOPMENT

Temporarily necessitated by the Civil War, federal income tax did not become a permanent fixture in the United States until February 1913, when it was ratified as the Sixteenth Amendment to the Constitution. Subsequent revenue acts were codified in 1939 and again in 1954 as the Internal Revenue Code, which was recodified in 1986 after passage of the 1986 Tax Reform Act.

The 1913 income tax produced a degree of chaos because of the haste with which it was introduced and the lack of guidance offered to those preparing returns. As late as 1939, less than 6 percent of the population was affected by federal tax. By the end of World War II, more than three-quarters of the population were subject to federal tax. This major increase in scope set the stage for tax return preparation services to assume a heightened importance and presence. In a fairly short period of time, a service industry of rapidly growing dimension took shape.

Traditionally, tax returns have been filed through U.S. postal mail. Indeed, as midnight draws near on April 15, post offices are congested with long lines of last-minute filers rushing to mail their returns before the tax deadline. A paper tax return received by the IRS through the mail is processed through what the IRS calls "pipeline processing." Once received, the return must go through sorting, batching, numbering, coding, data entry, error resolution, and storage. The entire process can take between six to eight weeks to complete. Not until this process is completed can a return be processed for refund. During peak filing periods, refunds can take as long as eight weeks to be returned to the taxpayer. While paper filing is still common today, the age of computers has introduced electronic filing of tax returns.

Championed by the IRS, the trend toward electronic filing is growing. Electronic filing reduces the amount of time it takes for a taxpayer to receive a federal tax refund and provides a greater guarantee to the taxpayer that the return is mathematically correct. An electronically filed return eliminates the initial steps of "pipeline processing." Electronic filing uses automation to replace most of the manual steps needed to process paper returns, resulting in faster and more accurate processing. Tax preparers who are registered with the IRS as Electronic Filing Originators (EFOs) can file returns electronically to the IRS for a fee—typically \$15 to \$25. Using this method, a refund takes about three weeks to be returned; refunds may be received sooner if a taxpayer chooses to have the refund deposited directly into a savings or checking account.

An eligible electronic filing customer may also apply for a refund anticipation loan (RAL). Within one week after the date of filing, the filer receives a check in the amount of the loan, less the bank's transaction fee and any tax return preparation fee. The IRS then directly deposits the filer's actual federal income tax refund into a designated account at the bank in order for the loan to be repaid. The bank charges interest on the loan.

CURRENT CONDITIONS

In 2002, about 47 million Americans filed the federal tax returns electronically, with that number growing to an estimated 54 million in 2003. In 2003 the IRS rolled out a new program called Free File that offered free online tax return filing for certain segments of the population. The IRS offered these free services through a partnership with 17 tax preparation companies.

Tax preparation software and Web-based filing have become extremely popular with people who file simple returns and do not employ a tax preparation specialist. Brian L. Clark noted in *Money*, "For taxpayers who prepare their own returns, the biggest decision used to be which software program to buy. These days, it's whether you should use a program at all or just go to one of the programs' Web site." Tax preparation software for individuals costs between \$20 and \$40. Online filing fees run about \$20 for federal and \$10 for state returns. According to TurboTax's Web site, the average Turbo Tax software user is between the ages of 35 and 54, college educated, with an income between \$50,000 to \$75,000. Two-thirds of Turbo Tax's customers are men, and most have previously used a tax software program. Those most likely to file using Turbo Tax's Web-based program are between the ages of 18 and 45, college educated, with an income level between \$25,000 and \$50,000.

The main customers for such tax return experts as H&R Block and Jackson Hewitt are those who do not want to undertake the task themselves but are filing fairly

simple returns. Taxpayers with complex tax issues involved usually turn to professionals. Although some tax preparers charge as little as \$100, most charge at least \$250, with charges for complicated returns reaching much higher.

According to the Consumer Federation of America and the Consumer Law Center, consumers paid almost \$2 billion in fees and charges related to tax refund anticipation loans. These loans, which are based on the amount of an anticipated tax return, have come under scrutiny by consumer advocacy groups because of the high fees they carry. The loans cost, on average, between \$35 to \$90 but can reach as high as \$250. In 2003 Massachusetts became the first state to place a cap on prices for these loans. However, the Massachusetts law is not expected to significantly affect the tax return loan industry unless other states follow suit.

INDUSTRY LEADERS

With sales of more than \$2.9 billion in 2002, resulting in a net profit of \$434.4 million, H&R Block easily outpaced its nearest competitors. In 2002, H&R Block served about 19 million taxpayers in the United States, Canada, and Australia. H&R Block has approximately 10,000 offices located throughout the United States, of which about 4,500 are franchised operations. H&R Block is the largest seasonal white-collar employer in the United States. It has approximately 1,200 regular full-time employees and hires nearly 100,000 seasonal employees. In order to maintain its workforce, H&R Block offers good pay, stock options, and commissions that range from 20 to 30 percent. In the late 1990s H&R Block started to expand from its traditional operation, offering investment, tax planning and mortgage services. It also bought eight accounting firms to start its own U.S. accounting firm.

Software company Intuit sells personal finance (Quicken), small business accounting (QuickBooks), and consumer tax-preparation software (TurboTax). Intuit posted revenues of \$1.4 billion in 2002, resulting in a net income of \$140.2. Intuit also provides on-line filing options at turbotax.com.

SIC 7299

MISCELLANEOUS PERSONAL SERVICES, NOT ELSEWHERE CLASSIFIED

This industry covers establishments primarily engaged in providing personal services, not elsewhere classified. Establishments primarily engaged in operating physical fitness facilities, including health fitness spas and reducing salons, are classified in various lodging industries depending on the type of lodging provided; if they do not provide lodging they are classified in **SIC 7991: Physical Fitness Facilities**.

NAICS CODE(S)

- 624410 (Child Day Care Services)
- 812191 (Diet and Weight Reducing Centers)
- 532220 (Formal Wear and Costumes Rental)
- 812199 (Other Personal Care Services)
- 812990 (All Other Personal Services)

This industry encompasses a wide array of niche industries that provide personal services in one realm or another. Diverse establishments such as dating services, costume rental shops, massage parlors, scalp treatment

services, tuxedo rental, escort services, baby sitting bureaus, and valet parking outfits all are placed in this miscellaneous industry classification.

An estimated 19,037 miscellaneous personal service establishments were in the United States in 1996. In the late 1990s, some of the leading companies in this industry were Philadelphia-based ARAMARK Corp., with \$6.7 billion in 1999 sales; Weight Watchers International, headquartered in New York, with estimated sales of \$1.5 billion; GE Capital Mortgage, of Cherry Hill, New Jersey, with \$1.3 billion in sales, and Unifirst Corp., of Wilmington, Massachusetts, with 1999 sales of \$487.1 million.

Among the largest business segments of this industry classification are dating services, weight loss centers, and formal wear rental outlets. In 1999, the two most successful weight reducing companies that used the classroom method were Weight Watchers International and Jenny Craig, Inc., with \$321 million in sales. In an effort to expand into the non-overweight consumer market, the diet industry is expected to incorporate products and services geared toward total wellness on into the next century.

The miscellaneous personal services industry, including tax return preparation services, which are also discussed in **SIC 7291: Tax Return Preparation Services**, employed an estimated 149,300 workers in late 1999, according to the *Bureau of Labor Statistics*.

ADVERTISING AGENCIES

This industry includes establishments primarily engaged in preparing advertising (writing copy, artwork, graphics, and other creative work) and placing such advertising in periodicals, newspapers, radio, and television, or other advertising media for clients on a contract or fee basis. Establishments that either place advertising with media but offer no creative services or provide creative services but do not place the advertising with media are excluded from this industry.

NAICS CODE(S)

541810 (Advertising Agencies)

INDUSTRY SNAPSHOT

According to the *Advertising Age's* 2002 Agency Report, the world's six largest advertising agencies accounted for over 65 percent of \$39.28 billion spent on advertising worldwide in 2001. But the advertising industry has suffered during the first years of the 2000s. The economy decline prior to and exacerbated by the terrorist attacks of September 11, 2001 has been sustained by the ongoing conflict with Iraq. As an indicator of the softened demand for advertising services, advertising agency employment fell to just over 180,000 in December 2002, down from an average employment of 194,400 in 2001 and 182,400 in 2002, representing the largest decline since 1991.

Advertising agencies are primarily responsible for two functions. The first is the production of advertising materials in the form of written copy, art, graphics, audio, and video. The second is the strategic placement of the finished creative product in various media outlets, such as periodicals, newspapers, radio, and television. Agencies generally receive compensation for production costs from the client, plus a standard 15 percent commission from the media source for the ad placement.

Advertising agencies can be found throughout the United States, with the greatest percentage located in large cities. Many have headquarters in New York and field offices in Chicago, Los Angeles, San Francisco, Atlanta, Detroit, and other major areas of commerce in order to be close to clients.

Although the larger agencies are more frequently mentioned in the media and in trade publications, the industry is actually predominately comprised of smaller agencies, many with only one or two principals. Industry observers credit lower overhead, diversified services, willingness to accommodate change, and an entrepreneurial attitude for the success of smaller, boutique agencies.

As many clients have begun to focus on a variety of forms of marketing communications, advertising agencies have had to look beyond conventional media-based advertising. Advertising budgets reflect this shift, with additional dollars being earmarked for point-of-sale promotions, public relations, and a major entry into the media mix—the Internet. Changing demographics and a savvy American consumer were the driving forces behind these alternative forms of marketing communications.

Some industry leaders have projected that advertising agencies will need to augment their primary line of work and change their longstanding compensation system based on commissions. Realizing the need for “inte-

grated marketing services,” many agencies have responded by offering public relations, direct mail, promotional, and Internet services.

ORGANIZATION AND STRUCTURE

The activities within an advertising agency are typically divided into four broad groups: account management, the creative department, media buying, and research. These divisions are usually physically separated, although all four areas work closely together to produce an advertising campaign in its entirety. Account managers usually have daily interaction with a counterpart at the client's office and coordinate the activities of the other departments according to the client's wishes. The creative department designs original themes or concepts for ads, while the media department places finished ads within the media in which they will receive the most exposure to a target audience. The research department provides data about consumers to help the agency and the client make informed advertising decisions.

Recently added to advertising agencies' roster of services are public relations, direct marketing, and promotional services. Other activities that used to be completed by outside vendors, such as photography and high-tech print work, have been brought in-house in many agencies.

BACKGROUND AND DEVELOPMENT

Advertising agencies began in the mid-1800s, when independent agents sold newspaper space. Later these agents took on the added responsibilities of writing and designing the actual advertisements. Such advertising agents could be found in major industrial areas such as Philadelphia, New York, and Boston. Volney Palmer opened offices in 1841 in Philadelphia. Representing a selected list of newspapers, Palmer sold space to advertisers and received a 25 percent commission from the newspapers. After his death, Joy, Coe & Co. took over the business and renamed the firm Coe, Wetherill & Company. This agency later was absorbed by N.W. Ayer & Son, the oldest U.S. advertising agency to be continuing operations in the early 2000s.

By 1860 roughly 30 agencies in the United States sold newspaper space by offering exclusive representation in selected periodicals. As new agents entered the scene, the principle of exclusive representation ended because publishers accepted anyone who brought in advertising. Most agents soon became independent brokers or middlemen, selling space to advertisers and then buying from publishers to fill their orders.

Increased commercial and industrial activity following the Civil War facilitated the growing acceptance of advertising as a sales tool. A new type of advertising agent also appeared on the scene at this time. Space

wholesalers, including industry leader George Rowell, purchased space in bulk from publishers at a discounted rate and then sold the space to advertisers. Some agents went as far as purchasing all the advertising space in the publications they represented, thereby essentially controlling selected periodicals.

Advertising legend J. Walter Thompson had his start in the industry at this time. Thompson persuaded several literary magazines to carry advertising, something not previously done. Thompson thought magazines should accept advertising because their widespread circulation could be a powerful selling medium. By 1900 his “List of Thirty” represented most of the popular women’s and general monthly periodicals. This transformation of magazines into an advertising medium had an enormous impact on the entire advertising industry, because magazines were the first publications with nationwide distribution.

George Rowell took an early step toward changing the advertising business into a modern-day agency. In 1875 Rowell announced that he would act on behalf of his clients, rather than the newspapers and periodicals in which their ads appeared. He was the first to offer a full line of services to advertising clients: to “act as their agent, working only in their interest, dealing to their best advantage . . . making up schedules, checking insertions, and paying bills,” according to *Advertising: Today, Yesterday, Tomorrow*.

Shortly after Rowell’s announcement, Ayer began what was considered to be a revolutionary plan—the open contract, plus commission. This arrangement created a long-term relationship between the advertiser and the agent. At first, commissions fluctuated from 12.5 percent to 8 percent to 15 percent. Although not immediately embraced by the rest of the industry, Ayer’s rate of 15 percent soon became the norm. The commission system has remained the traditional method of payment to an agency.

By the 1890s the advertising industry gained momentum due to the increased use of brand names and trademarks, the growing distribution of newspapers, the talent of experienced copywriters, and the success of earlier advertisers. For instance, only 121 trademarks were registered with the United States Patent Office in 1871. By 1875 that number had grown to more than 1,000 and by 1906 to more than 10,500. In addition, free newspaper delivery to rural areas exposed the entire country to national advertising campaigns.

The result was the creation of a relatively homogeneous marketplace, perfect for selling mass-merchandise items. By 1897 more than 2,500 companies had large-scale advertising campaigns, including many brands still known today. Kodak, Coca-Cola, Ingersoll, Prudential,

Waterman, Quaker Oats, Hire’s, Cream of Wheat, and numerous other goods became commonly known by their brand names.

By the 1920s advertising agencies had become professional entities in their own right. Agencies were organized into departments or operating units that served numerous clients. They offered specialized services in both campaign research and development and media placement. Copywriting staffs were augmented with art departments, and research departments were established.

Perhaps the most significant indicator of the increasing prevalence of the advertising industry was soaring ad budgets. For instance, Coca-Cola spent \$11,000 on advertising in 1893; by 1928 its ad budget had grown to \$5 million. Campbell’s Soup spent \$4,000 on advertising in 1899 and \$2.5 million in 1928. Wrigley started advertising its chewing gum with only \$32; 10 years later its ad budget had reached \$3 million.

Radio became a significant advertising medium during the 1920s with the formation of NBC in 1926 and CBS in 1927. Early radio stations only sold empty time, not time slots related to programming, as became common with television advertising. However, most of the big, nighttime radio programs were actually created by advertising agencies and were used as a way to communicate their client’s message. Advertising agencies also created daytime radio dramas. The Blackett-Sample-Hummert agency produced such programs for its client, the consumer products giant Procter & Gamble, and aptly named the programs “soap operas.”

The second revolution in advertising occurred in 1948 with the advent of television. This new form of entertainment came with large billings and even larger agency commissions. Combined with the healthy post-war economy, the advertising industry boomed during the 1950s.

“Staffs were again enlarged, new agencies formed, and mergers strengthened existing organizations. Branch offices proliferated, and small agencies formed networks to provide reciprocal services for their clients in cities across the country,” Paul Harper recalled in *Advertising: Today, Yesterday, Tomorrow*.

As new product categories proliferated, the overwhelming reliance on television advertising made millions for ad agencies. From 1976 through 1988 total U.S. ad spending grew faster than the economy as a whole. Meanwhile, the three television networks, which completely dominated the market, demanded and received continual advertising rate increases.

An industry downturn began in 1988. Industry observers suggested that the recession of the early 1990s only emphasized the diminished power of traditional advertising to sell products and services. “Even before

the recession, the industry began lagging behind gross national product growth. Total ad spending grew just 5 percent in 1989 and 3.8 percent in 1990—well below nominal GNP growth,” reported Mark Landler in *Business Week*.

Industry analysts suggested several explanations for the apparent loss of effectiveness of advertising. First of all, consumers became less receptive to the continual assault of commercials and also became more price conscious and less brand loyal. The days of a “Colgate family” or a “Crest family” effectively ended, as large numbers of shoppers bought primarily on the basis of price.

At the same time, technological advances and the proliferation of alternative communication tools transformed the way advertisers reached their customers. For example, computerized market research allowed manufacturers to collect detailed information about their customers. Direct marketing increased in usage and popularity, along with in-store promotions and price discounts. “Companies now spend 70 percent of their marketing budgets on promotions, leaving just 30 percent for ads,” Landler stated in *Business Week*.

Advertising agencies responded to these changes by expanding their services into new areas and developing new specialties like direct marketing or, later, Internet services. Some also expanded their reach by absorbing smaller shops located in strategic cities.

The proliferation of television viewing options also took its toll on the advertising industry. The networks of ABC, CBS, and NBC used to account for 93 percent of the U.S. homes watching TV. By 1993, however, the big three maintained only a 60 percent share, while cable television and alternative networks claimed the difference. In 1997 network commercials accounted for about \$13 billion in advertising revenues, or about 29 percent of total television advertising. During the early 1990s network television stations responded to the increased competition of cable TV by cutting their ad rates in an attempt to draw back advertisers. But since agencies obtained most of their commissions from placing media ads, they lost money with the implementation of rate reductions.

In addition, as clients searched for greater creativity and lower costs, many advertisers divided their ad jobs by assigning media and creative work to different agencies. Larger companies even began to bring some of their marketing, advertising, and promotional work in-house. Smaller advertising agencies appeared to be more capable of adjusting to the evolving marketing needs of their clients. A lack of bureaucracy and emphasis on creativity helped smaller agencies become the fastest-growing segment of the industry by capturing large accounts. Some large advertisers demanded that main line agencies change their work habits and entrenched processes to accommo-

date all aspects of a marketing campaign, including packaging, in-store promotions, direct mail, direct response, toll-free comment lines, database marketing, coupon redemption programs, and cable programming.

According to the Television Bureau of Advertising, the total dollar value of U.S. advertising spending rose by 7 percent in 1997 to reach \$187.5 billion. This figure seemed to indicate that the advertising industry had fully recovered from its depression in the 1980s, a recovery that began in the early 1990s. By segment, television accounted for the greatest share of the industry, with 23.8 percent, accounting for more than \$44.5 billion in ad revenues. Newspapers, despite their declining readership, recorded advertising revenues of \$41.7 billion, or a 22.2 percent share. Direct mail posted \$36.9 billion, or 19.7 percent, of total ad revenues. Radio brought in \$13.5 billion, or a 7.1 percent share; the Yellow Pages sold \$11.4 billion in ads for a 6.1 percent share; and magazines drew \$9.8 billion, or 5.2 percent. The remaining revenues were generated by farm publications, business papers, outdoor ads, and miscellaneous media.

If television was the second revolution in the advertising industry, few would argue that the Internet represented the third revolution. In 1996 *Advertising Age* reported in its own online forum that the dollar size of the Internet segment of the interactive industry had grown from \$366 million in 1994 to \$771 million in 1995 and \$1.5 billion in 1996. Projected sizes for 1997 and 1998 were \$2.4 billion and \$3.7 billion, respectively.

CURRENT CONDITIONS

In the days that followed the terrorist attacks of September 11, 2001, the advertising industry suddenly stagnated. World-leader Interpublic Group’s stock fell 23.1 percent, and Omnicom’s stock dropped 18.4 percent. Overall media billings dropped by 10 percent in 2001, the worst decline in the industry since 1987. As declining sales put downward pressure on advertising prices, agencies responded by cutting costs through staff reductions, which fell across the board by 10 percent.

When the United States became entangled with Iraq in 2003, the advertising industry continued to feel the effects of the sluggish economy and lack of consumer confidence. In an attempt to return to the familiar, common in times of uncertainty, advertisers began returning to television. A survey conducted by Morgan Anderson reported that 63 percent of the top 100 advertisers said they planned to spend more on television in 2003, whereas 15 percent planned to spend less and 22 percent planned to spend the same amount. Advertisers have adjusted to the uncertain economic and political situation by agreeing to shorter contracts and carefully targeting their advertising budgets.

Although the industry struggled in the early 2000s to stay afloat, the industry leaders were more apt to be toppled by merger and acquisition mistakes than the slow economy. Smaller firms, however, continued to weather the storm and wait for brighter days. A sustained conflict in the Mid East, combined with an ongoing recessive economy in the United States, would put pressure on smaller operations to compete for their smaller portion of the nation's advertising dollars.

INDUSTRY LEADERS

WPP Group PLC. WPP Group PLC, a marketing conglomerate built by takeovers and the world's third largest advertising company in 1998, claimed the title as the world's largest ad agency based on billings in 2002. Comprised of 1,400 in 100 countries WPP recorded a gross income of nearly \$8.2 billion in 2001. Included in this London-based collection of companies were the large advertising agencies J. Walter Thompson Company and Ogilvy & Mather. In addition to advertising services, WPP had operations in media planning, buying and research, information and consultancy, public relations and public affairs, and specialist communications.

WPP began in 1958 as Wire and Plastic Products, a small manufacturing firm. During the late 1980s the company, renamed WPP, ventured into advertising by acquiring several small marketing firms. In 1989 it became the world's largest advertising company by purchasing Ogilvy Group in a transaction that nearly crippled the company by overloading it with debt during an industry-wide recession. After recovering by the mid-1990s, WPP turned to fueling growth through the establishment of international offices rather than through large acquisitions. By 1997, however, the firm reverted to its acquiring ways and purchased a number of firms throughout the remainder of the decade, among them Batey Holdings, Management Ventures, and Goldfarb Consultants, as well as acquiring stakes in Asatsu and AGB Italia Group.

The Interpublic Group of Companies, Inc. The Interpublic Group of Companies, Inc. was the world's largest advertising group before being overtaken by rival WPP in gross billings. Based in New York, this holding company operated Universal McCann, Lowe Lintas & Partners Worldwide and also Western Initiative Media Worldwide. These subsidiaries actually served rival clients while using the resources of the parent. Although Interpublic had, historically, focused on advertising services, in the mid-1990s it expanded into such new areas as interactive technology and brand consultancy.

Interpublic began in 1911, when Harrison McCann established a small advertising firm to serve Standard Oil of New Jersey. Through a 1930 merger, this firm became McCann-Erickson Co. After acquiring a variety of strate-

gic companies, McCann-Erickson reorganized itself in 1961 as a holding company that provided resources for its separately operating subsidiaries. Acquisitions continued through the 1990s as the company, then known as Interpublic, strengthened its advertising operations while venturing into such markets as public relations, direct marketing, film production, sports management, and Internet services. Interpublic held 15.7 percent of the world market share of advertising in 2001. In 2002 the company posted revenues of over \$6.2 billion.

Omnicom Group Inc. Omnicom Group Inc., which also once held the position of the world's largest advertising agency, posted revenues of \$7.5 billion in 2002. This New York-based holding company operated three of the top ten global advertising networks—BBDO Worldwide, DDB Worldwide, and TBWA International. It also operated various smaller advertising agencies as well as Diversified Agency Services, which is a global public relations/direct marketing network of more than 75 companies, and Optimum Media Direction, an independent media-buying service. Omnicom, which ranked as the world's third largest advertising agency as recently as 1994, credits its growth to an aggressive acquisition campaign enacted in the mid-1990s. Among such acquisitions were Ross Roy Communications, one of the largest full-service marketing communications services companies; Ketchum Communications Holdings and Fleishman-Hillard, two top public relations firms; and London-based GGT Group. Omnicom offers its services to clients worldwide on a local, national, pan-regional, or global basis.

Young & Rubicam Inc. Young & Rubicam Inc., based in New York, operated in five primary areas in the late 1990s: advertising, database marketing and customer relationship management, perception management and public relations, branding identity consultation and design services, and healthcare communications. It consisted of such companies as Young & Rubicam Advertising, Dentsu Young & Rubicam, The Bravo Group/Kang & Lee, Wunderman Cato Johnson, KnowledgeBase Marketing, Brand Dialogue, The Media Edge, Burson-Marsteller, Cohn & Wolfe, Landor Associates, and Sudler & Hennessey.

Founded in 1923, Young & Rubicam achieved several decades of steady growth by fostering an unencumbered, creative atmosphere. The firm made history during the 1960s by producing the first television commercials in color. The 1970s were marked by acquisitions, a strategy that proved unwise when the industry hit a recession in the 1980s. The early 1990s also provided a challenge for the firm, which pleaded guilty to bribery charges in connection with a Jamaican tourism account. In 1993 the company announced its fourth restructuring in eight years. In 1994 one of the company's top execu-

tives, Thomas Mosser, was killed by a bomb attributed to the Unabomber. In 1995 the company's luck seemed to turn around, though, when it landed the Colgate-Palmolive worldwide brand advertising account valued at an estimated \$200 million. Still, the company suffered from a heavy debt load. To ease this burden Young & Rubicam ended its 75-year tradition as a private company by holding its initial public offering in May 1998. The company reported revenues totaling nearly \$1.1 billion in 2002.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, 279,370 people held jobs related to advertising in 2001. Of that number, management occupations totaled nearly 15 percent. Chief executives had a mean annual salary \$121,220; general and operations managers, \$100,940; market managers, \$81,980; sales managers, \$92,960; and advertising and promotion managers, \$77,960. Art, design, and media-related occupations accounted for 20 percent of all jobs in the industry. Mean annual salary for graphic designers was \$45,340; multi-media artists and animators, \$47,120; writers, \$56,360; public relations specialists, \$47,430; and art directors, \$70,720. Advertising sales-related jobs totaled 23 percent of the industry's workforce. The mean annual salary of an advertising sales agent was \$49,130. Administrative and office support occupations totaled nearly 25 percent, with a mean annual salary of \$29,910.

Similar to other industries, the field of advertising was traditionally dominated by large, public corporations, many a collection of independent agencies. However, most professionals who worked in the industry were employed at small agencies. In fact, the average firm had only 11 employees, and nearly four out of every five agencies employed fewer than 10 people. Advertising agencies varied greatly in size and scope of activities. Workers in smaller agencies might be responsible for a variety of tasks, while those in larger agencies would find their job duties to be more narrowly defined.

The advertising industry was highly competitive in terms of entry. Most entry-level applicants had earned at least a bachelor's degree, and many had participated in internships or gained some kind of previous advertising work experience. Managers, executives, sales people, and administrative support workers accounted for 9 out of every 10 jobs in the industry.

AMERICA AND THE WORLD

As major U.S. manufacturers of consumer products ventured into overseas markets, U.S. advertising agencies followed. Marketers and ad agencies viewed international expansion as an essential part of their future growth. Compared to the mature U.S. market, such inter-

national markets as Asia and Latin America offered tremendous growth possibilities. Other promising regions are China, the former Soviet Union, and Eastern Europe.

Some agencies forayed into Vietnam, a country touted as the next boom market in Asia. With 68 million people—half under the age of 19—Vietnam held tremendous potential for marketers of consumer goods. Agencies that had established a presence by the mid-1990s included J. Walter Thompson, Backer Spielvogel Bates Worldwide, Ogilvy & Mather Worldwide, and Saatchi & Saatchi.

