According to the National Conference of State Legislatures, the average salary for state legislators in the early 2000s ranged from \$15,000 to \$60,000 for those states that paid an annual salary. Only eight states paid legislators for the days they were in session. U.S. Congress voted to increase members' salaries to \$154,700 annually for the year 2003, up from \$141,300 in 2000.

Minority and majority leaders, along with the speaker of the House, earned considerably more. But Congresspersons also enjoy a windfall of perks, and many representatives, after leaving their posts, are able to secure lucrative work as lobbyists, attorneys, and consultants. Gubernatorial salaries ranged from approximately \$65,000 to \$179,000.

AMERICA AND THE WORLD

Most industrialized nations have a legislative federal arm that resembles the one in the United States. They are typically bicameral, allow for some system of checks and balances with executive and judicial branches, and represent the general population to varying degrees. However, checks and balances on legislative powers varies greatly from country to country.

As of the close of the century, no global legislative body or entity yet existed. The United Nations continued to have its member nations adopt "resolutions," and envisioned enforcement power under its newly formed International Court of Justice, but its jurisdiction was limited to member nations only.

Of significance to the development of a global economy was the proliferation of multinational corporations, organized under the laws of one country but doing business worldwide. In the early 2000s, Internet business continued to usurp conventional marketing strategies, raising new issues about the scope of intellectual property law (rights to Web sites, trademarks and service marks, computer software, and so on) and the ability to enforce such laws in other countries. The need for a global legislative body, in conjunction with a global enforcement entity, became a topic of discussion.

SIC 9131

EXECUTIVE AND LEGISLATIVE OFFICES COMBINED

This category covers councils and boards of commissioners or supervisors and such bodies in which the chief executive is a member of the legislative body itself.

NAICS CODE(S)

921140 (Executive and Legislative Offices, Combined)

The U.S. government is distinguished by a strict separation of powers between federal and executive offices, as outlined in the U.S. Constitution. Likewise, most state constitutions embody this unique and important American division of legislative labor. It serves to reduce the power that government has over its citizens. However, many local governments are largely devoid of this separation of powers. For the sake of simplicity and efficiency, city and county governmental units often combine administrative and lawmaking functions.

The three primary types of city governments are: mayor-council, commission, and council-manager. Under the mayor-council arrangement, the mayor is technically charged with overseeing executive functions, such as formulating policy, presiding over functions, and preparing the budget. The council acts as the legislative body and establishes ordinances. In reality, however, the mayor often controls the actions of the council and ensures that laws are properly enforced. Most large cities still use a mayor-council government.

Under a commission form of city government, several commissioners are elected to serve as heads of city departments. A presiding commissioner usually acts as the mayor, but the commission oversees both administrative and lawmaking functions. Council-manager governments work similarly, but a council selects a city manager to run the government. City manager responsibilities vary, but many managers act in both legislative and executive roles to some extent.

During the early 2000s, most county governments in the United States used the commission, or board, arrangement. In 2002, there were 3,043 county governments, 19,431 municipal governments, and 16,506 town/township governments in operation throughout the United States. At the county level, for example, more than one-fifth were structured with combined legislative and executive responsibilities. By 2003, slightly less than 60 percent of counties operated under the commission form.

County boards are typically comprised of three to five members elected from county districts, though boards range in size from 1 to more than 100 members. Consolidation of the three branches of government is most common in the South, but the majority of counties combine at least the executive and legislative offices—a legacy of the English governing system. In addition to traditional boards, an increasing number of states have moved to a county-manager system, in which the commission selects a manager to serve in a capacity similar to that of a city manager.

Also at the county level, voters typically elect several officials, or row officers, to handle specific executive functions. Elected county officer positions may include sheriff, prosecuting attorney, treasurer, county clerk, clerk of court, and many others. The degree of control that the county board or manager exercises over the row officers varies by county, but the responsibilities of the officers commonly include legislative and executive duties.

In the early 2000s, city managers earned an average of \$92,338, and county managers earned an average of \$107,500. They commonly had a mix of education and experience related to public administration, business, and politics. Employment of city and county managers will likely increase as more entities adopt that form of government.

SIC 9199**GENERAL GOVERNMENT, NOT ELSEWHERE CLASSIFIED**

This group covers government establishments primarily engaged in providing general support for government, which include personnel, auditing, procurement services, and building management services, and other general government establishments, which cannot be classified in other industries. Public finance is classified in **SIC 9311: Public Finance, Taxation, and Monetary Policy**.

NAICS CODE(S)

921190 (All Other General Government)

The general government not elsewhere classified (NEC) division includes several offices and agencies associated with civil rights, civil service, accounting, personnel, purchasing, and supply. Three of the largest of these offices, all on the federal level, are the General Accounting Office (GAO), the Office of Personnel Management (OPM), and the General Services Administration (GSA).

The GSA establishes policy for and provides economical and efficient management of government property and records. It oversees the construction and operation of buildings; purchasing and distribution of services and supplies; disposal and use of property; management of general transportation, traffic, and communications; and management of automatic data processing resources. Established in 1949, this massive federal bureaucracy ballooned into about 20 separate Washington, D.C., units and programs, and 11 regional offices with thousands of workers by the mid 1990s. The administrator of the GSA is supported by his deputy and chief of staff. Offices under GSA control range from the Office of Child Care and Development Programs to the Office of Business, Industry, and Governmental Affairs and the Office of Emerging Technology. The 1999 estimated budget for the GSA was \$328 million dollars.

The OPM administers recruiting, examining, training, and promotion programs for federal workers. Its duty is to ensure that the federal government provides applicants and employees personnel services designed to develop and encourage the effectiveness of employees. The OPM also provides benefits to retired employees and their survivors. Established by the Civil Service Reform Act of 1978, the OPM inherited many of the responsibilities of the old Civil Service Commission. It is comprised of a director who oversees several offices, an Advisory committee, six functional groups (e.g. retirement and career entry), and five regional offices. OPM's estimated 1999 budget was \$48 million.

The GAO is the investigation arm of Congress. Established in 1921 by the Budget and Accounting Act of 1921, it examines matters relating to the receipt and disbursement of public money. It supports Congress primarily by auditing and evaluating government programs and activities, usually at the request of house committees and members. The GAO is charged with finding inefficiency, waste, fraud, and illegality in government programs and bringing them to the attention of Congress. It also develops and prescribes accounting and fiscal policies, and provides legal counsel and services to Congress related to money and expenditures. The 1999 budget for the GAO was \$354 million.

The Commission on Civil Rights, a smaller federal entity, collects and studies information on discrimination or denials of equal protection of the laws because of immutable physical characteristics, religion, or national origin. It was created in 1957 under the Civil Rights Act, and consists of 16 different offices, divisions, and units.

In addition to the GSA, OPM, GAO, and a few other separate entities, there are numerous branches and divisions of large federal offices that conduct activities similar to the major offices. Likewise, numerous and varied counterpart offices and agencies operate in state and local governments. Although general government NEC offices account for a significant portion of overall government employment, prospects for job growth are slim given public pressure to eliminate new government spending.

At the state and local level, cumulative government expenditures on construction, equipment, land, and maintenance of existing structures came to \$158.9 billion in 1996. State and local governments employed about 940,000 people in NEC administrative and otherwise unallocable positions during that year.

SIC 9211**COURTS**

This classification covers civilian courts of law. Military courts are classified in **SIC 9711: National Security**.

NAICS CODE(S)

922110 (Courts)

ORGANIZATION AND STRUCTURE

The law affects every aspect of modern society. It regulates the entire range of relationships among individuals, groups, businesses, and governments, defining rights and restrictions on conduct, communications, and transactions. Everything from paying taxes and entering into contracts to constructing buildings and punishing criminals is touched by the law. Even some aspects of personal relationships, such as divorce or child custody, are governed by law.

Because social needs and attitudes are continually changing, the law is also constantly changing. In many cases, the court system is the impetus for change. Judges play an important part in the development of the law by interpreting how particular laws apply to specific circumstances. When social mores change, judges—the interpreters of the law—can in effect rewrite the laws.

The court system is a vast network of federal, state, county, and local courts that provides a forum in which to interpret laws when disputes arise. Criminal matters are usually separated from civil matters, but a court of “general jurisdiction” may hear either. Issues that involve federal laws or the U.S. Constitution may be brought in federal district courts; matters between private parties are generally heard in a state’s “circuit court” or court of common pleas. Courts may gain jurisdiction over foreign defendants who have committed a criminal or civil wrong while in this country. Likewise, through the Alien Tort Claims Act, illegal aliens may sue American companies for wrongs committed in other countries.

The court system encompasses a wide array of external support entities such as sentencing boards, Friends of the Court, probation and parole boards, local police and sheriff departments, state prosecutors and public defenders, lawyers, public service and community organizations, law schools, correctional institutions, and, often, social services. Conversely, within a courtroom, there are bailiffs, court officers, court reporters, administrative staff, and, importantly, the judge’s clerk (a misnomer, as the clerk is usually a graduate law student or a full attorney, depending on the level of court).

Judges. Judges oversee the legal process and resolve civil disputes or determine guilt in criminal cases for which there is no jury. They also determine the procedural process to be followed in the courts and provide instructions to juries in cases for which a jury is seated. Judges are responsible for assuring that trials are conducted fairly and that individual legal rights are safeguarded—particularly in criminal cases. Judges typically listen to the attorneys for each party while they

argue their cases, examine witnesses, and present other evidence. Judges make rulings on the admissibility of evidence, methods of questioning witnesses, and legal validity of disputes between opposing attorneys.

Judges are also responsible for conducting pretrial hearings and other types of formal hearings. They may determine whether there is sufficient evidence to merit a criminal trial, establish whether bail will be allowed for criminal defendants, and set conditions for the release of an accused until trial. They may also rule whether certain evidence can be used at trial and whether television cameras will be allowed in the courtroom. Judges also decide whether a right to a trial by jury exists, and they make sentencing decisions.

Most judges have experience as lawyers prior to joining the bench. They are employed by local and county governments, state governments, and the federal government. Local judges are usually elected in local elections. State supreme court justices are appointed by the governor. Federal judges are appointed for life by the president, with the consent of the Senate. The prestige associated with being a judge fuels keen competition for these coveted positions.

Kinds of Courts. The Constitution of the United States divides the federal government into three branches of government: executive, legislative, and judicial. The executive branch includes the president, his cabinet, and certain federal agencies. The legislative branch is comprised of the U.S. Congress and certain federal agencies. The court system falls under the judicial branch, which is responsible for interpreting the laws passed by the legislative branch. Although the judicial branch is the smallest of the three branches, its power is significant.

The court system in the United States includes federal courts, state courts, and county or municipal courts. Each of these courts serves a particular purpose. In some cases, litigants must go to a particular court; in others, they may, to some degree, choose their “forum.” Court systems are generally three-tiered, whether federal or state. First, there are the trial courts, then the courts of appeals, and, finally, the supreme courts (the ultimate appellate courts).

The federal court system begins with the District Court, where trials are held for cases involving federal issues or where the parties to the case are from different states. If someone loses a case in District Court, he or she can appeal to the Court of Appeals in the appropriate district. The highest rung of the judicial branch is the U.S. Supreme Court—a body composed of nine justices, each appointed for life by the president. One justice serves as the chief justice.

The U.S. Supreme Court has discretionary authority to decide which cases it will hear. Cases come from more

than 100 federal courts and scores of state courts. The court accepts only those cases that it believes are of significant public concern—issues like abortion, racial integration, and school prayer have all been decided by the Supreme Court. Nearly all cases reach the court by a petition for certiorari (a legal document to call up another court's records), and the vast majority are denied. In fact, no petition is even considered unless at least one justice believes it important enough, at which point at least four justices must vote in favor of granting the petition for the case to be heard.

Once a case has been accepted for review, the attorneys for the parties submit to the court written arguments known as briefs. They can then make their arguments in a public courtroom. The justices reflect on the matter and hold weekly conferences to debate and discuss their ultimate decision. Only the justices are present during the conference in order to maintain complete secrecy until the decision is announced. After the conference, the chief justice makes assignments about who will write each opinion. However, if the chief justice votes with the minority, the most senior justice who votes with the majority will make the assignment.

The state court system operates both a civil court system, for civil disputes, and a criminal court system. The most minor civil suits begin at the local level with small claims court. This is a local court, usually serving a particular county, in which those with claims up to a certain amount of money (typically \$3,000 to \$5,000) can go to court and have a judge decide their case without the cost or assistance of an attorney. In fact, attorneys are usually not allowed to represent the parties in a small claims action. The next level of state court is the municipal or justice court. Typically, this court covers a county-wide area in which the county is divided into judicial districts. Municipal courts usually hold preliminary hearings for criminal matters to determine whether there is enough evidence for a trial to proceed, conduct trials for misdemeanor violations, and hear civil actions up to the jurisdictional limit, which varies widely. The monetary limit for these courts is higher than small claims court but usually lower than superior court, which is the next rung on the ladder.

Superior courts or circuit courts—generally one in each county—are where the majority of cases are heard, including felony trials, juvenile hearings, probate proceedings, divorce actions, and most other civil lawsuits, including business disputes, personal injury actions, and employment litigation. If a citizen loses a case in one of these trial courts, he or she typically can appeal to the court of appeals. If one still is not satisfied with the decision, he or she can take the case to the highest state court, the state supreme court. State supreme court justices, appointed by the governor, review decisions of the

court of appeal at their discretion and are not obligated to accept all cases for review. However, all capital offense convictions are automatically appealed to the supreme court. After that, the court of last resort is the U.S. Supreme Court, which hears only those cases the court feels are of great public concern.

Litigants who do not wish to wait for their day in court may consider “alternative dispute resolution,” such as binding arbitration or court-directed mediation. In most state courts, fewer than 10 percent of cases actually go to trial; by far the majority of them are settled or adjudicated by alternative means. By 2003, the American Arbitration Association (AAA) had more than 8,000 arbitrators in place throughout the world. In 2002 alone, the AAA participated in 230,255 cases representing \$728 million in claims. Nearly 3,300 of these cases were commercial in nature and involved claims of at least \$250,000.

BACKGROUND AND DEVELOPMENT

One of the first laws enacted by the first U.S. Congress was the Judiciary Act of 1789, which established a federal court system. It was somewhat of a duplication of the state court system, but the reasoning for the introduction of a federal system was sound. At that time, there was great fear of prejudice by the citizens of one state against another. It was believed that federal courts would assure out-of-state litigants a forum that would be free from local bias.

A landmark legal decision studied by law students across America is *Marbury v Madison*, decided in 1803. One cannot study the court system of today without understanding the historical underpinnings of the entire system, for it was this legal decision on which the system was founded. *Marbury* involved a struggle between different branches of government and found the judicial branch to wield the greatest power. The Supreme Court ruled that the judiciary had the power to review the constitutionality of a congressional law. This meant that although the legislative branch could pass a law, the judicial branch could review it and decide whether it was constitutional and how it should be applied to particular circumstances. This made the judicial branch the “final arbiter” of the law.

Another landmark decision affecting the court system was handed down in 1819, when the *McCulloch v Maryland* decision established the supremacy of federal law over state law. It also enunciated a doctrine of implied powers for the federal government that has become the cornerstone of federal power and one of the most basic aspects of American constitutional law.

The American court system of the late twentieth century operated, at least in theory, much the same way it always had. Little had changed in the way of formal

structure and organization. However, across the nation, particularly in major metropolitan areas, the courts became clogged with a morass of litigation, making it difficult for the system to keep up with demand. In many large cities, civil lawsuits took as long as five years to go to trial. In the criminal arena, some accused waited for periods of a year—or more—for their day in court. As a result, many prosecutors increased the use of plea-bargaining, wherein the accused pleads guilty, perhaps to a lesser charge, to try to alleviate the backlog of cases in the courts. In civil matters, divorce and child custody proceedings caused significant backups on the courts' dockets, causing many state courts to establish separate divisions for "domestic matters." Even the country's highest court, the U.S. Supreme Court, was dragged into controversy in 1999 when the National Association for the Advancement of Colored People (NAACP) and other African American groups publicly denounced the high court's low representation of minority law clerks working for the judges.

Between 1995 and 1999 the American public witnessed two major court events that changed perceptions of the legal system forever. First was the trial and ultimate acquittal of football celebrity O.J. Simpson for the murders of his wife, Nicole Simpson, and Ronald Goldman, who was with her at the time. Second was the televised impeachment trial of President Bill Clinton, also acquitted, for alleged perjury involving his illicit affair with White House intern Monica Lewinsky. In 1999, concerned that the general public believed trial outcome was more dependent on money and "who-you-knew" than on truth and merit, the National Center for State Courts (NCSC) conducted a national survey, funded by the Hearst Corporation, to gauge public trust in court systems. The results were not altogether surprising:

- Americans were generally split on whether they believed the media's portrayal of courts was accurate.
- A full 81 percent of Americans believed that politics influenced court decisions.
- Americans resoundingly (by 87 percent) believed that having a lawyer significantly added to the cost of going to court, and a surprising 6 of 10 Americans believed they could represent themselves in court if necessary.
- Most Americans (79 percent) believed that judges were honest and fair in deciding cases.
- Americans overwhelmingly believed that cases were not being resolved in a timely manner, and most gave an "average" grade to court performance in their communities.

A major court trend in the 1990s was the proliferation of "mass tort litigation," a term applied to multistate class actions by large groups of similarly situated litigants who

have suffered common injuries: breast implant, tobacco, and asbestos cases are a few. In 1998 and 1999, after nearly a decade in court, the largest of the breast implant manufacturers and tobacco companies respectively entered into settlement agreements coordinated by several courts that had originally "joined" the cases.

An issue among state legislators in the 1990s was the enactment of laws establishing monetary ceilings or "caps" on the amount litigants could be awarded in personal injury court cases. This trend was abruptly halted in 1998 and 1999, when several states' high courts overturned the laws, finding them unconstitutional and a violation of a person's fundamental right to have "his or her day in court" and be compensated for his actual loss, without limit.

CURRENT CONDITIONS

By the early 2000s, the nation's courts were contending with increased levels of overall activity. For example, according to the National Center for State Courts (NCSC), the number of cases filed in state trial courts reached 92 million in 2000-01—an eight-year record. This activity was partially fueled by a rise in domestic violence cases, which the NCSC said had increased 11 percent since the late 1990s. Not all forms of cases were on the rise, however. Felony cases at the state level were stagnant in comparison to the late 1990s, whereas tort filings had declined over the course of 10 years. At the state supreme court level, the NCSC reported that criminal petitions were increasing at a substantial rate.

According to the Justice Department's Bureau of Justice Statistics (BJS), in 2001 there were 2,341 local prosecutorial districts in 2001, 77 percent of which were overseen by a full-time prosecutor. This percentage was up from 53 percent in the previous decade. On average, these offices closed 976 criminal cases in 2001. However, this number varied considerably depending on the size of the office. For example, large offices averaged 48,000 cases or more, while this total was nearly 13,500 in mid-sized offices, more than 1,000 in smaller ones, and 300 in offices headed up by a part-time prosecutor.

Along with the rising pervasiveness of Internet connectivity, U.S. courts faced a larger number of cases involving so-called "cyber-crime." In 2002, the BJS reported that some 42 percent of prosecutors' offices "brought felony or misdemeanor charges of computer-related crimes. In terms of specific computer-related crimes, 30 percent of all offices prosecuted offenses dealing with the transmission of child pornography, 27 percent credit card offenses and 22 percent bank card fraud. Computer sabotage was prosecuted by 5 percent of offices and theft of intellectual property by 3 percent of offices." In addition to crimes pertaining specifically to computers, court cases increasingly involved technology

in general. One example is the increasing use of DNA as evidence. The BLS reported that approximately 66 percent of prosecutors' offices used DNA evidence in court during 2001, up from about 50 percent in 1996.

By the dawn of the twenty-first century, the highest courts of the land were still the arbiters of social, legal, and political disagreement, hearing and deciding issues unthinkable in earlier times: whether a woman may still be impregnated with frozen sperm if she is now divorced from the sperm donor; whether school districts may be sued by the parents of children harassed by other students; whether death by lethal injection constitutes "cruel and unusual punishment," or whether gun manufacturers may be sued for their roles in promoting violent crimes.

By 2003, the U.S. Supreme Court continued to hear cases of national importance, such as the use of tax dollars to fund religious education and how family medical leave policies relate to state employees. However, it also was forced to acknowledge the new political landscape that emerged after the terrorist attacks against the United States on September 11, 2001. One such case came from the 9th U.S. Circuit Court of Appeals. It involved prisoners from Afghanistan and other nations that the United States was holding prisoner at a military base in Cuba. According to the Associated Press, a coalition of clergy members and lawyers filed a lawsuit against President George W. Bush, Secretary of Defense Donald Rumsfeld, and other individuals claiming that the prisoners' basic human rights were being violated. Although the U.S. Supreme Court ultimately denied to hear the case, it demonstrates the complexity of issues the high court faced in the early 2000s.