“Many Asian countries offer a predominately young and hungry marketplace,” A. William Deval, senior vice president, Asia-Pacific, for Grey Advertising told *Advertising Age*. “In addition to new-found prosperity and a growing population of younger consumers, changing political forces are opening Asian markets to greater numbers of foreign goods.” Japanese firms set up 26 joint ventures after Vietnam relaxed its foreign investment law in 1988. U.S. companies, however, were restricted by a trade ban from investing in Vietnam.

Latin America also was expected to be an increasingly popular destination for marketers. This region provided a sizeable market of young consumers, as 65 percent of its population of 450 million was under 30 years old, and 37 percent was between the ages of 10 and 29. These age groups are successful target markets for consumer products.

SIC 7312

OUTDOOR ADVERTISING SERVICES

This industry includes establishments primarily engaged in the preparation of poster displays and painted and electronic spectacular displays on billboards, panels, bulletins, and frames, principally outdoors. Such establishments may construct, repair, and maintain display boards and may post advertisements. Establishments primarily engaged in manufacturing electrical, mechanical, or plate signs and advertising displays are classified in **SIC 3993: Signs and Advertising Specialties**.

NAICS CODE(S)

541850 (Display Advertising)

INDUSTRY SNAPSHOT

Outdoor advertising was the first, and at one time the only, form of advertising in the world. By 1997, with the competing advertising media of television, radio, magazines, newspapers, and cable television, outdoor advertising—primarily billboards—made up less than five percent of total advertising expenditures in the United States.

Historically, outdoor advertising agencies have relied heavily on tobacco and alcohol advertising — at one point these accounts provided more than 50 percent of their revenue. However, in the past few decades outdoor advertising of these products has dropped substantially because of the public’s increasing concern for health and safety.

With the decline in tobacco and alcohol advertising, outdoor agencies began to focus on attracting new business. Some advertisers were quite successful in doing so as the most popular billboard spaces, once dominated by long-standing tobacco contracts, became available. According to the Outdoor Advertising Association of America (OAAA), advertisers spent more than \$4.4 billion in 1998. Billboards alone generated the lion’s share — \$2.3 billion, an increase of 9.1 percent over 1997. This increase marked the sixth consecutive year of growth in the industry. This trend was expected to continue during the

late 1990s, when the OAAA projected spending on billboards would increase by ten percent each year.

In an attempt to win new clients in the 1990s, outdoor advertising agencies began to use such technologically-advanced equipment as computerized painting and mapping services. These tools allowed outdoor ad companies to provide high-quality images and to target specific geographic and demographic markets. Additionally, outdoor agencies promoted the cost effectiveness of their medium. Outdoor advertising, which in 1999 cost about 81 cents CPM (cost per thousand), was relatively inexpensive compared to other media. A 30-second television ad averaged \$10.40 CPM on prime-time network and \$18.90 CPM for a prime-time spot. A 60-second radio ad during drive-time cost \$5.57 CPM. A quarter-page newspaper ad averaged \$11.03 CPM, while a four-color magazine ad cost \$9.14 CPM.

Marketers of apparel, packaged goods, financial services, entertainment, and other consumer products and services began to increase their usage of outdoor advertising in the early 1990s. For example, in 1992 McDonald’s launched its first outdoor campaign with the introduction of its Value Meals program. Unlike McDonald’s, however, most marketers do not use outdoor advertising for product launches, but instead work the medium in conjunction with television and radio. By 1995, such marketers as fashion designers Calvin Klein, Ralph Lauren, and Donna Karan started using outdoor advertising as a major part of their ad campaigns—a move many in the industry took as a sign of the medium’s growing strength. “The fashion industry has definitely brought respectability to the medium,” Terry McGrath, a partner at the PGR Media ad agency, told *Marketing News*. “It’s bringing in advertisers that wouldn’t have even considered it before.”

ORGANIZATION AND STRUCTURE

The outdoor advertising industry can be divided into two major classifications: on-premise and off-premise. On-premise advertising basically entails the use of signs to identify a business establishment. Off-premise advertising is a service in which outdoor displays are erected and maintained on property owned, leased, or controlled by a third party.

Off-premise outdoor advertising has generally been geographically subdivided—rural versus urban. The rural road sign tends to the immediate needs of the traveling public, such as food, fuel, and lodging. In urban settings, three kinds of off-premise advertising have historically been found. The first two, transit advertising and neighborhood point-of-purchase, have historically produced only a small volume of business, although by the late 1990s the industry had begun to fully utilize advertising on mass transit buses, subways, taxicabs, and more. The third category of off-premise advertising—called a

standardized medium, but better known as a billboard—has dominated the outdoor industry.

Bulletins are the largest kind of billboards and can be found in three sizes: 14 feet by 48 feet, 10.5 feet by 36 feet, and 20 feet by 60 feet. Usually these boards are found on interstate highways. The traditional billboard, sometimes called a 30-sheet, runs 12 feet by 24 feet and has been used for niche marketing. Relatively new to the industry has been the eight-sheet billboard, measuring 6 feet by 12 feet. Previously found in highly dense areas with limited space, eight-sheets are being used in suburban communities and have been especially popular for regional and ethnic marketing. At an average price of \$100 to \$150 per board in the 1990s, eight-sheets were significantly less expensive than the traditional posters, which sold for an average of \$500.

New, technologically-advanced boards have also begun to show up in outdoor advertising. One example has been the Premier panel, created by Patrick Media Group. This type of board offers improved graphics by printing ads on vinyl using computer technology. The Premier panel also has 30 percent more space than a traditional 30-sheet because it stretches the advertisement around the board rather than containing it inside the frame.

BACKGROUND AND DEVELOPMENT

The history of outdoor advertising can be traced to the development of mass communication. Until the fifteenth century, public posting was the only means (other than the town crier) of disseminating information. In 1450, when Johannes Gutenberg invented printing from moveable type, messages could be duplicated on a wide-spread basis and advertising in its infancy took the form of a handbill. Around 1480, William Caxton introduced a new type of printing in England and the first poster was printed. When German Alois Senfelder perfected the lithographic process in 1796, he provided the means for merging the all-type handbill with graphics, creating an illustrated poster.

The printing press made possible the development of two other media: the handbill and the circulated bill. The handbill was popular because it could be distributed in quantity. The circulated bill was the forerunner of newspapers and magazines.

At first, bill-posting consisted of sticking advertisements on walls and fences around London and hoping that the competition would not tear them down or cover them with postings of their own. Eventually, standards were developed to ensure exposure for a set period of time, which required gaining the exclusive rights for posting. As the areas with the most traffic grew, bill-posters soon began to build their own surfaces. Due to the tendency to use fences for posting, these new structures took the name of “fences.” Bill-posting spread overseas

with the development of the colonies in North America, and the new structures built in America soon were referred to as “billboards” or “boards.”

Early poster advertising in the United States consisted of notices selling farm stock and equipment and announcing county and state fairs, theatricals, circuses, horse races, community parades and celebrations, carnivals, and medicine shows. Since a large portion of the posted material was used to advertise the theater, the local theater manager was often in charge of the outdoor advertising in the city. It also was a common practice to ensure the protection of a posting by giving a present, such as tickets to the circus, to the owner of the billboard.

Outdoor advertising broadened its scope with the advent of the automobile and the U.S. highway system. From the 1920s to the 1960s, outdoor advertising was considered one of the best ways to reach consumers outside the home, especially in areas not covered by the major daily newspapers or magazines. The unchecked growth of outdoor advertising subsided by the early 1970s as environmentalists began to complain about the “clutter,” especially in rural communities. Through the work of Lady Bird Johnson, the Highway Beautification Act, which set limitations for billboards in rural areas, was passed in the mid-1960s. December 1991 saw the passage of the Intermodal Surface Transportation Efficiency Act (ISTEA), which banned the construction of new billboards along scenic highways. Despite these and other local restrictions, U.S. cities remain covered with out-of-home advertising opportunities.

Tobacco marketers were the largest outdoor advertisers in 1992, spending \$123 million. At the same time, however, the category posted the greatest decline in spending—33.5 percent. To illustrate, TDI, a large outdoor advertising agency, received 23.5 percent of its total revenue from tobacco companies in 1991, but that percentage had dropped to less than 5 percent by 1994.

Because the outdoor ad industry relied so heavily on alcohol and tobacco advertising, it was hit hard by the continual drop in outdoor spending by alcohol and tobacco producers. These reductions can be credited to health considerations and legal restrictions—such as those adopted by many states that forbade liquor, beer, and tobacco billboards from being within 500 feet of places where children spend a significant amount of time.

CURRENT CONDITIONS

Annual spending for out-of-home or outdoor advertising has remained relatively small, accounting for less than five percent of all media billings in the mid 1990s. Although agency executives do not foresee outdoor advertising surpassing, or even approaching, the reach of broadcast television, they do acknowledge that the industry has gained popularity with their clients since it has

become a cost-effective and timely medium. Advertisers use billboards to support primary media plans, and some major accounts have stepped up their outdoor coverage.

By the late 1990s, as outdoor advertising by alcohol and tobacco companies waned, other categories increased their spending in this medium. According to the OAAA, in 1998 the category of local services and amusements was the greatest spender, accounting for \$190.9 million, or 10.6 percent, of all outdoor advertising revenues. Public transportation, hotel, and resorts, was a close second, with \$176.8 million, or 9.9 percent of total spending. Retail accounted for \$162.7 million, or 9.1 percent; miscellaneous merchandise for \$161.7 million, or nine percent; restaurants for \$158.1 million, or 8.8 percent; and media and advertising for \$143.5 million, or eight percent. A relatively sharp decline preceded the seventh-place category, automotive dealers and services, which accounted for \$120.3 million, or 6.7 percent of outdoor ad dollars. The remaining top ten categories were insurance and real estate, with \$94.6 million, or 5.3 percent; automotive, with \$90.2 million, or five percent; and financial services, with \$73.6 million, or 4.1 percent.

INDUSTRY LEADERS

Outdoor Systems, Inc., was the largest outdoor advertising firm in North America in 1999, generating revenues of \$705.9 million in 1998. The company had 112,500 bulletin, poster, mall, and transit advertising displays in the United States, Canada, and Mexico, and about 125,000 subway advertising displays in New York City alone. The company operated in each of the 50 largest U.S. markets, 13 of the 15 largest Canadian markets, and 44 of the largest 45 Mexican markets. Founded in 1980, the company served the local Phoenix market until it went public in 1996. With that influx of capital, the company expanded rapidly, purchasing Gannett's outdoor advertising operations before acquiring Mediacom, Van Wagner Communications, and dozens of other competitors by the late 1990s. In May 1999, the company agreed to be acquired by Infinity Broadcasting Corporation in an \$8.3 billion transaction.

Following that purchase, Infinity Broadcasting Corporation became the nation's leading outdoor advertising company. Outdoor Systems' 235,000 displays were folded into Infinity's outdoor advertising subsidiary, TDI Worldwide, which operates in the United States, the United Kingdom, Ireland, and the Netherlands. Infinity was founded as a small collection of radio stations in 1973, but aggressively began increasing its holdings during the 1980s. By the mid 1990s, it was the largest radio group in the United States. The controversial antics of such radio personalities as Howard Stern and Don Imus generated publicity for Infinity — and fines from the Federal Communication Commission. Westinghouse

Electric (later renamed CBS) purchased Infinity in 1996, then spun it off two years later.

By 1999, Lamar Advertising Company was the largest U.S. outdoor advertising company in terms of the number of displays. Operating in 42 states, the firm had erected approximately 125,600 billboards and signs as well as 23,600 Interstate logo signs and 6,100 transit ads. The company has grown steadily since its formation as a bill-posting company in 1902. Beginning in the 1970s, Lamar fueled its diversification and geographic expansion through acquisitions. In 1998, the firm acquired about 40 companies, contributing to its annual revenues of \$288.6 million. In September, 1999, Lamar paid \$1.9 billion for the outdoor advertising business of AMFM Inc.; as part of that deal, Lamar was required to divest itself of approximately \$30 million worth of billboards.

WORKFORCE

The work force of outdoor advertising agencies is relatively small. According to the U.S. Bureau of the Census, more than 1,300 establishments operated in this industry in the mid 1990s. This figure was expected to increase to more than 1,400 by the late 1990s. The number of employees in the mid 1990s totaled approximately 13,500 and was expected to reach 14,000 by the late 1990s. According to the U.S. Department of Labor, these figures represented less than 25 percent of the work force for the entire advertising industry.

RESEARCH AND TECHNOLOGY

Technological developments such as computer painting, 3-D effects, weekly changes of boards, and geographic and demographic mapping have transformed outdoor advertising into a timely, targeted, and cost-effective medium. One of the most significant technological advancements has been the creation of computerized painting, which has eliminated the quality problems associated with traditional painting methods. Computerization allows advertisers to see their ads beforehand on a computer screen, easily make changes, speed delivery time, and assure consistency in reproduction.

The introduction of computerized mapping and tracking systems has been another important technological development for the out-of-home advertising industry. In late 1995, the OAAA established voluntary industry standards involving the use of bar coding and geocoding technologies. Global Positioning Systems (GPS) are used by many outdoor companies to track the precise location of billboards, as well as to incorporate other geographic and demographic data in order to devise customized marketing solutions. Standards for bar coding facilitate the tracking of advertising copy for all interested parties, including advertisers, printers, and outdoor companies.

Another innovation came with the invention of Poster Audience Research (Postar) in 1996. The system uses both demographic research and neural network technology to estimate the traffic passing billboards in a specified location and the relative visibility of the advertisement. Advertisers can use this information to manipulate other technology, such as rotating billboards that stay fixed during certain times of the day. For instance, advertisers seeking to reach businesspeople can have their signs appear during rush hour, while consumer goods appear during the middle of the day.

In July, 1996, the Federal Highway Administration reversed its ban on off-premise changeable message signs. This technology enables a single structure to display up to three different messages or images. While still subject to state regulations, this federal decree has given outdoor campaigns a boost in competing for the advertising dollar, particularly since consumers have increasingly come to expect flashy and otherwise high-tech ad campaigns.

INDUSTRY SNAPSHOT

Companies included in this industry are called “rep firms.” They sell advertising time or space on radio, broadcast television, cable television, and in print. Most rep firms specialize in a single medium. Company leaders per medium dominated their respective industries, as rep firm consolidation occurred throughout the 1990s.

According to the Radio Advertising Bureau (RAB), radio advertising reached a record \$15.4 billion in 1998, a 13 percent increase over the previous year. Approximately \$2.8 billion came from national spots, \$11.9 billion from local spots, and the remaining \$720 million from network advertising. Despite these results, radio comprised only about 7 percent of the \$188 billion advertising industry in 1997.

In contrast, television—broadcast and cable—brought in about \$47.5 billion in annual advertising revenue in 1998, accounting for a 23.5 percent share of all advertising. Networks (ABC, CBS, NBC, and FOX) garnered approximately 29 percent of broadcast television’s annual advertising revenues.

Meanwhile, newspapers and magazines achieved more than \$51.8 billion in annual advertising revenue—approximately 27.6 percent of the market in 1997. Direct mail and other media sources accounted for the remaining percentages.

Of the \$188 billion spent for advertising in the United States in 1997, approximately \$110 billion was spent on national spots. This represented about 59 percent of all expenditures. The media rep firms listed in this industry are responsible for the placement of these national ads, which can run in any market or combination of markets.

ORGANIZATION AND STRUCTURE

Most television stations, radio stations, and newspapers have their own personnel to handle sales within their respective markets. However, national media representatives are called in to sell commercial time or print space to clients outside a local market. This sales arrangement has been based on economy, since it would be too costly for every television station, radio station, and newspaper to have its own sales staff in every major market across the country.

Radio networks are arranged in a fashion similar to their television counterparts, such as ABC, CBS, and

SIC 7313

RADIO, TELEVISION AND PUBLISHERS’ ADVERTISING REPRESENTATIVES

Establishments primarily engaged in soliciting advertising on a contract or fee basis for newspapers, magazines, and other publications or for radio and television

NBC. The network provides programming to stations throughout the country and receives advertising time in exchange. Unlike national spots, network ads run simultaneously on a particular network throughout the country.

Media reps sell national spots that can be placed in any market in any combination of U.S. markets. Other kinds of advertising include local spots and network ads. Local spots are advertisements that usually are solicited by the local staff of a television station, radio station, or newspaper. Network advertising refers to those ads that run on network television or network radio.

BACKGROUND AND DEVELOPMENT

The media rep business began with the original form of mass communication in the United States, the newspaper. Emanuel Katz started one of the first rep companies in 1886. At the request of William Randolph Hearst, Katz went to New York to convince advertisers to purchase ads in Hearst's newspapers in San Francisco. When this venture proved successful, Katz opened his own media rep firm in 1888, the E. Katz Special Advertising Agency.

Media rep firms like Katz's expanded their client lists to include radio and television during the late 1940s and early 1950s. Many rep firms decided to specialize in one kind of medium. For example, Katz dropped all newspaper representation in 1969 in order to focus on broadcast media. Others, like The Interep Radio Store, later known as Interep National Radio Sales, remained loyal to their traditional medium.

In 1996, President Clinton approved the Telecommunications Act, which had great implications on many industries, including that of media representation. Some key provisions of the Act included: discontinuation of limits on television station ownership; removal of barriers to ownership of TV stations and cable systems serving the same market; relaxation of limits on radio station ownership; and de-regulation of cable service rates.

CURRENT CONDITIONS

Radio. Recently rising from the shadow of television, radio advertising continues to increase in annual revenue. September, 1999, marked the 85th consecutive month of sales growth in the radio industry. Radio stations and networks reached a record \$15.4 billion in advertising revenue in 1998, a 13 percent growth rate over the previous year.

Industry experts have attributed "dot-com" advertising as the impetus for much of this growth. Radio is an effective means of publicizing Web sites, both at the national and local level. Gary Fries, CEO of the RAB, identified this segment as an area of growth for radio. Quoted in an April, 1999, press release, he remarked, "Dot-com advertisers are using Radio overwhelmingly

—more than 80 percent of their ad budgets in many cases—to build brand identity and to tell people where they are located."

Television. The Television Bureau of Advertising (TVB) reported that total advertising expenditures for local, national, and syndicated television reached \$47.5 billion in 1998, accounting for 23.5 percent of the nation's total advertising. That year, 98.3 percent of the nation's households had at least one television, compared to 87.1 percent in 1960, 64.5 percent in 1955, and 9.0 percent in 1950.

Network advertising accounted for the largest share of television's total, \$13.7 billion. Local spot was the second largest generator of advertising revenue, accounting for \$12.2 billion. It was followed by national spot (\$10.6 billion), cable (\$8.3 billion), and syndication (\$2.6 billion).

Consolidation marked the media rep industry during the 1990s. However, an obstacle to this trend has been client stations that continue to object to dual representation — having the same company represent competing stations within a market. Yet some stations have started to reconsider the parameters of dual representation, opening the door to the possibility of future structural changes. For example, NBC decided to seek outside representation for its national spot business, and rep firm Petry tried to win the entire \$230 million NBC account. The firm already represented Fox stations in New York, Los Angeles, and Chicago, where NBC also has stations. To avoid direct confrontation between Fox and NBC, Petry suggested that the firm create a separate division for NBC. In the end, Fox opposed the arrangement, and Petry was awarded only a portion of the NBC account.

One possible explanation for TV broadcasters' willingness to explore alternative sales representation could be the emergence and growing strength of cable television. More than 65.8 million or 67.2 percent of the nation's total households in the United States had basic cable in 1997. Cable television's share of total TV advertising rose from 3.4 percent in 1985 to 6.3 percent in 1990 and to about 17.0 percent in 1998. Between 1990 and 1998, total advertising revenues on cable television have grown from \$2.4 billion to an estimated \$8.3 billion. Yet the growth of cable television itself may be slowed due to competing services, such as direct-broadcast satellite (DBS) and alternative access into the consumers' homes through telephone lines or computer modems.

Newspapers. The newspaper industry began to recover from the poor showing of the late 1980s and early 1990s as the total dollar value of advertising placed in the nation's newspapers started growing in 1993. In 1997, newspaper-advertising revenues approached \$41.7 billion, accounting for a 22.2 percent share of the nation's

total advertising. However, many industry experts believe that some advertising will never return to the newspaper. Beyond a sluggish economy and poor consumer spending, the changing dynamics of the marketplace may have affected newspaper advertising permanently.

Most major department stores have shifted some of their newspaper advertising dollars into local television and radio spots. Packaged goods marketers have traded newspapers ad dollars for coupons and other kinds of promotions. And large discounters that have taken the lead from department stores and specialty retailers do not buy much advertising. Moreover, the existing purchasing system—one lacking in standard advertising billing and rate practices—has made it difficult for newspapers to retain national and retail chain advertisers.

Perhaps more significant, however, is the decline in newspaper readership by the late 1990s. According to the RAB, newspapers experienced a decline in some 5.5 million readers between 1986 and 1996. Part of this decline is attributable to the availability of news, classified ads, and employment ads on the Internet.

Magazines. Magazines, particularly consumer publications, suffer the same competition from the Internet as do newspapers. Still, like newspapers, magazine advertising revenues continue to grow, even though readership has largely stalled. The TVB reports that magazines posted more than \$9.8 billion in ad revenue in 1997, at a 9 percent annual increase.

INDUSTRY LEADERS

New York-based Katz Media Group, Inc., a subsidiary of AMFM Inc. (formerly Chancellor Media), is the oldest media representation firm in the United States. Operating in the United States and the U.K., it sells advertising time for more than 2,100 radio stations, 300 television stations, and 1,645 cable systems, as well as Internet sites. In 1888, Emanuel Katz established the nation's first media representative firm. Initially operating in the newspaper market, the firm expanded into radio advertising during the 1930s and into television in 1949. By 1969, these later ventures proved more lucrative than print media did, so Katz abandoned newspaper representation to focus on electronic media. In 1992, the company became the nation's largest media rep organization when it acquired Seltel, a rival television representative. Also in 1992, Katz ventured into cable television by purchasing a stake in Cable Media Corp., which was merged with National Cable Advertising in 1994 to form National Cable Communications, the nation's largest cable rep firm. The following year, Katz began selling advertising on websites. In 1998, Katz, having been purchased by Chancellor Media the previous year, posted revenues of \$192.8 million.

Interep National Radio Sales, Inc. was the nation's largest representation firm devoted solely to radio by the late 1990s. The firm sold radio advertising time for nearly 2,300 stations through its eight subsidiaries—ABC Radio Sales, Allied Radio Partners, Caballero Spanish Media, Cumulus Radio Sales, Infinity Radio Sales, Clear Channel Radio Sales, D&R Radio, and McGavren Guild Radio. The company was founded when Daren McGavren purchased a regional rep firm with radio stations in the Pacific Northwest. The Daren McGavren Company was established during the 1950s, when radio's identity was in flux due to the arrival of television. As other radio rep companies ventured into television during the 1960s, the Daren McGavren Company stuck with radio. McGavren soon expanded his company with the acquisition of Ralph Guild and his radio stations. Throughout the 1980s, radio rep firms consolidated through mergers and acquisitions, and by 1984, only two mega rep firms were in place—McGavren Guild and Katz Radio Store. McGavren Guild was renamed The Interep Radio Store in 1988, and adopted its current name in 1997.

RESEARCH AND TECHNOLOGY

The introduction and usage of software packages in all aspects of the media representation industry has produced increased productivity, efficiency, and ease in purchasing. Examples of computer software usage can be found in the cable TV and radio rep business. Turner Broadcasting Sales, along with other cable networks, began to use Cable Xchange, a software system created by Jefferson Pilot Data Service. This program provides up-to-the-minute information on inventory availability, generates sales proposals, and covers post-analysis work such as monitoring airtime and tracking audience guarantees.

“Cable Xchange is designed to take our entire sales process electronic, from proposal through post-analysis,” says Rick Sirvaitis, executive vice president and chief operating officer for Turner Broadcasting Sales. “It will save not only time, but also cut down on errors from re-inputting orders.”

Radio rep firms also have been relying upon computer technology to automate their sales operations. Interep introduced an exclusive software package that can identify radio stations whose listeners are likely to purchase specific brands of consumer products. The BrandNET software program can localize a brand's consumer profile and then identify the radio station whose audience has the most similar profile and would have the highest purchase potential.

The Internet and World Wide Web sparked interest in the mid 1990s when Katz created Millennium Marketing, a subsidiary dedicated to selling advertising and sponsorship on the Internet. Initial clients included the

Sci-Fi Channel, Better Homes and Gardens Live, and Car Talk. By the late 1990s, the Internet had become a force to be reckoned with in virtually every advertising segment. Some media, such as radio and television, experienced notable increases in ad revenues from web marketers publicizing their sites. In a single year, television drew an 81 percent increase in Internet advertising revenues, from \$120.3 million in 1997 to \$217.2 million in 1998. Likewise, radio drew \$44.5 million in Internet advertising revenue during the first nine months of 1998, compared to \$15.6 million for the full-year 1997.

SIC 7319

ADVERTISING, NOT ELSEWHERE CLASSIFIED

This classification covers establishments primarily engaged in offering advertising services, not elsewhere classified, such as aerial advertising, circular and handbill distribution, distribution or delivery of advertising material or samples, and transit advertising. Establishments primarily engaged in direct mail advertising are classified in **SIC 7331: Direct Mail Advertising Services**; those that write advertising copy, but do not place the advertising with media, are classified in **SIC 8999: Services, Not Elsewhere Classified**; and those that provide services in commercial art, graphics, or other creative advertising services, but do not place the advertising with media, are

classified in **SIC 7335: Commercial Photography** or **SIC 7336: Commercial Art and Graphic Design**.

NAICS CODE(S)

481219 (Other Nonscheduled Air Transportation)
541830 (Media Buying Agencies)
541850 (Display Advertising)
541870 (Advertising Material Distribution Services)
541890 (Other Services Related to Advertising)

The advertising services offered by this industry include coupon distribution; display service, except outdoor; independent media buying services; poster advertising, except outdoor; distribution of product samples; shopping news advertising and distribution; and sky writing. Approximately 2,246 establishments operated in this industry in 1998, employing 45,500 workers. Leaders by sales volume in the late 1990s included LM Berry and Company, SFM Media Corporation, and Heritage Media Corporation.

Historically, one of the most active sectors of this industry has been media buying services. These companies are independent of traditional advertising agencies and serve their clients only by purchasing media. Responsibilities of media buyers include monitoring media space and purchase availability; verifying the accuracy of ads placed; and calculating rates, usage, and budgets. These services charge 3 to 5 percent of the cost for the ad, as opposed to the traditional 15 percent charged by agencies.

As clients have become more cost-conscious, many have bypassed the traditional advertising agency and moved to independent companies to make their media purchases. For instance, more than 22 percent of the 201 agency executives responding to a 1992 *Advertising Age* Beta Research Corp. survey reported that their clients use independent media services. As of 1998, media buying services handled 6 percent of all advertising.