AMERICA AND THE WORLD

In 1998 the International Criminal Court, which was the world's first permanent war crimes tribunal, was established in The Hague (Netherlands). Created by international treaty and adopted by 60 nations, it was empowered to try cases of human rights violations and aggression. The court parallels the International Court of Justice (ICJ), under charter of the United Nations (UN) at the Peace Palace in The Hague. The ICJ hears matters involving international law and also renders advisory opinions. Although these judicial efforts portended a significant international desire for a global "Big Brother," their enforcement powers are more specious than substantive: how do nations punish other nations for war crimes? Historically, trade bans and economic punishment have not worked and have often resulted in black market proliferation. Notwithstanding, the growing sentiment at the turn of the twenty-first century was for commonality and universal application of humanitarian law among civilized nations.

SIC 9221

POLICE PROTECTION

This industry classification includes government establishments primarily engaged in law enforcement, traffic safety, police, and other activities related to the enforcement of the law and preservation of order. The National Guard and military police are classified in **SIC 9711: National Security**. Private establishments primarily engaged in law enforcement, traffic safety, police, and other activities related to law enforcement are classified in **SIC 7381: Detective, Guard, and Armored Car Services**. Government establishments primarily engaged in prosecution are classified in **SIC 9222: Legal Counsel and Prosecution**. Government establishments primarily engaged in the collection of law enforcement statistics are classified in **SIC 9229: Public Order and Safety, Not Elsewhere Classified**.

NAICS CODE(S)

922120 (Police Protection)

ORGANIZATION AND STRUCTURE

Police protection encompasses a wide range of protective services, involving many different municipal, state, and federal government agencies. These agencies often have overlapping authority, creating a vast network of law enforcement functions. The broadest authority possible is given to certain federal agencies.

Local police officers have many responsibilities and work in major metropolitan areas, small towns, and rural areas. They may investigate crimes, arbitrate domestic disputes, administer first aid, direct traffic, or investigate fires. Some areas use police on foot, bicycle, or motor patrol, whereas many other officers have desk assignments wherein the voluminous paperwork required for law enforcement is completed. Others may be assigned to special units such as mounted police who patrol on horseback, rescue teams, canine corps, helicopter patrol, or youth gang detail. Some officers become experts of another sort, working in a laboratory doing chemical or microscopic analysis, firearms identification, or handwriting or fingerprint identification. Nearly all police officers must write reports and maintain police records.

Most police organizations have a chain of command similar to that commonly utilized by American military organizations. In large cities, sergeants, lieutenants, and captains direct the work of squads or companies of officers. Ranking officers report to a chief of police or a police commissioner. In small towns, however, the chief of police naturally commands a small force; in some instances, he or she may be the only officer in town.

Generally, local police departments are covered by civil service regulations that require applicants to pass a test for the job. Because of the physical and character demands of the job, applicants must pass a rigorous physical and psychological examination, as well as a background investigation. Each promotion to a higher rank may also require passage of an additional civil service examination.

County sheriffs generally cover rural areas or the outskirts of an incorporated city. In many cases, they are the only local police force, and in others they supplement the city police force. They often work as bailiffs, keeping order in courtrooms, and may work as guards in county jails. Many sheriffs' departments have fewer than 10 uniformed officers.

State police officers patrol highways to enforce traffic laws. They also provide aid to stranded motorists, call for emergency roadside services, and provide traffic control when road repairs are being made and during special events. State police have authority to enforce criminal laws and give traffic citations in local communities away from the highways, in most cases. They may also assist

local police in crime investigations or provide crowd control during civil disturbances.

Federal law enforcement efforts include a vast network of special agents that work for various federal agencies and investigate particular types of criminal activity. Federal agents wield much authority because of their nationwide jurisdiction—they can cross state lines and negotiate with law representatives of foreign countries. Border patrol agents are a good example of federal law enforcement efforts.

The Federal Bureau of Investigation (FBI) employs special agents who investigate serious crimes such as bank robberies, kidnapping, terrorism, organized crime, theft of government property, and espionage, among other transgressions. The FBI is one of the most technologically advanced law enforcement agencies in the country, and it concentrates its efforts on the most serious offenses. It also is called in to investigate crimes committed across state lines, where local police are unable to extend their authority. Agents for the FBI are graduates of accredited law schools or have accounting degrees or foreign-language skills.

Like the FBI, the Drug Enforcement Agency (DEA); the U.S. Marshals Service; and the Bureau of Alcohol, Tobacco, Firearms, and Explosives (ATF) are part of the U.S. Department of Justice (DOJ). DEA agents conduct investigations of illegal drug activity, often working undercover. They also may be involved in preparing documents to justify the seizure of financial and other assets gained by illegal activity. U.S. Marshals serve criminal warrants issued by federal judges and are often responsible for the safety and transport of jurors and prisoners. ATF agents investigate a range of illegal activity, from suspected illegal sales of guns, to underpayment of taxes by liquor importers, to illegal transport of cigarettes. Formerly part of the Department of the Treasury, the law enforcement function of ATF was moved to the U.S. Department of Justice on January 24, 2003.

Along with the U.S. Customs Service and the Secret Service, the Immigration and Naturalization Service (INS) is part of the Department of Homeland Security (DHS). INS agents enforce laws regulating the entry of aliens into the country. U.S. Customs agents enforce laws concerning smuggling of goods into the country, searching for banned items in tourists' belongings and among the cargo of ships and planes. The U.S. Secret Service not only protects the president, the vice president, their families, and visiting foreign dignitaries, but also investigates counterfeiting and the forgery of government checks or bonds. In addition to law enforcement agencies within the DOJ and DHS, the Department of the Treasury is home to the Internal Revenue Service (IRS). IRS agents investigate evasion of payment of federal taxes by U.S. taxpayers.

BACKGROUND AND DEVELOPMENT

The U.S. police system has its roots in England. The City of New York was so impressed with the efficiency of the London Metropolitan Police that it sent a delegation to London to study the department in 1833. The result was the formation of the New York City Police Department in 1844, the first of its kind in the United States. It was followed by the establishment of the Boston Police Department in 1850. Americans did not adopt the English system entirely, however. The English and European systems favored strong central government control. In contrast, Americans favored local control—the early settlers were suspicious of any type of centralized government control. Local autonomy was fiercely defended, which is probably why the United States still maintains local police forces.

The New England states became centers of commerce and industry, with a municipal-type government and a locally elected constable to enforce the laws. In the southern part of the country, which was more agricultural and rural, the county form of government was more suitable, and the county sheriff became the preferred law enforcement officer. The first state police agency was the Texas Rangers, created in 1835, and the first federal law enforcement agency was the Secret Service, formed in 1865.

As the twentieth century came to a close, the nature of police work was very different—and arguably more dangerous—than it had been many years before. For example, on July 24, 1998, Americans were shocked to learn that two policemen were gunned down in the line of duty while guarding the nation's Capitol in Washington, D.C. Thus, concern for protecting the protectors was justifiably heightened. In 1999, 10-year-old Stephanie Taylor of Oceanside, California, made national news when she raised \$3,000 to help purchase bulletproof vests for the city's local police dogs. In addition, the Police Executive Research Forum (PERF) remained very active in legislative lobbying on all matters involving gun control, a politically charged issue for all American following a deadly rash of school shootings from 1996-99 that killed dozens of students in various cities around the country.

Notwithstanding, stories of alleged police brutality continued to make headline news as the century came to a close. One of the most controversial stories involved New York police officer Justin Volpe, who in 1999 confessed to beating and sodomizing Haitian immigrant Abner Louima. Another politically charged matter was the string of appeals filed on behalf of death-row inmate Mumia Abu-Jamal, indicted for murdering a policeman in the 1980s.

On a national level, with the booming stock market of 1998 and 1999, there was an epidemic rise in securities and investment fraud. In 1998, the FBI reported 865

securities fraud indictments and informations, with seizures of nearly \$40 million and total restitution of over \$1.2 billion. By 1999, Internet-related stock fraud was costing investors \$10 billion per year. With an estimated 200 million Internet users in the year 2000, the number of online investors was expected to triple by 2003.

Another big crime market in the latter 1990s was a major increase in “product counterfeiting,” the unauthorized duplication and mass production of “bootlegged” videotapes, sound recordings, and computer software. In such matters, local police agencies often coordinate with the FBI in scam operations directed at containing the spread of this black market. The 1998 bombing of the United States Embassy in Nairobi, Kenya, the October 1999 crash of Egyptair Flight 990, and a rash of bombings at abortion clinics also resulted in the cohesive networking of local, state, and federal police authorities to combine resources for investigation and information processing.

CURRENT CONDITIONS

By the early 2000s, police agencies were forced to contend with unprecedented concerns about significant terrorist attacks on U.S. soil. On September 11, 2001, the worst terrorist attacks in U.S. history took place when hijacked commercial airliners were used to destroy the World Trade Center towers in New York. Other attacks that day involved a hijacked jet that damaged the Pentagon, as well as the crash of another hijacked jet in Pennsylvania. Subsequently, mail tainted with deadly anthrax bacteria was circulated in the U.S. postal system, causing several deaths and forcing the U.S. Postal Service (USPS) to implement a number of security measures. In addition to the anthrax scares, in 2002 a 21-year-old college student from Wisconsin planted 18 pipe bombs in rural mailboxes. Although no deaths resulted from the pipe bombs, a number of postal workers and residents were injured. During a time span of five days, the USPS dedicated some 150 postal inspectors to the case—which covered five states, including Colorado, Illinois, Iowa, Nebraska, and Texas—before it was finally resolved.

Conditions such as these led Congress to create the U.S. Department of Homeland Security. Along with the Homeland Security Council, this new government agency created the Homeland Security Advisory System, which uses five warning levels to communicate perceived terrorism “threat conditions” to the American people. These levels are: low (green), guarded (blue), elevated (yellow), high (orange), and severe (red). As the potential for an attack increased, state and local law enforcement agencies, as well as National Guard units, were increasingly involved in security efforts coordinated by various federal agencies.

Following the September 11 attacks, the FBI began sharing unprecedented levels of sensitive intelligence with local police executives, including police chiefs and sheriffs at approximately 18,000 U.S. police agencies. In some large cities, departments devoted entire units exclusively to counter-terrorism. For example, in the New York Police Department, some 1,000 officers were assigned to this task. In addition, 300 officers took part in a counter-terrorism bureau that was led by a retired general from the U.S. Marine Corps, according to the Associated Press. Task forces established by the FBI to combat terrorism even involved police officers from leading U.S. universities, where large numbers of foreign individuals come to study.

The potential for such attacks called for high levels of scrutiny to avoid possible disasters. This heightened need for vigilance also required continued cooperative efforts between citizens and police agencies. Many local agencies continued to adopt a "community policing" approach in which officers build close, ongoing relationships with residents and neighborhood organizations. The intention is to establish trust, solve problems before they lead to crime, and draw on citizens as a resource for crime prevention. Also, many police agencies and departments have secured Internet Web sites that provide information to the general public about police work. According to the Community Policing Consortium, by 2003 some 86 percent of Americans were protected by law enforcement agencies that relied on community policing. This was a significant increase from 1993, when only 15 percent of the population benefited from this added protection.

In 2002, Harris Interactive conducted a national opinion poll to gauge consumer opinion about police. According to the *Westchester County Business Journal*, the overall results were positive. The publication reported that, in the category of friendliness and helpfulness, 73 percent of respondents rated police as "excellent" or "pretty good." In terms of being responsive to calls for assistance, 68 percent of respondents gave police a positive score. An almost identical percentage (67 percent) gave police a positive rating for refraining from the use of excessive force.

WORKFORCE

In 2001, the U.S. Department of Labor reported that nearly 3 million people were employed in protective service occupations. This total included almost 600,000 police and sheriff's patrol officers and more than 87,000 detectives and criminal investigators. Most were employed by local government agencies, as there are about 18,000 state and local police agencies in the country.

Job stress is common for police officers, whose work brings them in contact with some of society's worst members and conditions, sometimes in life-threatening circumstances. In 1995, 162 officers died in the line of

duty, the highest number since 1989. By 1998, that number had come down to 137 police officers and detectives, but 38 of the 137 were homicide victims. In 2001, the number of officers killed in the line of duty had increased again, reaching 159. Of these, 39 were homicides.

RESEARCH AND TECHNOLOGY

Anyone who had not heard of DNA testing prior to the O.J. Simpson trial and President Clinton's impeachment trial probably learned more than he or she ever wanted to know about it during those few months of trial. Taxpayer dollars continue to help bring police agencies up to state-of-the-art technology in crime prevention and detection. New ways of identifying persons based on biological characteristics, such as "biologic fingerprinting," have evolved, as have electronic devices for pinpointing an officer's location. Additionally, by the late twentieth century many police agencies around the country had started implementing test devices for remote gauging of blood alcohol levels. Using this technology, persons on probation for substance abuse offenses could breathe into their specially equipped telephones from their homes, and their blood-alcohol levels would be electronically measured and transmitted to local police authorities.

SIC 9222

LEGAL COUNSEL AND PROSECUTION

This classification includes government establishments primarily engaged in providing legal counsel to or prosecution for their governments and operation or administration of crime prevention programs. Government establishments primarily engaged in the collection of criminal justice statistics are classified in **SIC 9229: Public Order and Safety, Not Elsewhere Classified**.

NAICS CODE(S)

922130 (Legal Counsel and Prosecution)

Criminal practice and procedure is an area of law that encompasses both private and public employment. As further discussed, those accused of a crime may hire private legal counsel for their defense or, if they qualify as indigent, may request the trial court to appoint counsel for them ("public defenders"). Conversely, all prosecuting and "district" attorneys are public employees at the local, state, or federal level. This is because all crimes, even if committed against individuals, actually are violations of local, state, or federal laws. According to U.S. Census Bureau statistics, there were at least 474,000 judicial and legal employees working at all levels of government in 2000, including approximately 400 federal magistrate judges. Magistrates render findings of probable cause, order warrants, and often conduct criminal misdemeanor trials.

Defense attorneys may represent clients accused of nearly any crime, including "white-collar" offenses such as fraud, stock manipulation, or tax evasion. Many defense attorneys work for a local office of the public defender—a state or county government agency established to provide legal representation for accused who cannot afford to hire a private lawyer. Because the U.S. Constitution guarantees the right to adequate legal coun-

sel, many people use this service. In fact, some offices are overwhelmed by the number of people in need of legal representation, in which case the court appoints an attorney from a private law firm—compensated at a given rate at government expense—to represent the accused. Defense attorneys also come from private law firms or from legal aid clinics established to provide legal services to the poor. Finally, public interest organizations, such as the American Civil Liberties Union (ACLU) and the National Association for the Advancement of Colored People (NAACP), among others, sometimes employ lawyers to represent clients in criminal court proceedings.

Prosecuting attorneys may work for federal government offices such as the Justice Department or the U.S. Attorney's Office, for state offices of the attorney general, or for a city or county in the office of the district attorney. The majority of prosecuting attorneys work at the county level as deputy district attorneys, representing the government against those accused of violating state and local laws, including the initiation of proceedings against inebriates, the mentally ill, narcotics addicts, and those accused of nonsupport of minor children.

The district attorney also is the legal advisor to the county grand jury, which is utilized to hear testimony and examine evidence for the purpose of determining whether an indictment will be pursued against the accused. District attorneys often maintain their own staff of investigators to pursue crimes of greater severity in efforts to assure a more successful prosecution. District attorneys may operate their own intelligence units to combat organized crime.

The Justice Department and U.S. attorney conduct investigations and prosecutions of serious federal crimes, such as political assassination, organized crime and racketeering, and crimes that take place on federal lands such as national parks, museums, and federal government buildings. Drug trafficking also falls within their jurisdiction. In 2003, there were 93 U.S. attorneys (appointed by the president of the United States) serving throughout the United States and its territories/possessions.

For lawyers interested in government service, job prospects may become brighter. Public concerns about crime and the administration of justice may lead to increased funding to payroll additional government-employed lawyers and judges. Government lawyers generally enjoy greater job security than lawyers in private practice but may earn significantly less, at least in the early stages of a career.

By contrast, government lawyers frequently are given greater responsibility at an earlier stage of their career than their counterparts in private practice. They sometimes handle trials for significant criminal prosecutions early in their career, often battling skilled and prom-

inent private lawyers in the courtroom. In addition, many government prosecutors and defense attorneys utilize the valuable experience gained through government service to successfully pursue careers in private law firms, elective office, or judgeships.

Prosecutors and defense attorneys primarily are employed by city and county government entities, as well as state and federal agencies. Some legal positions also are available in the armed forces. The majority of the lawyers who work for the government do so at the local level, where judicial and legal employees outnumber their federal counterparts more than four to one. Most of the lawyers working for the federal government are employed by the Departments of Justice, Treasury, and Defense, and advance through the civil service system.

SIC 9223

CORRECTIONAL INSTITUTIONS

This classification covers government establishments primarily engaged in the confinement and correction of offenders sentenced by a legal court. Private establishments primarily engaged in the confinement and correction of offenders sentences by a court are classified in **SIC 8744: Facilities Support Management Services**. Halfway houses for ex-convicts and homes for delinquents are classified in **SIC 8361: Residential Care**.

NAICS CODE(S)

922140 (Correctional Institutions)

INDUSTRY SNAPSHOT

According to the U.S. Department of Justice (DOJ), the incarceration rate in federal and state prisons and local jails nearly doubled from the late 1980s to the late 1990s. According to a report issued by the DOJ in 2003, the number of inmates in U.S. prisons and jails exceeded the 2 million mark for the first time in June 2002,

representing 1 in every 142 American citizens. Among these inmates, approximately 1.4 million were at the federal and state levels and nearly 665,500 were held in local jails. The male prison population ratio constituted 1,309 inmates per 100,000 Americans, whereas the female population accounted for 113 per 100,000. The number of inmates held in local jails, or in state and federal prisons, increased at an average annual rate of 3.8 percent from late 1995 to mid-2002. Despite a slowing growth rate, America's jails were filled to 93 percent capacity in mid-2002, up from 90 percent the year before but down from 97 percent in the late 1990s. By the late 1990s, federal and state prisons were operating at from 13 to 27 percent "above" capacity.

Americans are willing to pay for more correctional institutions, at a cost of between \$25,000 and \$30,000 per prisoner per year in recent years (not counting the burgeoning cost to the public for conviction appeals). With the exception of a slight increase in 2001, annual crime rates have steadily declined since peaking in 1991, although multiple reasons for the decline must be factored in. One has been an attempt to control of recidivism, or crimes repeatedly committed by the same criminal.

ORGANIZATION AND STRUCTURE

The correctional system in America, just like the government, is operated on four different levels: federal, state, county, and city. Each has jurisdiction over certain areas, but they also have some overlapping zones of responsibility. By the end of the twentieth century, there were approximately 3,300 jails in the country, by far the majority of them under the auspices of county governments.

Federal Prisons. The federal prison system, administered by the Bureau of Prisons, includes approximately 40 institutions designed to house men and women who have, for the most part, violated federal laws. Federal prisons are among the most heavily guarded in the nation and provide maximum security. Begun in 1891, the federal prison system was formed when Congress passed legislation to establish three federal penitentiaries at Leavenworth, Kansas; McNeil's Island, off the coast of Washington state; and Atlanta, Georgia. Each remain a part of the federal prison system today. These institutions were intended to house those convicted of serious felonies—murder, rape, kidnapping, treason, and the like. These were generally considered to be the most serious of crimes, and the criminals were considered to be the most violent and dangerous. The prisons built to house them were to provide the maximum amount of security against escapes, riots, or other disturbances. They were generally built away from cities and communities, often in rural areas, for few citizens want prisons located in their neighborhood.

But not all of the correctional institutions operated by the federal prison system are maximum-security facilities. Medium-security prisons exist in which prisoners may be afforded greater freedom of movement. Prisoners who have demonstrated good behavior may, in some cases, be transferred from a maximum-security prison to a medium-security facility or even a minimum-security facility. At these facilities, often referred to as “country clubs,” inmates are not subject to constant surveillance and are often housed in open, campus-like structures. They may have lounges, libraries, outdoor recreational facilities, and sleeping rooms rather than traditional cells. Golf courses, tennis courts, and swimming pools are not unheard of at these institutions, which house nonviolent offenders. Those found guilty of such white-collar crimes as forgery, embezzlement, and tax evasion are often sent to minimum-security correctional institutions.

Least restrictive of all federal institutions are the prerelease centers in metropolitan areas across the country. These centers were established to function as halfway houses to hold prisoners nearly due to be released. Prisoners housed at prerelease centers may hold jobs in the community, visit family, and receive counseling to prepare them for life on the outside.

The Bureau of Prisons is responsible for more than 102 facilities nationwide. Federal detention centers in New York and Arizona house those individuals awaiting trial on federal charges. Additionally, separate detention centers have been established to detain those suspected of entering the country illegally.

State Prisons. As for prison systems run by the states, each state has its own uniquely run prison system adapted to meet its own needs and the demands of its citizens. For example, states with expanding urban populations have experienced different crime problems than those in rural states.