Western International Media led this industry with more than \$2.3 billion in media billings in the mid 1990s. Since 1989, many accounts have moved to independent media services like Western International. These include the \$90-million American Isuzu Motors account, the \$90-million Nike account, the \$70-million Reebok International account, and the \$50-million Bally account. In 1996, this trend continued when Bell South Corporation awarded its \$185-million plus account to Western International Media. Efficiency of service and the power of media buying consolidation have been two reasons cited for the switch to independents.

Promotional items and services make up another active segment in this industry. This segment has been especially successful in grocery stores. In the past, marketers of packaged goods have used kiosks that dispense

coupons, along with advertising on supermarket floors and shelves to promote their products. The industry, however, has been developing a new generation of promotional services that capitalize on technology. In 1997, for example, J.C. Penney, Toys “R” Us, and Boston Market offered coupons from an Internet site called Cool Savings. Developed by the Interactive Coupon Network (ICN), customers retrieved proprietary printing software that allowed them to customize and print their own coupons locally. Encoding assured that coupons were authenticated. McDonald’s and Domino’s participated in another online experiment called Smart Save in 1997. Using the Internet and a “smart” card, consumers visited the Smart Save site, browsed for coupons, and transferred the information to the “smart” card for later use.

Transit advertising was expected to be another growth area for the industry. Gannett Outdoor Group operates transit displays in six major markets including New York and Los Angeles. Gannett’s subsidiary in Canada, Toronto-based Mediacom, also has predicted a growing market for transit advertising and recently added about 500 new travel shelters throughout Canada. In 1996, Outdoor Systems of Phoenix agreed to buy Gannett Outdoor Group for \$690 million. Meanwhile, Patrick Media Group operates bus shelters in Orange County, California and Miami. The company also provides transit advertising in the Bay Area Rapid Transit (BART) system throughout the San Francisco Bay area. Patrick Media was sold in 1995 to Eller Media for \$518 million.

Advertising employment was expected to grow rapidly through the year 2006, due to increased competition between other industry competitors and the need for more effective marketing.

ADJUSTMENT AND COLLECTION SERVICES

This category covers establishments primarily engaged in the collection or adjustment of claims other than insurance. Establishments primarily engaged in providing credit card service with collection by a central agency are classified in **SIC 6153: Short-term Business Credit Institutions, Except Agricultural**; those providing adjustment services are classified in **SIC 6411: Insurance Agents, Brokers, and Service**; and those providing debt counseling or adjustment services to individuals are classified in **SIC 7299: Miscellaneous Personal Services, Not Elsewhere Classified**.

NAICS CODE(S)

561440 (Collection Agencies)

561491 (Repossession Services)

INDUSTRY SNAPSHOT

Debt collectors are businesses acting as third-party agents to recover outstanding debts from consumers and businesses. Most credit grantors initially attempt to collect the money due using their in-house collection departments. At some point, however, it becomes more economical to hand over past-due accounts to a collection company. In turn, the agency works to recover the amount still owed and is paid a percentage of the amount received. According to the American Collectors Association (ACA), in 1997, more than \$32.2 billion in outstanding debt was collected — out of the \$247.4 billion in new accounts turned over that year to third-party collection agencies.

The debt collection industry has grown from small, localized businesses to nationwide companies. The industry has also become more regulated with the implementation of the Fair Debt Collection Act of 1977. This legislation mandates behavioral guidelines for creditors. Violations of the act are reported to the Federal Trade Commission (FTC). In addition, the majority of states also regulate debt collection agencies through state licensing, registration, or certification of the right to conduct business within a particular state.

Debt collection industry leaders have been large, computerized agencies, such as the NCO Group and Outsourcing Solutions. Beyond the few major national cor-

porations such as these, the remaining companies in the industry are small, local, private companies.

ORGANIZATION AND STRUCTURE

Collection and accounts receivable management agencies are third-party agents that assist in recovering delinquent or written-off debt. Although most large corporations have their own internal collection departments, a creditor will typically release the debt to a collection agency after the account is 180 to 240 days in arrears. Third-party agents can generally provide more effective service at a lower cost than in-house personnel. Collection agencies usually are compensated by commission, based on the percentage of debt recovered.

Some collection agencies market a prepaid letter service that includes dunning notices and related reporting and collecting services. This type of service generally has been used by smaller businesses and organizations. With a letter service, the client prepays a flat fee rather than paying through a percentage of the money collected. The more traditional collection service operates through the activities of the contingency collection agencies, working on commission and earning 25 to 35 percent of the amount collected.

The debt collection industry can be divided into four main groups: health care, including hospitals and doctor's offices; retail businesses, including department stores and credit-card companies; utilities; and commercial accounts, or businesses owing money to other businesses. Hospitals and bank cards have provided the greatest amount of overdue debt collection placements. Various health services and utilities also have become large users of collection agencies. Education and government-backed loans, both relatively new categories, have also grown. Previously, debt collectors lacked the staff or expertise to handle these kinds of accounts.

BACKGROUND AND DEVELOPMENT

The debt collection industry, often called accounts receivable management, was traditionally characterized by small, local businesses with shady reputations at best. However, since the late 1970s, the collection agency industry has transformed into nationwide companies with "hundreds of closely supervised collectors and computerized operations," reported Clifford J. Levy in a 1991 issue of *The New York Times*.

Changes in the appearance and activities of the debt collection industry have been due to two factors: the growth of national companies demanded that debt collectors operate on a national basis and have highly computerized facilities; and the implementation of the Fair Debt Collection Act of 1977. Administered by the Federal Trade Commission (FTC), this legislation has determined specific rules of conduct for debt collectors. According to

the act, debt collectors cannot threaten debtors, lie to them, or call them at inappropriate times. Conversations and correspondence with debtors are to be confidential, and debtors can tell collectors to stop contacting them. As a result of the act, less-than-professional operators have been pressured to upgrade their practices or have been forced out of business.

Despite the Debt Collection Act, complaints have been on the rise in the early 1990s. In fact, consumers filed 2,000 debt-collection complaints with the FTC in 1992, double the amount filed in 1991. However, this figure remains well below the 5,000 complaints received annually before 1977. One example of debt collection harassment has been the case that the FTC brought against Payco American in August 1993. The company was charged with using abusive language, falsely threatening arrest, and improperly revealing personal financial information to outsiders. All of these charges are in violation of the Debt Collection Act.

Due to government regulations and the emergence of national, commercial, institutional, and government accounts, the debt collection industry experienced consolidation between the 1970s and 1990s. The result was a decline in the number of debt collection agencies in operation, from about 6,500 at the end of the 1970s to approximately 5,500 to 6,000 in 1994. Industry revenues grew from roughly \$2.5 billion to around \$5.5 billion during the same time period. Higher revenues fueled more growth in the number of collection agencies in 1995 to 7,400 nationwide, again increasing the number of establishments in this industry.

CURRENT CONDITIONS

The American Collectors Association (ACA) compiles and publicizes statistics on the nation's consumer debt. By the late 1990s, the average consumer debt was \$300. Outstanding consumer installment debt totaled \$1.3 trillion as of March, 1999. There were nearly 152 million credit card holders in 1998, with total outstanding credit card debt reaching \$538 billion. About 1.4 million consumers, or 8 percent of Americans, filed for bankruptcy in 1998. In 1996, more than \$13 billion in bounced checks were written, a total projected to rise annually by 2 to 4 percent through 2020. Additionally, 496 million fraudulent, or forged, checks were written in 1997, valued at \$9.9 billion.

Aside from commerce-based debt, Americans owe large amounts of money in other markets. The ACA reports that the U.S. General Accounting Office totals child support delinquencies in excess of \$56 billion, although other estimates place the total closer to \$200 billion. Only about 22 percent of such debt is currently recovered by state governments, but that percentage is anticipated to improve with the utilization of private col-

lection agencies. Private agencies are also employed by the government in collecting its own outstanding debt in the form of taxes, fines, fees, overpayments, and student loans. By the end of 1997, about \$259 billion in non-tax debt was owed to the federal government, while the Internal Revenue Service was owed another \$110 billion. Due to steadily increasing college tuition costs, the amount of student loan debt has skyrocketed. During 1995, the U.S. Department of Justice filed about 1,140 student loan default cases in federal court — in 1998 it filed 14,080 such cases. As of September, 1997, the U.S. Department of Education was owed \$44.7 billion.

One of the strongest factors in determining the collectability of a debt is the timetable for turning an account over to a collection agency. Generally, the rule has been “the sooner, the better.” When a loan is 90 days overdue, a 75 percent chance of collecting exists, but the odds fall .5 percent with each passing day. By the time a loan is 180 days or six months past due, the chance for recovery has dropped to 30 percent. After a year, it is less than 10 percent.

INDUSTRY LEADERS

The NCO Group, Inc. was the world’s largest provider of accounts receivable collection services, a position that it claimed through its August, 1999, acquisition of Compass International Services Corp. The Pennsylvania-based firm had grown rapidly by acquiring rivals, adding some 15 companies to its stable since the mid 1990s. In addition to bad debt recovery, NCO also offered such services as billing, customer service and support, delinquency management, and marketing strategy, research, sales, and fulfillment. The firm operated from call centers throughout the United States and the Caribbean, as well as in Canada and the United Kingdom, where it operated under the name Financial Collection Agencies (FCA). NCO’s revenue for 1998 reached \$179 million; this increase of 109.9 percent over the previous year was principally attributable to the acquisition of such companies as MedSource Inc. and FCA International Ltd.

By the late 1990s, Outsourcing Solutions Inc. was a leading provider of debt collection and accounts receivable management services. Founded in 1995, the Missouri-based company operated more than 60 call centers in the United States, generating nearly \$480 million in revenue in 1998. The privately-held company also offered such services as billing, contract management, portfolio purchasing, customer service, and market research.

WORKFORCE

The 1998-99 *Occupational Outlook Handbook* reports that approximately 260,000 Americans were em-

ployed as bill and account collectors in 1996. About 16 percent worked for third-party credit reporting and collection agencies, with the remainder employed directly for institutions, such as banks and retail stores, that extend credit. Employees typically worked on commission, earning a percentage of what they collect from past-due accounts. Agency employees usually are paid a salary and commission, which varies among companies. In 1996, the median salary was \$410. The *Occupational Outlook Handbook* projects that employment in the industry is expected to grow significantly faster than the national average through 2006, as the amount of consumer debt increases. In an attempt to produce a more professional and well-trained workforce, the ACA conducts 250 seminars a year for its members and their employees and administers certification and degree programs for advanced training in professional collections.

RESEARCH AND TECHNOLOGY

Computer technology has provided tremendous assistance in making debt collection companies highly automated. Prior to the introduction of computers, debt collectors conducted their business entirely by paper. By the start of the 1980s, collectors started using computers to maintain files, call debtors, and search for addresses.

By the mid 1990s, large national debt collection agencies had turned into giant data processing centers. Computerized services common to the debt collection industry include automated phone dialing and file retrieval, access to national databases for address information, and customized collection methods. One example of an automated agency has been Atlanta-based Nationwide Credit. Nine hundred collectors work out of 11 offices using an automatic dialing service. This computerized system calls debtors until the phone is answered. Immediately, the call is sent to a collector while the debtor’s credit history simultaneously appears on the collector’s computer system. Collectors also are able to access national databases of addresses, information collected from telephone directories, subscription houses, and voter registration records.

Another example of the advances in computer technology is the development of *Payment*, a PC-based software program developed by GE Capital Corp. This program devises custom-made debt collection per debtor. First the software program downloads the debtor’s credit and repayment history from a mainframe to the collector’s PC. With this information, the software program calculates the best method for getting each debtor to pay the outstanding amount due. Using this program, GE Capital handled 300 private label credit cards, including R.H. Macy & Co., Montgomery Ward & Co., and Apple Computer Inc.

SIC 7323

CREDIT REPORTING SERVICES

This industry includes establishments primarily engaged in providing mercantile and consumer credit reporting services. Examples of such establishments include consumer credit reporting bureaus, credit bureaus and agencies, credit clearinghouses, credit investigation services, and mercantile credit reporting bureaus.

NAICS CODE(S)

561450 (Credit Bureaus)

INDUSTRY SNAPSHOT

Credit reporting services are a prime source of credit information for both consumer and mercantile (business) markets. Although there are numerous credit reporting agencies operating all over the United States, with most specializing within specific industries, the services they offer are usually limited to reference books, ratings, recommendations, and reports. Some agencies, such as Dun & Bradstreet, provide all these services, whereas other agencies may offer only one or two. Whereas reference books, ratings, and recommendations are primarily used by credit managers, credit bureau reports can be used by others to verify that individuals or firms have listed all of their debts and provide valuable clues about individuals' or firms' payment behavior. Marketers may also use such information to effectively segment their markets based on credit performance criterion.

The industry is dominated in the United States by three credit bureaus: Equifax, Experian, and Trans Union. These companies compile data from public records and creditors to create credit reports for over 200 million Americans. All three companies maintain a contract with an independent company, Fair Isaac, which

transposes the data into a credit score. Credit scores range from 350 to 800 points, with score of 620 or above considered good. Access issues and consistency among reporting bureaus generated controversy in the 2000s. In 2003, 75 percent of mortgage lenders and 80 percent of large financial institutions relied on credit scores to assess credit risk.

ORGANIZATION AND STRUCTURE

Most credit bureaus are either owned by or under contract agreement with one of the United States' three major consumer credit reporting agencies: Equifax, Experian, and Trans Union. These national agencies maintain centralized computer databases that contain the credit records of more than 200 million Americans. Similarly, agencies such as Dun & Bradstreet Information Services provide credit information on more than 10 million U.S. businesses. Credit bureaus generate more than a half-billion credit reports every year and two billion pieces of information about consumer trade activities are entered into consumer credit records each month.

Consumer and mercantile credit are the two broad categories of services that are offered by the credit reporting agencies in the United States. Consumer credit is the medium of exchange that an individual consumer may offer to a seller of goods or services or to a lender of money. Consumers use credit to obtain items in the present and pay for them at some future time. Despite the fact that virtually every person in America eventually has contact with some phase of consumer credit, the extent to which consumers use credit varies. Consumer credit reporting services provide information on retail, service, and cash credit. These services gather and evaluate information on a consumer's credit activities for his or her lifetime. Based on this information, agencies provide a consumer's credit rating to the party seeking credit information.

Consumer Credit. Retail credit is sought before processing retail sales to consumers. The sale may take place as a revolving credit, an installment credit, or an open charge transaction. Credit reporting services are critically important to the business of retail credit. For example, credit reporting services provide information on each consumer that applies for retail credit cards such as American Express, Visa, or MasterCard. Credit reporting agencies are also extensively used to check the credit status of mortgage applicants. Many retail outlets that provide installment credit, which is a plan that allows a customer to pay in several installments, also use credit reporting agencies in a similar credit-check fashion.

Service credit consists of credit provided to consumers for services rendered, such as those by doctors, dentists, and lawyers, or for the use of gas, electric, or water utilities. The credit reporting services provide

credit ratings for consumers of these service organizations.

Cash credit involves lending money directly to consumers. Organizations such as consumer finance companies (sometimes called personal finance companies or small loan companies; commercial or industrial banks (personal or consumer loan departments); credit unions; insurance companies; and other types of lenders seek the service of the credit reporting establishments. They request advice from these companies before approving the loan and consequently providing money to the consumer.

Mercantile Credit. Business credit is one of the principal means by which business executives can translate opportunities into productive ventures. Credit reporting establishments provide two types of services to the organizations seeking business credit information: commercial and cash credit.

Commercial credit is extended when a manufacturer or supplier provides goods to another party (an intermediary, wholesaler, or final retailer) for resale to the consumer. Credit reporting services are used extensively in this area due to the volume and the value of goods exchanged. This is especially true when a supplier is conducting new business with an unfamiliar party. In this case, credit reporting services are used to provide information in the form of a credit rating that contributes to the critical final credit evaluation.

Cash credit allows businesses to borrow cash to acquire both current and fixed assets, which it agrees to repay on a long (over five years); intermediate (one to five years); or short (less than one year) term basis. Organizations such as commercial banks, investment companies, insurance companies, commercial finance companies, and even individuals seek credit information about businesses before lending them cash.

Types of Consumer Credit Reporting Agencies. Information about the credit position of individuals and families may be purchased from many sources. Since credit investigations have become extremely specialized, organizations usually rely on specialists. Credit information in the files of specialized credit reporting agencies can be used more than once. In fact, multiple use of the same information is the principal on which a consumer credit reporting agency is founded.

There are several types of consumer credit reporting agencies. Some agencies serve a wide geographic area with their own computer database. The primary source of their data is accounts receivable tapes of credit grantors and public record information. The four major credit reporting firms in the United States are Equifax, Experian (formerly known as TRW Information Services), Trans Union, and CSC Credit Services.

Some agencies operate by contract arrangement with the large computerized reporting firms. Such agencies pay a monthly fee for the access to the file data. Any credit bureau has access to the records of all other bureaus. The credit file of an individual who moves from one area of the country to another is available to credit businesses in a new community through inter-bureau reporting arrangements. Therefore, computerized bureaus have instant access to the credit histories of millions of people.

There are three types of commercialized sources of credit information. The general mercantile agency, Dun & Bradstreet Inc., reports on any business enterprise in response to subscribers' credit inquiries. The Business Credit Reporting Service of the National Association of Credit Management operates for the systematic exchange of ledger information among members. And the Specialized Mercantile Agencies reports on business enterprises in particular lines of trade at subscribers' request.

An annual or monthly fee is usually charged for credit reporting services, and is billed to all members according to the membership contract. A per report cost is also charged, which varies depending on the type of report required and the format in which it is received.

Operation of Consumer Credit Bureaus. Credit bureaus must maintain control of the data they collect. To comply with the Fair Credit Reporting Act, credit bureaus must carefully check on the identity of all that request credit information. Individuals or firms that are not members of the bureau can purchase reports if they have a legitimate need and are properly identified. The Fair Credit Reporting Act lists permissible purposes for obtaining consumer credit reports.

The information needed to create a credit report is gathered from a variety of sources, located in one or more trading areas that are willing to exchange information. Credit bureaus try to secure data from as many creditors and other sources as possible. Bureaus obtain ledger information from credit grantors, verify employment with employers, and collect credit-related public records from courthouses. The present status of the consumer is of most importance, but the reader of a credit report is usually greatly interested in the historical status as well (i.e., how often the consumer was significantly late in paying bills).

Credit bureaus check public records regularly to gather credit-related data. A bankruptcy, lawsuit, judgment, or divorce may affect a consumer's paying habits regardless of his or her previous record. Also, as the population becomes more mobile, consumers make many purchases outside their local trading areas. Under these circumstances one credit bureau must request a credit report from another bureau. Through an inter-bureau re-

porting system, the record of an individual in other markets is readily available.

In using multiple sources of credit information, credit bureaus distinguish between facts and statements of opinion. According to Associated Credit Bureaus, Inc., consumer credit reports contain personal information such as: a person's name, last reported address, social security Number, date of birth, marital status, spouse's name, number of dependents, previous addresses, and employment information; a listing of the consumer's credit information, including credit account numbers, the creditors' name, the amount of last payment, the credit limit of the account and the timeliness of the credit payments; a listing of public record information, such tax liens, court judgments, and bankruptcies; and an inquiry section that lists all creditors who have reviewed a copy of the credit report. This final section is particularly important for consumers to examine when they receive a copy of their report because it acts as an audit trail to ensure that no unauthorized parties have accessed the report.

Credit reports once included opinions of credit grantors and even comments about the subject's parents. But now credit bureaus refuse to place any information other than verifiable, factual data in their files. Credit reports do not contain any information about a person's character, lifestyle, race, national origin, religion, medical history, political affiliation, sexual preference, friends, or relatives.

Legal Aspects of Credit Reporting Business. Section 602 of the 1971 Fair Credit Reporting Act regulates the credit reporting industry. The act established, among other things, the length of time that adverse information may remain in a credit file. This legislation bars the inclusion of "bankruptcies . . . which antedate the report by more than 10 years . . . , suits and judgments which . . . antedate the report by more than seven years or until the governing statute of limitations have expired . . . , paid tax liens which . . . antedate the report by more than seven years . . . , accounts placed for collection . . . which antedate the report by more than seven years, . . . any other adverse item of information which antedates the report by more than seven years," according to section 605 of the Fair Credit Reporting Act. The Federal Trade Commission (FTC), which is responsible for enforcing the act, has announced interpretations that have affected credit reporting organizations' mode of operation. For instance, if a credit grantor declines credit privileges to an applicant based on information in a consumer credit report, the credit grantor must advise the applicant and provide the name and address of the credit bureau.

Since the Fair Credit Reporting Act became law, credit grantors have been extremely conscious of the

definition of a credit reporting agency. Legally, if a credit grantor relays third party data as distinguished from its own ledger information, it becomes a credit reporting agency itself. For example, if an electronics appliance store calls a clothing store about a consumer's paying habits and the clothing store provides secondhand information learned from a utilities company, the clothing store is then deemed to be a consumer reporting agency and is liable for all the record-keeping and interview procedures required in the Fair Credit Reporting Act.

One of the most important provisions of the act is the right to know the contents of one's own credit records. The law provides that every consumer reporting agency reveal, upon request and proper identification of the consumer, the contents of all file information on the consumer, the sources of the information, and any recipients of reports on the consumer. Furthermore, the law states that a consumer cannot be charged for a report if, within the past 30 days, the consumer has been denied credit because of a report from a credit bureau or has received a notice from a collection department affiliated with a credit bureau. The act also allows individuals the right to challenge the accuracy of information and have it reverted, updated, or removed. Individual states also have their own laws that deal with credit reporting.

BACKGROUND AND DEVELOPMENT

Local credit bureaus are primarily a twentieth-century development, though credit has long been a feature of American business. The first credit bureau was founded in the middle of the nineteenth century, but the growth and development of credit bureaus was slow prior to World War II. For a long time, retailers who sold on credit either operated their own system of checking a consumer's financial resources or, in the case of small retailers, advanced credit to neighbors who they knew from daily interactions. As cities grew and merchants could no longer keep up with the demands of either knowing or checking on their customers, they increasingly turned to credit bureaus for assistance. Credit bureaus have become the main clearinghouses for information provided by their subscribers, members, and other outside sources. Furthermore, credit bureaus are the quintessence of close cooperation within businesses serving the American population.

In the nineteenth century, the possibility of securing organized and factual data on business organizations was extremely remote. Credit decisions were usually hit-or-miss affairs. As a result, business experienced large credit losses that had to be offset by greater margins of profit. The impetus for developing the first organized sources of credit information grew out of the uncertainties and losses experienced during the economic panic of 1837, the rapid changes in the country's economic structure,

and the expansion of trading areas. Manufacturers and suppliers needed credit to trade over wide geographic areas. This implied that credit judgment could no longer be based on personal relationships, nor could adequate information be gathered in the immediate vicinity of the creditor. Consequently, a system of organized credit reporting evolved to eliminate some of the major uncertainties of trade.

In 1841, Lewis Tappan, widely acknowledged as an excellent judge of a credit risk, organized the Mercantile Agency to collect and disseminate information for the benefit of creditors. Though the agency had its headquarters in New York City, Tappan developed a branch office system to penetrate major trade centers. R. G. Dun, an employee of the Mercantile Agency, became the sole proprietor of the company in 1859 and changed the name to R. G. Dun & Co. In 1849, John M. Bradstreet, an attorney in Cincinnati, founded the Bradstreet Company, which operated in a manner similar to the Mercantile Agency and served the same areas of trade. In 1933, the two firms merged to form Dun & Bradstreet, Inc.

Another commercial credit reporting agency includes the Business Credit Reporting Service of the National Association of Credit Management (NACM). The NACM was organized in 1896 to cope with the growing problems of fraud, misrepresentations, interstate commerce, absence of a uniform federal bankruptcy law, and increasing demand for credit. From a humble beginning of less than 600 members, NACM represented 30,000 member companies by the late 1990s.

Origin and Growth of the Credit Association Bureau. The organized exchange of consumer credit information between local regions started in the early 1900s. In 1906, William H. Burr, owner of a credit company in Rochester, New York, had the managers of several other consumer credit reporting agencies meet with him and discuss the possibility of forming a national association of credit bureaus. Their cooperation gave birth to the sole national organization of credit bureaus, then called the National Association of Retail Credit Agencies, now known as Associated Credit Bureaus, Inc. (ACB).

Today ACB is one of the most active trade associations in the credit reporting industry, representing more than 1,450 consumer credit, mortgage reporting, and collection service companies, and offering its members such varied benefits as interbureau reporting rosters, standardized reporting forms, trade publications, educational services, credit bureau research, and annual meetings and conferences. ACB also operates a comprehensive certification program leading to the designations ACB Certified Credit Reporter, ACB Certified Collector, and ACB Certified Credit Interviewer.

CURRENT CONDITIONS

The three major credit bureaus all gather information independently of one another. Because some creditors may only report to one or two bureaus, the information gathered is not consistent. The result is that the same individual can have three different credit scores, generated from three different reports. How lending institutions use these scores also varies greatly. Mortgage lenders usually buy all three scores, but do not usually average them. Whereas some lenders take the middle score, those looking for business may opt to focus on the high score, and conservative lenders may take the bottom score.

Credit score can impact the interest rate a consumer is offered from the lender: the higher the score, the lower the rate, and the lower the score, the higher the rate. "In some cases, a 50-point difference would have no effect on your auto insurance premium," Bernie Birnbaum of the Center for Economic Justice told *Money*. "In other cases, it could double it." According to a study of over 500,000 merged credit reports conducted in 2002 by the National Credit Reporting Association, 29 percent of all consumers had scores that ranged more than 50 points. Because of the weight that credit reports carry in determining credit worthiness, consumer advocacy groups are pushing for more transparency in the credit reporting industry, as well as better safeguards against reporting errors.

Consumers can purchase their credit reports to ensure accuracy. In 2003 Equifax sold reports directly to consumers for \$12.95 per report; a Trans Union report cost \$9.00. Direct-to-consumer sales exploded in the early 2000s after legislation was introduced at both the state and federal levels requiring credit bureaus to disclose consumer credit information, including scores, to consumers. Forced into the direct-to-consumer business, the credit bureaus suddenly realized the extensive growth potential for the market.

Due primarily to direct-to-consumer sales, the credit reporting industry is expected to grow substantially through the remainder of the decade. Consumer-based sales of credit scores and reports were approximately \$200 million in 2002 and are forecast to increase to as much as \$1 billion by 2005. Although third-party resellers control approximately 75 percent of the direct-to-consumer market, the three credit bureaus are expected to use their access information as a strategic advantage to up their stake in the market.

INDUSTRY LEADERS

Equifax Inc. posted a net income of \$178 million on revenues of \$1.1 billion in 2002. One of the largest credit reporting services in the nation, Equifax retains information on some 400 million credit holders. Equifax was

founded in 1899 to provide local Atlanta businesses with individuals' credit histories. The young firm diversified into the investigation of insurance applicants' backgrounds, and later expanded into other industry segments. By 1973 the company had grown so large that the Federal Trade Commission filed an antitrust suit against its consumer credit division; the suit was dropped in 1982. During the 1980s and early 1990s Experian facilitated growth through acquisitions in the United States and across Europe. By the end of the decade, it sought to establish a beachhead in the fertile Latin American market.