City and County Jails. The city and county correctional facilities are known as jails, rather than prisons. There are literally thousands of local jails in cities and counties around the nation. These local jails include police precinct lockups where a person accused of a crime may spend a few hours, a few days, or several months. There is a technical distinction between prisons and jails. Prisons are for those people who have been convicted of a crime, typically a felony. Jails are generally reserved for those who have been accused of a crime and are awaiting trial or for those who are convicted of minor offenses, such as misdemeanors, where the period of incarceration is less than one year.

BACKGROUND AND DEVELOPMENT

Punitive imprisonment has its roots as far back as ancient Rome, Egypt, China, and Babylon, and was

firmly established in Europe during the Renaissance. But in many early societies, offenders were dealt with otherwise—exile, banishment, and barbaric physical punishments. The jail, the workhouse, the reformatory, and the convict ship all antedate the prison as we know it.

Throughout the eighteenth and nineteenth century, the Northern states led the way in prison development in the United States. In the 1820s, Northern cities such as New York attracted large numbers of homeless boys and girls. Many of the older ones turned to crime to support themselves, so in 1825 New York became the first American city to open a House of Refuge for delinquent juveniles. Boston and Philadelphia quickly followed suit. Although the original House of Refuge was a city institution, it became the precursor to statewide juvenile institution systems.

After the Civil War, regional differences between the North and South became even more pronounced. In the South, the land was devastated and the economy was poor. Southern states had little time, money, energy, or inclination to devote resources to their prison system, so the earlier custom of prisoners paying for their own upkeep was revived. Prisoners in the South were expected to earn their way by being thrust into labor-intensive work farms.

Clapped into leg irons and linked together with heavy chains—hence the term “chain gang”—prisoners throughout the South repaid the states for their room and board by building public roads and chopping brush near highways. Twelve-hour workdays were common and discipline was often enforced with a whip and a gun. Some prisoners were hired out to private companies as contract labor. The business owner assumed responsibility for clothing, housing, and feeding the prisoners, in exchange for the hard labor of the inmates. Some contractors saved money by nearly starving the prisoners and drove the men to work extremely hard. Contract labor and chain gangs were eventually outlawed.

As the number of female felons began to grow, Congress appropriated funds to construct the first federal prison for women in 1925—the Federal Reformatory for Women in West Virginia. These early federal prisons would prove to be only the beginning for the federal prison system, and the 1920s saw a rapid increase in the male prison population, due in some measure to the introduction of the automobile and Prohibition. Auto theft became an increasingly common occurrence, and Congress made it a federal crime to transport a stolen car across state lines. Prohibition, which halted the legal manufacture, sale, and transportation of alcoholic beverages, inspired bootleggers to commit many federal law violations. It was the crime wave during the Prohibition era in the 1920s that led to reorganization of the Federal Bureau of Investigation and creation of the Bureau of

Prisons, which Congress established in 1930, to oversee the entire federal prison system.

Throughout the latter half of the twentieth century, the ideological emphasis shifted away from the punishment methodology and toward rehabilitation of offenders. The assumptions of rehabilitation point to forces such as poverty, unstable family life, and limited mental capacity as producing maladjusted individuals who have difficulty conforming to society's rules. Rehabilitation proponents argue that given proper treatment and social services—educational, vocational, and psychiatric—the criminal can be remolded into a well-adjusted and productive member of society.

Since World War II, the pace at which treatment and rehabilitative services have been offered to prisoners has quickened. In the 1990s vocational and educational training, individual psychological counseling, group therapy, halfway houses, work release programs, and other behavior modification programs were all assimilated into the modern penal system. But the rehabilitative model has come under increased scrutiny. Some wonder whether it is working, with the ever-increasing numbers of violent offenders in U.S. society. Others wonder whether the causes of crime can ever really be diagnosed and treated. Critics point out that California, a state in which the rehabilitative model has been firmly entrenched, has one of the highest recidivism rates in the country.

CURRENT CONDITIONS

As of mid-2002, people in their twenties comprised more than 18 percent of inmates in federal or state prisons and local jails. Nearly 17 percent were in their 30s, and almost 11 percent were in their forties. Inmates aged 18 to 19 or over 55 represented the smallest populations, accounting for approximately 2 percent and 1 percent of inmates, respectively. Of all inmates, about 34 percent were white, 44 percent were black, and 19 percent were Hispanic. There were more than 165,800 incarcerated women, substantially outnumbered by approximately 1.8 million men. Notwithstanding, the growth rate for female inmates at state and federal prisons from 1995 to 2002 was higher (5.4 percent, compared to 3.6 percent for men).

In mid-2002, the nation's jails supervised 737,912 individuals, approximately 90 percent of whom were held in a jail facility. This overall total was an increase over 2000 and 2001, when jails supervised 687,033 and 702,044 people, respectively. Jails represent more of a transient inmate population than that found in prisons. Jail populations are typically comprised of many short-term offenders such as drunk drivers, domestic violence offenders, drug addicts, and weapons violators.

A controversial issue on the rise by the close of the century was the trend to "privatize" prisons, that is, to

house excess prisoners in privately owned, for-profit facilities. Several states were even negotiating with neighboring states to take their excess prisoners. By mid-2002, 6.1 percent of all inmates were held in privately operated facilities. This represented a decrease from the same period a year before, when this number totaled 8.8 percent. Of the 86,626 inmates held in private facilities in mid-2002, the majority (76.6 percent) were state prisoners, and the remainder were federal prisoners. Among the states, Texas and Oklahoma had the largest number of prisoners in private institutions, representing 12.4 percent and 7.8 percent of the total private inmate population, respectively. According to the U.S. Department of Justice (DOJ), the overall decline in privately incarcerated prisoners in 2002 was largely attributable to the state of Texas, where these types of prisoners dropped from 16,331 in late 2001 to 10,764 by the middle of 2002.

Another sensitive, and disturbing, issue was the increasingly violent nature of juvenile crimes. In the late 1990s and early 2000s, America reeled from news that young preteens were gunning down schoolmates, murdering their parents, and engaging in violent acts of animal abuse. Of particular controversy was the varied treatment of juvenile offenders within the criminal justice system, as different laws applied in each state. Whether to try violent juveniles as adults and place them in prison or to consider their ages as mitigating factors carried heated arguments on both sides and across all strata of the academic and professional communities. Because society has not been successful in "rehabilitating" violent offenders (recidivism remains frighteningly high), the way in which society addresses juvenile crime in the coming years will remain a high priority in Congress, in the courts, and in U.S. homes.

According to a Gallup poll conducted in September 2000 and cited in the DOJ's *Sourcebook of Criminal Justice Statistics 2001*, 49 percent of those surveyed felt that U.S. prisons were doing a good job at "maintaining high security to keep prisoners from escaping", whereas 18 percent rated prisons as doing an excellent job in this area. However, the poll revealed that Americans were less satisfied with prisons in other areas. For example, 48 percent of respondents indicated that prisons were doing a poor job of "rehabilitating inmates so they are less likely to commit crimes in the future." Another 34 percent rated prisons as doing a fair job in this regard. Finally, in terms of "maintaining a safe environment for inmates in prison," 37 percent gave prisons a fair rating, 26 percent gave them a poor rating, and 25 percent rated prisons as doing a good job.

WORKFORCE

According to the *Occupational Outlook Handbook, 2002-03 Edition* published by the Bureau of Labor and

Statistics, job opportunities for correctional officers are expected to be favorable through the year 2010, increasing faster than the average for all occupations. The average annual salary for federal correctional officers was \$37,430 in 2000. Employment of correctional officers at privatized facilities was estimated at 19,000 in 2000.

Expansion and new construction of correctional facilities is expected to create even more new jobs. In addition, employment of correction officers is usually not affected by economic conditions or the overall level of government spending because security is vital at penal institutions. In approximately 36 out of 50 states, correction officers are represented by labor unions. It is the correctional officers who enforce the rules and regulations of the nation's prisons, negotiating a highly stressful work environment on a day-to-day basis. Other staffers at federal prisons include social workers, psychologists, vocational instructors, teachers, doctors, and nurses.

SIC 9224

FIRE PROTECTION

This classification covers government establishments primarily engaged in fire fighting and other related fire protection activities. Government and private establishments primarily engaged in forest fire fighting and fire protection services are classified in **SIC 0851: Forestry Services**. Private establishments primarily engaged in other fire-fighting services are classified in **SIC 7389: Business Services, Not Elsewhere Classified**.

NAICS CODE(S)

922160 (Fire Protection)

INDUSTRY SNAPSHOT

Public fire departments responded to 1.73 million fires in 2001, according to the National Fire Protection Association (NFPA). At 6,196, civilian deaths in 2001 were significantly higher than the previous year (4,045). However, this total included 2,451 people who were killed during the terrorist attacks against the World Trade Center in New York on September 11, 2001. Had that tragic event not have occurred, the number of civilian deaths from fires would have decreased from the previous year. Property damage directly caused by fire increased steadily during the late 1990s and rose from \$10 billion in 1999 to \$11.2 billion in 2000. However, in 2001 these damages skyrocketed to \$44 billion because of the events of September 11. In fact, 76 percent of the damages recorded in 2001 (\$33.4 billion) were attributed to the September 11 attacks.

Fire incidence in major cities was at its peak during the civil unrest of the 1960s and 1970s. However, overall trends have been downward since the late 1970s. The number of fires fell from 3.3 million in 1977 to 2.3 million in 1987 and 1.8 million in 1997. This decrease is due in part to improved fire code enforcement, mandatory sprinkler and smoke alarm laws, an increase in the utilization of other fire prevention methodologies, and innovations in fire-fighting technology.

Even today, though, the United States has the highest fire death rate of any industrialized country. Researchers have linked this fact to a difference in attitudes, pointing out that families who experience fire loss are ostracized in countries such as Japan and Holland. Fire departments in other countries also tend to devote a much larger portion of resources to prevention rather than suppression.

ORGANIZATION AND STRUCTURE

Fire departments have two basic fire-related functions: prevention and suppression. Fire prevention activities aim to keep fires from starting. Fire suppression activities seek to put out fires once they have started, to rescue individuals, and to protect property from the paths of fires. More and more, fire departments also operate emergency medical services and air crash services that relate only tangentially to the problems of fires in structures.

In most urban areas of the United States, the fire-fighting service is primarily the responsibility of the local government. In suburban and rural areas, either independent voluntary organizations or profit-making firms may provide the service instead. Most professional fire departments today have a past that includes volunteer elements, with traditions dating back, in some cases, to the nineteenth century or even colonial times.

The local nature of fire protection reinforces individual fire department identities. Variations in procedures

also reflect regional differences in building construction and environmental conditions. The major influences at the national level are the National Fire Protection Association (NFPA), a consensus standard making organization; the U.S. Fire Administration (USFA), a directorate within the Federal Emergency Management Administration; the USFA's National Fire Academy (NFA); the International Association of Fire Fighters (IAFF), the largest union; and the International Association of Fire Chiefs (IAFC).

Cities across the nation have made significant cuts in their budgets to adapt to a changing economic environment. Additional budget pressure has come from mandates for safer equipment and specialized training in such areas as hazardous materials and medical response. These demands have increased at the same time that the declining fire rate provides less actual fire-fighting experience to younger members, thus creating the need for more training in fire-fighting basics.

CURRENT CONDITIONS

Frequently the first emergency response teams to arrive on scene, fire departments are taking on larger roles in emergency medical treatment, natural disasters, and terrorist incidents. This also puts fire department personnel at more risk. This was especially evident in New York City on September 11, 2001. On that tragic day, an unprecedented number of firefighters (340) were killed, along with a chaplain and two paramedics. This stands in stark contrast to the 99 deaths that took place in other incidents across the country that year. Shockingly, the number of firefighters who lost their lives on September 11 exceeded the number of full-time firefighters killed on the job over the previous 20 years. In the wake of this disaster, many citizens developed an even greater respect for America's firefighters. For example, following September 11, it was not uncommon to see people wearing apparel with the "FDNY" insignia in cities across the nation.

In addition to the events of September 11, a bombing in the late 1990s involved a "secondary bomb" timed specifically to target responders arriving to provide aid in the wake of the initial attack. Additionally, responders at Columbine High School in Littleton, Colorado, came under attack while rescuing injured students. Many fire departments now are working closer with law enforcement to manage these mass casualty incidents.

Fire departments continue to struggle to meet tightened safety standards from two sometimes conflicting sources: voluntary standards promulgated in recent years by the NFPA and mandatory standards of the U.S. Occupational Safety and Health Administration (OSHA). Newer equipment—such as insulated pants-and-jacket combinations—also has had physical and psychological

effects on individual firefighters. Meanwhile, changes in the building environments, such as synthetic materials and thermal-insulating windows, create fires of greater intensity and toxicity.

The U.S. Bureau of Labor Statistics forecasts that these pressures will move smaller departments from volunteer toward paid membership, creating new jobs. Larger, urban departments, however, are likely to have little job growth.

Although the nation's fire departments face situations that are more complex and dangerous than ever before, as well as more stringent standards, many fall short of having the resources required to carry out their duties. According to the *Needs Assessment Study of the U.S. Fire Service*, conducted by the NFPA for the U.S. Fire Administration (USFA) and released in 2003:"

- Many of the nation's fire departments do not have enough fire stations to achieve widely recognized response-time guidelines and lack key equipment, prevention programs, and a wide range of training.
- Approximately a third of all firefighters per shift are not equipped with self-contained breathing apparatus (SCBA).
- Most fire departments do not have the ability to handle unusually challenging incidents with local specialized resources and do not have written agreements to direct use of nonlocal response resources.
- In general, fire departments do not have enough portable radios to equip more than about half of the emergency responders on a shift, and most radios lack intrinsic safety in an explosive atmosphere and are not water-resistant."

WORKFORCE

Because fire fighting is such a specialized occupation, many people who begin their careers as firefighters with a particular department remain with that department for the duration of their career. Fire fighting is a uniformed, quasi-military service. Firefighters typically work swing shifts or long shifts and work in groups of 5 to 12 people. Most firefighters rotate on a 24-hour work shift, with many firefighters moonlighting in different trades during their off hours.

Important legislation passed in late 1999 amended the Fair Labor Standards Act (FLSA) to add a definition of a firefighter. FLSA has a special overtime exemption to accommodate the unusual schedules of local government fire and emergency services agencies, in part used due to the unpredictable nature of emergencies. This exemption allows an average of 53 hours per week before overtime is due. However, prior to 1999, the FLSA did not explicitly define firefighter, leading to inconsistent court interpretations on whether incidents involving

emergency medical services were covered under the firefighter exemption. The new legislation, supported by both labor and management, defined a firefighter as an employee trained in fire suppression who has the authority and responsibility to engage in fire suppression and is employed by a fire department of a municipality, county fire district, or state. Under the legislation, the firefighter is covered under the exemption whenever he or she is engaged in the prevention, control, and extinguishment of fires or response to emergency situations where life, property, or the environment is at risk. This definition of a firefighter was also adopted under the Standard Occupational Classification (SOC) guidelines issued by the Department of Labor, Bureau of Labor Statistics.

In 2000, there were approximately 258,000 firefighters on payroll in the United States, along with 62,000 first-line managers or supervisors and 13,000 inspectors. In a recent year, approximately 804,200 people were volunteer firefighters. The fire service is overwhelmingly male and traditionally blue-collar. Entry to most career fire departments is based on competitive testing, with rigorous tests for physical strength and agility. Promotion is often based on a combination of competitive testing and seniority. Paid departments experience little turnover. Many departments are beginning to require some college education for promotion.

When full-time firefighters are used exclusively, labor costs—including benefits—may exceed 90 percent of the total costs of fire service delivery. Nearly 80 percent of active firefighters are union members. Fire departments have a low rate of turnover; most job openings result when firefighters retire or change careers.

A major and legitimate concern of firefighters is safety. The rate of deaths in the line of duty is much higher for firefighters than for police officers or other city employees. The USFA reports that approximately 100 firefighters die each year in duty-related incidents. Exposure to heat, smoke, and building collapse pose intense danger. Moreover, smoke inhalation may cause respiratory problems, heart failure, and cancer. One response to the danger has been more generous death, disability, and retirement benefits for firefighters.

SIC 9229

PUBLIC ORDER AND SAFETY, NOT ELSEWHERE CLASSIFIED

This category covers miscellaneous government establishments primarily engaged in public order and safety, not elsewhere classified, including general administration of public order and safety programs. Collection of statistics on overall public safety also is included.

NAICS CODE(S)

922190 (All Other Justice, Public Order, and Safety)

This government group includes several miscellaneous safety, emergency preparedness, and statistical offices, most of which operate as components of other major government offices, centers, and bureaus. In addition to federal units, each state maintains its own safety, order, and statistical programs, often in cooperation with federal initiatives. Eight of 10 government inspection and compliance positions in the United States are for the purpose of preserving the general welfare and safety of its citizens. These include mine safety and health inspectors, consumer safety inspectors, and highway safety investigators. According to the U.S. Census Bureau, there were approximately 163,000 inspectors and compliance officers employed during the 1990s (the latest available statistic). Of these, state governments employed about 34 percent, the federal government employed about 31 percent, and local governments about 18 percent. The remaining 17 percent were employed in various private sector positions.

Safety offices exist in a number of major U.S. federal government departments. The Food Safety and Inspection office, for example, is part of the Department of Agriculture and is directed by the Assistant Secretary of Marketing and Inspection Services. It was established in 1981 to regulate and enforce food safety in the meat and poultry industries. The responsibility to monitor the safety of egg products was added in 1994. Likewise, the Center for Food Safety and Applied Nutrition conducts research and develops standards for foods, including additives and colors. It is part of the federal Department of Health and Human Services.

In addition to food surety, several safety offices are operated within the U.S. Department of Transportation (DOT). The Port Safety and Security Program, for instance, is administered by the Coast Guard to enforce marine safety in ports and anchorages. The Federal Highway Administration, also a DOT office, operates a highway safety program that researches and constructs safer roadways. Similarly, the DOT's National Vehicle Safety Program conducts numerous driver and vehicle safety services and educational programs. Besides the DOT, other offices with major safety programs in this category include the Consumer Product Safety Commission, the Defense Nuclear Facilities Safety Board, the National Transportation Safety Board, and the Occupational Safety and Health Administration.

In response to increased terrorist threats, which included attacks against the United States on September 11, 2001, as well as mail tainted with anthrax, the U.S. Department of Homeland Security (DHS) was formed. The Senate approved the new agency in November 2002 as the 107th Congress came to a close. According to the DHS, its formation represented the "most significant transformation of the U.S. government since 1947, when Harry S. Truman merged the various branches of the U.S. Armed Forces into the Department of Defense to better coordinate the nation's defense against military threats."

The DHS includes 22 different government departments that President George W. Bush consolidated in order to better protect the nation. According to the DHS, "The new department's first priority is to protect the nation against further terrorist attacks. Component agencies will analyze threats and intelligence, guard our borders and airports, protect our critical infrastructure, and coordinate the response of our nation for future emergencies. Besides providing a better-coordinated defense of the homeland, DHS is also dedicated to protecting the rights of American citizens and enhancing public services, such as natural disaster assistance and citizenship services, by dedicating offices to these important missions."

The DHS consists of five major divisions. The first and largest is Border and Transportation Security (BTS), followed by Emergency Preparedness and Response (EPR), Science and Technology (S&T), Information Analysis and Infrastructure Protection (IAIP), and Management. These divisions encompass a variety of agencies, including the Transportation Security Administration, the U.S. Customs Service, and the Federal Law Enforcement Training Center. In addition to these five divisions, the DHS also includes the U.S. Coast Guard, the U.S. Secret Service, the Bureau of Citizenship and Immigration Services, the Office of State and Local Government Coordination, the Office of Private Sector Liaison, and the Office of the Inspector General.

Federal public order offices and agencies also exist under several major departments. One of the largest of these departments is the Federal Emergency Management Agency (FEMA), which responds to national disasters. Established in 1979, it is the focal point within the federal government for emergency planning, preparedness, mitigation, and response. Previously an independent government agency, FEMA was moved under the newly formed Department of Homeland Security in March 2003. From its 10 regional offices, FEMA works closely with state and local governments to provide training and to administer relief programs. It also oversees a taxpayer-supported insurance program that provides inexpensive coverage for homeowners in flood plains destined for destruction. FEMA provided important emergency relief in the 1990s for victims of Hurricane Andrew, Midwest floods, the Oklahoma bombing of a federal building, and a Los Angeles earthquake.

In the early 2000s, FEMA played an instrumental role in responding to the September 11, 2001, terrorist attacks. According to the agency, during that disaster FEMA "coordinated its activities with the newly formed Office of Homeland Security, and FEMA's Office of National Preparedness was given responsibility for helping to ensure that the nation's first responders were trained and equipped to deal with weapons of mass destruction." The U.S. International Development Cooperation Agency's International Disaster Assistance Program provides relief for foreign catastrophe victims.

Like safety and public order offices falling under this classification, several federal departments maintain programs that collect and evaluate safety statistics. Among the largest of these offices is the Department of Commerce's U.S. Census Bureau, which keeps tabs on U.S. households and related demographic data. The Bureau of Justice Statistics collects crime data for the Department of Justice. The DOT has several safety data programs as well, such as the Bureau of Transportation Statistics.

Together, the terrorist attacks against the United States on September 11, 2001, in which hijacked commercial jets were used to destroy the World Trade Center towers in New York and inflict damage on the Pentagon, represented the greatest threat to public security in U.S. history. In addition to the massive cooperation that was necessary among various federal, state, and local officials to deal with the attacks themselves, these agencies faced an entirely new environment afterward, in which the threat of terrorist attacks became commonplace. Along with the Department of Homeland Security's Homeland Security Council, this new government agency created the Homeland Security Advisory System. The system uses five warning levels to communicate perceived terrorism "threat conditions" to the nation. These levels are: low (green), guarded (blue), elevated (yellow), high

(orange), and severe (red). As the potential for an attack increases, state and local law enforcement agencies, as well as National Guard units, are increasingly involved in security efforts coordinated by various federal agencies.

Another recent challenge for public safety offices was “Y2K readiness,” with intense focus on potential computer failures and “cyberterrorism.” By 1999, computers across the nation controlled everything from hospital emergency power to wastewater treatment. A single failure could have affected large numbers of people. For this reason, an estimated 5 million Americans worked through the New Year’s weekend in a state of preparedness for any disaster or catastrophe that might manifest. Two million of these were federal, state, and local government employees. FEMA established 10 regional centers to monitor potential catastrophes and in such an event would have had backup support from 26 federal agencies and the Red Cross. The federal government also established 15 emergency command posts continuously feeding reports back to Washington throughout the holiday weekend.

SIC 9311

PUBLIC FINANCE, TAXATION, AND MONETARY POLICY

This industry classification includes government establishments primarily engaged in financial administration and taxation, including monetary policy; tax administration; collection, custody, and disbursement of funds;

debt and investment administration; government employee retirement and other trust funds; and the like. Income maintenance program administrations are classified in **SIC 9441: Administration of Educational Programs**. Government establishments primarily engaged in regulation of insurance and banking institutions are classified in **SIC 9651: Regulation, Licensing, and Inspection of Miscellaneous Commercial Sectors**.

NAICS CODE(S)

921130 (Public Finance)

INDUSTRY SNAPSHOT

The economic policy in the United States is determined by a complex web of organizations representing both the legislative and executive branches of government. The economic policies covered in this classification can be broadly divided into fiscal policies and monetary policies.

In general, fiscal policy is the policy of a government with respect to taxation, the public debt, public expenditures, and fiscal management. These policies serve to stabilize the national income of a country. In the United States, a policy of stability and growth has traditionally been pursued. The Employment Act of 1946 explicitly required the government to create and maintain “useful employment opportunities, including self-employment” and to promote production and a high standard of living in a manner that is consistent with free enterprise. The fiscal policy of the United States is determined and implemented by the Congress and the president by changing deficit expenditures and/or changing federal tax rates. Fiscal policies can be expansionary or contractionary. Expansionary policies can take the form of either a decrease in tax rates that increases private sector expenditures or an increase in government spending. Contractionary policies are decreases in deficit spending caused by either an increase in tax rates that decreases private expenditures or a decrease in public expenditures.

In general, monetary policies are government policies that relate to the supply or the use of money. This policy is implemented through the control of credit exercised through the central banking authority. Typically the objective of a monetary policy is to achieve price stability in the economy. In the United States, monetary policy is controlled by the board of governors of the Federal Reserve. The instruments used in the implementation of monetary policy include open market operations and variations in rates for rediscounts, loans, and advances in the legal reserve requirements. All of these have an impact on both the availability and cost of bank credit.

In setting its policies, the Federal Reserve Board looks at three measures of money. The first is called M1 and refers to the currency in the hands of the public, demand

deposits, and interest-bearing checking accounts. Second is M2, which includes assets in M1 plus all deposit liabilities of depository institutions, money market funds, overnight repurchase agreements, and overnight Eurodollars. Third is M3, which includes M2 plus large denomination time deposits, term Eurodollars, and all other repurchase agreements. Broad measure of liquid assets, L, is also regularly reported by the Federal Reserve.

ORGANIZATION AND STRUCTURE

The organizations responsible for public finance, taxation, and monetary policy can be divided into two categories: government agencies and legislative committees. The various agencies and departments are primarily responsible for implementing policy measures. The most important agencies are the Commerce Department, the Congressional Budget Office, the Council of Economic Advisors, the Federal Reserve System, the Internal Revenue Service, the Office of Management and Budget, Small Business Administration, the Treasury Department, and the U.S. Trade Representative. The most important legislative committees are the House Banking and Finance Committee; the House Budget Committee; the House Ways and Means Committee; the Joint Economic Committee; the Joint Taxation Committee; the Senate Banking, Housing, and Urban Affairs Committee; the Senate Budget Committee; and the Senate Finance Committee.

The Commerce Department. The U.S. Commerce Department provides business and government with relevant economic statistics research and analysis. The Commerce Department acts as the principal advisor to the president on federal policy affecting industry and commerce. The department develops and maintains macroeconomic models and other analytical tools necessary to analyze economic policy issues such as the effect of federal legislation, regulations, and programs. The department also promotes national economic growth and development, competitiveness, international trade, and technological development. As one of the government's main sources of economic data, the Commerce Department maintains the Economic Bulletin Board; the National Trade Data Bank; and the National Economic, Social, and Environmental Data Bank.

Created on March 4, 1913, the Commerce Department is headed by the secretary of commerce and is divided into five sections—each headed by an undersecretary. These sections are the National Oceanic and Atmospheric Administration (NOAA), the International Trade Administration (ITA), the Bureau of Export Administration, Economic Affairs, and the U.S. Travel and Tourism Administration.

The Congressional Budget Office. The Congressional Budget Office (CBO) is a nonpartisan office that provides the House and Senate with budget-related information

and analyses of fiscal policies. The CBO does not make policy recommendations but limits its activities to presenting options for consideration. The Balanced Budget and Emergency Deficit Control Act of 1985, also known as the Gram-Rudman-Holings Law, assigned the CBO the additional tasks of reporting whether the projected federal deficit exceeds the legal limits, calculating the amount of excess that must be removed to eliminate any deficit excess, and alerting the Congress to a recession in the economy that might require the suspension of deficit targets.

The CBO is divided into six divisions, each administered by a director and a deputy director. The directors are appointed to four-year renewable terms by the Speaker of the House and the president pro tempore of the Senate based on the recommendation of both budget committees.

The Council of Economic Advisors. The Council of Economic Advisors (CEA) is comprised of three members and a supporting staff of economists. The CEA advises the president on economic developments, trends, and policies, as well as preparing the Economic Report of the president for Congress. The CEA was established by the Employment Act of 1946 and is an agency within the executive office of the president. The members are appointed by the president with the advice and consent of the Senate.

The Federal Reserve System. The Federal Reserve System is responsible for setting U.S. monetary policy. The system is the central banking structure of the United States and was created by the Federal Reserve Act in 1913. It influences credit conditions through buying and selling treasury securities in the open market, fixing the amount of reserves depository institutions must maintain, and determining interest rates. The Federal Reserve Board chairman and vice chairman are appointed by the president for four-year terms. The remaining seven members of the board are appointed for 14-year terms.

The Internal Revenue Service. The primary responsibility of the Internal Revenue Service (IRS) is the administration and enforcement of internal revenue laws except those related to firearms, alcohol, and tobacco. The IRS is a division of the Department of the Treasury and was established in 1962. The IRS develops national policies and programs for the administration of Internal Revenue laws.

The Office of Management and Budget. The Office of Management and Budget (OMB) prepares the president's annual budget and works with the CEA and Treasury Department to develop the government's fiscal program and oversee the administration of the budget. The OMB also reviews government regulations and coordinates administration procurement and management policy.

The Small Business Administration. The Small Business Administration (SBA) promotes small-business interests through financial aid, counseling, and ensuring that small businesses receive a fair portion of government contracts. The SBA is also involved in loan programs for small businesses. The agency acts in two manners: it can lend money directly to the small business, or it can cosign a loan through a lender.

The Treasury Department. The U.S. Treasury Department formulates and recommends domestic and international financial, economic, tax, and broad fiscal policies and manages the public debt. The Treasury Department is the chief financial department of the government and advisor to the president on economic policy. The Treasury Department also serves as the government's primary financial manager, taking responsibility for cash management and investment of government trust funds, credit administration, and debt collection. The Treasury Department was created on September 2, 1879, and is overseen by the secretary of the Treasury, a cabinet officer appointed by the president.

The U.S. Trade Representative. This office is a cabinet-level agency within the office of the president. The U.S. Trade Representative acts as the president's chief advisor on international trade policy, has the primary responsibility for developing international trade policy and coordinating its implementation, and is chief negotiator for international trade agreements. The office of the U.S. Trade Representative was created by the Trade Expansion Act of 1962 to negotiate all trade agreements on behalf of the United States.

The various legislative committees are responsible for setting economic policy through legislation. A brief discussion of each of the committees follows:

The House Banking, Finance, and Urban Affairs Committee. This committee has jurisdiction over legislation dealing with domestic monetary policy, including the Federal Reserve System. This committee also oversees financial aid to commerce and industry, the measurement of economic activity, federal loan guarantees, economic development, and economic stabilization measures.

The House Budget Committee. The House Budget Committee exercises jurisdiction over congressional budget resolutions that fix levels for federal spending, revenues, deficit, and debt. The committee also has jurisdiction over reconciliation bills, which modify existing programs to meet budget goals.

The House Ways and Means Committee. The House Ways and Means Committee exercises jurisdiction over legislation dealing with the debt ceiling, investment policy, and taxes. The committee oversees the Internal Revenue

Service and sets excise tax rates for the Bureau of Alcohol, Tobacco, and Firearms.

The Joint Economic Committee. The Joint Economic Committee studies and makes recommendations on economic policy, including fiscal policy. The committee also maintains data on aggregate economic activity.

The Joint Taxation Committee. The Joint Taxation Committee performs staff work for the House Ways and Means and Senate Finance Committees on domestic and international tax matters in the Internal Revenue Code, the public debt limit, and savings bonds. It also provides those committees with general economic and budgetary analysis and provides revenue analysis for all tax legislation.

The Senate Banking, Housing, and Urban Affairs Committee. The Senate Banking, Housing, and Urban Affairs Committee exercises jurisdiction over legislation dealing with bank regulation, domestic monetary policy, financial aid to commerce and industry, the measurement of economic activity, federal loan guarantees, and economic stabilization measures. The Committee also oversees the Federal Reserve System.

The Senate Budget Committee. The Senate Budget Committee exercises jurisdiction over congressional budget resolutions, which set levels for federal spending, revenues, deficit, and debt. It also exercises jurisdiction over reconciliation bills, which modify existing programs to meet budget targets, and oversees the Congressional Budget Office.

The Senate Finance Committee. The Senate Finance Committee exercises jurisdiction over tax legislation. It oversees the Internal Revenue Service and sets excise tax rates for the Bureau of Alcohol, Tobacco, and Firearms.

BACKGROUND AND DEVELOPMENT

On March 4, 1951, the board of governors of the Federal Reserve System and the Treasury Department reached an accord that established the coordination of monetary and fiscal policy in the United States. This was to be done in a manner consistent with the independence of monetary policy. The accord stated that the two offices had reached agreement with respect to debt management and monetary policies to be pursued in furthering their common purpose—to assure the successful financing of the government's requirements and, at the same time, minimize monetization of the public debt.

The beginning of the Korean War in June of 1950 increased the government's requirements for debt financing. This increased the importance of a treasury policy that would ensure the availability of low-cost borrowing, stable money rates, adequate bank reserves, and stable markets for government securities.

The Federal Reserve System has tried to gain greater control over monetary policy. On October 6, 1979, the board of governors announced a new series of programs that would “assure better control over the expansion of money and bank credit,” curb speculation, and thus dampen inflationary forces. These policy objectives were met by placing greater emphasis on the supply of bank reserves and less emphasis on limiting fluctuations in the federal fund rates.

The early 1990s were marked by widespread public discontent with the economic policies of the U.S. government. Years of slow growth and recession were seen as indicators that new policies should be developed and implemented. This sentiment was reinforced by the end of the Cold War and the resulting belief that American economic resources could be better deployed. The election of 1992 brought a Democrat to office for the first time in 12 years, largely on a platform that stressed new economic priorities and policies. That year also saw the political appearance of Ross Perot, who gained popularity by stressing the need to change U.S. economic policy for good reason: the federal deficit hit an all-time high of more than \$290 billion dollars in 1992. It has declined every year since.

The nation entered the millennium with a balanced budget, an accomplishment first achieved in 1998, following years of overspending. In 1999, revenues totaled \$1.8 trillion and expenditures were \$1.7 trillion, resulting in a surplus of \$124.6 billion. In 2000, revenues were \$2 trillion and expenditures amounted to \$1.8 trillion, resulting in a surplus of \$236.4 billion.

All in all, 1999 was a very good year, according to the Federal Reserve Board’s Humphrey-Hawkins Report. Economic expansion had moved into its ninth straight year, and unemployment was the lowest since 1970, at approximately 4 percent. Real gross domestic product was annualized at better than 4 percent growth, and stock indexes set world records in 1999—the Dow Jones Industrial Average breaking 10,000 points for the first time in history. Federal Reserve Board Chairman Alan Greenspan became a household name, as he carefully kept inflation in check by adjustments to the interest rate, and an aging America overwhelmingly supported extra protection for funds intended to keep the Social Security trust fund solvent.

CURRENT CONDITIONS

In the early 2000s, the nation’s budget surplus began to dwindle. In 2001, revenues of nearly \$2 trillion and expenditures of almost \$1.9 trillion resulted in a budget surplus of \$127.3 billion. In 2002, a deficit reappeared as revenues, at almost \$1.9 trillion, were less than expenditures of about \$2 trillion. This amounted to a \$157.8 billion shortfall. The U.S. government budget for fiscal

year 2004 estimated that a deficit would exist through 2008. During that timeframe, the shortfall was projected to reach a high of \$307.4 billion in 2004.

On the revenue side, the federal government gained about \$858 billion dollars from personal income taxes and more than \$148 billion from corporate income taxes in 2002. When added to miscellaneous federal taxes such as excise, estate and gift, custom duties and fees, and so on, total federal revenues were nearly \$1.9 trillion that year.

Where does the money all go? In 2002 the budget for the Department of Health and Human Services was nearly \$466 billion; the Department of the Treasury was to receive more than \$370 billion; and the Department of Defense budget was almost \$332 billion. On the other hand, the Department of Agriculture was budgeted for nearly \$69 billion; the Department of Labor, about \$65 billion; and the Department of Justice, just \$21 billion. The list goes on.

The United States suffered from weak economic conditions in the early 2000s. Although a small amount of economic growth did occur in 2002, tax reductions by the Bush administration and an increase in government spending took their toll on the budget. Significant spending increases have occurred recently in the areas of homeland security and defense, stemming from the nation’s response to terrorist threats and the U.S. military’s involvement in Iraq. In the wake of the budget deficit, federal contributions to national savings fell, and the national savings rate dropped to 15 percent of the gross domestic product in late 2002. This was the lowest rate since the 1940s.

In May of 2003, Congress was on the verge of approving a tax-cut package that included \$330 billion of tax cuts and \$20 billion of aid to financially struggling states over the course of 10 years. The plan would provide \$226 billion in the first two years, offering what many Republicans lauded as a much-needed stimulus to a the country’s weak economy. President Bush claimed it would help to create much-needed jobs. However, many Democrats were concerned about the rising national debt and called the plan irresponsible. They argued that the plan benefited the wealthy at the long-term expense of the working class. Among the provisions of the plan, which was approved by the House on May 22, 2003, were a reduction of the highest tax rate from 38.6 percent to 35 percent, tax reductions on capital gains and dividend income, and an increase of the child tax credit from \$600 to \$1,000 in the years 2003 and 2004 for those with children under the age of 17.

SIC 9411

ADMINISTRATION OF EDUCATIONAL PROGRAMS

This category covers government establishments primarily engaged in central coordination, planning, supervision, and administration of funds, policies, intergovernmental activities, statistical reports and data collection, and centralized programs for educational administration. Government scholarship programs are classified here. Included are federal and state education departments, commissions, and similar educational organizations. Schools and local and state school boards operating schools are classified in educational services industries. Human resource training is classified in **SIC 8331: Job Training and Vocational Rehabilitation Services**, and administration of such programs is classified in **SIC 9440: Administration of Social, Human Resource and Income Maintenance Programs**.

NAICS CODE(S)

923110 (Administration of Educational Programs)

INDUSTRY SNAPSHOT

Virtually all of the functions conducted by the educational programs administration industry were connected in one way or another with the U.S. Department of Education, which administers more than 150 educational programs and guidelines for the nation's more than 119,000 schools. Despite carrying a legacy of controversy as old as the U.S. Constitution, the Department of Education grew from a meagerly funded agency charged with a single task—the gathering and dissemination of educational data—into a \$56.2 billion federal program with widely varied responsibilities that changed with each presidency. In recent years, much of the debate

about the Department's authority and goals has centered on the question of state versus federal rights. So widespread was past resistance to a powerful, centralized department of education, not until 1979 was the century-old office granted cabinet-level status. Even then its survival was far from secure, for in Ronald Reagan's 1980 presidential campaign, he threatened to abolish the Department, saddled as it was with charges of mismanagement and ineffectiveness.

From the early 1980s forward, the education debate was shaped by a national call for fundamental reform, particularly at the elementary and secondary levels, where approximately half of the Department's spending went. The Department of Education only contributed around 6 percent of revenues to schools across the country, whereas the remaining 94 percent was divided between local and state sources. The Department of Education served as both mediator and scapegoat for a debate that showed no signs of ending.

When, where, and how meaningful and widespread reform would take place—and what role the department would assume—were questions that would take years to answer. Private schools, small companies specializing in educational administration, and select public schools were paving the way. In doing so, they heightened public discussion of school choice, school vouchers, and a return to core curricula. President Bill Clinton's Goals 2000: the Educate America Act, criticized for its occasionally vague language, nevertheless gave clarity to the debate in 1994 and authorized the initial release of \$647 million for experiments in reform. In 2001 President George W. Bush's No Child Left Behind Act resulted in what some considered to be the most dramatic reform to the educational system in many years. Effective in the 2002-03 school year, the legislation focused on improving student achievement standards and increasing accountability for states, school districts, and individual schools.

During the latter half of the 1990s, statistics from the National Center for Education (part of the National Assessment of Educational Progress) indicated that academic achievement in the nation's schools had steadily turned upward. However, during the early 2000s a host of challenges remained for educators. This was especially true in poverty-stricken schools, where as many as 66 percent of fourth graders did not have adequate reading skills. Schools in poorer districts also continued to struggle with funding inequities, in comparison to schools in more privileged districts. Given these circumstances, it was readily apparent that no single solution would or will continue to turn achievement levels around for all students.

ORGANIZATION AND STRUCTURE

The Department of Education includes: the Secretary (OS), Deputy Secretary (ODS), Under Secretary (OUS),

Intergovernmental and Interagency Affairs (OIIA), Inspector General (OIG), General Counsel (OGC), Bilingual Education and Minority Languages Affairs (OBEMLA), Human Resources and Administration (OHRA), Legislation and Congressional Affairs (OLCA), Civil Rights (OCR), Elementary and Secondary Education (OBESE), Educational Research and Improvement (OERI), Vocational and Adult Education (OVAE), Special Education and Rehabilitative Services (OSERS), Postsecondary Education (OPE), Chief Financial Officer (CFO), and regional offices.

Although no overall plan or consistent philosophy for the federal government's education programs exists, they are divided into four general categories. The first is promoting equal educational opportunities for students. The Chapter 1 program under Title I of the Elementary and Secondary Education Act of 1965 (ESEA) was the largest federal program promoting equal educational opportunity. The 2002 Department of Education budget for Title I was \$9.9 billion for disadvantaged students under the program. This number was expected to increase toward the mid-2000s, reaching \$11.4 billion in 2003 and \$12.4 billion in 2004. These included low-income children, migrant children with special needs, and children needing help with school readiness. Also included under the category of equal educational opportunity was funding for immigrant education, bilingual education, and Native American education grants.

Programs stimulating education reform are included in the second category of federal education programs. The Chapter 2 program of Title I of ESEA, blocking grants to state and local private and public educational authorities for improving schools, is included in this category. Also included are Safe and Drug-Free Schools and Communities grants, Eisenhower Mathematics and Science Education programs, and the Magnet Schools Assistance Program for desegregating schools.

The third category, general support, covers funding for school districts affected by federal activity, which limits the property tax revenues that go to schools in that area. In recent years, about 16 percent of the nation's school districts received the federally legislated Impact Aid, with funds targeted to districts enrolling children living on Indian lands and children of members of the uniformed services who live on government property. In 2002, the Department of Education devoted approximately \$1.1 billion to Impact Aid. Spending was expected to remain about the same in 2003 and then decrease in 2004, falling to \$1 billion.