Moody's Investor Services—owned by Dun & Bradstreet until that company split in two in 2000—is one of the world's largest providers of business, commercial-credit, and business-marketing information services. Founded in New York in 1841 as one of the first commercial credit-reporting agencies, the firm expanded overseas in 1857. Two years later it launched the *Dun's Book*, containing information on 20,000 businesses; that number surpassed one million three decades later. Since the 1960s Dun & Bradstreet has pursued a strategy of growth through acquisitions, including that of Moody's Investors Service. By the late 1990s it had operations in 37 countries and a global database that covered more than 57 million businesses in more than 200 countries. In 2002 Moody's Corporation, the investor service's new parent, posted a net income of \$288.9 million on approximately \$1 billion in revenues.

Experian Information Solutions Inc., another major player in the credit reporting industry, supplies consumer and business credit, as well as direct marketing and real estate information services. During 1998 the firm began shifting its focus from consumer credit operations to marketing information and services, causing credit information revenues to stagnate at \$576 million in fiscal 1999, a relatively small portion of the firm's total revenues of \$1.5 billion. Experian was formerly known as TRW Information Systems & Services, the group of information businesses previously owned by TRW Inc. In November 1996, U.K.-based Great Universal Stores PLC purchased Experian for \$1.7 billion. Headquartered in both Orange, California, and Nottingham, England, Experian maintains a database of some 780 million customers and had offices in 16 countries in 1999. It also holds a minority interest in Central Communication Bureau, Japan's third-largest consumer credit information agency. In 2002 Experian posted \$1.6 billion in sales.

Founded in 1969, Trans Union LLC is the youngest of the nation's three largest consumer credit reporting services. In 1970 it introduced Cronus (Credit Reporting Online Network Utility System), the first online information storage and retrieval data-processing system to complement the automated techniques used by credit gran-

tors. In 1980 the firm was acquired by the Marmon Group, a global association of manufacturing and service companies. By the late 1990s, Trans Union offered such products as credit reports, credit and insurance risk scoring models, target marketing systems, pre-employment evaluation reports, skip tracing and search tools, collection services, customized lists, and transaction services. It operated in the United States, Canada, Botswana, Chile, Hong Kong, Italy, Kenya, Mexico, Namibia, Peru, Puerto Rico, South Africa, and Spain. Parent Marmon Group posted revenues of \$6.5 billion in 2002.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, the credit reporting industry employed 170,450 people in 2001. About 7 percent of the industry's jobs were in management, which had a mean annual salary of \$77,380. Chief executives reported a mean annual salary of \$117,740, and general and operations managers reported a mean annual salary of \$79,780. Administrative and office support occupations totaled almost 80 percent of the industry's jobs. The in-category position of account and bill collectors totaled over 42 percent of all jobs and paid a mean annual salary of \$25,760. Customer service representatives, representing over 10 percent of all jobs, were paid an average annual salary of \$23,650. Officer managers earned an average annual salary of \$38,370.

RESEARCH AND TECHNOLOGY

The explosion of using the Internet during the late 1990s has impacted the credit reporting industry significantly. In 1997 QSpace Inc. became the first provider of online consumer credit reports, available for a fee at www.qspace.com. This revolutionary move was quickly adopted by the industry's major players. By 1999 the Internet had become a convenient, fast, and inexpensive delivery channel of mercantile credit information, and similar delivery of consumer credit information is expected to become widespread in 2000.

Equifax, the industry's leader, began utilizing the Internet for delivery of both business and consumer credit information in late 1999. It also entered into an alliance with the portal Lycos to offer its products and services on a new co-branded Web site. Also in 1999, Experian launched several Internet-based products, including a verification-enhancement service.

Because of the ease and convenience of Internet delivery of credit information, the issue of consumer privacy has become an important consideration for credit reporting agencies. The sensitive nature of the information, as well as the strict regulations of the Fair Credit Reporting Act, has prompted these companies to foray cautiously into new technologically driven delivery

mechanisms. It is likely that the U.S. government and consumer watchdog groups, which have been scrutinizing various Internet-related privacy issues during the late 1990s, will keep a close watch on such practices by credit reporting agencies.

SIC 7331

DIRECT MAIL ADVERTISING SERVICES

This category includes establishments primarily engaged in creating, producing, and mailing direct mail promotional pieces for clients. This industry also encompasses establishments primarily employed in compiling and selling mailing lists. Establishments primarily engaged in reproducing direct mail copy on order but performing none of the other direct mail advertising services are classified in manufacturing, industry group 275 if they print the copy and in **SIC 7334: Photocopying and Duplicating Services** if they duplicate the copy by photocopying or similar reproduction methods.

NAICS CODE(S)

541860 (Direct Mail Advertising)

INDUSTRY SNAPSHOT

Despite the fact that a majority of consumers claim they receive too much unwanted, unsolicited mail, commonly known as "junk mail," the direct mail advertising industry continues to grow. In 2002 marketers spent approximately \$49.1 billion on direct mail, which generated sales of over \$636 billion, up 9.4 percent from 2001. These figures represent a decade-long period of sustained growth. Direct mail-generated sales were an estimated \$260.2 billion in 1992, \$390 billion in 1997, and \$421.2 billion in 1999.

Direct mail's expenditures are expected to grow at 6 percent per year through 2008, at the same rate projected for total advertising. Advertisers are seeking to replace mass media marketing with more focused and targeted marketing activities, which serve to increase response rates and reduce unproductive mail. As a result, new opportunities are opening up for database marketers, companies that gather and manage purchase history and personal information.

Concerns about privacy, however, are affecting the industry. More consumers are choosing to remove their names from mailing lists, and new laws regulate the companies' use of personal information. The Internet is also exerting an influence over the industry. Although web research complements direct mail efforts by providing new ways to gather information, it also competes with traditional print media for limited advertising dollars. E-commerce is relatively cheap compared to direct mail packages. As with direct mail packages, unsolicited commercial e-mail, a practice known as "spamming," has come under fire with consumer advocates, prompting new legislation.

ORGANIZATION AND STRUCTURE

Direct mail, like other forms of advertising, plays an important role in the U.S. economy by informing consumers about products and services. By expanding information and distribution channels, advertising is thought to benefit both businesses and customers with a more efficient market. Direct mail is part of the larger direct marketing industry, which also includes specific types of ads that are found in newspapers and magazines, on television and radio, and in telephone marketing.

Like other forms of direct marketing, direct mail ads differ from more traditional general advertising in several ways. The most important distinction, though, is that direct mail advertising typically solicits a direct response from the consumer. General advertising, by contrast, usually seeks to promote a company or product image, inform consumers, or sway public opinion. While direct mail may also attempt some or all of these goals, its primary purpose is to elicit a tangible, measurable reaction.

Besides prompting consumers to take a specific action at a certain time, direct mail also differs from general promotional mail in that each advertisement is usually targeted at specific individuals at their addresses. For this reason, direct mail is often referred to as a form of target marketing. It is also unique because customers respond directly to the company that placed the ad, so the marketer maintains control of the offer throughout its delivery. In contrast, companies that use general advertisements lose control of their message—at the moment an ad enters a distribution channel, consumers are left to decide when, where, and how they will react to the promotion. Direct mail ads are also more likely to stress benefits and features of a product or service. Furthermore, direct mail commonly contains repetitive messages within each ad, whereas general advertisements rely on repetition over time.

Although some advertising firms were engaged solely in providing direct mail services, most companies in the industry were active in all aspects of direct marketing. Moreover, many of the largest companies that offered direct marketing also provided general advertising services. In addition to actually printing, assembling, and mailing promotional pieces, most direct mail firms provided services related to strategic planning, research and development, results tracking and reporting, and database management.

Types of Ads. Direct mail promotions can be categorized as lead generation, mail order, traffic building, subscription marketing, and fundraising. According to a 1996 Gallup survey, about 89 percent of direct mail advertisers employ lead generation mailers. These ads simply ask recipients to exhibit an interest in the com-

pany's offer. For instance, consumers may indicate a desire for more information by returning a response card requesting that the company call or write them with more data. Lead generation ads are often used to build a list of prospects on which the company can focus its future marketing efforts.

Direct mail advertisers also vary the contents of their packages. The traditional format includes an outer envelope, cover letter, product brochure, order form, and sometimes a separate reply envelope. The 1999 study conducted by the Graphic Arts Marketing Information Service (GAMIS) stated that direct marketers were using co-op packs, card decks, ride-alongs, statement stuffers, and self-mailers. The new models tend to be simpler in design and therefore cheaper to produce. Direct mail advertisers also use more four-color printing and specialty papers to attract potential customers.

Almost all direct mail campaigns fall into one of three market categories: charitable contributions, business ads, or consumer promotions. According to the 1996 Gallup survey, companies used many different forms of direct mail to generate leads and sales. The survey reported 86 percent used brochures; 80 percent, direct mail letters; 77 percent, flyers; 69 percent, newsletters; 55 percent, postcards; 35 percent, catalogs; 25 percent, invoice inserts; and 22 percent used package inserts. Average mid-sized and large companies' direct mail production was 672,100 pieces each year.

Benefits and Disadvantages. Organizations seek services from direct mail companies for selectivity and personalization. By carefully selecting the group of consumers that will receive an ad and carefully tailoring the message to that group, a direct mail company can maximize the efficiency of a client's marketing dollars. For this reason, direct mail advertising is the most cost-effective means of advertising for many types of products. In addition to savings related to marketing expenditures, direct mail allows many manufacturers to completely bypass costly retail centers and distribution facilities by delivering products through the mail.

Direct marketing companies also offer the benefit of being able to measure and test the effectiveness of a company's advertising efforts. In fact, direct marketing firms commonly test multiple offers and formats before distributing an ad on a broad scale. This important feature allows an organization to exercise more control over its promotion than is allowed by almost any other type of media. A related advantage, in comparison to other forms of advertising, is that direct advertising campaigns are more difficult for competitors to monitor and track.

A major disadvantage of direct mail is that it can be very expensive. Direct mail firms typically charged at least 40 cents per piece to print, assemble, and mail even

a relatively simple promotion. In addition, clients often pay for creative services, tracking, and strategic planning. In comparison, a full-page advertisement in a trade magazine that reaches 50,000 readers may cost as little as \$2,000 to \$3,000. Another disadvantage of direct mail is mailbox competition. In the *New York Times*, Stuart Elliot reported that direct mail climbed to 44 percent of all pieces of mail handled by the post office in 1998, up from 41 percent a decade ago and 32 percent in 1978.

Consumer perception is another pitfall. Most consumers commonly refer to direct mail as “junk mail,” and hold in low regard the more cost-efficient mail-merge packages that combine pieces from a number of different advertisers in one envelope. More than 50 percent of direct mail envelopes end up in the garbage. Moreover, many consumers—the DMA reported more than 3 million—were exercising their right to have their names removed from mailing lists. Fewer consumers take the time to clip and redeem coupons the way they once did, making it difficult to track the effectiveness of direct mail campaigns. Despite a general rise in coupon face values, the overall coupon redemption rate fell throughout the decade—6 percent in 1993, 9 percent in 1994, 6.5 percent in 1995, and 8.6 percent in 1996.

Mailing Lists. Mailing lists are the backbone of the direct mail advertising industry. Regardless of how competent and alluring an offer may be, the success of any direct mail promotion is contingent upon the quality of the mailing list used to distribute the piece. To avoid unnecessary expenses, list providers must insure that address lists are up-to-date, devoid of duplicate names or addresses, and accurate. Mailing lists were commonly sold on labels for anywhere from \$7 to \$80 per thousand for one-time use and about twice that amount for computerized lists that could be used more than once.

Mailing list companies offer the critical advantage of market segmentation by tailoring a list to include only the consumers to which it would be profitable for a company to advertise. For instance, a luxury Japanese car dealership may wish to send an advertisement to all residents in Southern California that earn more than \$150,000, have two or more children, own a three-car garage, and currently drive a German car. Using computer database management techniques, list companies in the early 1990s were able to extract even the most unique niches, such as that just described, from a list of names and information.

In the early 1990s, list companies offered more than 10,000 different lists, most of which could be tailored to suit specific requirements. The four major types of lists were response, compiled, consumer, and business. Response lists were made up of people that had previously responded to a direct marketing promotion. Because

these lists typically provided higher response rates and were more difficult to create, they commonly cost \$50 to \$80 per thousand. Furthermore, these lists accounted for approximately 60 percent of list industry sales.

Compiled lists were usually created using mass listings from voter registrations, telephone books, licensed driver listings, or other common groups. These lists typically cost \$25 to \$30 per thousand. Consumer lists were compiled from the general U.S. population and were segmented by various demographic factors. Because these lists often were not proprietary and were sold in huge volume, they usually cost \$7 per thousand. In 1992, more than 90 percent of the U.S. population was accessible through more than 6,000 consumer mailing lists. Business lists (13 percent of sales) contained addresses of more than 9 million different enterprises from more than 4,000 lists in 1992. Prices in this segment ranged from \$35 to \$40 per thousand names.

By the late 1990s, however, a fundamental shift had occurred regarding the perception of information. For decades, information collected about or from consumers was regarded as the property of the organization that collected it, to be used at that organization’s discretion. But another consensus developed that said the information was the property of consumers, whose consent should be required before information about them was used. Privacy protection laws, which seek to limit the transfer of personal information, especially medical histories and other sensitive data, have been enacted or were under consideration in the United States.

BACKGROUND AND DEVELOPMENT

Direct mail advertising was invented by Benjamin Franklin in 1744. He produced a mail order catalog bearing this promise: “Those persons who live remote, by sending their orders and money to said B. Franklin, may depend on the same justice as if present.” About 100 years later in Philadelphia, in 1841, the first advertising agency was opened. In 1863 Congress authorized the issuance of a discount stamp for mailers of “printed matter and manuscripts,” known as second-class mail. It also issued a third-class stamp for “bulk mailers.”

Direct mail advertising in the United States did not become a popular marketing tool, however, until the beginning of the twentieth century. Although still not considered an important information and distribution channel in the early days of the industry, several large companies relied heavily on direct mail to promote their businesses. Sears, Roebuck, and Co., which marketed heavily through its innovative mail catalogs in the early 1900s, became a notorious early example of direct marketing. The Montgomery Ward, Aldens, and Spiegel companies also mailed large numbers of catalogs.

In addition to the large catalog retailers, store-based retailers and industrial advertisers helped expand the industry. In fact, these organizations accounted for the bulk of direct mail sent out by the 1910s. National Cash Register (NCR), for instance, attained legendary results by using mail order to generate leads and to support its sales force. On the cutting edge, NCR mailed tens of thousands of advertisements targeted specifically at niche markets, such as butchers and grocery storeowners. Fundraisers, particularly politicians, were also beginning to realize the benefits of direct advertising.

In response to the growing volume of direct mail advertising, lettershop owners and their customers formed the Direct Mail Advertising Association (subsequently called the Direct Marketing Association or DMA) in 1917. The organization was established to help advance the fledgling industry and grew throughout the 1920s from its initial membership of around 500. The 1920s also saw the emergence of several companies devoted solely to providing direct mail services. For example, DIMAC Direct of St. Louis, Missouri, was founded in 1921 and remained an industry leader in the early 1990s.

Despite immense setbacks during the Great Depression of the 1930s, when DMA membership fell to less than 300, the industry continued to progress. The post-World War II economy spurred the success of direct mail companies, which were using their increasing political clout to influence postal rates. By the late 1950s, the DMA had about 2,500 members, and the direct mail industry represented a multi-million dollar business. The industry maintained steady growth in the 1960s and 1970s, spawned in part by new catalog retailers like L.L. Bean, Inc., J.C. Penney, and Lillian Vernon. Also boosting industry growth in the 1970s was the advent of postal ZIP codes, which allowed companies to more easily target their mailings.

By 1980, U.S. companies were spending more than \$7.6 billion per year on direct mail advertising, and total mail order sales had risen to \$72 billion. Furthermore, direct mail accounted for nearly 15 percent of all advertising expenditures. During the coming decade, these figures were destined to rise substantially, for both technological and demographic reasons.

One of the greatest reasons for the proliferation of direct mail advertising during the 1980s was the metamorphosis of American lifestyles. More women working outside the home meant that households had more expendable income but less time to spend it. As a result, many consumers adopted direct mail advertisements, such as mail order catalogs, as an alternative to conventional shopping behaviors. Moreover, personal selling through direct marketing became more popular, which put a pinch on traditional retail outlets. The average cost of a business-to-

business phone sale, for instance, had grown from \$57 in 1971 to \$137 in 1979 to more than \$250 by 1987. Technological advances also increased the power and decreased cost of computers, allowing direct mail advertising firms to achieve almost exponential efficiency gains. By 1990, computers dominated every step of the direct mail process, from program planning and list development to order fulfillment and response tracking.

The proliferation of new niche products and services boosted industry profits in the 1980s. A dominant market trend since the 1980s was highly specialized offerings that targeted individual needs. Because direct mail provides efficient access to niche market segments, it became the medium of choice for growing numbers of companies. These companies also benefited from toll-free telephone numbers and private mail services, which further increased the efficiency of direct mail advertising efforts.

Other factors that contributed to the growth of the direct mail industry in the 1980s included: greatly expanded use of credit cards; the availability of computerized mailing lists; an aging population that shopped at home more often; and a rise in single households. By 1990, expenditures on direct mail topped \$23 billion, representing a more than 300 percent rise since 1980. Furthermore, mail order sales grew to more than \$200 billion by 1990. Direct mail expenditures also had grown to represent nearly 20 percent of all advertising dollars and had grown faster than any other segment of the advertising industry during the 1980s. In addition, industry employment leapt from 44,000 in 1983 to approximately 90,000 by 1990.

The growth of the direct mail advertising industry, which averaged well over 10 percent during much of the 1980s, continued in the early 1990s, despite a sluggish economy that reduced overall advertising activity. The industry remained healthy and billings for direct marketing services rendered by ad agencies surpassed \$4 billion. Direct billings increased 15 percent in 1990 and 13 percent in 1991. Furthermore, total expenditures on direct mail increased 4.5 percent in 1992, versus a 2.9 percent increase in 1991 and a 7 percent increase in 1990. In fact, total direct mail expenditures climbed from \$11.8 billion in 1983 to more than \$25.4 billion by 1992.

By 1993 the direct mail advertising industry had firmly established itself in almost every sector of the economy. Once considered "junk mail" by some large corporations, direct response ads had become an important form of advertising for even the most elite and sophisticated corporations. IBM, General Motors, Nieman Marcus, and similar organizations were using direct response ads to promote their products and services. Small companies, too, were increasingly turning to direct mail to increase sales and to compete with larger companies.

According to a Gallup study in 1996, 77 percent of U.S. companies used direct mail, and marketing executives considered it the most effective technique in reaching their objectives. The survey reported that marketing executives credit direct mail sales with an average of 5 percent of their company's revenue. Compared to other media, however, direct mail continued to trail telephone marketing by volume of sales generated.

By 1997, sales generated by direct mail surpassed an estimated \$421 billion per year, according to the DMA. As further evidence of the upward trend, approximately 100 million Americans were making shop-at-home purchases each year in the early 1990s, and 70 percent had used a toll-free number to purchase an item. About 68 percent of all magazine subscriptions were sold through mail order in the early 1990s, accounting for more than \$190 million in sales. Also, insurance premiums totaling more than \$10 billion per year were earned through mail order. In 1991, the average American spent \$425 as a result of mail order advertisements. Furthermore, about 25 percent of all charitable contributions were obtained through mail solicitations, totaling about \$50 billion.

In the late 1990s, the direct mail industry was thriving. In 1998, direct mail advertising accounted for 4 out of every 10 pieces of U.S. mail and generated more than \$421 million in sales. Industry experts projected moderate growth into the next decade. Yet, the volume of incoming mail has not affected consumers' response rate. Most direct mail marketers considered a 2 or 3 percent response rate to be successful. Up to 98 percent of the people who receive unsolicited mail reject the offers, most tossing the direct mail unopened. The United States Postal Service (USPS) says that consumers are just as likely in the early 2000s to respond to direct mail as they were 10 years ago.

What has changed is the sophistication of the direct mail packages. An important shift in marketing has occurred in the last few years—a move away from mass marketing and towards a more information-led, targeted audience. Advertisers and agencies strive to increase the relevance of—and decrease customer annoyance with—direct mail by customizing the pitches they send to customers.

Database companies provide sophisticated information about customers by overlaying generic information, from phone lists and driver records, for example, with specific information about customers' spending patterns and family size. The Internet provides direct marketers with a powerful new information-gathering tool. "The consumer technology that makes the Internet possible," stated Stuart Elliot in the *New York Times*, "is also helping direct marketers in their quest for the grail of relevancy by making it easier than ever to compile exten-

sive information about consumers before any mail is sent."

The direct-mail techniques have also become more sophisticated. A USPS study estimated that more than 20 percent of advertising mail was thrown away unread, partly because it looked unprofessional. To offset this image, the industry has developed new printers that add color, personalize addresses with special fonts to look hand written, and can add personal touches like deliberately crossed-out names. Direct-mail envelopes are sometimes designed to look like express mail and next-day delivery packages to imply urgency.

Consumers are not the only targets of direct-mail advertisers. The GAMIS study reported a rising trend of business-to-business direct-mail marketing. In 1998, business-to-business expenditures represented 39 percent of direct mail expenditures according to the GAMIS study; by 2009, they were expected to hit 45 percent. Consumer direct mail, which accounted for a 61 percent share in 1998, was expected to shrink to 55 percent by 2008.

Industry Challenges. Despite strong growth, the direct mail industry was not without its problems in the late 1990s. Postal rates increased in 1996, increasing the costs of and reducing the efficiency of direct mail ads. This change led direct mail agencies and their clients to streamline their lists to reduce the size of mailers and customize their pitches. Moreover, as the cost of mailing grew, more companies moved toward telephone marketing. By 1995, the telephone marketing industry had seized 40 percent of the total direct marketing expenditures, surpassing direct mail by 17 percent. But by 1999, the tide had again changed. In a Pitney Bowes "Mail vs. Telemarketing" survey, U.S. customers stated a preference to mail by a four-to-one margin.

Industry success was leading to another problem—overcrowded mailboxes. Because direct ads were competing with increasing numbers of other mail promotions for consumer attention, the response rate and profitability of sending out direct mailers was beginning to decline. Like the increase in postal rates, this problem encouraged more precise market segmentation.

Environmental waste, created by approximately 65 billion direct mail pieces sent out every year, represents a continuing challenge to the direct-mail industry. Each year, those direct ads and catalogs consume more than 1 million acres of forest. According to a study by Carnegie Mellon University, bulk mail was responsible for 5 percent of all paper pollution in 1996. The study concluded that companies could also find equal response and sales using the Internet. Consumer environmental awareness has negatively impacted the public's perception of mail

ads. In an effort to reduce waste, the DMA reported that direct mail advertisers now use more recycled materials.

By 1997, the direct mail industry faced some competition from Internet marketing. Termed "spam" in Internet jargon, bulk e-mail grew with the number of subscribers. In 1996 the difference in cost was 99 percent less to send bulk e-mail instead of direct mail. Philadelphia-based Cyber Promotions, Inc., would send an e-mail ad to more than a million computer users for as little as \$59 in 1996. This controversial practice was far from becoming commonplace entering the late 1990s, though, and faced potential government regulation in several states despite the general "hands-off" approach to Internet commerce promoted by the Clinton administration.

However, by 1999, new synergies were emerging between the direct mail and Internet industries. A report commissioned by Pitney Bowes, Inc., Mailing Systems Division, "The Role of Mail in E-commerce Study," analyzed the relationship between direct mail and the Internet. It concluded that direct mail was considered the most effective tool for getting customers to go to a Web site and place an order, and it was nearly as powerful as Internet advertising in encouraging Web site visits, or "hits." Mail could help develop awareness, sales, and customer relationships, which, combined with the reach of the Internet, could create a powerful sales medium. In December 1999, Big iDeals, Inc., a Silicon Valley-based direct marketing services company, launched the Big iDeals Internet Guide, a 16-page booklet featuring multiple advertisers in a single publication that targeted women aged 25 to 54 who had an Internet connection. *PR Newswire* stated that the new publication signaled a new trend among marketers toward using traditional direct marketing in conjunction with online marketing.

And at the end of the century, the direct-mail industry experienced strong consumer backlash. The efforts of direct-mail marketers targeting customers and perfecting mailers were viewed by some as intrusive. Privacy advocates successfully lobbied for more consumer protections against information gatherers. According to the *Economist*, the Federal Trade Commission gave a warning that only 2 percent of Web sites had a comprehensive privacy policy. A flood of complaints led the DMA to strengthen its privacy policies with stipulations called the Privacy Promise to American Consumers took effect July 1, 2000.

In the late 1990s direct mail advertising methods continued to become more sophisticated. For instance, more advertisers stressed database marketing, which entailed maintaining computerized information about customers and leads generated from previous ad campaigns. Such databases were used to market new, or "add-on," products and to establish a relationship with

the consumer that would lead to a pattern of sales. By 1992, 54 percent of advertisers were using database marketing, and 23 percent planned to begin doing so in the near future. Many direct mail agencies offered database management services to their clients.

Direct advertisers also continued to practice greater media integration, which involved running direct mail ads as part of a larger multi-media promotion. Sophisticated campaigns coordinated the image, message, and timing of multiple marketing channels to increase their overall effectiveness. According to Joanna Lowenstein in *Folio*, one method that might improve direct-mail response was telesurveying in advance of a direct-mail campaign. New technology and international marketing would also play a role in future growth.

CURRENT CONDITIONS

According to a survey conducted in 2002 by StoptheJunkMail.com, 87 percent of Americans polled said that they received too much unsolicited mail, and 65 percent of those polled threw away their direct mail without opening it. In contrast, *American Demographics* reported that nearly three out of every four adults regularly read their direct mail, and 59 percent of those surveyed had opened their direct mail within the last week.

Despite the conflicting study results, there was a perceived public distain for unsolicited advertising, yet the industry continued to thrive. Credit card companies, which sent out a record four billion solicitation letters in 2002, received a strong response from certain demographic segments of the U.S. population. According to a 2002 survey of 2,000 adults conducted by Vertis, a marketing services company, 48 percent of those polled had obtained their most recent credit card via direct mail solicitation, whereas other sources received much lower percentages: a friend or relative (7 percent), at their bank (7 percent), special event/in-person promotion (4 percent), Internet (3 percent) or telemarketer (3 percent). According to Vertis' study, although only 21 percent of senior Americans read unsolicited advertising, 43 percent of those under the age of 25 read unsolicited mail.

The direct mail advertising industry was affected dramatically in the fall of 2001, in the aftermath of the terrorist attacks of September 11, which were followed by the spread of anthrax through the U.S. postal system. A survey by the DMA reported that one-third of all Americans began treating their mail with new suspicion. Warnings went out across the nation to avoid handling mail from unknown senders. As a result mass mailings dropped 7 percent from September 10, 2001 through November 30, 2001, compared to the same period of the previous year, and some companies reported a 50 percent decline in response rates. The DMA advised marketers to use a return address and a logo if possible to clearly

identify the origins of the mail arriving in consumers' mailboxes.