The final category is promoting educational preparation for employment. The focal point in this area is the Carl D. Perkins Vocational and Applied Technology Education Act for programs of instruction in areas such as business math, instructional arts, electronics, and office manage-

ment. The Adult Education Act supports programs for adults wanting to complete high school education, become literate, or enroll in employment-related training.

BACKGROUND AND DEVELOPMENT

Colonial education was controlled by churches and the economically privileged. Consequently, education was viewed as a personal, rather than a public, concern. Children of factory workers, farmers, and other laborers received very limited education, just enough to allow them to fulfill their roles in society. After the colonies won their freedom from England, the primary goal of the Constitution's framers was to protect the personal and religious freedoms of the people from central authorities. Therefore, education, discerned as a personal choice, was left to the discretion of local and state agencies. However, several early American leaders still wished to promote education, including George Washington, who sought support for a national university following the Revolutionary War. In 1785, the Continental Congress passed the Survey Ordinance, which provided for sections of land to be set aside for schools in newly created townships. The intention of this law was further bolstered by the passage two years later of the Northwest Ordinance, which offered educational land grants and stated that "schools and the means of education shall forever be encouraged."

During the nineteenth century, the Industrial Revolution and huge advances in science began to change public attitudes toward education. The quality of schools, then under the jurisdiction of individual schoolmasters, was questioned, and the radical idea of taxing citizens to support the education of everyone, regardless of class or income, was being debated openly.

Henry Barnard, who would become the first United States Commissioner of Education, was an early supporter of "common schools," the development of a school system, and its funding through taxation. He also was a fervent supporter of the need for the government to gather and distribute data on education. Barnard had been influenced by his contemporary Horace Mann, who crusaded for public education in Massachusetts. As a Connecticut legislator, Barnard created a commission to obtain facts about the state's common schools. The commission found less than one-half of the state's school-age children were in school, three-fourths of its schools were unfit for use, and there were no standards for teachers. To make matters worse, Connecticut was considered to be one of the best states in terms of education. By 1840, Barnard convinced the U.S. Bureau of Census to include questions regarding the numbers of schools and colleges in the country and questions regarding the rate of illiteracy. He continued to promote the establishment of a federal agency to collect comprehensive education data.

The Civil War stymied the growing movement for a national education office except for one major piece of legislation. In July 1862, President Abraham Lincoln signed into law the Morrill Act. The legislation designated that money from the sale of federally owned lands should go to some of the nation's colleges and universities. This marked the true beginning of land-grant schools and was the first major step in legitimizing a role for the federal government in education.

After the Civil War, interest was high among educators to establish a federal office. Representative James A. Garfield, later President Garfield, introduced a bill into Congress to create such an office. After a year of contentious debate, the Department of Education was created through the Organic Act in March 1867. The Department's principal task was to gather and publish data on education with the intent to foster the growth and improvement of the nation's public schools. The Department also was to conduct related studies, two of which were mandated. The first was a federal land-grant study and was included in the original bill. The second followed the appropriation of funds and mandated a study of education in the District of Columbia.

From its earliest days, the Garfield-sponsored law was controversial. In fact, to pacify supporters of state rights, the Department of Education was downgraded to an office within the Department of Interior the year after it was formed and then renamed the Bureau of Education in 1870. In 1929, still within the Interior Department, the agency was renamed the Office of Education. In 1939, it became part of the Federal Security Agency, then, in 1953, it was assigned to the Department of Health, Education, and Welfare. All this movement was indicative of the ongoing debate about the role of the federal government in education. Overall, the first 75 years of the Department of Education were marked by lack of authority, lack of funding, and unpredictable support in Congress.

In addition, the early collection of information was extremely difficult because of the size of the nation and the suspicion of state and local officials and the educators themselves. Still, by 1875, the agency had collected information on nearly all grades of school and later added statistics on private schools, school expenditures, the value of physical plants of schools, and other types of data. In 1923, the agency added a team of field statisticians who visited schools and collected detailed and accurate information. The statistical component of the Department of Education, the National Center for Education Statistics, made these comprehensive visits until 1963. After World War II, the office began an annual survey of college and university enrollment. In the mid-1960s, these education statistics were used for legislative purposes for the first time. Then, at the end of the decade, data on educational outcomes or achievement

was collected for the first time. Statistics comparing the United States with international educational achievements were not added until the 1990s.

Federal involvement in education peaked at different times in U.S. history. The department's first significant responsibilities came following passage of the Smith-Hughes Act in 1917 and the Smith-Bankhead Act in 1920, both of which provided grants to states for vocational education. This function became even more prominent during the years of the Great Depression. But it was not until the 1950s that significant changes began to take place in the Department. The advent of the space race and the Cold War during this decade accelerated federal spending on education through the National Defense Education Act of 1958. In addition, the 1954 *Brown v Board of Education* Supreme Court desegregation case focused attention on both the equality of opportunity and the disparity among the nation's schools, followed by President Lyndon Johnson's Great Society programs of social reform and educational advancement during the 1960s. The Economic Opportunity Act of 1964, which created the Head Start program for preschool children, and the 1964 Civil Rights Act, which prohibited discrimination in the use of federal funds, included education funds. The Elementary and Secondary Education Act of 1965 (ESEA) was also passed to promote equality of education. All had an effect on the Department of Education, whose administrative budget grew from around \$2 million in 1950 to more than \$15 million by 1965; total money disbursements then moved up to more than \$760 million.

In 1972, the Emergency School Aid Act was passed to assist desegregating schools. The Education for All Handicapped Children Act of 1975 mandated free and appropriate education for disabled children. The elementary and secondary education legislation passed in the 1960s and 1970s mainly dealt with specific needs of small groups of students. Critics said the needs of the majority of students were being ignored by federal education programs and the broad variety of programs lacked coordination.

When the Carter administration came to power, a study group was formed to develop proposals for upgrading the Office of Education, which was then a part of the Office of Health, Education, and Welfare. After failure to get action on an education bill in 1978, a new bill was offered to Congress the following year. The Department of Education Organization Act created a cabinet-level department and authorized a budget of \$14.2 billion for the 152 programs and 17,000 employees.

Opponents of the bill cited the loss of state and local control of education, the diminishment of civil rights protection, the increased influence of special interest groups, and a higher tax burden as major concerns. To address these issues, the legislation included the protec-

tion of state and local rights regarding education policy, programs, and administration; an Office of Civil Rights within the department; and an Intergovernmental Advisory Council on Education, including state and local officials, public and private school representatives, and parents and students.

Combined public and private spending on education in the United States represented not only a mammoth industry but a huge national investment amounting to 7.3 percent of the nation's gross domestic product. Only Canada spent more of its national gross domestic product on education than the United States. The 1990 Census found that 6.3 million school children (ages 5 to 17) speak a language other than English at home. The same year, the Department of Education stated that 5 percent of the 41 million elementary and secondary students in the United States have "limited English proficiency." Of those students speaking English as a second language, 37.8 percent speak English less than very well. But as William Dunn reported in April 1993, there was a steadily growing group of poor and uneducated immigrants in the United States, and students coming from these families were experiencing difficulty in the American educational system, despite English as a Second Language (ESL) programs.

Guaranteed Student Loans. An October 1992 *Financial World* article claimed that the Department of Education's biggest financial problem was the student loan program. In 1992, loans totaling \$11 billion were made; that same year, \$3.6 billion in previously made loans fell into default. To address the problem, the Department started to make some changes, including eliminating financing for schools with the largest student loan default rates. They also started monitoring loans to students already in default and collaborating with the Internal Revenue Service (IRS) to collect payments from defaulters' tax refunds. Finally, the Department sought to upgrade its financial controls both for the student loan program and the Department in general.

In 1983, the National Commission on Education, a board appointed by Secretary of Education Terrel H. Bell, concluded that the American education system was in trouble and for younger Americans to compete internationally, reforms would need to take place. In response to the commission's influential *A Nation at Risk* report, a wave of school restructuring occurred. In 1989, the Bush administration's Education Summit, which included the nation's governors, developed six national education goals to be met by the year 2000. President Bush's proposed education reform legislation, called America 2000: Excellence in Education, failed to pass in Congress, however. Instead, Congress created the National Council on Education Standards and Testing (NCEST), which recommended voluntary participation by the states in an

education program that would compare students by means of "world-class standards."

The Goals 2000 passed in Congress in March 1994. It authorized \$647 million for school reforms nationwide, including \$400 million in grants targeted for state and local school agencies. The Act also established the first national education goals and standards for education.

The eight national education goals for all students and schools included in Goals 2000 were: all children will start school ready to learn; at least 90 percent of students will finish high school; students will leave grades 4, 8, and 12 with demonstrated competence in English, math, science, foreign languages, civics and government, economics, arts, history, and geography; teachers will have access to programs for the continued improvement of their skills; the United States will be first in the world in math and science achievement; every adult will be literate and possess the skills to compete in a global economy; every school will be free of drugs and violence; and every school will promote involvement of parents in their children's education.

The act also established a 19-member National Education Standards and Improvement Council (NESIC) to develop voluntary national curriculum content, student performance tests, and opportunity-to-learn programs. Funding for combating violent crime in schools and for new research institutes within the Office of Education Research and Improvement was authorized as well. Detractors of the act said that it was too general to bring any significant change to American education and that making the measures voluntary was a concession to the powerful national teachers' associations. Moreover, such goals had been put forth by previous administrations to no noticeable effect.

By the end of the 1990s, states were aggressively forging ahead to make good on their promises. New York declared that by 2003, all students graduating from high school must pass a Regents Examination in mathematics, science, American history, and global history. For the 1998-99 school year, California's controversial "Proposition 227," which replaced bilingual education programs with those emphasizing English as the primary language, was too new to gauge its efficacy but appeared to be gaining ground.

In the last few months of 1999, Congress was completing work on fiscal 2000 legislation for the Department of Education, amid heavy lobbying by student loan providers and college lobbyists. President Clinton indicated that he would veto any budget that did not include funding for several of his proposed programs, including Americorps and the hiring of 100,000 new schoolteachers. Also contentious were efforts to remove certain fees attached to federal student direct-loan programs and raising the maximum Pell grant by \$125, to \$3,250.

The total 1999 budget for the Department of Education was \$34.3 billion. This included \$7.3 billion for the Office of Special Education and Rehabilitative Services, \$1.3 billion for the Office of Vocational and Adult Education, and \$386 million for the Office of Bilingual Education and Minority Language Affairs. (Its largest expenditure was for the Office of Postsecondary Education, at \$14.1 billion.)

During its 1998-99 term, the U.S. Supreme Court delivered an important decision affecting public education. In November 1998, the Court declined to review, and thus let stand, the decision of the Wisconsin Supreme Court that upheld the constitutionality of the Milwaukee school voucher program (*Jackson v. Benson*). In such programs, individual credit vouchers are given to parents by local, state, or federal government entities to be used for sending their children to a school of the parents' choosing. Often, this has meant private, parochial (including religious) schools. Two basic challenges against these vouchers have thus been defeated, the first having to do with separation of church and state, and the second involving the reality that such vouchering draws students away from the public school system, thus affecting federal funds to public schools.

CURRENT CONDITIONS

By the early 2000s, the nation's educational administrators faced a number of serious challenges. One of the most daunting involved state budget shortfalls, brought on by weak economic conditions and decreasing tax bases. During the 1990s, when economic conditions were more favorable, many states chose to fund schools through income taxes instead of property taxes. Ultimately, this trend had a negative effect. According to the January 19, 2003, *Chicago Tribune* , "The lingering national economic downturn, which last year resulted in trims to administrative expenses and loss of extracurricular activities, now is forcing districts to make severe cuts that directly affect the classroom."

In the aforementioned *Chicago Tribune* article, the paper provided figures from the National Council of State Legislatures (NCSL) that revealed that U.S. school districts were short \$49 billion at the start of the 2002-03 academic year. By January, the deficit had increased by another \$18 billion. Despite these grave conditions, *Education Daily* reported that only 9 states ended up cutting budgets for primary and secondary education that year, whereas 12 made cuts at the postsecondary level. Looking ahead, the magazine cited figures from a NCSL survey that found states would face a combined shortfall of at least \$69 billion by fiscal year 2004, impacting educational programs at the primary, secondary, and postsecondary levels.

Based on information from the National Association of Student Grant and Aid Programs (NASSGAP), state

spending on postsecondary student financial aid was expected to increase 5 percent in 2002-03, according to *Education Daily*. Although this was a positive sign given the state of the economy, the rise was smaller than 2001-02's increase of 10 percent and the 12 percent increase achieved in 2000-01. That states continued to increase assistance levels despite budget shortfalls showed their continuing commitment to education. In fact, NASSGAP revealed that state spending on student aid has increased by 66 percent since the late 1990s.

Amidst these conditions, some school districts sought ways to reduce costs and maintain operations. In some states, including Oregon and New York, districts considered moving to shorter academic years by instituting four-day school weeks. However, prohibitive state laws hindered many districts from going in this direction, whereas other districts risked jeopardizing already falling levels of state funding. Other cost-cutting measures involved students and teachers cleaning their own classrooms. This was the case in Oklahoma, where custodial jobs were cut at one school district. In Hawaii, cutbacks caused a potential toilet paper shortage. This effectively caused schools to choose between basic essentials and much-needed educational resources like textbooks. Nationwide, schools also were looking to decrease energy costs in both new and existing facilities through improved operations and by designing better buildings and relying on more efficient technologies.

In January of 2002, President George W. Bush signed the No Child Left Behind Act of 2001 (NCLB). According to the Department of Education, "The Act is the most sweeping reform of the Elementary and Secondary Education Act (ESEA) since ESEA was enacted in 1965. It redefines the federal role in K-12 education and will help close the achievement gap between disadvantaged and minority students and their peers. It is based on four basic principles: stronger accountability for results, increased flexibility and local control, expanded options for parents, and an emphasis on teaching methods that have been proven to work." The act allows children in schools that fail to meet state academic standards to move to another public school without incurring excessive transportation costs. In the U.S. government's budget for fiscal year 2004, the Department of Education listed successful implementation of NCLB as one of its major challenges. In addition to improved accountability for student achievement, support was to come from an increase in grant funding. This included an increase in Title I grants to aid poverty-stricken schools at the local level.

The total 2002 budget for the Department of Education was \$56.2 billion. This included \$8.7 billion for the Office of Special Education and Rehabilitative Services, \$6.2 billion for School Improvement Programs, and \$1.9 billion for the Office of Vocational and Adult Education.

(Its largest expenditure was for the Office of Postsecondary Education, at \$12.3 billion.)

SIC 9431

ADMINISTRATION OF PUBLIC HEALTH PROGRAMS

This category includes government establishments primarily engaged in planning, administration, and coordination of public health programs and services, including environmental health activities, mental health, categorical health programs (e.g., cancer control, communicable disease control, maternity, child health), health statistics, and immunization services.

NAICS CODE(S)

923120 (Administration of Public Health Programs)

The U.S. public health system consists of programs administered by federal, state, and local government agencies; voluntary health care and research associations, such as the American Red Cross and the American Cancer Society; and professional associations, such as the American Medical Association and American Dental Association. Although several agencies of the federal government had responsibility for aspects of public health, the U.S. Department of Health and Human Services (DHHS) is the principal federal health agency.

ORGANIZATION AND STRUCTURE

The Department of Health and Human Services (DHHS) oversees most of the U.S. government's health programs. It is headed by the Secretary of Health and Human Services, a cabinet-level position appointed by the president and confirmed by the Senate. The surgeon general, the chief medical officer, and various agency heads report to the secretary. In 2003 the department employed 65,500 people and had a budget of \$502 billion. These numbers both increased from 1999, when the Department employed 59,800 workers and had a budget of \$387 billion. DHHS' operations are divided between Public Health Operating Divisions, which include much of what was formerly the Public Health Service, and Human Services Operating Divisions, which include Medicare, Medicaid, and the Administration for Children and Families. The human services divisions are discussed in greater detail under **SIC 9441: Administration of Social, Human Resource, and Income Maintenance Programs**.

Major divisions of the DHHS include the National Institutes of Health, the Food and Drug Administration, the Centers for Disease Control, the Substance Abuse and Mental Health Services Administration, the Health Resources and Services Administration, the Agency for Toxic Substances and Disease Registry, the Indian Health Service, and the Agency for Healthcare Research and Quality.

The National Institutes of Health (NIH). This top-level agency includes National Cancer Institute; the National Eye Institute; the National Heart, Lung, and Blood Institute; the National Human Genome Research Institute; the National Institute on Aging; the National Institute on Alcohol Abuse and Alcoholism; the National Institute of Allergy and Infectious Diseases; the National Institute of Arthritis and Musculoskeletal and Skin Diseases; the National Institute of Biomedical Imaging and Bioengineering; the National Institute of Child Health and Human Development; the National Institute on Deafness and Other Communication Disorders; the National Institute of Dental and Craniofacial Research; the National Institute of Diabetes and Digestive and Kidney Diseases; the National Institute on Drug Abuse; the National Institute of Environmental Health Sciences; the

National Institute of General Medical Sciences; the National Institute of Mental Health; and a number of others. Almost all of the NIH institutes and research centers are located in Bethesda, Maryland. In 2003, the NIH had 17,693 employees, including roughly 4,500 scientists and medical personnel, and a budget of \$27.2 billion.

Food and Drug Administration (FDA). The FDA is responsible for enforcing the Food, Drug, and Cosmetic Act of 1938 and the Drug Amendments Act of 1962, which were designed to ensure the purity of food products and the safety and effectiveness of drugs, cosmetics, and therapeutic devices. The FDA inspects all food and drug manufacturing facilities, enforces sanitary standards at restaurants and other public eating places, establishes labeling requirements for food and drugs, and reviews test results on all drugs before they are approved for use in the United States. The FDA had more than 10,479 employees in 2003, including roughly 2,000 scientists and 1,000 inspectors and investigators. The FDA's 2003 budget totaled \$1.7 billion.

Centers for Disease Control (CDC). The CDC, located in Atlanta, Georgia, maintains records on the incidence of disease and provides information to health agencies worldwide. The agency also investigates the causes and works with state health care agencies to control the outbreak of diseases and administers the U.S. quarantine program at ports of entry. The CDC includes the Center for Chronic Disease Prevention and Health Promotion; the Center for Environmental Health and Injury Control; the Center for Infectious Diseases; the Center for Prevention Services; the National Center for Health Statistics; and the National Institute for Occupational Safety and Health. The CDC also administers the Agency for Toxic Substances and Disease Registry, which was established in 1980 by the Comprehensive Environmental Response, Compensation, and Liability Act to clean up hazardous waste sites. The Public Health Service is responsible for identifying the health risks involved with toxic wastes and developing ways to lessen the danger of working with hazardous substances. In 2003 the CDC employed a workforce of 8,668 people and had a budget of \$6.8 billion.

Substance Abuse and Mental Health Services Administration. Created in 1992, the Substance Abuse and Mental Health Services Administration is responsible for developing substance abuse treatment and prevention programs in conjunction with state and local agencies, as well as programs to promote mental health. The division also supports efforts to develop local mental health facilities by providing leadership and federal grants. Approximately 588 persons staffed the agency in 2003 with a budget of \$3.2 billion.

Health Resources and Services Administration (HRSA). The HRSA is charged with improving health

care services in areas without adequate resources. The agency is responsible for the National Health Service Corps, which recruits and assigns physicians, dentists, and nurses to areas with a shortage of health care professionals. The agency also provides grants for health care education and administers well-child programs through the Bureau of Maternal and Child Health and Resources Development. In 2003 this agency's \$7.1 billion budget was implemented by a workforce of 1,937 people.

Indian Health Service (IHS). With 14,961 employees, including roughly 1,270 physicians and dentists and 2,700 nurses, the IHS is responsible for providing health care to more than 1.5 million Native Americans. The IHS has 63 health centers, 44 health stations, 36 hospitals, and 5 residential treatment centers under federal management. In addition, it has 445 health care facilities under the direction of Indian tribes or Alaska Native corporations, including 13 hospitals and 170 Alaskan village clinics. The Bureau of Indian Affairs transferred responsibility for Native American health care to the Public Health Service in 1955. The Indian Health Service was elevated to agency status in 1988. Its 2003 expenditures were budgeted for \$3.5 billion.

Agency for Healthcare Research and Quality. Established in 1989, the Agency for Healthcare Research and Quality focuses on improving the quality of patient care. It also assesses new health care technologies, promotes health care services in rural areas, and investigates questions of medical malpractice and liability. This agency employed 294 persons and had a \$309 million budget in 2003.

Office of the Assistant Secretary for Health. Several public health programs are conducted by the Office of the Assistant Secretary for Health. These include population research and family planning by the Office of Population Affairs, the promotion of healthy lifestyles by the Office of Disease Prevention and Health Promotion, the President's Council on Physical Fitness and Sports, special health initiatives for minorities, and the National AIDS Program.

BACKGROUND AND DEVELOPMENT

Early efforts to provide for the public health in the United States were concerned with quarantine and sanitation. As early as 1795, the governor of New York appealed to the state medical society for help in controlling epidemics. The medical society recommended improving drainage in low-lying areas, collecting refuse from along river banks, controlling the air pollution from slaughter houses and soap factories, and generally cleaning up "the accumulation of filth in the street."

The U.S. Public Health Service traced its beginnings to 1798, when Congress authorized the Marine Hospital Fund for the "care and relief of sick and disabled

seamen.” The fund was financed by a 20-cents-per-month tax on merchant seamen and administered by the Treasury Department. The first Marine Hospital was established on Castle Island in Boston Harbor in 1799. Other hospitals, often small facilities located in boarding houses, were eventually established in port cities from Newport, Rhode Island, to Charleston, South Carolina. As the nation expanded west, Marine Hospitals also were established in Chicago, Cleveland, New Orleans, and several other cities along the Mississippi and Ohio rivers.

For much of the nineteenth century, the Marine Hospital Fund concerned itself primarily with caring for merchant seamen. It also was poorly managed. By 1869, when the first permanent public health department was created by Massachusetts, only 9 of 31 Marine Hospitals built since 1798 were still in operation. In 1871, Dr. John Maynard Woodworth was appointed to the new position of Supervising Surgeon of the Marine Hospital Service. Woodworth, who envisioned a much broader role than caring for ill seamen, eliminated the patronage system and instituted examinations for all job applicants. Woodworth also had been General William T. Sherman’s chief medical officer during the Civil War and reorganized the Marine Hospital Service along military lines. He gave his “officers” military titles, put them in uniform, and assigned them where they were needed most. In 1873, Woodworth’s title was changed to surgeon general.

Meanwhile, the concept of public health developed slowly in the United States. New York, which was struck by an outbreak of yellow fever in 1798, received permission from the state legislature to pass its own health laws and appointed a city health inspector in 1804. But by 1830, only five major cities had established boards of health. In the mid-1840s, New York also became one of the first cities to pass legislation requiring the registration of births and deaths. In 1845, New York City health inspector John C. Grissom published a report entitled “A Brief View of the Sanitary Conditions of the City,” in which he found “an immense amount of sickness, physical disability, and premature mortality among the poorer classes.” Grissom also concluded “that these are, to a large extent, unnecessary, being in a great degree the results of causes which are removable.”

Shattuck Report. When the American Medical Association was founded in 1847, one of its first endeavors was to collect information on sanitary conditions from around the country, which focused attention on the growth of slums in American cities. In 1850, the Massachusetts Sanitary Commission published what became known as the Shattuck Report, written by Lemuel Shattuck, a former teacher and bookseller.

Shattuck revealed the extent of communicable disease, especially among the poor, and recommended es-

tablishment of a state board of health and local boards in every community. The Shattuck Report also discussed the need for environmental sanitation, the inspection of food and drugs, well-child programs, vaccination against smallpox, control of air pollution, treatment of alcoholism, and city planning. Although Massachusetts did not implement the Shattuck Report for almost 20 years, it became a blueprint for later public health activities.

Metropolitan Board of Health. In 1857, Philadelphia organized a National Quarantine and Sanitary Convention, attended by 73 delegates from nine states. City health officers also met in Baltimore, New York, and Boston over the next three years, but the Civil War interrupted plans for a fifth conference scheduled for Cincinnati in 1861. After the war, the Council of Hygiene and Public Health, formed by a citizens group in New York, published a report on sanitary conditions that shocked the community into action. In 1866, the state legislature created a Metropolitan Board of Health with broad powers to improve sanitary conditions in a four-county area. Members of the board included four physicians who served as sanitary commissioners, the health officer for the port of New York, and four police commissioners.

In *A History of Public Health*, George Rosen called the Metropolitan Board of Health “a turning point in the history of public health not only in New York City, but in the United States as a whole.” Rosen noted that a “change from a haphazard to an efficient administration was as essential to the development of a complicated urban industrial society as the provision of new scientific knowledge. In fact it was the provision of a stable administrative foundation which made it easier to incorporate new scientific knowledge into public health practice.”

Although Louisiana established the first state health department in 1855, it was largely ineffective. However, several states soon established boards of health patterned after the New York Metropolitan Board of Health. Massachusetts adopted many of the ideas contained in the earlier Shattuck Report and established a state board of health in 1869. California followed in 1870, the District of Columbia in 1871, Minnesota and Virginia in 1872, Michigan in 1873, Maryland in 1874, Alabama in 1875, Wisconsin in 1876, and Illinois in 1877.

National Board of Health. In 1878, following an outbreak of yellow fever that killed an estimated 14,000 Americans, Congress passed the first Federal Quarantine Act. It assigned responsibility for enforcing port quarantines to the Marine Hospital Service. However, Congress failed to appropriate any money for enforcement and instructed Surgeon General Woodworth not to interfere with state laws.

Meanwhile, the American Public Health Association, founded in 1872, lobbied Congress to create a national

health department. In 1879, Congress created a National Board of Health, comprised of nine members appointed by the president, including one each from the Army, Navy, and Marine Hospital Service. Quarantine responsibility was shifted to the National Board of Health, which also began monitoring outbreaks of disease and providing grants for states to create sanitary facilities.

Woodworth died 11 days after passage of the act creating the National Board of Health, which he had bitterly opposed. However, he was succeeded as surgeon general by Dr. John B. Hamilton, who continued the fight. Hamilton repeatedly accused board members of corruption or ineptitude. There also were growing complaints from the states, which felt the board was encroaching on their rights. In 1883, Congress refused to continue funding for the National Board of Health. Responsibility for port quarantines was returned to the Marine Hospital Service, which also was directed to investigate the origin and causes of epidemic diseases. Dr. Joseph J. Kinyon established the first "laboratory of hygiene," forerunner to the National Institutes of Health, at the Marine Hospital on Staten Island in 1887.

In 1889, following another deadly outbreak of yellow fever in the South, Congress officially created the Commissioned Corps of the Marine Hospital Service, a mobile force of physicians organized along military lines. The surgeon general was to be appointed by the president and confirmed by the Senate. The following year, Congress gave the Marine Hospital Service interstate quarantine authority. In 1891, when Dr. Walter Wyman became surgeon general, the Marine Medical Service had a budget of \$600,000 and the Commissioned Corps consisted of 54 medical officers.

U.S. Public Health Service. This service has the responsibility for providing medical examinations to all immigrants. The Quarantine Act of 1893 charged the Marine Hospital Service with refusing admission to the United States to "idiots, insane persons . . . persons likely to become a public charge, and persons suffering from a loathsome or a dangerous contagious disease."

In 1902, the Marine Hospital Service officially became the Public Health and Marine Hospital Service, reflecting the widening scope of its activities. Forty of the 45 states then had some form of state health department, and the surgeon general also was directed by Congress to convene national conferences on public health annually or "whenever in his opinion the interest of the public health would be promoted by such a conference." Five state health authorities also could require the surgeon general to convene a conference to discuss a public health emergency.

Also in 1902, Congress passed the Biologics Control Act, which made the Public Health and Marine Hospital

Service responsible for regulating the transportation and sale of vaccines, serums, or other medical products designed for human use. The Hygienic Laboratory, which had begun the manufacturing of diphtheria antitoxin in 1894, was moved to Washington, D.C., where divisions of chemistry, zoology, and pharmacology were added to its facilities. When Surgeon General Wyman died in 1911, the Public Health and Marine Hospital Service budget was \$1.75 million and the Commissioned Corps also had grown to 135 officers.

The Public Health and Marine Hospital Service officially became the Public Health Service in 1912, when Congress extended its authority to "investigate the diseases of man and conditions influencing the propagation and spread thereof, including sanitation and sewage and the pollution either directly or indirectly of the navigable streams and lakes of the United States." Dr. Rupert Blue, who directed the agency's efforts to eradicate plague in San Francisco following the earthquake of 1906, became surgeon general. That same year saw the founding of the National Organization of Public Health Nursing.

World War I. On April 2, 1917, President Woodrow Wilson asked Congress to declare war on Germany. The following day, he issued an executive order making the Public Health Service part of the U.S. military. By that fall, more than half a million men were drafted and sent to makeshift training camps. The Public Health Service was set to work ensuring sanitary conditions, including drinking water and waste disposal.

The Public Health Service was also charged with controlling the spread of venereal disease among servicemen, which included treating infected prostitutes. In 1918, the Army Appropriation Act established a division of venereal disease within the Public Health Service with a budget of \$2 million.

In 1918, following an outbreak of "Spanish influenza" that eventually spread to 46 states and killed half a million Americans, Congress created a Reserve Corps that allowed the Public Health Service to recruit health professionals other than physicians for emergency duty. More than 2,000 doctors, nurses, and clerks were recruited to the Public Health Service during the epidemic.

Federal Security Agency. The Federal Security Agency became responsible for the care of returning soldiers, and by 1921 the agency operated 62 hospitals. But in 1922, Congress established the Veteran's Bureau, later to become the Department of Veteran Affairs, which took over all but 24 Marine Service hospitals. The 1920s also saw new attempts to consolidate government services into a national department of health. However, Surgeon General Hugh S. Cumming opposed the move, which he believed would diminish the role of the Public Health Service, and the efforts failed.

In 1930, Congress passed two acts that would significantly affect public health administration in the United States. The first was the Parker Act, named for New York Congressman James S. Parker, which authorized the Public Health Service to recruit sanitary engineers, pharmacists, and dentists for the Commissioned Corps. The second was the Ransdell Act, named for Louisiana Senator Joseph Ransdell, which created an expanded National Institute of Health within the Public Health Service in place of the Hygienic Laboratory.

The Public Health Service continued to expand under President Franklin D. Roosevelt, whose New Deal programs included the Social Security Act, passed in 1935, which provided federal grants for states to develop public health programs in addition to benefits for retired workers. In 1936, the Public Health Service received applications for funds from every state, which ultimately led to the creation of the Division of State Relations.

In 1937, Congress passed the National Cancer Act, which created the National Cancer Institute. In addition to setting up laboratories within the Public Health Service, the National Cancer Institute awarded research grants to individuals and nongovernmental institutions, establishing a pattern for federal support of biomedical research. In 1938, Congress passed the Venereal Disease Control Act, which for the first time charged the Public Health Service with eradicating specific diseases.

In 1939, Roosevelt issued an executive order that brought the Public Health Service under the administration of the newly created Federal Security Agency, along with the Civilian Conservation Corps, National Youth Administration, Office of Education, U.S. Employment Service, and Social Security Board. The Food and Drug Administration was added in 1940.

World War II. At the start of World War II, Public Health Service officers were assigned to each of the Army Service Commands to oversee sanitary conditions. The Public Health Service also coordinated state emergency medical services, including a nationwide network of 300 hospitals to treat casualties, and commissioned officers served in war zones with the U.S. Coast Guard from 1941 to 1945. In 1942, the Public Health Service created the Office of Malaria Control in War Areas, based in Atlanta, which attempted to control the spread of disease in Southern states and the Caribbean by eradicating mosquito larvae and draining swamps. By 1943, the Office of Malaria Control, which extended its scope to include typhus, employed 4,300 people, including 300 commissioned officers. Between 1940 and 1945, the Public Health Service doubled in size, to 16,000 employees, while the Commissioned Corps quadrupled to 2,600 officers, two-thirds of whom were in the Reserve Corps.

As the war wound down, Congress began to enact legislation that would shape the future of the Public Health Service, beginning with the Public Health Service Act of 1944, which consolidated and revised most of the legislation then relating to the Public Health Service. The act also realigned the Public Health Service into four divisions: the Office of the Surgeon General, the Bureau of Medical Services, the Bureau of State Services, and the National Institute of Health. In 1946, the Office of Malaria Control became the Communicable Disease Center under the Bureau of State Services. The Public Health Service also assumed responsibility for national vital statistics, which had been a function of the Census Bureau.

A critical shortage of health care facilities after the war also led to creation of the National Hospital Survey and Construction Program in 1946, which provided grants for construction of state-run hospitals and positioned the Public Health Service as the lead agency in the planning, design, and operation of medical facilities. Between 1947 and 1971, the Public Health Service disbursed \$3.7 billion in state grants, accounting for about 10 percent of all hospital construction in the United States. Under the National Mental Health Act, also passed in 1946, the Public Health Service established a broad program of grants for research, training, and creation of mental health services.

Health, Education, and Welfare. The research facility founded as the Hygiene Laboratory in 1887 became the National Institutes of Health in 1948 with creation of the National Heart Institute, National Institute of Dental Research, National Microbiological Institute (which would become the National Institute of Allergy and Infectious Diseases in 1955), and Experimental Biology and Medical Institute (which would be absorbed into the National Institute of Arthritis and Metabolic Diseases in 1950). Other institutes of health would be created later, beginning with the National Institute of Mental Health in 1949 and concluding with the National Institute on Aging in 1974.

In the late 1940s, the Hoover Commission on Executive Reorganization also recommended creation of a Cabinet-level department for education and welfare. But it was not until 1953 that newly elected President Dwight D. Eisenhower created the Department of Health, Education, and Welfare (HEW) by executive order. The new department, which would become the Department of Health and Human Services in 1979 with the creation of the Department of Education, assumed all functions of the Federal Security Agency. Oveta Culp Hobby was appointed secretary of HEW, but administration of the Public Health Service remained with the surgeon general.

The Public Health Service faced a major crisis soon after the reorganization. In 1955, Surgeon General Leon-

ard Scheele endorsed a new vaccine for polio developed by Dr. Jonas Salk, and HEW issued licenses to six pharmaceutical companies to begin distribution. Within two weeks, there were reports from across the country that vaccinated children were developing full-blown polio. Scheele issued a statement calling for a halt to all vaccinations while the vaccine was reexamined. The problem was quickly traced to one pharmaceutical company, but more than 70 children contracted polio from the vaccine and 11 died. Secretary Hobby and her special assistant for medical affairs resigned two months later.

Despite the polio scare, the Public Health Service continued to expand beginning in 1955, when the Bureau of Indian Affairs (BIA) in the U.S. Department of Interior transferred responsibility for Indian health care programs. Federal health care for Native Americans had begun in the early nineteenth century with Army doctors attempting to contain smallpox and other contagious diseases among tribes living near military posts. Originally part of the War Department, the BIA was transferred to the Department of the Interior in 1849, with the first federal hospital for Indians built in Oklahoma in the 1880s. By the mid-1950s, the BIA operated 48 hospitals and was responsible for the health of more than half a million Indians and Alaska natives.

The Armed Forces Medical Library, later known as the National Library of Medicine, became part of the Public Health Service in 1956. Further expansions came with the Community Health Services and Facilities Act of 1961, the Vaccination Assistance Act and the Health Professionals Education Act of 1963, and the Nurse Training Act of 1964—each of which directed the Public Health Service to provide financial or research support for state health care programs.

Smoking. In the mid-1950s, the Public Health Service, the American Cancer Society, and the American Heart Association formed a panel to study the effect of smoking on health. In 1956, Surgeon General Leroy Burney wrote an obscure article for the *Journal of the American Medical Association* that concluded, “The weight of evidence at present implicates smoking as the principal etiological factor in the increased incidence of lung cancer.”

In 1964 HEW published the results of a two-year study, entitled “Smoking and Health: Report of the Advisory Committee to the Surgeon General of the Public Health Service,” that reaffirmed the earlier conclusion. Dr. Terry Luther, who succeeded Burney, declared, “Cigarette smoking is causally related to lung cancer in men. The magnitude of the effect of cigarette smoking far outweighs all other factors. The data for women, though less extensive, point in the same direction.”

Based on the Public Health Service report, Congress passed legislation in 1966 that required a warning label

on all cigarette packaging. Cigarette ads were banned from radio and television in 1971, and cigarette companies were required to include a health warning in advertising in 1972.

Reorganization. After Lyndon Johnson became president in 1963, he presented Congress with a far-reaching program of social reform that included major health-related legislation. In 1965, Congress passed laws that expanded the role of the Public Health Service in the fight against heart disease, the care of migrant workers, the vaccination of children, and local health care planning. However, the most significant health care legislation, Medicare and Medicaid, did not involve the Public Health Service, which viewed the programs as medical insurance rather than the provision of health care.

In 1965 John Gardner became secretary of HEW and transferred the surgeon general’s statutory authority to himself, although Dr. William Stewart, who had succeeded Terry as surgeon general, continued as head of the agency. Then in 1968, Wilbur Cohen replaced Gardner and initiated another reorganization. He created three agencies within the Public Health Service: the National Institutes of Health, the Food and Drug Administration, and the Health Services and Mental Health Administration. Cohen also assigned administrative responsibility to Dr. Philip Lee, then the assistant secretary for health and scientific affairs. The surgeon general was relegated to deputy administrator.

The changes continued after Richard Nixon was elected president in 1968. In 1969, Secretary of HEW Robert Finch appointed Dr. Jesse Steinfeld to be surgeon general, over the protests of many in the administration who thought the job should be left vacant. When Elliot Richardson replaced Finch in 1971, he appointed a committee chaired by former undersecretary of HEW John Perkins to study the future of the Commissioned Corps. The committee concluded that the Commissioned Corps should be replaced by a civil service career system for health care professionals and that the position of surgeon general should be eliminated. The recommendation was never carried out, but the position of surgeon general was left unfilled for four years after Steinfeld resigned in 1973. The deputy surgeon general, Dr. S. Paul Ehrlich, Jr., fulfilled the ceremonial duties of the surgeon general until 1977.

Despite the controversy surrounding the role of the surgeon general, the Public Health Service expanded under the Nixon administration. In 1970, Congress passed the Occupational Safety and Health Act, which created the Occupational Safety and Health Administration (OSHA) within the Department of Labor to establish and enforce workplace health and safety standards. In addition, the law created a National Institute for Occupa-

tional Safety and Health under the Public Health Service to study the causes of employee illnesses and accidents. Also in 1970, the Public Health Service established the Institute on Alcohol Abuse and Alcoholism and the National Health Service Corps, which recruited health care professionals for rural areas of the country with a critical shortage of health care services.

Tuskegee Project. The Public Health Service faced another controversy in 1972, when a former venereal disease program worker raised questions of ethics and racial prejudice in the Tuskegee syphilis project. In the early 1930s, the Public Health Service, the Macon County, Alabama, Health Department, and the Tuskegee Institute began studying syphilis in a group of black patients. They continued the study without medical intervention for almost 40 years, despite the fact that penicillin had proved effective against syphilis in the 1940s. The Center for Disease Control attempted to defend the study by claiming that penicillin sometimes led to adverse reactions in patients with advanced cases of syphilis. However, a medical review panel dismissed the claim and called for an immediate end to the project. The government later paid \$10 million in out-of-court settlements to survivors of the program and families of those who had died.

Following revelations about the Tuskegee Project, the Public Health Service underwent another reorganization in 1973, when five operational level agencies were created under the Office of the Assistant Secretary for Health. The Centers for Disease Control was established as a separate agency, along with the Health Resources Administration, the Health Services Administration, the Food and Drug Administration, and the National Institutes of Health. A sixth agency, the Alcohol, Drug Abuse, and Mental Health Administration, was created in 1974. The name was later changed to the Substance Abuse and Mental Health Services Administration.

Swine Flu. Late in 1975, four Army recruits fell ill with a new strain of influenza, dubbed "swine flu," that was believed related to the pandemic Spanish influenza of 1918 that killed more than half a million Americans. The swine flu virus was isolated in 1976, and the Public Health Service began preparing for a nationwide immunization program that fall. When more than 200 people came down with a respiratory illness after attending an American Legion convention in Philadelphia, the immunization program was put into effect. Almost 50 million Americans were inoculated between October and the middle of December.

However, by November there were also hundreds of reports of a rare condition known as Guillain-Barre Syndrome, which left its victims paralyzed. Horribly, the cause was traced to the swine flu vaccine. Moreover,

researchers had proved that the "Legionnaires disease" was not swine flu, and there had not been any reports of swine flu in the United States since the four recruits had become ill a year earlier. The Public Health Service announced suspension of the immunization program on December 16, 1976. More than 1,000 people eventually developed Guillain-Barre Syndrome and the government paid more than \$84 million in liability claims.

Healthy People. In 1977, President Jimmy Carter appointed Joseph Califano as secretary of HEW. Califano then recruited Dr. Julius Richmond, the first director of Project Head Start, as Assistant Secretary for Health. However, Richmond agreed to serve only if he also was appointed surgeon general, thus filling the vacancy that had existed since 1973 and avoiding the ambiguity of who ran the Public Health Service.

Richmond established an Office of Disease Prevention and Health Promotion to launch what he called a "second health revolution" that would address the issues of smoking, drinking, nutrition, sedentary living, and poor safety practices. In 1979, the Office of Disease Prevention and Health Promotion published "The Surgeon General's Report on Health Promotion and Disease Prevention."

The report, which became known as "Healthy People," established goals for 1990 that included a 35 percent reduction in infant mortality, a 20 percent reduction in mortality among all age groups, and a 20 percent reduction in the number of days of illness among the elderly. In the forward, Califano said, "You, the individual, can do more for your own health and well-being than any doctor, any hospital, any drug, any exotic medical device." A companion report, "Objectives for the Nation," was published in 1980 and established specific targets by age group for several health categories.