As direct mail marketers optimistically predicted, the public's fear of what came into their homes via the U.S. Postal Service was relatively short-lived. The industry, however, continued to face other challenges, including rising postal costs and increased competition from Internet-based advertising. In a study released in January 2003, Blue Martini Software, Inc. reported in its annual poll of 6,000 retail executives that for the first time retailers planned to invest more in e-mail advertising than direct mail advertising. Also, direct mail advertisers had to conform to new rules that went into effect in 2003 that guarded against misrepresentation and misleading advertising.

INDUSTRY LEADERS

Valpak Direct Marketing Systems, Inc. was selected as the top franchiser in the direct mail advertising category by *Entrepreneur* in January 2003. There are about 220 Valpak franchises in the United States, Canada, Mexico, and Puerto Rico, along with five corporate-owned facilities and a corporate-run Web site. The company sends over 500 million direct advertising packets every year.

Wunderman, the direct marketing arm of advertising giant WPP, Inc., reported revenues of \$378.2 million in 2002. Other industry leaders included Rapp Collins Worldwide, of New York, with revenues of \$360.2 million in 2002, and Digitas (formerly Bronner, Slosberg, and Humphrey) of Boston, which produced \$321 million in revenues in 2002.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, the industry group categorized as mailing, reproduction, commercial art and photography, and stenographic services employed 317,220 people in 2001. The industry's 22,900 mail machine operators and clerks (not including the postal service) reported a mean annual salary of \$19,300; other office machine operators (except computers), totaling 21,550, reported a mean annual salary of \$21,440; print machine operators, totaling 10,220, reported a mean annual salary of \$26,010; and customer service representatives, totaling 7,280, reported a mean annual salary of \$28,110.

Although job growth will continue to occur with advertising agencies, an increasing number of direct mail advertising positions will open up with product and service companies that are moving their direct mail operations in-house. In addition, direct mail ad occupations will become increasingly blurred with other advertising positions, as the trend toward multimedia and integrated marketing proliferates.

AMERICA AND THE WORLD

Direct mail advertising originated and developed in the United States, and America still leads the world in the use of direct advertising. In fact, while nearly 45 percent of all global advertising dollars are spent in the United States, a much larger proportion of global direct mail dollars are spent domestically. For instance, the average American receives about 290 pieces of direct mail per year, far more than citizens in any other country. Canadians, who receive the second largest number of mail ads, get only about 130 pieces per year, and much of that is mailed by U.S. companies.

Germans, in contrast, receive about 70 pieces per year, and Britons get about 40 direct mail ads each year. People in Australia only see about 15 mail ads every year. Even in Japan, which has a relatively advanced direct mail industry by world standards and a very high per capita gross national product (GNP), companies only spend about \$14 billion per year advertising through the mail. Furthermore, many direct mail agencies in that country lag far behind U.S. firms in automation and information technology.

Besides the fact that other countries lag behind the comparatively advanced U.S. advertising industry, direct mail is popular in the United States for several reasons. For instance, the American lifestyle is more suited to mail advertising than most foreign societies. The U.S. marketplace imposes fewer language barriers than marketers in Western Europe, for example, might encounter. Finally, the lowest postal rates in the industrialized world make the United States a haven for direct mail advertisers. While in 2003 a first-class letter could be mailed for only 37 cents in the United States, Germans and Italians paid the equivalent of about 63 cents per letter. First-class letters in Japan and Norway cost about 50 cents, and most European Community nations charged more than 40 cents per piece.

Many Americans have become jaded by some less-than-honest direct-mail practices. Scandals involving Publishers' Clearinghouse, in which some elderly Americans lost their savings, served to tarnish the industry's image. However, direct mail was considered a new phenomenon in many parts of the world. While many Americans toss direct mailers in the trash unread, recipients in the Czech Republic and Russia, for example, pore over their mailings and pass them along to others. Higher postal rates and language barriers have not dissuaded many U.S. companies from launching direct mail campaigns overseas, and many increased their efforts by 1998.

However, other overriding political and economic factors radically changed the international investment landscape—and the prospects for successful advertising campaigns. The 1997 and 1998 financial crises that

toppled economies from Asia to Russia and Brazil posed challenges to direct-mail marketers, including reduced demand, increased protectionism, and the deterioration of infrastructures, according to William J. McDonald in *Direct Marketing*.

RESEARCH AND TECHNOLOGY

Direct mail advertising companies continued to benefit from advances in automation and information technology that increased the value of their services. Advances in computer technology were already allowing companies to make mailings more personalized and specific. For example, many catalog producers were working toward developing personalized catalogs that would be tailored to certain demographic profiles. The same company's catalog, for instance, might be tailored during printing to emphasize different products or offers for a variety of different customer types.

Direct mail advertisers might also be impacted, perhaps negatively, by multimedia technology which would eventually integrate video, optical disk storage devices, and personal computers. Multimedia would increase the trend toward consumer controlled advertising by allowing consumers more power in choosing which ads and media they internalize. Advancements in recycled paper, printing technology, and ink would likely help the industry move toward reduced waste and lower production costs.

SIC 7334

PHOTOCOPYING AND DUPLICATING SERVICES

This category covers establishments primarily engaged in reproducing text, drawings, plans, maps, or other copy by blueprinting, photocopying, mimeographing, or other methods of duplication other than printing or microfilming. Establishments primarily engaged in printing are classified under **SIC 2752: Commercial Printing, Lithographic**; **SIC 2754: Commercial Printing, Gravure**; and **SIC 2759: Commercial Printing, Not Elsewhere Classified**. Those companies engaged in providing microfilming services are classified under **SIC 7389: Business Services, Not Elsewhere Classified**.

NAICS CODE(S)

561431 (Other Business Service Centers (including Copy Shops))

INDUSTRY SNAPSHOT

The quick-printing industry represents a relatively new dimension of both the commercial printing and graphic arts industries. Most companies in the photocopying industry began as printers offering while-you-wait service dubbed "quick printing." What began as a small segment of the printing market experienced phenomenal growth beginning in the 1970s, changing the printing industry forever. In 1969, 1,000 quick printers were operating in the United States, and by 1974 that number had reached 6,000. From 1975 to 1992, the quick-printing industry exploded, and an estimated 30,000 businesses were operational by the early 1990s.

By 2000, the number of quick-printing establishments was dwindling, due to consolidation in the industry. There were 7,743 quick-printing establishments in 2000, down 5.2 percent from the previous year, and down 0.7 percent per year since 1994. The volume of shipments in the quick-printing industry was on the rise, however, with \$5.96 billion in shipments in 2000, up nearly 13 percent from the previous year. Sales in the industry had increased at an annual rate of 10.6 percent since 1994.

ORGANIZATION AND STRUCTURE

The quick-printing industry generally provides two types of services: convenience and commercial. With storefront locations in strip malls and downtown shopping districts, the convenience quick printer serves the needs of small businesses and consumers. Convenience quick printers include both independent and franchised operations that rely largely on copiers and paper plates on 11" x 17" presses. The commercial printer typically provides services similar to those of the convenience shop, with larger facilities and several added capabilities for serving the needs of larger businesses.

BACKGROUND AND DEVELOPMENT

The quick-printing industry emerged from the development of the Itek camera/platemaker, acquired in the early 1960s by Bill LeVine, a commercial printer. This machine produced black ink on 8" x 11" paper with photocopiers or electrostatic plates, forming images in powdered or liquid ink directly on the surface to be printed.

In the 1970s, quick printing generally produced black-and-white or one-color offset prints on flat surfaces using photomechanical plates or paper mats. By the end of the decade, however, the industry was augmented by the introduction of high-speed copiers, which produced one-color prints.

By the 1980s, many quick printers were able to offer a variety of paper sizes and two- and four-color copies. Furthermore, high-speed copiers became more common in the industry, as did large document copiers. During this

time, copier technology advanced, and some quick printers offered desktop publishing systems, camera and darkroom facilities, and advanced bindery equipment. The 1990s were dominated by the growing adoption of digital technology, new products and services, Web pages and publishing, and transmission of data to the quick printer electronically. Regardless of a business' development, continued growth and perhaps survival are dependent on adaptation to and adoption of digital imaging and electronic communication.

The historic paths to becoming a giant in the industry have been to open multiple small sites and build volume, open a facilities management site within a large corporation, or migrate steadily from quick printing only to graphic arts services.

Some of the challenges to the industry have been the cost of paper, which seems to have stabilized; keeping up with technology; and the increasing demands for shorter turnaround time. Printing and copying is divided into four major areas: multicolor copying (26 percent), copying (25 percent), black and white (17 percent), and rapidly growing digital printing (6 percent).

Toner-based copying dramatically changed the nature of quick printing, especially for high-volume work. High-speed copying, able to produce quality halftones and two-sided copies, set the standards for the quick-printing industry. Wide format or folio printing has also continued to grow with close to 200,000 printing devices installed 1996.

To strengthen the scope of their service, quick-print shops began to expand into areas outside of copying and printing. For example, according to a 1990 National Association of Quick Printers (NAQP) member survey, 81 percent of its membership provided fax services and 53 percent offered desktop publishing. Some shops even rented computers and sold office supplies. Although not the source of major profits, such diversifications offered customers value-added service.

Many quick-print shops tested the market for color copying and further automation in desktop publishing. By 1992, more than 60 percent of NAQP's membership offered full-color copying. Moreover, a joint study conducted by the NAQP and *Quick Printing* magazine indicated that the companies widely regarded as industry leaders had offered color copying services since at least 1987.

As early as 1991, a study by Printing Industries of America predicted that quick printers would represent the largest segment of the printing industry, measured by the number of establishments, by the year 2000. Much of this growth was attributed to the introduction of franchise operations during the mid-1970s. The prediction proved true: franchisers became an integral part of the quick-

printing industry, and the top four companies had roughly 1,000 shops each.

Acquisitions and mergers were prevalent in 1996. There were 85,000 high-speed copiers operating in the United States, with 45 percent of them in the print-for-profit sector. Quick-print shops derived 35 percent of their revenue from copiers that are easier to operate than presses and incorporate finishing productions such as binding and/or stitching or gluing.

With the market for photocopying and duplication services booming, retailers in related industries saw the opportunity for expansion. Their distribution infrastructure was already in place via an established chain of retail outlets. Office superstores found easy entrance to the market by establishing quick-print sites in their stores. Office superstores such as Office Depot, OfficeMax, and Staples actively sought a chunk of the traditional quick-print market. For example, by the mid-1990s, OfficeMax carved out 5,000 to 7,000 CopyMax quick-print shops within its stores.

Video capturing, a process in which individual frames can be pulled from videotape and incorporated into printed materials, represented another area for growth in the industry. The ability to generate art and assemble pages electronically also remained a lucrative service. According to Bob McKarney of the quick-print franchise Sir Speedy, "In the near future, quick printers will be able to go directly from computer to press. PC color software and filmless platemaking systems were developed before the century ended. For short runs (300 to 500), an operator could direct graphics directly from computer to color copier." By 2000, this proved to be true.

In spite of predicted shakeup in the quick-print industry, which experienced its first-ever decline in sales in 1991, the industry recovered and continued to grow throughout the decade. Observers had predicted up to a 25 percent reduction of shops in the mid-1990s, claiming that only those capable and willing to keep up with technology would survive. Tom Carnes, president of PDQ Printing, observed in *American Printer* that "the market is over saturated with quick printers. Many are good at putting ink on paper but not at running a business." Elwood Smith, past president of NAQP, agreed: "Many quick printers won't make it," he noted in *American Printer*, adding that "Those that do will have to provide extra-good service and quality products. They will have to be customer oriented and market driven."

A growing number of quick printers were turning to the Internet for advertising. For example, displaying initial color proofs for review by clients, StarNet provided an on-demand fully digital printing service running Docutechs and Indigo E-Print 1000 machines. Another

company, Dave's World, was set up exclusively for Internet and intranet work. Targeting audiences and specializing may become more important than generalizing and diversifying in the future.

CURRENT CONDITIONS

Although the number of quick-print establishments shrank, the industry was nevertheless growing in 2000, up approximately 13 percent for the year. That represented a significant rebound for an industry that was coming off a decrease of 23 percent in shipments in 1999. Sales in the industry have increased at an annual rate of 10.6 percent since 1994. Chains and franchises began dominating smaller, independent printers who had further trouble as paper and energy prices rose in the early 2000s. All 10 leading states in terms of number of quick printers saw a drop in the number of operations in 2000, with Texas experiencing the biggest loss of 11 percent fewer quick printers.

Forecasts for growth in the industry vary. Demand for inexpensive copies and among commercial customers is likely to increase. New large format printing technologies are enabling printers to produce commercial photos and graphics, which could also increase sales. The rise of digital photography—with 22 percent of households in the United States owning a digital still camera at the end of 2002—promises to widen the market as well. Kinko's announced in April 2003 that it would install digital print kiosks in 800 locations due to the high demand for retail-based digital photofinishing services.

However, quick-printing competition is likely to increase in other areas with the popularity of e-mail and Web sites as marketing vehicles and may have a negative impact on industry sales. Since 2000, most of the major quick printers offer services via the Web, including the ability to take orders, upload digital documents, and receive same-day service. Customers can also design business cards, logos, and other products online where they could be saved for easier reordering.

INDUSTRY LEADERS

Among the leading companies, including private and franchise, are Kinko's, Inc., with \$2.1 billion in sales, and TRM Copy centers. The top franchises in the industry in the early 2000s in terms of dollar volume were Sir Speedy, Kwik Kopy, AlphaGraphics, American Speedy, Insty-Prints, Proforma, LazerQuick, and Signal Graphics.

Founded in 1981, TRM Corporation had 398 employees and \$70.6 million in annual sales in 2002. Rather than owning and operating retail copying centers, TRM Copy Centers placed its 30,000 TRM Centers in small, independent retail establishments such as pharmacies, gift shops, and convenience stores throughout 56 metropolitan areas in the United States, Canada, and the United

Kingdom. This mode of operation allowed the company to maximize its market potential and more effectively compete with regional shops. Host locations of TRM copiers collected the usage fees for the copiers and were billed by TRM on a monthly basis. TRM's inventory of copy machines consisted largely of copiers that the company rebuilt to better-than-new condition and serviced through a highly trained field staff. Most customers used TRM machines for convenient, low-volume copying at reasonable prices.

With more than 1,000 centers throughout 30 countries, Sir Speedy, Inc. is one of the world's largest franchisers of copying centers. Headquartered in Laguna Hills, California, the Sir Speedy franchise network generated about \$400 million in network sales in 2002. The annual average sales revenue for a typical Sir Speedy center exceeded \$500,000; of those franchises, the top 25 averaged over \$1 million in sales.

Sir Speedy has adapted to cash in on the computer-created document and electronic duplication now prevalent with digital technology. Sir Speedy acquired PIP Printing near the end of 1996. Toronto-based Moore Corporation sold its chain of quick print and copy centers in Europe to Sir Speedy in 1996. Sir Speedy president Don Lowe recently signed an agreement with Eastman Kodak to launch Kodak's Photo Portfolio CD to create multimedia presentations for customers. SpeedNet, a bulletin board, lets franchisees create and send documents in minutes to any one of 880 copy centers. It targets the 41 million Americans who work at home.

Kinko's Copies—a nonfranchised corporation that is controlled by Paul Orfalea, the 32 percent owner of Kinko's, Inc.—became a \$400 million plus chain in 1995. By 2002, sales were an estimated \$2.1 billion. In a major move possibly precipitated by a copyright infringement lawsuit, Kinko's decided to shift from a college student clientele toward small and medium-size businesses, including self-employed people working from home. At the end of the 1990s, Kinko's operated more than 1,000 business centers. It has also equipped its stores with self-service desktop publishing computers. Voice and video services, allowing customers to conduct video conferencing for \$75 an hour, began in 1996. Most centers now offer Internet access to customers. With its copying and computer supplemental services, the company caters to executives, small business owners, and home office workers. Nearly all Kinko's shops are open 24 hours a day and market themselves as the customer's branch office. An investment fund injected \$200 million into Kinko's in exchange for a minority stake in order to help finance expansion. Going into the new millennium, Kinko's planned to go public.

Kwik Kopy Corporation, a \$372.7 million empire based just outside of Houston, Texas, is among the oldest

quick-print shops in the industry. Founded in 1967 as an offshoot of Bud Hatfield Printers, Kwik Kopy had 25 printing centers by 1970. In 1972, when franchising became the leading trend in the quick-printing industry, Kwik Kopy's business flourished, and by 1977 the company had established 170 printing centers in 18 states. Posting an 18 percent growth rate annually in the early 1990s, Kwik Kopy had 735 centers in 13 countries, including Canada, Australia, South Africa, Israel, and the United Kingdom, by 2000. Kwik Kopy rewards its franchise owners for timely submission of reports and other behaviors it wants to reinforce. The company's Stars program allows franchisees to mentor their peers by visiting each other's shops, suggesting changes, and submitting feedback to corporate headquarters. Kwik Kopy's target customers are volume repeat corporate accounts.

AlphaGraphics, which operates about 300 stores in 14 countries worldwide, offers AlphaLink Direct, allowing customers to electronically transmit documents and graphics from their home, office, or laptop computer directly to local AlphaGraphics sites around the world. The company was founded on the principle of combining high technology with sound business practices. System-wide sales for 1996 were \$246 million. AlphaGraphics' strategy going into the new millennium called for acquisitions internationally and a projected goal of 700 stores by 2000.

WORKFORCE

Nearly 160,000 owners, managers, and other employees work at the 33,000 quick-printing centers throughout the United States. In 1997, the total number of employees involved strictly in photocopying and duplicating services was at 87,221; roughly three-quarters of these were production workers. The latter group worked an average of 36.5 hours a week and earned an average of \$10.80 per hour in 1996. Growth in the industry was projected to continue into the 2000s. According to Printing 2000, the quick-printing industry could expect an annual growth rate of between 5 percent and 8 percent during this time.

By 1999, the photocopying and duplicating services industry was dominated by large franchise operations and operations linked to office superstores. Nonetheless, average sales for all establishments, many of which were single-owner, small shops, were an estimated \$888,000. An average of 8.6 employees worked in each shop and accounted for about \$103,000 in sales per employee. According to PrintImage International, the premier professional industry association, management positions (i.e., production, customer service and general managers, and bindery supervisors) averaged \$10.56 to \$20.76 per hour with \$675 to \$6,500 average yearly bonuses. Wages for professional employees, (i.e., graphic artists, press

and copier operators, strippers, and mailing service technicians), averaged from \$9.15 to \$14.64 per hour and \$575 to \$1,062 in yearly bonuses. Also, a new trend in the industry was to engage outside sales representatives. Average compensation, based on average sales of \$303,577, was generally about \$52,000.

AMERICA AND THE WORLD

Quick-copy centers expanded internationally in two ways. Some particularly well-financed franchise operations opened shops abroad. Others, including independent operations, added services geared toward international business communications needs.

Franchises such as AlphaGraphics and Sir Speedy established operations in Russia, Hungary, Australia, Bahrain, the United Arab Emirates, Canada, and Mexico. AlphaGraphics planned to build a network of 40 printing franchises in Mexico and expected to open 40 shops in Spain. In 2000, Sir Speedy expanded into Thailand, Singapore, and Poland.

Some expansion plans took the form of joint ventures, such as the union of American Speedy Printing Centers of Bloomfield Hills, Michigan, with a British printing shop to create EuroSpeedy Printing Centers in the United Kingdom. Kinko's Copies branched out into the Japanese market with services based in Nagoya under the name Kinko's Japan KK.

Smaller, independent quick printers found that exporting services was not the only way to take advantage of the growing global economy. Many quick printers began offering foreign language word processing, page layout, and typesetting computer programs; translation and proofreading services; and an increased awareness of foreign standards for paper and envelope sizes and business forms.

RESEARCH AND TECHNOLOGY

The most dramatic technological developments in the 1990s involved desktop publishing. Elwood Smith claimed that "Desktop publishing represents the next step in the evolution of quick printing—the most important innovation since the Itek camera/platemaker." Given the increased amount of work based on disk conversion, some industry observers even predicted that quick printers would eventually become desktop publishing experts.

Offering one-stop service for all printing needs, AlphaGraphics was one of the first quick printers to become involved in publishing, referring to itself as a desktop publishing retailer. Several other shops made complete conversions to computerized service—including Laser Image in Durham, North Carolina, which operated a completely automated shop, including computerized page layout, high-speed copiers, high-speed laser printing, and electronic color copying.

Computers were also used increasingly for managing shop operations in the industry. By the end of the 1990s, utilizing software for estimating needs, tracking orders, and updating inventory had become the industry standard.

A new class of multifunction peripherals combining printing, copying, scanning, and/or faxing into a single system has also emerged. Xionics Document Technologies, Inc., is the leading supplier of these embedded systems whose technology has been adopted by Hewlett-Packard, IBM, Seiko, Epson, and Panasonic. RISO furthered the trend toward multifunction systems by making it possible to incorporate once separate, after-print operations such as perforation, slitting, scoring, folding, and stapling. Another innovation is Electronics for Imaging's Fiery Xje embedded controller that turns digital copiers into high-speed network printers such as the Ricoh Corporation's Aficio 2000 series.

Mopy, the practice of making multiple copies of originals to take to the printer, can cut costs in some cases. The HP LaserJet 5SiMopier is touted as the first printer designed to make multiple copies; this method could save two cents a page.

New "gapless" printers pioneered by Heidelberg-Harris have been followed by other versions from Mitsubishi, KBA, and MAN Roland. The technology eliminates or minimizes the blanket and cylinder gaps and makes it feasible to build wide-format color quality offset presses that run at high speeds and take a digital image and print it on paper, film, canvas, or adhesive-backed material for large format jobs. Once limited to pen plotters, it is now 85 percent of the inkjet market. Changes in plotters have resulted in applications in quick-print shops with large format color printing solutions.

SIC 7335

COMMERCIAL PHOTOGRAPHY

This category includes establishments primarily engaged in providing commercial photography services to advertising agencies, publishers, and other business and industrial users. Establishments primarily engaged in still and video portrait photography are classified in **SIC 7221: Photographic Studios, Portrait**, and those primarily engaged in mapmaking are classified in **SIC 7389: Business Services, Not Elsewhere Classified**. Establishments primarily engaged in producing commercial video tape or films are classified in **SIC 7812: Motion Picture and Video Tape Production**.

NAICS CODE(S)

481219 (Other Nonscheduled Air Transportation)

541922 (Commercial Photography)

Commercial photographers provide the images for American business. Whether those images are as simple as a daytime photograph of a small town ice cream shop for a newspaper advertisement, or as complex as a carefully lit, elaborately staged still photo of an ice cream sundae for a nationally distributed magazine advertisement, they are created by commercial photographers. Commercial photographers also provide photos for annual reports, brochures, catalogs, and a range of other business needs. "Commercial work means: You make it. We photograph it," photographer Bud Hjerstedt told the *Northeastern Wisconsin Business Review*. "You can't think of a single thing, a single company, that cannot use photography."

The commercial photography industry is remarkably eclectic, with few boundaries in terms of business size or activity. Large cities may provide employment for hundreds of commercial photographers, some working out of shops with several thousand square feet of studio space and sophisticated film processing facilities, some working freelance with their own equipment and facilities. In larger markets, many commercial shops develop specialties in some area of photography, such as food, fashion, or industrial photography. Small towns, on the other hand, may have just a few commercial photographers

who shoot an advertising layout one day, a senior picture the next, and a wedding on the weekend. At the time of the last industry census in 1992, there were just over 4,200 commercial photography establishments with combined revenues of \$1.5 billion operating in the United States. By the late 1990s, the Bureau of Census estimated that sales rose to \$2.2 billion.

Salaries for commercial photographers depend on the region and how hard the photographer is willing to work. Ken Bourdon of Bourdon & Bourdon Studios told the *Tribune Business Weekly* that a small town photographer may charge between \$600 and \$1,200 a day for his or her work, while a photographer working in a large city can charge from \$2,000 to \$3,500 a day. Such per day charges include all the lighting, staging, and assistants that the photographer may employ. The U.S. Bureau of Labor Statistics indicated that there were over 154,000 people employed as photographers and camera operators in 1996; 4 out of 10 of these photographers were self-employed. Larger commercial photography shops also employ photo processors and lab technicians. Self-employed commercial photographers have the potential to earn much more than the salaried studio photographer, but the potential risk for failure is greater. An established freelancer with many jobs and contacts can make \$350,000 in an average year. By contrast, median annual income for salaried photography/camera professionals was about \$30,000—the top and bottom 10 percent earned \$75,000 and \$14,500 respectively.

The commercial photography industry has traditionally been open to self-starters who learned the trade in the armed services, at one of many photographic schools scattered throughout the country, or from a more experienced photographer. With some technical expertise and a flair for visual images, one could set up shop. As the industry becomes more sophisticated and more dependent on complex digital equipment, additional training will be required.

The leading technological development in the industry is digital image processing, which was revolutionized by the 1992 introduction of the Leaf Digital Studio Camera, made by Leaf Systems Inc. of Southboro, Massachusetts. The Leaf Camera, which sells for a base price of \$29,000, converts visual images to computer pixels immediately. This allows the photographer to instantly view and manipulate the "photograph" on a computer screen. No film processing is required.

The cost of digital equipment remained stagnant through 1996 and into 1997. The cost of Leaf Systems equipment had not dropped since 1993. However, the equipment was expanding and improving at a phenomenal rate; new digital cameras and computer photography software, as well as new digital printers, were being developed that could make high resolution images on

photographic paper almost as good as standard photographic prints. By the close of the century, Kodak, Ricoh, and Sony had all developed small, handheld compact digital cameras in the \$300-\$500 price range, including software. However, digital cameras with resolution comparable to standard photographic methods still sell at prices as high as \$20,000.

For those studios that could afford the high price of going digital, it was a profitable transition. Infinite Photo & Imaging, an Arlington, Virginia full-service lab, equipped itself with state-of-the-art cameras, computers, and printers to become a fully digitized lab in the mid 1990s. Their new equipment produced high quality 4x8 foot prints, the most requested size, with any style of paper needed for commercial, trade show, corporate, and museum printing. By the beginning of the new century, they were capable of producing the world's largest, seamless photograph (48 inches by 67 feet) and large-scale reproductions up to 80 feet in length.

A watershed for the industry came when Warner Bros. publicists for the 1994 film *Batman Forever* used some of the latest digital technology. Warner credited the technology with helping the film break summer box office records. Publicists used standard color negative cameras, but used digital scanners and printers to make the posters and publicity photographs. The digital printer used could create a print every 75 seconds, greatly speeding up their production. These images were also scanned onto CD-ROM for delivery to New York for processing onto the movie Web site. At the premiere of the movie in California, photos of Jim Carrey's arrival were taken on digital cameras, stored on a memory card that could hold up to 84 images, then sent via modem to New York. They were placed on the Web site before the premiere was over.

Digitizing has also changed the industry in unexpected ways; for example, it introduced companies to stock photographs kept on CD-ROMs. By 1997, stock photographs sold for \$250 to \$1,500, depending on quantity and demand. With a CD-ROM, a company could buy a disc containing thousands of stock images for a cost of \$10 to \$250.

Even as digital equipment becomes increasingly prominent, traditional cameras and films will remain a part of commercial photography for many years.

SIC 7336

COMMERCIAL ART AND GRAPHIC DESIGN

This industry includes establishments primarily engaged in providing commercial art or graphic design services for advertising agencies, publishers, and other business and industrial users. Establishments primarily engaged in art, except commercial and medical, are classified in **SIC 8999: Services, Not Elsewhere Classified**; those engaged in medical art are classified in **SIC 8099: Health and Allied Services, Not Elsewhere Classified**; and those providing drafting services are classified in **SIC 7389: Business Services, Not Elsewhere Classified**.

NAICS CODE(S)

541430 (Graphic Design Services)

INDUSTRY SNAPSHOT

The commercial art and graphic design industry encompasses the business of selling artwork for business (promotional) purposes, rather than for strictly aesthetic purposes. The artwork can be produced using a myriad of techniques, including hand painting, computer-aided design software, and video cameras. Commercial art and graphic design can be found on posters, packages, films, and television.

Commercial art remains subject to many of the same standards of "high art," regardless of its ultimate use or intended purpose. Therefore, a graphic designed for an advertisement may not be as significant as the Sistine Chapel murals, but the difference between them is one of degree rather than kind. Commercial art is similar to other art in that it is custom made, and it requires time, skill, judgment, taste, and background on the part of the artist to produce it; it is usually purchased before it is produced; and there are few fixed standards for evaluat-

ing the end-product. Personal taste and opinion determine the effectiveness of commercial art.

Commercial art differs from other art in value. According to *Forbes*, the value of commercial art diminishes quickly. For example, LeRoy Neiman's limited edition sports prints sold at commercial galleries for \$2,000 to \$20,000 when they were first produced. At an auction in 1992, Neiman prints sold for 5 to 20 cents on the original dollar price. In contrast, the value of paintings by Pablo Picasso or Vincent Van Gogh greatly appreciates over the years.

ORGANIZATION AND STRUCTURE

The structure of the commercial art industry is characterized by individual freelance artists and corporations who produce commercial art graphics as well as the businesses who buy the art. In the 1970s, this industry was characterized by many individual freelance artists who sold their work to agents—middlemen—who then found the ultimate buyer of the art work.

Due to vertical integration and advances in technology in the 1980s and 1990s, many companies, such as advertising agencies, have created their own art and graphics departments. These departments have allowed firms to exercise more control over the commercial art process. Moreover, an abundance of commercial art and graphic design firms have entered the industry. The number of freelance artists has declined as the number of specialized design departments and firms has increased.

Artists have been using high-technology equipment such as computers, plotters, and printers since the 1960s, but the technological revolution of the 1980s has made such devices as color copiers, scanners, still video cameras, and desktop publishing software widely available for use as artistic tools. In commercial art and graphic design, high-tech equipment has all but replaced paint brushes and drawing pens at magazines, newspapers, and advertising agencies.

Desktop publishing (DTP) is a good example of how technology has changed this industry. DTP has become one of the most widely used forms of creating commercial and graphic art. DTP can produce attractive, artistic pages using different typefaces and graphic elements in harmony. The advantage of DTP is that even the smallest firm can cost-effectively publish in-house.

The basic requirements to engage in DTP are a computer with the appropriate software package, a mouse, a scanner, and a color printer. In the late 1990s, the cost of a small, high-end desktop computer dropped to under \$1,000 while a production system cost about \$10,000. Due to these relatively low startup costs, desktop publishing has allowed magazines, newspapers, and advertising agencies to create in-house graphics departments. More-

over, smaller entrepreneurs have emerged to create spectacular art and graphics with little investment in capital compared to other businesses.

Frequently, situations arise where the law plays an important part in commercial art and graphic design. In most commercial art and graphic design businesses, a legal counsel is hired for nearly all actual and potential legal problems. The services of a knowledgeable lawyer can save time, money, and misery. The major issues in commercial art and graphic design include contracts, agents, copyrights, royalties, patents, bailments, and ownership of artwork.

Each time an artist accepts an assignment for artwork, he or she enters into a contract. For contracts to be considered valid, a contract must have three common elements: offer, acceptance, and consideration. An offer may be made orally, in writing, or by conduct. For example, if a publisher from *Time* magazine delivers a story manuscript to an artist who is aware of the prices paid by the magazine, the assumption is that delivery constitutes an offer to the artist to illustrate the story at those prices. Acceptance also may be communicated verbally, in writing, or by conduct. In the *Time* example, the retention of the manuscript by the artist may be construed as acceptance of the offer. However, a written document stating the artist's acceptance would give the artist greater leverage in the court system and greater protection. Consideration is defined by the publisher's implied promise to pay at the known rates and by the artist's implied promise to illustrate the story. The consideration constitutes one party promising to pay a certain sum in exchange for the other party's promising to perform a certain act.

An agent is someone who acts on behalf of another—the principal—in dealing with a third party. The types of agents most commonly found in the art business are salespeople, advertising agencies, representatives, galleries, and studios. Agents are used by commercial artists and firms to allow their art to reach many outlets—buyers—who may be interested in the work. Agents, therefore, are middlemen who find the parties who will purchase the Artists' or firms' work.

The relationship between the artist/firm and the agent may be created by an oral understanding, by written agreement, or by implication. The law states that a true agent may not serve two masters. Therefore, the agent for the artist may not serve a third party—another artist—who has negative competitive ramifications for the artist.

Copyrights protect artistic works against unauthorized copying. In certain circumstances, an artist is wise to gain a copyright or royalties for a work instead of an outright sale of the artwork. A copyright is a limited monopoly granted by the government to an artist. A

copyright allows an artist to sell limited reproduction rights to several parties that would not conflict with one another in the use of the work. The duration of the copyright is 28 years and can be renewed for another 28 years. Specific artistic works that may be protected by copyright include works of art, models or designs for works for art, and reproductions of works of art.

A royalty arrangement with the manufacturer or publisher guarantees an artist a fee for each piece of his or her work that is sold. A royalty agreement may be most applicable when an unknown quantity of a product may be sold, such as in the sale of calendars, maps, greeting cards, and children's books. The royalty arrangement provides protection for both the publisher and the artist.

Design patents may be secured for new, original product designs that are novel and considered an invention. A piece of art is considered patentable if it has not been previously known or used by others in the United States, has not been patented in the United States or abroad, and has not been in public use for more than one year prior to the application for a patent, unless it is proven to be abandoned.

When an artist delivers a painting to an individual or studio for use as a sample of his or her work, the legal relation of bailment will ordinarily be created. The title to the material remains with the bailor, or the artist. The liability of the bailee, or the studio or individual, will vary. However, generally speaking, bailees' liabilities are in direct proportion to the extent of the benefit they are expected to derive from the bailment. Therefore, if the artwork is lost or damaged, bailees are liable for greater damages if they had been using it to procure work for profit, than if they had held the artwork for safekeeping without compensation.

In the absence of an oral or written agreement, the full rights of ownership belong to the purchaser. An artist can legally protect him or herself by presenting a specific written agreement. The artist can write into the purchase order any retention of rights or additional compensation requirements.

BACKGROUND AND DEVELOPMENT

In terms of revenues and number of employees, commercial art and graphic design establishments are smaller institutions than other service industry establishments. Interestingly, the average payroll per employee in commercial art and graphic design establishments was in the mid \$20,000, compared to \$17-\$20,000 for other service industries. These figures demonstrate that the higher salaries were justified by the significantly higher profitability of the commercial art and graphic design industry when compared to other service industries.

In the mid 1990s, the industry had an estimated 13,184 establishments, which employed about 51,300 people. Revenues for that year were estimated to be slightly less than that of 1995 — \$6.12 billion, as compared to \$6.2 billion in 1995.

California and New York had the most establishments, with 1,765 and 1,618, respectively. Other states with high numbers of establishments included Illinois (940), Florida (637), Texas (598), and New Jersey (507). Wyoming and Alaska had the lowest number of establishments, with 10 and 5, respectively.

CURRENT CONDITIONS

Computers continue to change the face of the commercial art and graphic design community. Hard copy mechanical art has been replaced by electronic mechanicals and film-based photography has been replaced by digital photography. In fact, by the beginning of the twenty-first century, digital proofing represented 25 percent of the market. Additionally, the increased use of color printers by advertising agencies, corporations and design firms also has impacted the industry.

In the late 1990s, the Graphic Communications Association of the Printing Industries of America developed GRACoL, General Requirements for Applications and Commercial Offset Lithography. GRACoL is a series of specifications that ensures uniformity of color.

Another concern facing small, independent commercial art and graphic design firms was their ability to compete in the job market. A human resources survey conducted by the Printing Industry of America found that more than 60 percent of firms with less than 10 employees do not offer benefit programs.

According to the Bureau of Labor Statistics, jobs in desktop publishing are expected to increase by 72.6 percent in the decade ending in 2008. A 27.1 percent increase is expected for designers; 25.7 percent for commercial artists; 23 percent for advertising and marketing sales; and only .2 percent for printing jobs.

INDUSTRY LEADERS

Most of the top 10 companies in the industry were privately held. The top 2 companies sold more than twice their nearest competition. Continental Graphics Corp. and Applied Graphics Technologies were the leading companies in the industry, with each posting in the neighborhood of \$250 to \$300 million in sales annually. Applied Graphics Technology is part of the communications empire headed by Mort Zuckerman, owner of *U.S. News and World Report*.

The other industry leaders were Creative Associates with \$86 million in sales; Avionics Research Corp. (\$80 million); GML Inc. (\$17 million); Stanford Blaine Design

Inc. (\$10 million); Desktop Graphics Inc. (\$9 million); T-Square Express Inc. (\$9 million); King Graphics Inc. (\$9 million); and United Letter Service Inc. (\$8 million).

SIC 7338

SECRETARIAL AND COURT REPORTING SERVICES

This category covers establishments primarily engaged in providing secretarial, word processing, typing, editing, proofreading, resume writing, letter writing, stenographic, or court reporting services.

NAICS CODE(S)

561410 (Document Preparation Services)

561492 (Court Reporting and Stenotype Services)

Many governmental bodies, businesses, and individuals have discovered that by outsourcing tasks like word processing, proofreading, and document transcription to specialized secretarial and court reporting services, they can save time and money, avoid adding to or straining their staff and equipment, and focus on their own core functions.

By the late 1990s, there were approximately 18,000 commercial establishments offering secretarial and court reporting services nationwide.

An official court reporter traditionally produces a court transcript containing such information as witness testimony, attorney arguments and examination of witnesses, and judicial comments and instructions. A freelance court reporter typically transcribes pre-trial depositions arranged by attorneys. In 1999, the National Court Reporters Association maintained approximately 31,000

members and sponsored various certification programs. Court reporting agencies generally provide some training to employees in the form of specialized shorthand reporting. Ranging from two to four years in length, these training programs focus on computer operation, grammar, law, and attaining at least 225 words per minute on a stenotype machine. Typically, employee benefits such as health insurance and pension plans are not offered.

While secretarial services perform a large portion of contracted work on their own premises, services are also provided on-site and in "satellite offices" set up within larger businesses. A contributor for *Home-Office Computing* reported word processing rates of \$2 to \$4 per page and secretarial labor rates of \$15 to \$20 per hour.

A vital question facing participants in this industry is how technology will alter it. Some industry observers have predicted the demise of professional services such as proofreading, editing, and court reporting due to advances in computer technology and software. For example, the use of computer software programs capable of spell checking has caused a decline in the need for proofreading services. Still, automated editing programs that can identify an ungrammatical or awkwardly constructed sentence remain unable to identify illogical or libelous assertions. High error rates still existed with the use of such voice and speech systems by the end of the 1990s.

Despite the advances in computer-aided transcription and voice-activated computer transcription, the profession of court reporting has flourished rather than suffered a decline. According to the National Court Reporters Association, more than 90 percent of all court reporters used some form of computer-aided transcription (CAT) at the end of the 1990s. New advances in real time reporting, where notes are converted into text and projected on monitors or screens as they are recorded, allow synchronized video testimony. Real time reporting has complied with the Americans With Disabilities Act by making testimony available to the vision and hearing impaired. James Stith remarked in *Career World* that while the use of videotape recording equipment has increased, it will not replace human reporters. He noted that "the technology is not as reliable as the human ear. It breaks down, and it takes longer for a person to listen to a tape than to read a transcript."

By the end of the 1990s, approximately 25 percent of all court reporters were using the Internet to e-mail, research, network, and advertise. It is predicted that during the first few years of the new millennium, court reporters will be using the Internet for nearly every aspect of their job. Transcripts are predicted to become available "on-demand." Furthermore, new software was developed to enable reporters, attorneys, and litigation staff to review transcripts more efficiently.

By the end of the century, the courts and attorneys were able to search transcripts using keywords and phrases to reexamine testimonies. Real time text has made it possible for the court reporter to provide an instant transcript to be displayed on computer monitors or projection screens for viewing. Besides its use for television captioning, this technology made it possible for the hearing-impaired to participate in trials, and it also extended the length of a career for judges suffering hearing loss.

INDUSTRY LEADERS

In 1999, the largest U.S. court reporting firm was Esquire Communications. Although law firms made up the majority of its clients, the company also provided service to insurance companies and various corporations. Total sales for 1998 equaled \$111 million, up 108 percent over 1997. Esquire owns the subsidiary DepoNet, which is a referral network consisting of 400 independent contracted firms providing court reporting and related services. Since 1997, Esquire has acquired more than 40 new companies, thus continuing to strengthen its presence in the legal field.

In 1997, the Bureau of Labor Statistics reported estimated sales receipts at \$3 billion for the industry. Nationwide, freelance court reporters earn an average yearly income of \$45,000, but 25 percent were able to make more than \$64,000 annually. Earnings were based on the reporter's education, experience, and geographic location. Budget cuts in the courts were expected to decrease the number of reporters working directly for them, but the need for freelancers and reporters willing to provide services was predicted to increase through the first decade of the new century.

SIC 7342

DISINFECTING AND PEST CONTROL SERVICES

This industry covers establishments primarily engaged in disinfection and in termite, insect, rodent, and

other pest control, generally in dwellings or other buildings. Establishments primarily engaged in pest control for lawns or agricultural production are classified in various agricultural service industries.

NAICS CODE(S)

561720 (Janitorial Services)

561710 (Exterminating and Pest Control Services)

INDUSTRY SNAPSHOT

The building disinfection and pest control industry is a multibillion dollar industry that overlaps with the building cleaning and maintenance service industry (see **SIC 7349: Building Cleaning and Maintenance Services, Not Elsewhere Classified**). For example, Service Master LP, a leader in the building cleaning and maintenance field, owns Terminix, Inc., one of the nation's largest pest control concerns.

Disinfecting and pest control companies are either independently owned enterprises, franchises, or part of a national company. Two of the largest franchise companies in the United States are Terminix, Inc. and Orkin Exterminators.

CURRENT CONDITIONS

Current research targets development of new types of pesticides, cleaning products, and other compounds for everyday use that are earth-friendly and non-toxic to humans and other animal life. But while development continues, the first choice among commercial establishments is to use those chemicals that have been formulated for the industry. Most products in use today are still toxic to the pests they are designed to eliminate, but toxicity is relative to exposure. While the level of toxicity of many of these products has been diluted in recent years, they still present a hazard to humans and domestic animals if used improperly. The industry recognizes the need for less toxic materials and such materials are in the development stages.

Types of Non-toxic Pest Control. Several methodologies other than the toxic chemical method of pest control are available. Preventive measures include sanitation and moisture control that aim to maintain unattractive environments for pests to dwell and reproduce. Mechanical means include caulking, screening, and traps. Insecticidal soaps are most effective against insects such as fleas. Insect Growth Regulators (IGRs) and pheromones are both hormonal methods for treating pest infestations. IGRs are laboratory-made growth hormones naturally found within insects. Their application prevents the insects from reaching maturity and thus reproducing. Pheromones — scent hormones — are used to bait traps and trick male insects into thinking they have found a female. Thus, that particular male does not achieve his reproduc-

tive goals. Repellents include citronella, eucalyptus, wormwood, and other commercially-prepared compounds. They do not kill but rather repel the targeted pest with no ill effects to the pest or the user. Biological controls are probably best known by those in agriculture. It is the intentional use of “good” organisms against “bad” ones. For example, trichogamma wasps can be used to control meal moths. A more common example is the use of cats to catch mice. While environmentally these non-toxic methods may have merit and some degree of effectiveness in certain situations, toxic chemical products are more often used for reasons of efficiency, speed, expense.

INDUSTRY LEADERS

At the end of the 1990s, the national leaders in sales among companies with interests in this industry were Service Master of Consumer Services LP, of Memphis, Tennessee, the owner of Terminix, with \$910 million in revenue; and Orkin Extermination Company of Atlanta, Georgia, with \$555 million in revenue.

WORKFORCE

In 1999, there were 91,800 employees in this industry, of which 73,300 were in production. Employees worked an average of 37.9 hours per week for a salary of \$11.93 per hour. Employment prospects were expected to increase through 2006 due to higher standards of living and increased regulation of pesticides, requiring more intensive, inclusive, and proactive treatments.

SIC 7349

BUILDING CLEANING AND MAINTENANCE SERVICES, NOT ELSEWHERE CLASSIFIED

This classification covers establishments primarily engaged in furnishing building cleaning and maintenance

services, not elsewhere classified, such as window cleaning, janitorial service, floor waxing, and office cleaning.

NAICS CODE(S)

561720 (Janitorial Services)

INDUSTRY SNAPSHOT

The building cleaning and maintenance industry provides services to a wide range of clients—private homes, multifamily residences, such as apartment buildings and housing projects, schools, libraries, museums, nursing homes, hospitals, government offices, hotels/motels and resorts, restaurants, churches and synagogues, community and senior citizen centers, airports, bus stations, railroad stations, marinas, and other commercial buildings and businesses.

In 1998, there were about 58,220 cleaning and maintenance businesses not elsewhere classified in the United States. The industry as a whole generated an estimated \$31 billion in sales, an increase of over 14 percent from the previous year. The industry employed 912 million cleaners and janitors in 1999. Of that number, about 20 percent were employed by cleaning and janitorial service companies. About a third of those employed worked on a part-time basis (less than 35 hours a week). The other 80 percent were employed by schools, hospitals, or other institutions or businesses as in-house cleaning staff.

ORGANIZATION AND STRUCTURE

Service industries are an increasingly important element of the American economy. One of the fastest growing service industries is the cleaning and building maintenance business. Some analysts estimate that the number of employees in the industry in the year 2005 could well exceed five million.

With changes in needs and technology, the old view of the janitor as someone who only swept out a basement has changed dramatically. While today's custodians or cleaners may still employ brooms, they also make use of a variety of other machines, tools, and skills to keep buildings clean and well maintained. For the most part, custodians and building maintenance employees work indoors, in heated and air-conditioned environments. Work shifts vary tremendously, and some establishments, such as hospitals, large hotels, or transportation companies may employ such personnel on a round-the-clock basis. Entry-level janitors can earn between \$12,500 and \$14,000 annually while experienced janitors may earn \$15,000 to \$20,000 per year, and college-educated managers can earn \$37,000 or more.

The types and sizes of cleaning and maintenance businesses range from the single-person enterprise to franchises and large, nationally-recognized companies that employ thousands of people. Smaller companies tend

to service residential dwellings primarily because of the fewer demands on resources (employees, skills, and time.)

For the most part, larger companies service commercial buildings, schools, and apartment houses because larger numbers of employees with varied skills are needed to do the job and because fees are higher for such establishments. This facet of the industry has become highly organized; more than 1,400 building service contractors belong to a national organization, the Building Contractors Association.

The number of such service companies has grown over the last few years because they have developed increasingly efficient and economical ways to accomplish cleaning and maintenance tasks. Part of that efficiency results from the ways in which a contractor contracts its services with the specific need of a particular client in mind: individual assignment, crew assignment, specific cleaning assignment, and general assignments.

In individual assignment, one person is responsible for a specific area. That person must know how to do all the different kinds of cleaning required, as well as basic maintenance. In a crew assignment, a team is responsible for an area, usually larger than a single area. Among them, they have all the skills required for the proper cleaning and maintenance required.

Specific cleaning assignments are different in that each member of the team has specific skills for a particular area. The team as a whole performs a wide range of jobs. Finally, the general assignment jobs provide almost limitless variety. There may be enough work for one person or a whole team of people. The responsibilities, as well as how many people will be assigned, vary according to needs.

INDUSTRY LEADERS

The top three companies in this industry by sales volume at the end of the 1990s were International Service Systems, Inc. (\$2 billion), American Building Maintenance Industries Inc. (ABM) (\$629 million), and Unicco Service Company (\$522 million). Founded in 1909 by Morris Rosenberg who invested \$4.50 in a bucket, mop, sponge, broom, and brush, ABM and its divisions posted sales in 1999 of over \$600 million. In addition to the usual janitorial services for owners of commercial, industrial, and institutional buildings, the company offers a wide range of services that includes: cleaning; elevator maintenance; air conditioning, heating, engineering, and energy conservation services; lighting and electrical sign maintenance; building security; parking garage management; and janitorial supplies. One small portion of its business also included pest control. However, since the company's focus had been to provide services to commercial, industrial, or institutional clients, the residential

nature of the pest control business seemed inappropriate. ABM therefore sold this division to Terminix in October of 1991.

Two other large cleaning and building maintenance companies in the country are both franchise chains: JaniKing and Service Master. JaniKing had 5,500 units in 1997. ServiceMaster, in business since 1947, had more than 4,306 franchise units in 1997. Both companies offer services that include residential and commercial cleaning services, disaster restoration, and specialized services such as window and carpet cleaning. In addition, ServiceMaster offers pest control and lawn care, and provides management services to health care facilities, schools, and factories.

In November, 1986, ServiceMaster purchased Terminix International, the nation's second largest pest control company. At the time, the company owned 164 outlets and 150 franchises nationwide. Merry Maids, a home-based cleaning business founded in 1980, came into the ServiceMaster fold, as did a Memphis-area home appliance maintenance and plumbing service with a client list of approximately 400. Then in 1990, ServiceMaster purchased two divisions of Waste Management, Inc., a pest control business and a lawn care service, further diversifying beyond its core building maintenance niche.

WORKFORCE

By the end of the 1990s, there were 912 million workers employed by this industry, most of whom worked under 30 hours a week for an average wage of \$8.68 per hour. The U.S. Bureau of Labor Statistics predicted the residential cleaning industry would have the second largest job growth rate through 2005. In the mid 1990s, a projected 9.4 million households paid a professional to clean their homes (9 percent of all homes).

SIC 7352

MEDICAL EQUIPMENT RENTAL AND LEASING

This classification comprises establishments primarily engaged in renting or leasing (except finance leasing) medical equipment. Establishments included within this industry may also sell medical supplies. Those establishments primarily engaged in finance leasing are classified in **SIC 6159: Miscellaneous Business Credit Institutions**.

NAICS CODE(S)

532291 (Home Health Equipment Rental)

532490 (Other Commercial and Industrial Machinery and Equipment Rental and Leasing)

The medical equipment rental and leasing industry provides an alternative to purchasing equipment outright and had significant growth for much of the 1990s. For many individuals and health care institutions, the advantages of renting or leasing expensive, high-technology equipment — subject to obsolescence as advances in medical technology spawned new, improved equipment — outweighed the advantages of purchasing such equipment. These advantages included preserving cash flow, increased flexibility to replace old equipment, and improved timeliness in acquiring the newest technologies. In the early 1990s, the industry generated roughly \$1.5 billion in sales, representing 5.1 percent of the total yearly leasing volume in the United States. According to a 1995 survey, approximately 63 percent of hospitals used some form of lease financing for medical equipment. A similar 1992 study indicated only 14 percent of hospitals used lease financing. Volume of medical equipment leasing is affected by increased cash reserves, attractive bond financing, and the growing market for refurbished equipment. In 1997, sales of refurbished medical equipment were estimated at \$240 million; total business activity in this industry was estimated at \$3.9 billion, a 3 percent increase since 1993.

Revenues in the medical equipment leasing and rental industry were expected to grow from \$5.6 billion in 1999 to \$8.3 billion by 2003. In 1998, a marketing study by Finova Copelco Capital and DVI estimated that 25 percent of all medical equipment was leased. Of that, an estimated \$2.5 billion of new medical equipment was purchased through leasing. Markets for the industry in the new millennium were hospitals, diagnostic imaging cen-

ters, chronic disease treatment centers, and physician group practices/clinics.

The medical equipment rental and leasing industry was comprised of a majority of relatively small businesses. The typical service establishment in the early 1990s employed 13 people, while on average a medical equipment rental and leasing establishment employed only 8. However, by the end of the decade, larger corporate players dominated the market. In 1998, sales leaders in this industry included Apria Healthcare Group Inc. with 8,175 employees and revenues of \$933.8 million; MEDIQ, Inc. which posted almost \$181 million in sales with 1,271 employees; and Universal Hospital Services, Inc., 462 employees and sales of \$69 million.

Nearly 85 percent of the medical equipment rental and leasing establishments in the late 1980s were owned by corporations, compared to about a 60 percent average for other service industries. This preponderance of corporate ownership is due largely to the expensive nature of medical equipment, which at once predicated the industry's existence and limited entry to those individuals or corporations possessing substantial cash reserves. Sole proprietorships constitute 10 percent of industry establishments, compared to over 30 percent in other service industries. The remaining 5 percent are controlled through partnerships.

Despite the large number of establishments located in Texas, the greatest regional concentrations of medical equipment rental and supply businesses are located in the eastern United States, particularly New York, New Jersey, and Pennsylvania, which have 732 establishments. The rest of the medical equipment and rental businesses are scattered throughout the United States.

SIC 7353**HEAVY CONSTRUCTION EQUIPMENT RENTAL AND LEASING**

This classification covers establishments primarily engaged in renting or leasing (except finance leasing) heavy construction equipment, with or without operators. Establishments primarily engaged in financial leasing are classified in **SIC 6159: Miscellaneous Business Credit Institutions**.

NAICS CODE(S)

234990 (All Other Heavy Construction)
532412 (Construction, Mining and Forestry Machinery and Equipment Rental and Leasing)

INDUSTRY SNAPSHOT

The U.S. Census Bureau estimated that \$3.8 billion was directly attributed to heavy construction equipment rental and leasing firms in the early 1990s. By the end of the 1990s, sales in the equipment rental industry were projected to reach nearly \$20 billion dollars. The number of establishments in this industry grew from 4,390 in 1988 to 5,790 in 1995. However, in 1997, the number of establishments had fallen to 4,961 as larger companies were buying up smaller ones and consolidating their operations. In 1997, the heavy construction equipment rental and leasing industry had a total average annual payroll of nearly \$1.9 billion, and employed an estimated 53,700 individuals.