During the 1980s, the Public Health Service continued to report that people were not adopting healthier lifestyles, and in 1990, the Office of Disease Prevention and Health Promotion extended its target date another decade with the publication of "Healthy People 2000: National Health Promotion and Disease Prevention Objectives." The American Public Health Association published a guide, "Eleven Steps to a Healthy Community," to assist states in achieving the "Healthy People 2000" objectives, and in 1993 reported that 41 states had adopted its model program.

AIDS. In 1981, doctors in the United States began reporting a strange new disease that left healthy young men susceptible to a variety of rare infections and cancers. In 1982, the Centers for Disease Control gave the disease a name, acquired immune deficiency syndrome (AIDS), after discovering that it weakened the body's disease-fighting immune system. In 1983, the Public

Health Service issued its first set of guidelines on AIDS prevention, which urged high-risk individuals to change their sexual practices and refrain from donating blood. In 1986, Koop released a more controversial report, much of which he wrote himself, urging sex education beginning in grade school and the use of condoms. He also denounced the notion of quarantines and called for tolerance.

Meanwhile, other agencies within the Public Health Service also became involved in the campaign against AIDS. In 1985, the Centers for Disease Control announced that it was safe for children with the disease to attend school; however, it recommended precautions for younger children who might be more likely to bite or scratch each other. The Food and Drug Administration also approved a test to screen for AIDS among blood donors and announced that the nation's blood supply was again safe.

Then in 1988, Koop took the dramatic step of writing and mailing an eight-page brochure on AIDS, "Understanding AIDS," to all 107 million households in the United States—the largest public health educational campaign ever. In 1988, the Public Health Service also established the National AIDS Program to provide support and coordination for federal, local, and private-sector efforts. During Koop's tenure as surgeon general, he also issued the first surgeon general's report on the health hazards of smokeless tobacco and assumed formal command of the Commissioned Corps, then with 5,500 uniformed officers. The Public Health Service also closed the last of the Marine Hospitals and assumed responsibility for health aspects of the toxic waste clean-up program known as Superfund.

Further controversies with subsequent Clinton administration nominees left the surgeon general's post vacant for more than two years. Shalala and Lee retained their posts in Clinton's second term.

As the century came to a close, it was easy, by funding and media coverage alone, to identify the most pressing public health issues: AIDS, tobacco-related disease and morbidity, food safety, and (more diffusely) the ability of the United States to respond to disease brought into the country from foreign sources. The World Health Organization had reported increases in infectious diseases, including a resurgence of tuberculosis, and U.S. pharmaceutical companies tried to keep pace with antimicrobials intended to defeat new strains of "superbugs," a term applied to mutated viruses and bacterium that are resistant to conventional treatments.

A 1998 report from the CDC indicated that there were approximately 400,000 tobacco-use related deaths per year in the United States alone. The 1999 class-action settlements with tobacco companies were allocated

among federal and state agencies to assist in treatment and education programs to address this problem. The 1998 "Fen Phen" scare, as well as illnesses and deaths reportedly connected to contaminated herbal sprouts and pet chews (pig ears and animal hooves), were addressed by the FDA. The FDA also released statements in 1999 proposing new rules regarding nutrition labeling on food products and the safe handling of eggs and egg products. In September 1999 the FDA issued a statement identifying a potential link between incidence of Down Syndrome and low maternal levels of folic acid.

CURRENT CONDITIONS.

During the early 2000s, a number of new public health threats emerged. Among these were heightened risks of bioterrorism, including the use of diseases like anthrax and smallpox as weapons. Other potential public bioterror threats included exposure to radiation, botulism, the plague, sarin nerve gas, sulfur mustard (mustard gas), ricin, and VX. In addition to bioterrorism were the spread of West Nile virus, as well as a new illness called severe acute respiratory syndrome (SARS).

An increased concern about biological weapons emerged in the wake of the terrorist attacks that were made against the United States on September 11, 2001. Following the tragic events of that day, mail tainted with deadly anthrax bacteria was circulated in the postal system, causing several deaths. According to the CDC, anthrax "is an acute infectious disease caused by the spore-forming bacterium *Bacillus anthracis*. Anthrax most commonly occurs in wild and domestic lower vertebrates (cattle, sheep, goats, camels, antelopes, and other herbivores), but it can also occur in humans when they are exposed to infected animals or tissue from infected animals."

Following the discovery of contaminated mail, U.S. government agencies responded in a variety of ways. The CDC began communicating information to the public about cross-contamination and the appropriate way to handle mail. In addition to basic information about anthrax, the CDC provided information about exposure, symptoms, diagnosis, testing, and screening. It also discussed the difference between symptoms of anthrax exposure and the flu and implications for pregnant women and workers, and provided information about the antibiotic Cipro, which was used in treatment. The U.S. Postal Service responded by implementing a number of security measures, including electron-beam irradiation for sanitizing mail in select locations. The organization also purchased nearly 90 million pairs of rubber gloves, as well as 5 million facemasks to safeguard its employee base. To protect postal customers, some 145 million postcards were sent to U.S. residents that provided explanations about what to do with suspicious items received via U.S. mail.

As described by the CDC, smallpox is “an acute, contagious, and sometimes fatal disease caused by the variola virus (an orthopox virus), and marked by fever and a distinctive progressive skin rash.” Although smallpox was considered eradicated in 1980 because of successful campaigns to vaccinate the population, the disease remained in storage in select locations and reemerged as a potential bioterrorism threat during the early 2000s. To prepare for a possible attack, the CDC requested that the U.S. government develop a program to protect the public. This plan included “preparedness teams” consisting of public health and health care employees. The government facilitated production of smallpox vaccine and began vaccinating these individuals in preparation for an outbreak. As of February 2003, the CDC indicated that enough vaccine existed “to vaccinate everyone who would need it in the event of an emergency.”

West Nile virus, West Nile fever, and West Nile encephalitis are related conditions that affect humans, as well as a number of other animals including birds and horses. The virus, which is transmitted by mosquitoes, was first discovered in the eastern United States in the summer of 1999. According to the CDC, “West Nile virus is a flavivirus commonly found in Africa, West Asia, and the Middle East. It is closely related to St. Louis encephalitis virus found in the United States. . . . West Nile fever is a case of mild disease in people, characterized by flu-like symptoms. West Nile fever typically lasts only a few days and does not appear to cause any long-term health effects. More severe disease due to a person being infected with this virus can be West Nile encephalitis, West Nile meningitis or West Nile meningoencephalitis. Encephalitis refers to an inflammation of the brain, meningitis is an inflammation of the membrane around the brain and the spinal cord, and meningoencephalitis refers to inflammation of the brain and the membrane surrounding it.” Although the CDC stressed that the chance of humans becoming infected with West Nile virus is low, the center indicated that the avoidance of mosquito bites was the best means of prevention. In addition, it encouraged citizens to report potentially infected dead birds to local and state authorities.

One final threat public health officials faced in the early 2000s came from a new respiratory illness called severe acute respiratory syndrome (SARS), caused by the SARS coronavirus (SARS Co-V). In 2003, outbreaks of this illness occurred in Asia, Europe, and North America. The World Health Organization identified the SARS outbreak in southern China in March 2003. Since then, the disease was believed to have spread via international travel. By May of 2003, *USA Today* reported that more than 8,000 possible cases had been identified across the globe, resulting in nearly 685 deaths. In North America,

the SARS outbreak occurred in the Canadian city of Toronto, where nearly 350 people were infected and almost 25 people died. In addition to presenting challenges for travelers and public health officials, SARS also impacted the world economy by affecting activities like business travel and tourism.

In response to SARS, the CDC communicated constantly with public health officials across the globe, including the World Health Organization. It also took very specific measures to address the emergence of this new public health threat. These included the provision of some 300 medical experts to address SARS, including scientists and medical officers who helped to conduct investigations in the United States and other countries; activation of a 24-hour Emergency Operations Center; issuing alerts for travelers; and conducting lab tests on specimens from infected individuals.

SIC 9441**ADMINISTRATION OF SOCIAL, HUMAN RESOURCE, AND INCOME MAINTENANCE PROGRAMS**

This category covers government agencies engaged in assistance to the elderly, child welfare, aid to families with dependent children, aid to the blind and disabled, medical assistance, human resource development, and related activities. The actual operations of the programs are classified in various social services industries, but both the administration and operation of Social Security, disability benefits under OASDI, disability insurance, Medicare, unemployment insurance, worker's compensation, and other social insurance programs for the aged, survivors, or disabled persons are classified under this industry. The offices that administer veterans' programs are classified in **SIC 9451: Administration of Veterans' Affairs, Except Health Insurance**. Local employment service offices are classified in Services under **SIC 7361: Employment Agencies**.

NAICS CODE(S)

923130 (Administration of Social, Human Resources and Income Maintenance Programs)

INDUSTRY SNAPSHOT

Federal activities directed toward the social welfare of Americans are overseen by divisions within the U.S. Department of Health and Human Services (HHS). It was created in 1953 as the Department of Health, Education, and Welfare (HEW). Following the Department of Education Organization Act, the Administration for Children and Families (ACF) is considered the largest (in terms of government-originated spending) and most expensive under HHS's umbrella. In 2003 this agency was expected to spend approximately \$47 billion on programs and agency overhead. Approximately 2.2 million families received aid to families with dependent children (AFDC) payments in 1970, but two decades later that number had grown to 4.1 million families. In 1997, new welfare reform legislation was implemented, replacing the AFDC with Temporary Assistance to Needy Families (TANF), a state-federal program. After peaking at 5 million in 1994, the number of families receiving government assistance gradually declined into the early 2000s, reaching 2.1 million in 2001.

In August 1997 The Children's Health Insurance Program (CHIP) was enacted as Title XXI to the Social Security Act to expand health insurance coverage for low-income children. By the early 2000s, HHS was taking steps to modernize CHIP in a number of different ways, along with welfare, Medicare, and Medicaid. In its

fiscal year 2004 budget the agency requested \$400 million for this purpose, which would be used over the course of the following decade.

ORGANIZATION AND STRUCTURE

Social Security Administration. The National Old-Age, Survivors, and Disability Insurance (OASDI) program, commonly called Social Security, is the largest federal income maintenance program. The benefits, administered by the Social Security Administration (SSA), are for retired workers (Social Security Act of 1935), disabled workers (1956 amendment), and their dependents and survivors (1939 amendment). Compulsory tax withholdings from employees, employers, and the self-employed are put in the OASI and DI trust funds to be used for retirement, death or disability benefits, benefits for survivors, vocational rehabilitation, and administrative expenses.

Also administered by the SSA is the Supplemental Security Income program (SSI). Established in 1972, SSI replaced Old-Age Assistance (OAA), Aid to the Blind (AB), and Aid to the Permanently and Totally Disabled (APTD). The program was intended for people without any other source of income.

Centers for Medicare & Medicaid Services. In the early 2000s, some 77 million Americans were beneficiaries of Medicare and Medicaid programs administered by the Centers for Medicare & Medicaid Services (CMS). The CMS, formerly known as the Health Care Financing Administration (HCFA), was renamed on June 14, 2001. Medicare recipients are the aged and disabled. Medicare consists of two programs: hospital insurance (HI) and supplementary medical insurance (SMI). Medicaid is for persons of limited means and is administered by the states.

Other Departments and Programs. The Office for Civil Rights within the Department of Health and Human Services is also responsible for the administration and enforcement of laws (e.g., the Americans with Disabilities Act of 1990 or the provisions of the Equal Employment Opportunity Acts) prohibiting discrimination in federally assisted health and human services programs.

Unemployment insurance, a federal and state program, provides benefits for the involuntarily unemployed. Worker's compensation, mainly administered by the states, is for insured injured workers. Other work-related programs, such as Black Lung, are administered by the U.S. Department of Labor.

BACKGROUND AND DEVELOPMENT

The concept of social welfare has existed in some form or another throughout much of history. Some 4,000 years ago, Babylonian ruler Hammurabi was among the first in government to voice concern for protecting the needy. Ancient Greek and Roman philosophers, too, sup-

ported the concept of society helping those in need, and grounds for assistance of the poor are found in a number of religious traditions, including Judaism and Christianity.

America's Social Welfare Roots. In the European Middle Ages (476 to 1453) Christian monasteries served the needy. Their hospitals provided a broad range of services for the ill, homeless, aged, orphans, and even travelers. They were, of course, far removed from the acute care institutions of modern America. Under the laws of the day, the medieval church was responsible for public welfare and could collect taxes to support its activities.

Medieval life was characterized by feudalism, and under this system most people were assured of at least minimal assistance for life. In the cities, those in need received some assistance from social, craft, and merchant guilds. Social stability, limited mobility, and a sense of obligation to the poor and needy of the community were essential to the social welfare activities of the Middle Ages. But eventually a series of upheavals resulted in a breakdown of this basic social welfare system. These included the bubonic plague (1348 to 1349), which killed nearly one-third of the English population, and several other natural disasters. With the decline of the Church of England, which had been largely responsible for social welfare, a new system was needed.

In response the English government in the mid-fourteenth century began placing restrictions on the poor and unemployed, as well as taking some responsibility for organizing voluntary assistance. These early English laws regarding the needy included: restrictions on begging and later laws against it (with death as one possible consequence to repeat offenders), involuntary apprenticeships for the children of the poor, and taxes and assessments to help provide for the needy and the poor. Such laws were drawn together under the Elizabethan Poor Law of 1601. It was this law that became the basis for early social welfare laws in America.

Problems of the Old World arrived in the New World in spite of an abundance of land and opportunity. The needs of the poor, the aged, the sick, and others were at first taken care of by the individual colonies, but as towns grew so did needs, and the colonists turned to the English Poor Law for guidance. Another strong influence was the Puritan value and belief system regarding poverty—the poor were considered inferior but part of God's order and were to be assisted by the people higher up on God's natural hierarchy. Some colonies made decisions regarding the poor in town meetings. One application of aid was to place a needy person in a private home for a fee. Other colonies gave tax relief directly to the poor or to physicians aiding the poor.

In general, communities took care of their own but showed resistance to assisting a growing number of

strangers or newcomers. Some colonies, such as early seventeenth-century Boston, passed laws allowing for forced removal of unemployed strangers, and the Plymouth Colony passed a residency statute regarding public assistance. Registering, bonding, fines, and whippings were other methods New England colonies used to deal with nonresidents they feared would become dependent on or destructive to the community.

Yet by the late 1700s, just prior to the American Revolution, certain colonies were spending as much as 35 percent of municipal funds on urban poverty. Urban problems had been exacerbated by war refugees and disabled soldiers from the French and Indian War in Canada, illegitimate children (up to one-half of all births during the Revolutionary period), widows of seafaring workers, and people affected by economic depressions, fires, and epidemics.

Religious, ethnic, and fraternal groups, as well as wealthy philanthropists, played major roles in assisting the poor: it was a period of cooperation between the public and private sectors, influenced by the humanitarian tenets of the Great Awakening (an evangelistic religious movement that occurred around 1740) and the Enlightenment (a philosophical movement that generally took place in Europe and elsewhere from 1700 to about 1789, or the beginning of the French Revolution). But the tradition of local assistance was widely disrupted following the American Revolution. Immigrants came in huge numbers. Also, industrialization, the spread of wage labor, and the growth of urban areas resulted in increased burdens on local governments.

In addition, broader social and economic changes in the Western world were transforming the traditional view of poverty. Classical economists of the eighteenth century supported the concept of an unregulated economy and saw social welfare programs as interfering with a natural economic process. In England, the Poor Law of 1601 was revised to reflect these new views. The law that had upheld the belief that the needy should be assisted came to an end after nearly 250 years. The new view was that poverty was a moral, not a social, problem. Such factors of the work environment as low wages, depressed industries, limited opportunity, and seasonal and technological unemployment were dismissed as barriers to individual achievement. Communities became reluctant to assist the needy and larger county- and state-run institutions were formed to take care of the problem. In 1824 the New York legislature passed the County Poor House Act and thus marked a shift from the towns to the counties as social-service providers. During the same period mental hospitals, prisons, and orphanages also were being established.

Another shift in American attitudes toward social welfare came during the Civil War. The needy benefited from the general understanding that in war, circumstances were

beyond the control of the individual. Significantly, the first national public-health group was formed and mainly operated by women. The United States Sanitary Commission organized local voluntary organizations to provide health education programs for soldiers. For the first time, the federal government was seen as the coordinator of social welfare needs that were universal in nature.

Problems that the United States faced prior to the war, such as those created by industrialization and urbanization, had to be contended with following the war; in addition, the nation was faced with the urgent needs of ex-slaves. The Congress created the first federal welfare agency, the Bureau of Refugees, Freedmen, and Abandoned Lands in the U.S. Department of War, to help during the transition from slavery to freedom. In existence from 1865 to 1872, the Bureau distributed food and assisted with employment, educational costs, and medical care. The federal government would not get as deeply involved in social welfare again until almost 100 years later. The nation continued to depend on voluntary organizations and local, county, and state governments for social welfare services.

Mothers' Pensions. Mothers' (or widows') pensions were early twentieth-century programs to assist single or widowed women with children. These programs marked yet another turning point in the debate between the deserving and the undeserving poor. The programs set some precedents for America's social welfare policy-to-come by keeping children with their mothers and keeping mothers at home rather than in the workplace.

The Birth of Social Security. In March 1933 Franklin Delano Roosevelt assumed the presidency and, with it, the daunting task of bringing the nation out of the Great Depression. Within his first hundred days in office he oversaw the passage of much of his New Deal program. But it was not until 1935 that the Social Security Act was passed. In its original form, this law established unemployment relief and old-age assistance, or social insurance, for American workers and designated that monthly benefits begin in 1940. The system was designed to return at least as much in benefits as an individual worker had paid in to the government. However, a 1939 amendment to the act weakened this commitment by instituting a formula in which benefits received would be based on average earnings during a confined period. The act also extended benefits to survivors and dependents, as well as the retired. In essence, Social Security was made to benefit a large cross-section of the population at the expense of its original intent.

In 1972 Congress added an automatic cost-of-living index to Social Security, so that benefits would rise accordingly. However, due to an error in the indexing plan, benefits began to rise faster than earnings. Despite

1977 legislation designed to correct the error, the Social Security fund continued to experience problems, largely due to high inflation and unemployment. Further legislation was introduced in 1983 to ensure OASDI's long-term health by, among other things, requiring a rise in the retirement age from 65 to 67, to take place between the years 2003 and 2027.

With the majority of American workers still under 45 years of age and years away from retirement, public sentiment during the early 1990s was toward changing Social Security policy to deal with the staggering financial burden. Changes suggested included: increasing retirement age to 72 years of age to delay payments; elimination of income limits on retirees in order to increase tax revenue; and the termination of surplus Social Security funds held in Treasury bills that are costly to redeem. Other changes suggested included separating out low-income old-age benefits from benefits related to contributions to the Social Security system. The federal Social Security retirement fund solvency was guaranteed until 2010 by 1983 congressional amendments, but the program's future beyond that date was considered uncertain.

With unemployment rates dropping in 1999 to the lowest levels since the 1970s (approximately 4 percent), America's attention shifted from welfare programs to retirement benefits. The Social Security Solvency Act of 1998, a contentious piece of legislation, never made it through in its proposed form. Notwithstanding, by 1999 the use of an estimated \$2.5 trillion Social Security surplus was hotly debated in Congress, resolved by a joint measure (referred to as the "lockbox" bill) to secure the trust fund from congressional meandering. Beginning in October 1999, the SSA began providing annual updates to the nation's employed, age 25 and older, timed to arrive three months before an annual birthday. The statements, at a cost of \$75 million annually, show current personal balances in each individual's account and project estimated retirement benefits. For those born after 1970, there will be a gradual increase in age requirement before full retirement benefits may be withdrawn: from 65 to 67. This measure was expected to affect 96 percent of the employed population in 2000.

Because of the extreme 1998-99 bull market in stocks, the "privatization" of Social Security accounts gained much attention—and political exposure. Two schools of thought emerged: one giving the federal government the authority to invest Social Security funds into speculative growth funds, and another allowing individuals to direct the destiny of their own funds, equal to an amount currently deducted from their paychecks. Negative consequences attach to both alternatives, so the twentieth century ended without any major changes to policy.

By 1999 all 50 states and the District of Columbia had complied with CHIP's requirement to develop plans

for children's health insurance. Some 18 states chose to implement this under Medicaid, whereas 17 states developed programs independent of Medicaid. By the year 2007, nearly \$40 billion was expected to be earmarked for this program.

Another critical issue in 1999 was Medicaid reimbursements to nursing homes, affecting 70 percent of nursing-home residents in the country. Average reimbursement rates in 1998 varied from \$329 per day in Alaska down to just \$62 per day in Nebraska. The disparity was the result of the Balanced Budget Act of 1997, giving block grants to states to control their own Medicaid costs. On the agenda were plans for legislators to tie reimbursement funds to quality of care received.

CURRENT CONDITIONS.