The heavy construction industry remained in a slump in the early 1990s, but showed signs of an upturn by the mid 1990s. Throughout 1996, industry sales and activity experienced a slow growth at 3 percent overall. As a result, leasing and rental of heavy construction equipment registered a slight, corresponding increase. By the end of the 1990s, the demand for equipment rentals continued to be very strong. Industry analysts estimated that overall revenues had grown by about 20 percent per annum over the last ten years.

ORGANIZATION AND STRUCTURE

This industry is concerned only with equipment rental and leasing arrangements that qualify as "operating" leases. Operating leases are generally short-term arrangements that allow contractors to acquire equipment for a fraction of the asset's useful life. "Financing" leases, on the other hand, are longer term arrangements that allow contractors to acquire equipment over a period of steady payments.

Construction contracting companies (lessees) lease or rent heavy equipment from leasing companies (les-

sors) under the assumption that higher productivity and profits are derived from equipment use, rather than from ownership of the equipment. In other words, companies that lease and rent equipment believe that they can generate greater returns by investing capital in business ventures other than equipment ownership. In contrast, firms that rent or lease equipment to contractors do so under the assumption that they can garner greater returns by investing their resources in, and managing, equipment — not building with the machinery.

One advantage accorded the lessee is flexible terms. Arrangements can be adjusted to the user's unique market conditions, cash flow expectations, equipment needs, and tax situation. Leasing or renting also allows the lessee to defer the risk of losses caused by obsolescence inherent in the purchase of heavy equipment. Furthermore, leasing frees the lessee's capital for investment in other ventures that would normally be consumed by the hefty down payment and debt burden usually required by purchase agreements.

Lessors benefit from the leasing arrangement because they typically have greater expertise in the equipment market than their clients and can more efficiently manage investments in expensive equipment. In most cases, lessors can offer equipment to the lessee for a price that is highly competitive to what the lessee would have to pay if it financed a purchase. Advantages that lessors cultivate include greater bargaining power when purchasing equipment, an increased ability to liquidate used equipment, lower financing costs, and lower equipment maintenance fees. Lessors can also benefit more than many lessees from various tax laws that apply to leasing, such as depreciation allowances.

In a study conducted by the CIT Group in 1996, 62 percent of contractors who intended to lease equipment in 1997 cited "limited need" as a major reason for leasing equipment. For the fourth straight year, "cost" continued to decline as a reason for leasing equipment. However, "unexpected need" gained popularity as a frequently cited reason for leasing equipment in 1997. By the turn of the twenty-first century, there was also a growing realization by contractors that it was more economical to rent than buy, unless the equipment could be utilized more than 75 percent of the year. By leasing, they were also able to access more and different types of equipment while taking advantage of the best technology available.

Equipment and Projects. The principal types of equipment leased and rented by firms included bulldozers, cranes, and earth moving equipment. Earth moving equipment includes a wide range of machinery such as tractors, trenchers, scrapers, graders, and crawlers. Miscellaneous pieces of construction machinery such as tunneling equipment, well drills, loaders, cutters, compac-

tors, excavators, oversized trucks, and portable mixers rounded out the industry's offerings. While some companies owned and leased many types of equipment for various heavy construction activities, other firms specialized in renting equipment for a specific line of work.

The largest manufacturer of the leasing industry's equipment in 1999 was Caterpillar Inc., which was also the largest supplier in the world. Other large manufacturers included CNH Global, Terex Corp., and John Deere. These companies, along with 700 others in the United States, accounted for most equipment sales to leasing companies, as well as 70 percent of all worldwide equipment sales.

The two basic divisions of the market for which leasing companies provided equipment were public and private. Private heavy construction activities included commercial and industrial projects that were completed with the intent of generating a profit for the owner of the project. Examples of private heavy construction projects include office buildings, manufacturing facilities, hotels and other commercial buildings, golf courses, oil wells, private electric utilities, hospitals, and private prolonged care institutions. In 1999, total U.S. expenditures for new private non-residential construction were \$175.2 billion.

Public heavy construction activities for which equipment was rented or leased were completed with public dollars, and not necessarily with the intent of generating a profit. Examples of such projects include schools, highways, water works, public utility plants, dams, railroads, canals, prisons, hazardous waste site clean-ups, and landfills. Indeed, real public works construction expenditures had been on a nearly uninterrupted upward trend since hitting bottom at \$78.9 billion in 1982 and 1983. At \$131.3 billion, real public works spending by the turn of the century was forecast to be 66 percent above the lows of the early 1980s.

BACKGROUND AND DEVELOPMENT

The heavy equipment rental and leasing business in America emerged as a recognizable industry during the U.S. construction boom of the 1960s. Although little of the construction equipment used during this time was rented or leased, some contractors began to realize advantages related to borrowing specialty equipment for short-term uses. Construction markets in the United States remained relatively strong in the 1970s and early 1980s, despite cyclical downturns, and leasing activity increased as a result of regulatory changes that made leasing more appealing to some companies. For instance, investment tax credits conveyed benefits to lessors of equipment that invested in new machinery. Furthermore, depreciation allowances were modified at various times and became particularly beneficial for most heavy equipment lessors during the early and mid 1980s. These allowances per-

mitted lessors to deduct from their tax burden larger amounts of expenses associated with equipment depreciation. Depending on the type of equipment being depreciated, some lessors were able to increase their profits by completely depreciating pieces of machinery long before their economic, or useful, life was complete.

In addition to favorable federal policies, the renting and leasing industry was helped by the construction boom of the mid 1980s. During this time, the total value of new construction soared from \$332 billion during 1983 to nearly \$420 billion by 1987. But while the amount of heavy equipment rented increased during this period, most companies continued to prefer to purchase their machinery; lessors thus enjoyed only a minor share of the entire equipment market. In fact, throughout the 1980s, contractors owned more than 90 percent of the equipment used for heavy construction.

The industry began to experience difficulties in the late 1980s. In 1987, the commercial construction market began plummeting into a virtual, and prolonged, depression. New commercial construction, not including maintenance and rehabilitation, fell from about \$87 billion in 1985 to \$67.5 billion in 1988 and \$53.8 billion by 1992.

In addition to the recessed market, regulatory changes had an impact on industry profits. The Tax Reform Act of 1986 eliminated investment tax credits the industry had previously enjoyed and reduced the benefits available through deduction of depreciation expenses. It also reduced corporate tax rates and strengthened the minimum corporate tax. All of these factors combined to reduce tax advantages that assisted firms in the industry.

Heavy construction equipment lessors benefited from a recovery in construction markets that began in 1992, when the value of new construction jumped four percent over 1991 to about \$373 billion. In addition, the election of President Clinton in 1992 meant that the public sector market for equipment would likely grow since Clinton had proposed increased federal spending on infrastructure of \$80 billion over four years. The Clinton administration also advocated adoption of new investment tax credits that helped lessors. Furthermore, \$155 billion was earmarked for construction spending under the Intermodal Surface Transportation Efficiency Act (ISTEA) during the 1990s, which served to increase demand for the rental of heavy equipment.

Although the construction market was expected to partially recover in the 1990s, regulatory constraints affecting heavy equipment lessors showed signs of increasing. Some state and local governing bodies that were seeking ways to increase revenues were mulling over tax rule changes that would increase taxes on leasing and rental transactions. For instance, Florida tried, but failed, to institute a proposal that would have allowed the state to

collect sales tax up front on leases, rather than on a periodic basis as rental payments came in. Multistate Tax Commission (MTC) proposals, which attempted to shift the source of leasing income in multi-state transactions, were also an important issue facing the industry in the mid 1990s. In 1996, an industry survey conducted by the CIT Group reported that firms in this industry cited governmental regulation as the single most serious problem facing the industry.

While the industry generally improved in the mid 1990s, firms continued to face stiff competition as a result of lackluster demand compared to the mid 1980s. Firms like Hertz, Prime, and Home Depot aggressively entered this industry. A capital crunch made it difficult for lessors in the industry to secure financing to buy new equipment or expand into different market segments. Furthermore, lessors were not able to rely on expanding international markets to boost sales as other segments of the construction and equipment industries. In fact, only a negligible amount of international trade occurred in the industry in the early 1990s. This was a result of the obvious impracticality of transporting heavy machinery long distances for short-term applications. In fact, most firms in the industry were characteristically localized. At the time (1996), Fred Anderson of the American Rental Association posited that “while major players like Prime and Hertz have equipment rental divisions, the predominant number of players are still locally-based independents.”

Other factors that determined the health of the industry in the 1990s included: interest rates, which reached lows in the mid 1990s and were remained relatively friendly to borrowers on into the new millennium; high commercial vacancy rates, which kept the lid on new office and retail development; and demographic factors that impacted school and hospital construction spending.

CURRENT CONDITIONS

According to Robert J. Merritt, President and CEO of the CIT Group, “In 1996, the construction industry expanded by nearly 3 percent in inflation-adjusted dollars.” Another bright spot in this industry was the 6 percent growth rate for commercial construction activities during that same year. By the end of the 1990s, the \$619 billion construction industry was growing at an annual rate of about 4 percent.

In 1999, a Buyers’ Intentions study conducted by the Associated Construction Publications asked contractors if they rented or leased equipment. The responses showed that on a national level, 46 percent rented or leased equipment; only 6 percent said they exclusively leased. It was evident that the rental market was growing at a brisk rate, while leasing seemed to be on the decline. Contractors indicated that they were only interested in buying equipment that they would use on a regular basis, such as

trucks and backhoe loaders then filling-in with rental units when they had jobs that required more equipment. Crawler dozers and cranes topped the list of popular equipment rentals.

INDUSTRY LEADERS

In 1997, Beco Construction Power Co. was the largest competitor in the industry with sales of about \$41 million. Morrow Equipment Company, of Oregon, was the second largest firm in the industry, realizing sales of \$38 million. Rounding out the top ten companies in 1997 were Rental Tools and Equipment Co., S and R Equipment Company Inc., McLean Rentals Inc., Ferdon Equipment Co., Brown Rental Equipment Company Inc., Strawn Merchandise Inc., United Crane and Shovel Service, and Bat Rental Inc.

By the end of the 1990s, however, the industry had changed. It was a large, fragmented market that was undergoing a major consolidation process—there were more than 20,000 small and medium-sized equipment rental equipment companies doing business in North America. United Rentals had become the number one equipment rental company by merging with U.S. Rentals and buying dozens of smaller rental firms. With more than 600 locations in Canada, Mexico and the United States, 1998 sales totaled \$1.2 billion and they employed 8,501 workers. Hertz Equipment Rental Corporation (HERC), a division of Hertz, emerged as the number two company with sales of \$631.3 million. Rental Service Corporation, who had been bought by Atlas Copco in 1999, had more than 280 locations and recorded sales of \$578 million. Other leading companies were Neff Corp. with sales of \$324 million and Nations Rent, Inc. with sales of \$236 million.

WORKFORCE

Positions in the heavy construction equipment renting and leasing industry entailed a variety of jobs in the mid 1990s. The greatest number of jobs was clerical, representing about 18 percent of the work force. Equipment operators and mechanics accounted for about 14 percent and 8 percent of all employees, respectively. Management and executive jobs accounted for 12 percent of industry employment. Other positions included work supervisors, bookkeepers and accountants, and sales people. Although the industry was expected to grow at an average rate in comparison to other sectors of the U.S. economy throughout the 1990s, above average growth was likely to take place in some occupations.

Forecasting to the year 2005, the U.S. Bureau of Labor Statistics identified the highest growth jobs in the miscellaneous equipment rental industry as counter or rental clerks. In the early 1990s, almost 10 percent of the workforce in this industry were counter or rental clerks.

RESEARCH AND TECHNOLOGY

As the construction industry became increasingly competitive in the late 1980s and 1990s, contractors were seeking advanced technology that would give them an edge in completing jobs faster and easier. Continuous technological advances in construction equipment were shortening the practical life span of some types of machinery, quickly rendering earlier models of equipment obsolete. As a result, in order to avoid ownership risks associated with obsolescence, the incentive to rent heavy machinery increased in the 1990s. By the turn of the twenty-first century, some of the larger companies were also planning for e-commerce in order to reduce costs and improve customer service. Catalogs were available on CD-ROM, customers had online access for electronic payments and many companies paid their suppliers electronically.

SIC 7359

EQUIPMENT RENTAL AND LEASING, NOT ELSEWHERE CLASSIFIED

This category covers establishments primarily engaged in renting or leasing (except finance leasing) equipment, not elsewhere classified. Establishments primarily engaged in finance leasing are classified in **SIC**

6159: Miscellaneous Business Credit Institutions. Establishments renting and leasing automobiles and trucks without drivers are classified in **SIC 7514: Passenger Car Rental**; those renting automobiles with drivers are classified in **SIC 4119: Local Passenger Transportation, Not Elsewhere Classified**; those renting trucks with drivers are classified in **SIC 4212: Local Trucking Without Storage**; those renting personal items such as lockers (other than refrigerated), clothes, and pillows are classified in **SIC 7299: Miscellaneous Personal Services, Not Elsewhere Classified**; those renting amusement and recreation items, such as bicycles, canoes, and beach chairs and accessories are classified in **SIC 7999: Amusement and Recreation Services, Not Elsewhere Classified**; and those renting commercial boats are classified in **SIC 4499: Water Transportation Services, Not Elsewhere Classified**. Establishments producing machinery and equipment (including computers and other data processing equipment) which lease or sell their products are classified in the manufacturing industries. Manufacturers’ sales branches or offices leasing or selling the machinery and equipment of their manufacturing plant are classified in the wholesale trade industries. Establishments primarily engaged in leasing computer time, including time sharing services, are classified in **SIC 7374: Computer Processing and Data Preparation and Processing Services**; and those renting or leasing computers or data processing equipment are classified in **SIC 7377: Computer Rental and Leasing**.

INDUSTRY SNAPSHOT

Companies in the miscellaneous equipment rental and leasing industry made short-term equipment loans to their customers for a fee. The industry, in general, garnered annual sales of approximately \$21 billion in 1992. According to the U.S. Census Bureau, 18,182 companies employed a work force of 143,741 in 1997. That same year industry sales were estimated to be \$14.7 billion.

Although rentals of some products slumped in the late 1980s and early 1990s, economic recovery and strong growth in selected segments, such as furniture,

gradually revived the industry as the last decade of the twentieth century came to a close. Demographic and financial trends generally boded well for long-term growth, but the business was strongly influenced by unpredictable tax laws and other legislation.

ORGANIZATION AND STRUCTURE

The miscellaneous equipment leasing industry encompassed the rental of numerous specialty products, such as portable toilets, video recorders, tools, pianos, and party supplies. The major product segments were airplanes, business machines (except computers), and furniture. Airplanes constituted about 16 percent of all equipment leased under nonfinance arrangements in 1991. An estimated 17 percent of all business machines in use in the United States were leased in the early 1990s, and office machines accounted for over 5 percent of all equipment rented. According to the Equipment Leasing Association, a trade organization, almost 80 percent of companies leased some or all of their business equipment in 1995. Approximately 6 percent of all office furniture was leased, and a growing number of individuals rented their home furnishings in the mid to late 1990s.

Leasing offered numerous advantages for both lessors and lessees. Many companies that leased equipment believed higher productivity and profits were derived from product use, rather than equipment ownership. An airline company, for example, might benefit from investing its limited resources in marketing or ticketing operations, rather than in jets. In turn, companies that leased equipment to others believed that they could do a better job of buying, financing, servicing, and selling equipment than could their customers.

Numerous financial and tax motivations were behind leasing. Companies that leased equipment avoided the risk of investing in an office machine, for example, that might soon become technologically obsolete. Or they might need the equipment for only a short time. In any case, the company was able to deduct its lease payments from its taxable income, rather than having to deduct equipment depreciation. In addition, companies could reduce their apparent debt burden by leasing. Finally, many individuals leased goods, like furniture, simply because they could not afford to obtain credit or buy.

Companies that leased equipment also benefited in several ways. Compared to their lessees, they were often able to acquire equipment at a low cost, liquidate it efficiently, and obtain acceptable financing terms. Lessors were also better positioned to take advantage of some tax laws, like depreciation allowances and investment tax credits.

Lease Types. The two primary types of leases were operating and finance (capital). Finance leasing compa-

nies, the lessors, which were excluded from this industry, essentially sold equipment to their customers, the lessees. The lessee typically rented the item for its entire useful life or agreed to eventually pay for and own the item through a lease-to-own arrangement. About 80 percent of all equipment leased in the United States during the early 1990s were finance leased.

Operating leases encompassed in this industry constituted short-term equipment loans. Lessors usually rented an item more than once during its useful life, and lessees did not commit to purchase the equipment in the lease. However, several types of operating leases were actually hybrids of finance and operating leases. The dollar-out lease and the bargain lease, for example, both allowed the user to acquire the equipment for a negligible or undetermined amount at the end of the lease. Under a sale-leaseback arrangement, a company sold its own assets and then leased them back from the buyer. Each type of lease combined different financial and tax advantages.

BACKGROUND AND DEVELOPMENT

Phoenician traders rented ships from the Egyptians around 500 B.C., but it was not until the latter half of the twentieth century that a recognizable leasing industry emerged. The introduction of numerous office machines contributed significantly to industry growth during the 1960s and 1970s. Plus, entirely new specialty leasing sectors emerged, such as airplanes, portable toilet rentals, refrigerated freight trailers, and cargo containers.

During the 1980s, the industry flourished in the wake of new tax laws implemented early in the decade. Lessors were able to take advantage of hefty new investment tax credits and higher depreciation allowances. Likewise, lessees benefited by writing off lease payments and, in many cases, reducing their effective tax burden. As a result, leasing of all types of equipment surged. Office equipment rentals, for instance, grew more than twice as fast as overall business investment in new equipment during the 1980s. By the late 1990s, equipment leasing was estimated to be a \$207 billion industry.

The industry was hammered in the late 1980s. Many of the tax advantages that boosted industry profits were quashed by the Tax Reform Act of 1986. Furthermore, a U.S. recession during the late 1980s and early 1990s thwarted demand. Importantly, the sizable aircraft leasing business suffered from airline industry infirmity, as airline traffic decreased, and some major carriers filed for bankruptcy. Airline leasing rebounded between 1992—2,155 aircraft under lease—and 1994—4,500 aircraft under lease. By 1996, 58 percent of all domestic operating aircraft were under lease while, worldwide, 44 percent of all global operating aircraft were under lease.

Despite major setbacks, some companies benefited from declining interest rates, which allowed them to purchase new equipment at a lower cost. In addition, a lack of investment capital forced a number of firms to lease rather than buy. Nevertheless, overall U.S. leasing industry revenues declined more than 4 percent between 1989 and 1991 and rose only slightly in 1992. According to the American Rental Association's 1997 "Cost of Doing Business Report," operating revenues rebounded 8.2 percent from 1994 to 1995 for firms within the **SIC 7359: Equipment Rental and Leasing, Not Elsewhere Classified** industry.

Miscellaneous equipment rental and leasing companies profited from a moderate U.S. economic upswing in 1993 and 1994. Office machine rentals increased an estimated 6 percent, and airline-operating leases continued to rebound from depressed 1990 levels. Furthermore, economic and demographic trends suggested at least modest growth through the mid 1990s, barring unforeseen federal entanglement. Relatively low interest rates, a greater general acceptance of leasing options, and the increased risk of equipment obsolescence all appeared likely to contribute to heightened leasing activity.

An industry bright spot in the early 1990s was the furniture rental business, most of which was not classified in this industry as of 1994. Indeed, the furniture rent-to-own business experienced rampant growth during the 1980s and early 1990s, culminating in a \$3.9 billion business with over 3.6 million customers by 1994. Many of these companies achieved huge profits by charging finance rates of between 40 and 400 percent compared to the 1993 national average rate of 111 percent.

Although most rent-to-own furniture rentals were classified as finance leases, they closely resembled operating leases. In fact, the majority of customers, unable to meet the terms of the lease, never took ownership of the furniture. As a result, federal initiatives in 1993 and 1994 were aimed at reclassifying the leases as operating, which could add billions of dollars to this industry group. At least two federal court decisions in the early 1990s corroborated those efforts.

CURRENT CONDITIONS

The industry received a boost from new leasing innovations that gained favor in the mid 1990s. Some office equipment lessors, for example, offered one-stop-shopping programs for corporate customers, whereby a single master lease was arranged to cover equipment and furniture for an entire office facility. In addition, Trans Leasing International of Illinois offered the LeaseCard, a credit card that allowed business owners to effectively purchase and finance goods at below-market interest rates.

In the long term, industry growth was largely influenced by the economic growth rate; interest rates and the supply of financing for new equipment; the stability of the credit environment, which affected the breadth of the market that lessors served; and federal legislation, which could easily bolster or deflate industry profits. In 1996, 30 percent of the estimated \$563 billion spent on productive assets was acquired through leasing, with an estimated 80 percent of all U.S. companies leasing some or all of their equipment. In December of 1999, the Equipment Leasing Association stated that the industry had an overall growth of 12 percent since the same time in 1998.

INDUSTRY LEADERS

In the mid 1990s, 18,182 companies competed in the miscellaneous equipment rental and leasing industry. According to the *County Business Patterns* from the U.S. Census Bureau, most were extremely small enterprises. Only 6 companies had more than 500 employees, 12 had between 250 and 500 employees, 60 had 100 to 249 employees, 201 had 50 to 99 employees, 1,081 had 20 to 49, 2,235 had 10 to 19, 5,577 had 5 to 9 and 9,010 companies had under four employees. The largest company in 1999 was Rent-A-Center Inc. with \$809 million in sales, with Rent-Way, Inc. at number two with \$494 million in sales. Other industry leaders included Aaron Rents, Inc. (\$370 million), CORT Business Services (\$319 million), Globe Business Resources, Inc. (\$147 million), Connell Equipment Leasing (\$125 million) and PLM International, Inc. (\$59 million).

WORKFORCE

Approximately 30,000 workers served this industry going into the 1990s. According to the U.S. Census, this number rose to 143,741 by the late 1990s. Counter and rental clerks comprised 12 percent of the work force, as did employees in sales and related positions. Truck drivers accounted for 10 percent of employment, and general managers and executives represented 8 percent of the work force. Long-term employment prospects were generally positive for this sector. In fact, opportunities in most occupations should escalate more than 50 percent between 1990 and 2005, according to the Bureau of Labor Statistics. Positions for clerks and sales workers, for example, appeared likely to rise between 60 and 70 percent.

EMPLOYMENT AGENCIES

This category pertains to establishments primarily engaged in providing employment services, except theatrical employment agencies and motion picture casting bureaus. Establishments classified under this code may assist either employers or those seeking employment. Establishments primarily engaged in operating theatrical employment agencies are classified in **SIC 7922: Theatrical Producers (Except Motion Picture) and Miscellaneous Theatrical Services**; those operating motion picture casting bureaus are classified in **SIC 7819: Services Allied to Motion Picture Production**; farm labor contractors are classified in **SIC 0761: Farm Labor Contractors and Crew Leaders**; temporary help services are discussed in **SIC 7363: Help Supply Services**.

NAICS CODE(S)

541612 (Human Resources and Executive Search Consulting Services)

561310 (Employment Placement Agencies)

INDUSTRY SNAPSHOT

An employment agency’s major function is to place people into short- or long-term positions. The industry has been positively affected by the boom in technology, the government’s efforts to get more people off welfare and into employment, the shift from corporate paternalism to the independent portability of employment skills, and the growing need for professionals on short-term bases. One cannot discount the role of temporary employment firms as a try-before-you buy means of find-

ing full-time employees. Employment agencies are also beginning to offer retirement and health care benefits.

Approximately three million workers in the United States use employment agencies to find temporary work. During the 1990s staffing services was one of the fastest growing segments of the U.S. economy, and temp agency jobs doubled between 1994 and 2000. The financial impact of temporary placement services is evidenced by Adecco, the world’s largest providers of temp workers, which posted revenues of \$18.2 billion in 2002. By the early 2000s, nearly one in six young workers was expected to use an employment agency before the age of 35.

Employment agencies are susceptible to changes in the economy. In a strong economy, with low unemployment rates, candidate numbers tend to be lower, but many businesses come knocking, in need of help to identify high quality employees in a tight job market. Agencies may even have difficulty filling a customer’s request for employees. When the economy slumps, however, the number of people looking for work increases, and candidates flood the employment offices in search of work. With so many available workers vying for so few new jobs, in a recessive economy employment agencies tend to find themselves with too many potential employees and not enough business clients.

ORGANIZATION AND STRUCTURE

Employment agencies are defined by the National Association of Personnel Consulting as “offering an orientation of finding jobs for people; building a back log of screened candidates by consistent advertising and by referrals from satisfied candidates and employers.” Placement fees are paid by either the job-seeking candidate or the employer and are contingent upon an offer by the employer and acceptance by the job seeker. Fee structures vary but are generally based on a percentage of the annual salary of the job being filled. These fees are also known as contingency fees.

Employment agencies are also called personnel placement firms, personnel consulting firms, and personnel service firms. Executive search, recruiting services, “headhunters,” and other firms that help employers fill higher level executive and management positions and place qualified candidates for these particular jobs are sometimes also known as employment agencies. Private agencies are more likely to combine career counseling and placement as one service. Applicants are more “job-ready,” whereas public agencies deal with people who are deemed in great need of supportive services before being considered job ready.

Licensed employment agencies are paid by job seekers that come to them for placement. These agencies generally serve hourly workers, first-line supervisors without degrees, clerical workers, and entry-level techni-

cal and professional workers. Recruiters locate candidates for positions. Professional search consultants conduct in-depth searches for potential candidates to fill specific job openings.

Search consultants can work on either a contingency or retainer basis. A contingency search typically costs 20 to 30 percent of the hire's salary, paid once the search is completed. Retained searches, usually for top-level jobs, cost a third of the placement's first year pay package, a third of which must be paid up front. For both types of searches, however, other fee arrangements are possible. Some firms will cut their fees if they are guaranteed several assignments. Other recruiters have begun charging on a per-hour basis. With so many start-up firms looking for talent, recruiters, like accountants and lawyers, before them, have received equity stakes in lieu of cash compensation.

The staffing industry has consolidated significantly. In 1997 the staffing and IT services industry recorded 356 mergers and acquisitions, up 16 percent from the previous year.

BACKGROUND AND DEVELOPMENT

The business of serving as a broker between employers and those seeking employment has existed for centuries, beginning perhaps as early as the fifteenth century. The English practice of indentured servitude would fall under this definition because it involved men acting as employment brokers or agents of free workers. These brokers acted on behalf of employers who did not have easy access to laborers. They negotiated the contracts that bound these free people to work for a specified period. Indentured servants agreed to work in exchange for benefits that ranged from free passage to the New World to food and lodging.

The first known private employment agencies were called "intelligence offices," which began sometime in the early nineteenth century. In his book, Martinez cites the "Employers and Servants Protestant agency"—established in 1819 for the "better regulation of Domestic Servants"—as the earliest reference to a bona fide employment agency. Martinez also notes that the first large scale employment agency appeared in 1863 as the American Emigrant Company, created to "secure laborers and skilled workers for a number of American employers." Fees were collected from employers and registration fees exacted from European job seekers. The agency paid for transportation to the United States then was reimbursed via future deductions from the immigrant worker's wages.

Private employment agencies appear with more frequency in the latter nineteenth century as evidenced by classified advertising in newspapers of the period. Before World War I, private employment agencies recruited

manual laborers or female domestics. Almost anyone could be an employment agent—the middleman and often the only source of information between employers and prospective workers.

Immigrants were valuable commodities to employment agencies because they provided cheap, capable, and, to their detriment, naive labor. Because of this imbalance, many immigrants were abused by unscrupulous employment agencies. Employment agencies were often located in poor neighborhoods, saloons, and pool halls, usually as part of patronage systems in big cities like Chicago and New York. People who "got out the vote" were rewarded with jobs.

Agencies specializing in hiring women as domestic servants also concentrated on hiring African American and immigrant women. But there was a difference, states Martinez: "Male employment agents sold jobs to the applicants, while the domestic employment agents sold servants to the housekeepers. In each case, the object being sold was scarce and the buyers were plentiful. Thus the buyer or the party paying the fee was not given as much service as the more precious marketable commodity."

Private employment agencies often had less than stellar reputations. Besides instituting a form of legalized indentured servitude, many often trafficked in providing houses of ill repute with immigrants and minority women who were often unaware of the actual type of employment to which they were applying.

Specialization in the industry did not occur until after the turn of the century, when agencies began serving teachers, nurses, barbers, and engineers. But the generic employment agency in the early 2000s evolved from what was termed the "white-collar" agency that placed clerks, secretaries, and managers in office positions.

In the late nineteenth century, white-collar workers primarily obtained work on their own. But by the early years of the twentieth century, employers found it increasingly difficult to find qualified office help and became increasingly dependent on employment middlemen to bail them out. After World War II, this type of agency multiplied rapidly.

Regulation. Government-supported agencies, by contrast, existed as state and municipal agencies as early as 1834 to alleviate unemployment. The U.S. government established a federal employment agency in reaction to the economic crisis of 1907—its focus being the employment of newly-arrived immigrants.

This action paved the way for another federal initiative in 1913 when the Department of Labor separated from the Department of Commerce to "foster, promote and develop the welfare of wage-earners of the United

States, to improve their working conditions, and to advance their opportunities for profitable employment.”

Between 1914 and 1917, specialized services such as the National Farm Labor Exchange, Marine Placement, and youth services were attempts to establish a national employment agency. The U.S. Employment Service was created in 1918 but was deemed ineffective in resolving unemployment because after the war ended, so did the worker shortage. Placement work for soldiers, sailors, and other civil service government workers pressed into service during the war was also discontinued by the fall of 1919.

It would take the Great Depression for the U.S. Employment Service to be resurrected under the Wagner-Peyser Act in 1933. The agency's principle focus was to find jobs for the millions of unemployed by overseeing the functions of labor recruitment under the National Recovery Act and state employment services. Access to employment services as a right of American citizenship was formalized under this act's passage.

The emergence of a federal agency appeared to threaten those in the private sector. Private employment agency leaders charged the government with spending taxpayers' money to find jobs for people who were already employed. Instead, they supported using tax dollars only for training and employing the unemployed and called for restricting federal employment programs to people who qualified for unemployment insurance.

Widespread abuse of job seekers by private employment agencies, however, had prompted attempts by state governments to regulate the industry. At issue was whether individuals had a right to full employment for free or whether they had to pay for it. The prevailing view at this time was that private agencies exploited workers by charging exorbitant fees and not guaranteeing job openings, especially when work was scarce. Private employment agencies also inhibited the free flow of labor during times of high unemployment. By 1914, 24 states had tried to directly regulate private employment agencies, and 19 states had created free public employment agencies. By 1928, all but nine states had instituted some form of legislation to regulate private agencies, either directly or indirectly. Canada and several European countries were also in the process of banning such agencies and establishing nationalized employment services.

Reform. After World War II, private employment services underwent tremendous specialization in response to the changes affecting American industry, whereas public employment agencies remained relatively less specialized along occupational lines. In the 1940s people sat around or went out on day jobs. From 1947 to 1960, the employment placement fees were paid by the employee.

The private employment agency industry earlier had created its own trade association, the National Employment Association, which was renamed the National Association of Personnel Consultants in the 1970s. As a trade association, it set out to abolish abuses and end discriminatory hiring practices as well as to lobby for its member agencies. The National Association of Personnel Consultants in 1988 represented close to 2,000 member employment agencies nationwide, including regional, state, city, and local private employment agencies. In addition to representing its member employment agencies, the Association, based in Alexandria, Virginia, also conducted annual seminars and supervised the certification of employment agency professionals.

The debate over whether employment agencies should be run by the government or by privately held companies continued into the early 2000s. Both types of agencies exist either as state and municipal-run public employment services or as private personnel consulting (employment) agencies. Public and private employment agencies provide services to the public. A 1991 *Current Population Survey* by the Bureau of the Census noted, however, that “Job seekers using private employment agencies had the highest likelihood of finding employment in 1991; almost one-fourth of them found jobs. In contrast, job seekers placing or answering ads or using public employment agencies were among those least likely to find a job in the second month.” The survey also noted that “almost 28 percent of the women who used private employment agencies were employed by the second month. In contrast, private employment agencies were the least successful for men—less than 23 percent of them found jobs” in that time period.

Around 1,992 companies requested the staffing industry to supply quality applicants and reduced their number of staffing corporation relations to one or two. The staffing industry maintained a growth rate of 10 percent to 14 percent in the mid-1990s. Technology became a hot field of outsourcing. Companies were requesting more workers in the computer, health care, legal and finance fields as they focused on job flexibility.

A small but possibly significant factor in voluntary unemployment may be the number of people whose interest in managing their own careers transcends the old company paternalism idea as the growing concern for their dispensability creates greater anxiety. Some people may leave by taking advantage of voluntary or involuntary “buyouts” or because of changes in lifestyles where other factors become more important.

New demand for just-in-time temporary workers was created by temporary work surges. In 1995, a record 2.26 million temporary employees worked daily. Challenges in finding people with appropriate skills came from de-

mands for highly skilled workers and a shrinking labor force stemming from an aging population.

In 1998, revenues for the 59 public staffing firms tracked by Staffing Industry Report grew 27 percent, while net income was up 20 percent. These results were down slightly from 1997 levels, owing to soft demand in some sectors and tight recruiting markets.

By contrast, the government's emphasis on employing the unemployed fostered growth of placement agencies. At the same time, declining government involvement in the job search process fostered the process of self-placement. The unemployed prefer direct job applications and networking over more formalized methods. The shift in jobs out of the manufacturing sector in part eroded government placement as well.

Growth of the Industry. Rapid growth in what is known as the private personnel consulting/employment agency industry occurred within the last quarter of the twentieth century in response to a fluctuating economy. Double-digit increases in revenues throughout the 1970s and 1980s made executive recruiting a booming business. Some industry leaders attributed the slowed growth in revenues in the 1990s to the fact that the industry as a whole was maturing. Nonetheless, with rapid growth came calls for reform.

Private employment agencies are market-driven, money-making businesses. Some professionals advocated that agencies should concentrate more on developing relationships with employers in order to generate business. Employment agencies are being forced to provide a higher level of services such as reference verification, computer testing, and consulting to justify the fees they charge.

Other professionals called for revamped fee schedules and better working arrangements between clients and consultants. For example, Donald A. Levenson stated in *Personnel* magazine that recruiting fees should no longer be based on "rigid fee schedules" but on "the value of the job, the degree of difficulty anticipated in recruiting candidates and the level of service desired by the client."

An increasing number of managers in the publishing industry used professional search firms. Many companies used the Internet. National Personnel Associates, Inc., founded in 1956 to provide leading edge support to executive level contingency placement firms, maintained a Web site for the public and its members.

A growing number of employment agencies used employee benefits to recruit workers. Benefits including paid vacations and holidays, bonuses, health care insurance, computer training, stock purchase discounts, 401(k) pension plans, and advancement potential started to be

offered by major temporary help services in 1995. In a survey of 2,000 temporary workers by the National Association of Temporary and Staffing Services, 56 percent received holiday pay, 46 percent free skills training, and 39 percent had paid vacation days. Kelly Services provided a week's paid vacation after working 1,500 hours in a 12-month period and six holidays for qualified workers. Manpower Inc. offered the same, plus two weeks of vacation after 1,800 hours.

The "executive-for-rent" concept gained in a business world concerned with re-engineering and downsizing. Paul Dinte, one of the first to capitalize on the idea, formed a leading executive firm that provided executives on a temporary basis.

In late 1999, the employment picture was excellent. Unemployment stood at a 30-year low of 4.1 percent, a remarkable achievement when coupled with continued low inflation. Long-term prospects were bright as well. The U.S. Bureau of Labor Statistics predicted employment would increase 14 percent between 1998 and 2008, a gain of more than 20 million jobs. All of the job growth was expected in the services sector. In the goods-producing sector, a rise in construction employment was projected to offset declines in manufacturing and mining. Health, business, and social services, coupled with engineering, management, and related services, were expected to account for almost half the jobs added to the non-farm sector from 1998 to 2008. By occupation, the greatest growth was expected for computer engineers and support specialists.

The 1998 to 2008 forecast called for the number of jobs in the personnel supply industry to increase by 1.4 million. While at this rate annual growth would still be a respectable 3.7 percent per year, it would be substantially below the 9.1 percent clip recorded from 1988 to 1998.

Staff reductions induced by restructuring and corporate mergers continued to hurt workers in the late 1990s. Despite the tight labor market, corporations announced more than 680,000 job cuts in 1998, the highest number for any year in the 1990s. Many of the cuts stemmed from the economic crises in Asia, Latin America, and Russia, which hurt manufacturing export markets and also caused increased competition from imports. Mergers and acquisitions also contributed to the layoffs.

At century's end, however, the economy was producing so many jobs that laid-off workers usually found new employment, albeit not always at prior salary levels. Older workers had more to fear than the young, who moved easily into technology-related employment stemming from the rise of the Internet. But workers from every segment of society—including inner city youth who have often been locked out of private-sector

employment—were benefiting from strong growth and low inflation.

As employers scrambled to find qualified workers, even small businesses were turning to executive recruiters—formerly the preserve of major corporations—to staff their companies. Much of the new business was coming from high-tech start-ups, generously supplied with venture capital to acquire the talent they needed. In the booming equity markets for new companies in the late 1990s, these firms were also able to offer headhunters stock options in lieu of cash for conducting the search.

The outlook for employment firms was mixed. But the booming economy created an enormous need for workers, a need that often could only be satisfied with the use of professional employment firms. Still the technologies of the Internet and database management were making it possible for some companies and job seekers to bypass staffing firms altogether. Employers could post job descriptions at their company Web sites or in newsgroups and have workers from around the world respond. New specialized employment Web sites appeared daily, concentrating on employment in fields like accounting and software.

Indeed, online job-matching became one of the fastest-growing businesses on the Internet, generating \$105 million in 1998. Many employment firms were creatively using the Internet to attract clients and find hires. The Internet broadened and sharpened the tools available to agencies for researching and reaching potential job candidates.

Even in the Internet age, recruiters served important functions. They could still make the argument that the best candidate for the job is probably not looking for a job at all and that the recruiter was best placed to find him or her and make the initial overture. Recruiters can also act as go-betweens in salary negotiations, which is often the toughest part of bringing a candidate onboard.

CURRENT CONDITIONS

After incredibly successful years during the 1990s, fueled in part by the dot-com and technology industry boom, employment agencies entered the 2000s at a slowed pace. Just as insiders were analyzing the potential effects of an oncoming recession, the terrorist attacks of September 11, 2001 slowed the U.S. economy markedly. With nearly no new hiring taking place and an ongoing rash of layoffs and downsizing, employment agencies were deluged with people looking for jobs and few business clients looking for workers. The impact on the employment services sector was substantial. According to the U.S. Department of Labor, Bureau of Labor Statistics, the number of temporary jobs fell to 2.87 million by

November 2002, down from a high of 3.95 million during the summer of 2000.

Previously, many temp jobs resulted in full-time employment. It was a way for both the employer and the employee to take a test drive before signing the final papers. Many workers used temp positions with the stated intention of landing a permanent position within a company. However, the recession altered this basic assumption, and temporary suddenly actually meant temporary. By the end of 2002, some firms reported that temp-to-permanent opportunities had fallen by 50 percent. With fewer jobs available, unemployed skilled workers were being offered much lower paying positions, often well below their ability level.

At best, many workers became “permatemps,” that is, workers who are, for all practical purposes, permanently employed but are laundered through a temp agency to a business client. This situation tends to leave workers with no job security, and they are seldom provided the same level of benefits as regular employees. According to *The American Prospect*, temporary workers between the ages of 20 and 34 earn around 16 percent less than their peers who are regular employees doing the same work. Despite employment agencies touting available employee benefits, only 5 percent of this group is covered by employer-provided health insurance. In all, less than one in five temporary workers receives regular benefits such as health insurance coverage.

If workers who use employment services were taking a hit, so also were the agencies themselves. Although the leaders in the industry were expected to weather the storm by diversifying their offerings, smaller firms were more susceptible to shifts in the market. For example, during September and October of 2003, *Staffdigest*, a staffing industry magazine, contacted 591 staffing agencies around the nation. According to the results of their survey, 11 companies had been sold or merged with another staffing company, 94 had telephone disconnections, and 67 reported budget cuts. Thus nearly 30 percent had been somehow significantly affected by the recessive economy. The only segment of the industry that remained exceptionally strong was health care staffing, which continued to grow at a rate of 15 to 20 percent annually as a response to an ongoing shortage of registered and licensed practical nurses.

Those in the staff industry tend to be the first to suffer at the onset of difficult economic times; however, they are also often the first to begin feeling the benefits of a resurgent economy. As businesses regain strength, they often turn to employment services to fill the gaps in their workforce caused by previous layoffs and downsizing. Thus, the employment agency industry was expected to remain flat as long as the economy was sluggish, but an

upturn in the industry might point to renewed health in the overall economy.

INDUSTRY LEADERS

In 2003, staffing companies with the largest U.S. presence were Adecco SA, Manpower Inc., Kelly Services, and Gevity HR.

Switzerland-based Adecco was the largest employment agency in the world, with more than 250,000 clients and 6,000 offices in 60 countries. It was formed by the merger of Switzerland's Adia and France's Ecco. Adecco places temporary and permanent personnel in many industries. The company significantly increased its presence in the United States by purchasing New York-based Olsten Corporation early in 2000. Previously, Olsten had itself been a leader in the industry with over 1,400 offices in the United States and more than a dozen other countries. In 2002, Adecco reported a net income of \$256 million on revenues of \$18.2 billion.

Manpower had about 3,900 owned and franchised offices in 60 countries, primarily France, the United Kingdom, and the United States. Most of its revenue came from placing staff in offices and light industrial settings. The company reported a net income of \$113 million on revenues of \$10.6 billion in 2002.

Kelly Services, formerly known for its "Kelly girls," expanded from its female secretary roots to become the second largest temporary agency in the United States. In 2003 Kelly supplied around 700,000 to its 200,000 customers in 24 countries. Chairman and CEO Terence Adderley owned slightly more than half the company. Revenues were in 2002 were \$4.3 billion, resulting in a net profit of \$18.1 million.

Gevity HR, previously known as Staff Leasing, loaned out its 100,000-plus employees to do tasks like payroll administration, risk management, and benefits administration for some 8,000 clients. The firm's main customers were small businesses with two to 100 employees, primarily in construction and service industries like auto repair, beauty salons, etc. In 2002, the company reported a net income of \$4.7 million on revenues of \$374.7 million. Chairman Charles Craig owned about 21 percent of the firm.

Among the biggest Internet employment sites were Monster.com, HotJobs.com, CareerPath.com, and CareerMosaic. Yahoo was prominent in local and regional job listings. In the college market, JobWeb and Jobtrak were the top names.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, the number of workers in the personnel supply services industry totaled over 3.4 million in

2001, a figure that was expected to rise to 4.6 million by 2008. Management occupations, which accounted for less than 2 percent of the employment base, had a mean annual salary of \$70,040. Business and financial operations positions, including employment, recruitment, and placement specialists, totaled another 3 percent of the industry and reported a mean annual salary of \$47,930.

Office and administrative support positions accounted for more than 31 percent of all the industry's jobs. Top in-category occupations included general office clerks (223,450 jobs), secretaries (187,940 jobs) data entry keyers (87,020 jobs), receptionists (77,130 jobs), customer service representatives (73,930 jobs), book-keeping and accounting clerks (53,380 jobs), stock clerks (50,180 jobs).

Transportation and material moving occupations totaled nearly 19 percent of the industry's jobs. Top in-category occupations included freight and stock movers by hand (369,300 jobs), packers and packagers by hand (141,270), and truck drivers (78,150 jobs). Production occupations, including assemblers, machine operators, and production workers, accounted for over 17 percent of the industry's jobs and reported a mean annual salary of \$17,920. Healthcare occupations, dominated by registered nurses and licensed nurse practitioners, held nearly 4.5 percent of the industry's jobs.

Most agencies, public and private, prefer to hire college graduates for interviewer jobs. Expansion of the personnel supply industry, especially in the private sector, was expected to continue. In addition to private personnel firms there were a number of positions in state employment agencies. Earnings varied because private personnel firms tended to pay workers on a commission basis with total earnings dependent upon the volume and value of the business they brought in. Commission rates were usually 30 percent of whatever the client was billed. Some were paid on a salary plus commission.

RESEARCH AND TECHNOLOGY

According to Internet Business Network, there was expected to be a total of 28.7 million Web job postings in 1998 alone. Surveys in 1999 indicated that the Internet was second only to newspapers as a tool for recruiters and job seekers.

The use of computer databases and online services to track potential employees and job openings is increasing among employment agency professionals, who consider computer and the Internet as a low cost alternative to traditional search methods. A computer database contains information on likely candidates and can be compiled by an employment agency, search firm, or government office.

In a matter of minutes, a candidate's resume can be accessed from the database according to the qualifica-

tions, areas of expertise, and training specified in a search. Employment agency professionals can either use one of the estimated 159 recruitment databases on the market or develop their own.

Some databases are open to the general public, but most corporate job banks and other privately held recruitment databases are confidential and are restricted to employment agency personnel. Recruiting databases include the Bank Executives Network, Corporate Organization and Research Service, College Recruitment Database, First International Personnel Consultants, and the National Insurance Recruiters Association. Because companies are turning to employment agencies to find managers and specialists with more sophisticated skills, they are more likely to use employment agencies using the latest technology. Employment agencies, in turn, are able to charge a flat fee based on the difficulty of the job search via a computer database, instead of charging employers a contingency fee based on a candidate's salary.

SIC 7363

HELP SUPPLY SERVICES

This classification includes establishments primarily engaged in supplying temporary or continuing help on a contract or fee basis. The help supplied is always on the payroll of the supplying establishments but is under the direct or general supervision of the business to which the help is furnished. Establishments providing both management and staff to operate a business are classified according to the type of activity of the business. Also excluded from this industry are establishments primarily involved in furnishing personnel to perform a range of services in support of the operation of other establishments, which are classified in **SIC 8744: Facilities Support Management Services**. Establishments supplying farm labor are classified in **SIC 0761: Farm Labor Contractors and Crew Leaders**.

NAICS CODE(S)

561320 (Temporary Help Services)

561330 (Employee Leasing Services)

INDUSTRY SNAPSHOT

Temporary employment is viewed by many economists as a leading economic indicator due to the fact that businesses can instantly correct changes in demand by stepping up or scaling back their temporary help. Typically, demand for temporary works has slowed in periods of economic recession, including the mid-1970s, the early 1980s, and the early 1990s. After a decade of phenomenal growth—with industry revenue tripling between 1990 and 1999 and reaching an all-time high in 2000—growth in the help supply industry slowed in the economic recession of the early 2000s.

Annual revenue of temporary help services was \$56 billion in 2001, a 12 percent drop from \$64 billion in 2000. After a record-setting daily temporary employment of 2.54 million in 2000, jobs were reduced 14 percent, or

360,000, to 2.18 million in 2001, the lowest since 1996. Although in the late 1990s and 2000 temp agencies struggled to recruit and keep enough staff to fill a growing amount of demand, the economic slowdown and unemployment rates rising alarmingly high have contributed to the shrinking temp market, where many agencies are under increasing pressure to fill fewer slots with more qualified workers. While fewer temps were being hired for full-time positions, employee turnover at temp agencies dropped to 341 percent in 2001 from 418 percent in 2000. There were 9.6 million people employed by temporary staffing companies in 2001, with over half eventually moving into permanent jobs.

Staffing agencies have made work more attractive, offering benefits and other perks that were not traditionally associated with temporary employment. Though the industry's core markets lay in clerical and light industrial personnel, during the 1990s sizable markets emerged for technical and professional temps—everything from programmers and engineers to accountants and lawyers.

The industry has also been able to build revenues faster than net placement levels. Several trends contributed, including rising wages, greater numbers of higher skilled placements, and, most recently, value-adding human resources services offered by staffing firms. For example, the use of vendor-on-premises services, in which the agency places a coordination staff on a large customer's site to manage temps in person, grew from 2,000 worksites in 1995 to 4,500 in 1999. The same year, even though average placement levels edged up just 3.9 percent, industry revenue increased 9.5 percent.

Leading reasons cited by companies for hiring temporary employees included unexpected increases in business, to fill a vacancy temporarily, to fill in for absent regular employees, for special projects, for seasonal needs, to screen job candidates, for assistance in peak times, to save on wage and benefit costs, and to gain special expertise.

ORGANIZATION AND STRUCTURE

Companies contract with staffing agencies to obtain personnel on a contingency basis. Typically the temp earns less than his or her in-house counterparts and receives benefits, if any, from the agency rather than the host employer. The company requiring temporary help usually pays anywhere from 25 percent to 50 percent of a temp worker's hourly wage to the agency to cover its fees. Although this may make temps more expensive than in-house workers on an hourly basis, in the long run companies figure they save from the flexibility and reduced administrative burdens of having a smaller in-house labor force.

More than 23,000 temporary employment establishments in the United States were in operation in 1997,

more than twice the number that were operating in the early 1980s. The companies managing these operations were primarily small, independent, one-office concerns, with a handful of companies operating on a national, and sometimes international, level. The relatively low investment required to establish a temporary employment business has encouraged small operators to enter the industry since its inception and accounted for the large representation of such companies in the 1990s.

Compared to the average number of employees per establishment in all service industries, the average number of employees per establishment in the temporary employment industry is significantly larger because of the nature of the business. In 1997 the typical administrative service industry establishment employed 26 workers, whereas temporary employment establishments employed an average of about 111 workers. Revenues per establishment were also higher in the temporary employment industry than the average recorded by all other service industries, with the typical administrative service entity posting just over \$1 million in revenues compared to the average of \$2.43 million per establishment in the temporary employment industry.

Geographically, temporary staffing agencies are fairly evenly distributed throughout the United States. They tend to be located near their customers, and thus agencies are clustered in large metropolitan areas with strong white-collar employment bases.

BACKGROUND AND DEVELOPMENT

The need for temporary or emergency employment presumably has existed ever since industry and commerce in the United States reached substantial proportions; employees have always fallen ill, businesses have always experienced surges of growth and spasms of decline, and a certain percentage of the national labor pool has always been idle. On a theoretical level, therefore, the maturity of the U.S. economy should have induced the emergence of a class of workers willing to satisfy the sometimes fleeting employment needs of corporate America.

The genesis of the temporary employment industry, however, lagged far behind the establishment of the national economy. Although distant progenitors of the industry began emerging as early as 1910, the basic, modern structure of the industry as it exists today did not develop until after World War II. Undoubtedly, businesses and industries had relied on temporary help in some form much before this time, but the industry, as a definable and organized entity, did not appear until the immediate post-war years when two temporary employment companies integral to the industry's organization and growth, Kelly Girl Service and Manpower, Inc., first formed.

Once a need for temporary employees had been identified by these two early entrants in the industry, other similar businesses were formed in rapid succession. Entry into the industry required little capital investment, with costs incurred from recruiting, advertising, and rent standing as the only significant financial exigencies for the would-be owner of a temporary employment agency. Consequently, with virtually no initial need for fixed investment, and the latent demand for the type of service provided, a majority of the companies that would lead the industry for the next 20 years—Olsten based in New York, Employers Overload in Minneapolis, and Western Girl in San Francisco, in addition to Manpower and Kelly Girl—were already established by the early 1950s.

As the number of industry participants proliferated during the early 1950s, by infiltrating new, untapped markets, the range of services offered by the industry also broadened. Initially, temporary employment agencies provided employees to perform primarily office and clerical duties, the one notable exception being Manpower's industrial niche, but other companies began operating in the early 1950s that focused on providing technical workers, such as engineers, designers, and draftsmen, on a temporary basis. This trend prompted the creation of a new breed of temporary employees that would prove to be a highly lucrative component of the industry. Moreover, some temporary help companies added sales divisions during the decade to perform marketing and promotional assignments, further widening the scope of the industry's services.

The industry received its greatest surge of growth, however, from geographical expansion, as companies already established in the industry extended their reach across the country. Manpower, for example, had opened 21 company-owned branch offices in 13 cities by 1954, six years after it first opened its doors. That same year, Manpower also began offering a franchising program, followed by Kelly Girl Services, which enabled franchise ownership under the Kelly name a year later, in 1955. Expansion was not restricted to domestic markets but stretched overseas, when Manpower opened offices in London and Paris in 1956. By the end of the decade, the temporary employment industry generated annual revenues of approximately \$100 million.

For the industry, which essentially had been in existence for only ten years, these initial developments—the broadening range of services it provided, the proliferation of new companies, and the dramatic growth of existing companies—established a firm foundation for the industry's future, validating the assumptions of the industry's founders that, indeed, American business and industry had a large appetite for temporary employment help.

As the industry headed into the late 1950s and 1960s, a period during which temporary help companies, on the

whole, enjoyed phenomenal success, its clients began utilizing temporary help for different reasons. Originally, the demand for temporary personnel stemmed almost exclusively from the need to replace sick or vacationing employees, but gradually employers began using temporary employment agencies to fulfill more strategic needs. Historically, companies experiencing an upturn in business hired additional labor on a permanent basis to meet deadlines during peak periods of activity, but once business activity returned to normal levels, the added employees remained, saddling the company with excess staff. By utilizing temporary employees, however, companies could quickly hire and dismiss a portion of their staff according to the dictates of their business cycle. This payroll fluidity enabled personnel managers to incorporate temporary employees into management plans, rather than relying on them only in panic situations, which underscored the necessity of the temporary employee in the American workplace.