By the early 2000s, debates about privatizing Social Security continued to rage on. A number of different proposals were on the table concerning how private investment accounts could be used as part of the program. Some of these plans called for the devotion of 33 percent of individual tax payments to private stock accounts, which many argued would exacerbate an already growing federal deficit to the tune of \$200 billion per year. Other plans, such as one proposed by Representative E. Clay Shaw (R-Florida), relied on government-funded accounts that could be used in conjunction with benefits to which a person was entitled. However, no easy answers existed to the dilemma, and many political analysts stressed that no real developments would likely occur until the conclusion of the 2004 presidential election.

In March of 2003, the Social Security Board of Trustees issued an annual report to Congress explaining that the long-term outlook for the Social Security program remained bleak. Costs were expected to exceed tax revenues in 2018, at which point gaps would be made up from monies in the Social Security Trust Fund. The report projected that the trust fund would be depleted by 2042 and that the fund "would require another \$3.5 trillion in today's dollars, earning interest at Treasury rates, to pay all scheduled benefits over the next 75 years." This amount was about \$200 billion higher than the figure cited in 2002's report.

After the report was issued, Social Security Commissioner Jo Anne Barnhart called it "yet another reminder of what we have known for some time: Social Security's long-term financing problems are very serious, and will not be fixed by wishful thinking alone." President George W. Bush, who strongly advocated privatizing the Social Security system, stressed that it was yet another reason to provide working people with a greater degree of choice, control, and ownership in the plan.

The report to Congress also contained bad news for the future of Medicare. According to the report, the

Medicare program was expected to lose its solvency in 2026. This date was sooner than previously expected; 2002's report projected the program would lose solvency in 2030. The *Boston Globe* cited comments from trustees about rising inpatient hospital costs, as well as lower projected tax revenues marked for Medicare, as reasons for the adjusted date. President Bush also touted the private sector as a solution to the Medicare dilemma, arguing that competition would serve to reduce costs. Bush's plan involved private "preferred provider plans," which supporters claimed would lower costs by slowing down the rate of Medicare growth via heightened competition. However, studies conducted by the private Center for Studying Health System Change and the nonpartisan Medicare Payment Advisory Commission presented figures showing that such plans have the potential to increase costs instead of resulting in desired savings.

One proposal on the table in April of 2003 involved the addition of prescription drug coverage for senior citizens willing to switch from traditional Medicare to a Medicare HMO. However, this drew opposition from all political sides. The *Boston Globe* dubbed a subsequent proposal, introduced in May 2003, as a "poorly disguised variation" of the first plan, in which senior citizens with traditional Medicare would get drug benefits only after paying deductibles ranging from \$4,500 to \$7,500. In the meantime, premiums for supplemental Medicare HMOs, which participants used to cover costs not paid for by Medicare (including prescription drugs), continued to increase, while benefits offered declined. In addition, many insurance companies began to drop these increasingly unprofitable plans from their portfolios. Although no one solution appeared to be a "silver bullet" for the challenges facing Social Security and Medicare in the early 2000s, one thing was clear: the price for inaction was too costly. Thus, as the nation moved toward the mid-2000s, it appeared that substantial developments of some kind were inevitable.

SIC 9451

ADMINISTRATION OF VETERANS AFFAIRS, EXCEPT HEALTH AND INSURANCE

This category includes government establishments primarily engaged in administration of programs of assistance, training, counseling, and other services to veterans and their dependents, heirs, or survivors. Also included are offices that maintain liaison and coordinate activities with other service organizations and governmental agencies. Veterans hospitals are classified in Hospitals categories, and veterans' insurance in the Insurance Carriers industries.

NAICS CODE(S)

923140 (Administration of Veteran's Affairs)

INDUSTRY SNAPSHOT

In 2002, there were an estimated 25 million veterans in the United States, most of whom served during periods of armed conflict. More than 70 million Americans, including veterans and their dependents, were potentially

eligible for veterans benefits provided by the U.S. government, representing approximately one-third of the nation's population.

Veterans' benefits were administered by the Department of Veterans Affairs, second in size only to the Department of Defense among government departments. In 2004, the Department of Veterans Affairs had a budget of approximately \$63.6 billion. About \$30.2 billion of the department's budget went to discretionary funding and \$33.4 billion to entitlements. Department-wide employment was about 203,000 in 2000, down from 266,000 in 1993.

ORGANIZATION AND STRUCTURE

The U.S. Department of Veterans Affairs is organized into three functional agencies: the Veterans Health Administration (VHA), the Veterans Benefits Administration, and the National Cemetery System. The VHA operates the largest health care system in the nation, including 173 medical centers, 133 nursing homes, 40 domiciliary care units, and 398 outpatient clinics. An estimated 3.6 million veterans received medical treatment in 1999. Combat veterans also received counseling at more than 200 Vietnam Veteran Outreach Centers for a variety of problems, including posttraumatic stress disorder. The budget for medical programs in 1999 accounted for more than 40 percent of the total budget.

The Veterans Benefits Administration is responsible for most nonmedical benefit programs, including disability compensation, pensions, burial benefits, rehabilitation assistance, home loan guarantees, and insurance. These entitlement programs amounted to \$20.1 billion in 1999, when the agency processed approximately 3.5 million claims by veterans seeking disability compensation or pensions. Another 631,640 widows, children, or parents of deceased veterans were receiving survivor benefits. In addition, more than 370,000 veterans or their dependents were receiving educational benefits, and about 343,954 veterans had received home loan guarantees for new mortgages, as well as refinancing. Since the GI Bill of Rights was passed in 1944, the government has guaranteed home loans for more than 15 million veterans and their dependents. About 20.7 million veterans and dependents have attended college or received job training. The Veterans Benefits Administration also administers the fourth largest insurance program in the United States, with 2.2 million policyholders.

The National Cemetery System consists of 114 cemeteries and 34 memorials and monuments to veterans of the nation's wars. More than 2 million veterans and family members are buried in these national cemeteries, which occupy more than 5,000 developed acres. The U.S. Department of Veterans Affairs also provides headstones and markers for veterans' graves in private cemeteries. In

1999, the National Cemetery System's 1,300 employees provided more than 61,370 interments. The agency projects that its interments will increase nearly 50 percent by 2008.

BACKGROUND AND DEVELOPMENT

The United States has provided veterans' benefits since 1818, when Congress finally agreed to pay veterans of the Revolutionary War pensions they had been promised for more than 40 years. During the War, the Continental Congress had encouraged enlistments by promising pensions for soldiers who were disabled in the fighting. It also approved a lifetime pension amounting to half-pay for all officers. However, because the Continental Congress did not have the power to raise money through taxes, there was no practical way to fulfill either promise.

In 1780, the Continental Congress voted to give officers who served until the end of the war half-pay for life, but according to Richard Severo and Lewis Milford, authors of *The Wages of War*, few officers ever expected to receive pensions because the Continental Congress lacked the resources to pay soldiers even their regular wages. In December 1817, after several other failed efforts, President James Monroe asked Congress to approve pensions for all veterans of the Revolutionary War and the War of 1812. Monroe told Congress, "In contemplating the happy situation of the United States our attention is drawn, with peculiar interest, to the surviving officers and soldiers of our Revolutionary Army, who so eminently contributed, by their services, to lay its foundation." Congress passed a bill the following year to give enlisted men \$8 per month and officers \$20.

Nearly 19,000 veterans applied for pensions in 1818. However, following the Panic of 1819, Congress amended the law to require that veterans be indigent before they qualified for a pension. More than 6,000 veterans were dropped from the pension rolls when they failed to prove poverty. These first pensions were administered by the office of the Secretary of War from 1818 until 1833, when Congress created the Bureau of Pensions, also within the Department of War. Prior to the Civil War, the administration of veterans' benefits was criticized for encouraging ex-soldiers to live at the government's expense and for encouraging graft and corruption.

Civil War. In many ways, the treatment of veterans after the Civil War was similar to what followed the Revolutionary War. By 1866, nearly 1 million Union soldiers had been demobilized and returned to their homes only to find there were no jobs available. The average Union soldier received about \$250 when he was discharged, but very little else. By 1868, New York Governor Reuben E. Fenton lamented that homeless vet-

erans in his state "are numbered by the thousands, and are altogether beyond the power of Executive and Legislative relief." He added that "their needs cannot be postponed," and called upon charitable organizations to help. The *North American Review* also estimated that in 1866 more than 5,000 former Union or Confederate soldiers were in state prisons, and one prison physician reported, "They have come to us with constitutions shattered by wounds, disease or intemperance." An estimated 45,000 veterans were addicted to morphine or heroin, which they had been given during the war for their injuries, and drug addiction came to be known as "the soldier's disease."

The United States did provide an annual pension for those who lost a limb: \$75 for a leg or \$50 for an arm. And in 1866, Congress funded the National Home for Disabled Voluntary Soldiers, which housed soldiers in 13 homes. However, the Commission of Inquiry and Advice in Respect to the Sanitary Interests of the U.S. Armed Forces advised that the government could not afford to pay for medical treatment of Civil War veterans.

When the Civil War ended, the United States had imposed a five-year cutoff on disability claims. The Arrears Act of 1879 allowed Civil War veterans to file new claims and collect pensions retroactively. John Sherman, then Secretary of the Treasury, estimated the pensions would cost as much as \$150 million, and the *New York Tribune* predicted "a grand scramble by a horde of hungry claims agents to get their hands on vast unearned portions of the national treasury." President Rutherford B. Hayes signed the bill into law despite the pressure to veto it. More than 47,000 new claims were filed in 1879 and nearly 140,000 in 1880, thus creating the first large veterans' administration bureaucracy. The Pension Building in Washington, D.C., was built in 1882 for the 1,500 clerks then needed to administer military pensions.

Grand Army of the Republic. Civil War veterans soon banded together to help influence governmental decisions concerning veterans' affairs. One such association was the secretive Grand Army of the Republic (GAR), founded in 1866, which was open to all honorably discharged members of the Union armed forces who served between April 12, 1861, and April 9, 1865. The GAR began as a fellowship, but soon took a more active role in petitioning the government to provide pensions and homes for veterans. By 1885, the GAR had nearly 250,000 members and was a powerful force in national politics.

Following the Civil War, veterans' benefits were the largest single item in the federal budget, accounting for almost 18 percent of the total. Nevertheless, when President Grover Cleveland vetoed a bill in 1887 that would have provided all disabled veterans with pensions, re-

ardless of whether their disabilities were caused by military service, the GAR launched a campaign to defeat him in the next election. When Benjamin Harrison was elected in 1888, the *National Tribune*, newspaper of the GAR, bragged that veterans had “vetoed the great vetoer.” Harrison, a brigadier general in the Civil War, was mindful of the support he received from the GAR and appointed James Tanner, commander of the GAR’s New York Department, to head the Pension Bureau. Tanner, who had lost both legs in the Civil War, immediately promised to review all pensions of less than \$3.75 a month.

In May 1889, the *Nation* noted that veterans’ pensions already cost more than \$88 million a year and estimated they would rise to \$95 million in 1890. The magazine, which called Tanner a “loud-mouthed Grand Army stump speaker,” added, “This is a greater amount than the cost of the entire military establishment of Germany, under which the people of that nation groan so loudly.” Many of the nation’s leading newspapers also expressed concern. The *Philadelphia Press* complained that Tanner “would apparently like to pension everybody and everything.” Tanner also irritated powerful people in Washington—he once told Representative Thomas Flood of New York that if the congressman’s brain “was blown into the eye of a mosquito, it would not make the mosquito blink”—and ignored the Secretary of the Interior, to whom he nominally reported. That proved to be his undoing. Six months after taking office, Tanner submitted his resignation.

Tanner was succeeded by another Civil War veteran, Green B. Raum. Although less vociferous than Tanner, Raum was more effective. Congress passed the Dependent Pension Act of 1890, which provided a pension for any veteran of the Union army who had served at least 90 days and was unable to earn a living, for any reason, by his own labor. The law also applied to widows, and by 1893 more than 1 million Union veterans or their widows were receiving more than \$150 million in benefits. The United States also operated seven National Soldiers’ Homes with more than 14,000 residents. In contrast, about 26,000 Confederate veterans were sharing about \$1 million from various state pensions. The GAR eventually grew to more than 500,000 members. Although its influence began to fade around the turn of the century, the GAR continued to exist until 1956, a year after the last Civil War veteran died.

Veterans Bureau. During World War I, Congress established the Bureau of War Risk Insurance, under the jurisdiction of the Treasury Department, to insure U.S. ships and their cargoes against the risk of mines, warships, and submarines. When the United States entered the war in 1917, the law was amended to provide death and disability benefits for members of the Armed Forces and their fami-

lies. Congress also created a Federal Board for Vocational Education to provide job training for disabled veterans. In 1921, Congress combined the Bureau of War Risk Insurance and the Federal Board for Vocational Education to create the Veterans Bureau. Charles R. Forbes, who had been appointed by President Warren G. Harding to head the Bureau of War Risk Insurance, became the first director of the new Veterans Bureau.

Forbes, however, proved to be a corrupt administrator who ignored the needs of veterans, padded the agency’s payroll, and cheated the government out of millions of dollars. In the span of a few months, he embezzled millions of dollars and sold nearly \$7 million worth of medical supplies to private interests for \$600,000. Forbes later fled to Europe, leaving more than 200,000 unopened pieces of mail from veterans, and officially resigned in 1923. When he returned to the United States in 1924, he was convicted of conspiracy to defraud the U.S. government.

A Senate investigation of Forbes later revealed that the Veterans Bureau had disallowed thousands of legitimate claims. Although more than 300,000 U.S. soldiers had been wounded in combat, the Veterans Bureau had approved only 47,000 claims for disability insurance, and even fewer veterans received any vocational training. The Senate concluded, “Neither Congress nor the people of the country intended that bureau employees should split hairs when the claimants affected are men who were wounded in battle.” In 1925, a columnist for the *American Mercury* wrote that “Congress little realizes that its creature, the Veterans Bureau, has probably made wrecks of more men since the war than the war itself took in dead and maimed.”

In 1930, Congress authorized President Herbert Hoover to “consolidate and coordinate government activities affecting war veterans.” The Veterans Administration, created by executive order, consolidated the Veterans Bureau, the Bureau of Pensions, and the National Home for Disabled Volunteer Soldiers. Brigadier General Frank T. Hines, who had been director of the Veterans Bureau under Hoover, became the first administrator, a position he would hold until 1945.

Bonus Army. In 1924, Congress overrode a veto by President Calvin Coolidge to pass a “bonus bill” that provided 3.5 million World War I veterans with Adjusted Compensation Certificates. These certificates, which amounted to about \$1,000 each, were to mature in 1945. However, in May 1932, during the Great Depression, more than 15,000 veterans calling themselves the Bonus Expeditionary Force marched on Washington, D.C., demanding immediate payment. President Herbert Hoover refused to meet with leaders of the Bonus Army and promised to veto any bill that authorized early payment.

Finally, when the Bonus Army camped out on the Potomac River and staged public protests, Hoover ordered the Army to disperse the men whom he labeled “Communists and persons with criminal records.”

General Douglas MacArthur, then Army Chief of Staff, assembled 600 troops, including 200 cavalry under the command of Major George S. Patton. MacArthur ordered the troops to advance on the protesters with tear gas and bayonets. At one point, when the protesters resisted with bricks and curses, Patton led the last mounted charge of the U.S. Cavalry against homeless Americans. One of the veterans roused by the cavalry was Joseph T. Agelino, who won the Distinguished Service Cross in 1918 for saving Patton’s life. After dispersing the protesters at the armory, MacArthur turned his attention to Anacostia Flats and marched on the camp. More than 300 veterans and family members were injured in the confrontation.

Afterwards, President Hoover accepted responsibility for MacArthur’s actions, but he claimed the protesters were rabble-rousers bent on insurrection, not veterans. However, an investigation by the Veterans Administration (VA) revealed that 94 percent of the marchers had been veterans, almost 70 percent had served overseas, and 20 percent were disabled. In New York, an outraged Governor Franklin D. Roosevelt said of Hoover, “There is nothing inside the man but jelly.” Roosevelt was swept to victory in the presidential election that fall.

Ironically, Roosevelt persuaded Congress to pass the Economy Act of 1933, which among other measures cut service-related disabilities by 25 percent, thus triggering another bonus march. This time, however, Roosevelt had the VA establish a camp for protesters 15 miles outside Washington, thus avoiding confrontations with police or the Army. Congress eventually passed a bonus bill over Roosevelt’s veto.

GI Bill of Rights. In July 1943, two years before World War II would come to an end, President Roosevelt told the American people during one of his radio “fireside chats,” “While concentrating on military victory, we are not neglecting the planning of things to come. . . . Among other things, we are . . . laying plans for the return to civilian life of our gallant men and women of the armed services. They must not be demobilized into an environment of inflation and unemployment.” In October, he proposed legislation that would finance one year of education for veterans who were honorably discharged, with the possibility that those with “exceptional ability and skill” might be able to attend college for three years at government expense.

Despite the fear expressed by Robert M. Hutchins, then president of the University of Chicago, that “colleges and universities will find themselves converted into

educational hobo jungles,” Roosevelt’s proposal became the Serviceman’s Readjustment Act, largely written by the American Legion and passed unanimously by Congress in 1944. Roosevelt signed the law, better known as the GI Bill of Rights, on June 22, 1944.

As passed, the GI Bill provided veterans with up to 52 weeks of unemployment compensation following their discharge from the service. The law, considered one of the most significant pieces of social legislation ever enacted, also provided veterans with job training and counseling, educational grants, loans to establish small businesses and farms, and mortgage assistance to buy homes. Eventually, more than 2 million World War II veterans would go to college on the GI Bill, which paid full tuition plus \$50 a month for those with more than two years of military service. By 1948, the government was paying tuition for nearly half of all male college students. In addition, by 1950, 20 percent of new homes were purchased with low-interest VA loans. Between 1943 and 1956, more than 600,000 disabled veterans also took advantage of job training under the Vocational Rehabilitation Act. According to Severo and Milford, “Whatever its shortcomings, the GI Bill . . . produced a generation of well-educated professionals, businessmen, and homeowners who became the basis for a greatly strengthened American middle class.”

The post-war administration of veterans’ benefits was not without controversy, however. Early in 1945, Frank T. Hines, who had run the VA since 1923, came under increasing criticism for his failure to adjust to the changing needs of American veterans. When President Harry S. Truman announced plans to “modernize” the VA late in 1945, Hines resigned. In his place, Truman appointed General Omar N. Bradley, who had been in command of all U.S. ground troops in Europe since the D-day invasion of Normandy in 1944. Bradley took over the VA in August 1945. He told his staff, which then numbered 65,000, “Our job is to give the veterans service, and we must not forget that the service we give them they have earned by sweat and blood. It is a service they have paid for. We must realize that it is not a charity service.”

In *Wounded Men, Broken Promises*, Robert Klein wrote that “Complaints about the treatment afforded veterans virtually disappeared” under Bradley. However, his tenure as head of the VA would be short-lived, as key leaders within the American Legion criticized Bradley’s failure to respond to their demands as Hines had. Bradley resigned as head of the VA in 1947 and returned to the Army, where he became Army Chief of Staff in 1948 and the first chairman of the Joint Chiefs of Staff a year later. Bradley was replaced at the VA by Carl R. Gray Jr., a former officer and vice president of the Chicago and Northwestern Railroad who was considered one of the most ineffectual administrators ever to run the agency.

Korean War. When President Truman ordered U.S. troops into Korea early in 1950, the government's initial position was that veterans of the "police action" would be entitled only to the peacetime benefits. Eventually, Congress extended the rehabilitation and vocational training offered to World War II veterans to those fighting in Korea under the Veterans' Readjustment Assistance Act, a GI Bill of Rights for Korean War veterans that provided fewer benefits than World War II veterans had received. When the Korean War ended in 1953 with a truce rather than victory, there was a general feeling in the United States that perhaps Korean War soldiers had not fought as hard as their World War II counterparts. The Army even refused to pay many former prisoners of war the \$2.50 per day they were entitled to in back pay.

Korean War veterans were not immune from the fear of communism that gripped the nation in the mid-1950s. Charges that hundreds of American prisoners of war had collaborated with the Communist enemy prompted the VA, invoking a 1943 law that denied benefits to anyone found guilty of treason, mutiny, or sabotage, to establish a committee in 1955 to examine the political activities of veterans. The first and last veteran the committee moved against was James Kutcher, a former VA clerk who had been fired in 1948 for espousing the beliefs of Leon Trotsky, a leader of the 1917 Bolshevik revolution in Russia. In December 1955, the VA notified Kutcher that it also was cutting off his disability checks. However, Kutcher hired an attorney, Joseph Rauh, who pressured the VA into holding a hearing. Public sentiment was overwhelmingly with Kutcher, and the VA was forced to restore his benefits. In 1956, a federal appeals court ordered the VA to rehire Kutcher and pay him back pay.

Vietnam War. Veterans returning from Vietnam also received a less than enthusiastic welcome by the government and the American people. In particular, educational benefits were substantially less than those offered to veterans of World War II or the Korean War. In addition, the country was suffering through a period of high inflation and recession. In the early 1970s, President Richard Nixon vetoed a bill that would have increased the number of doctors at VA hospitals, urged Congress to cut funds for vocational education, and impounded money that Congress had intended to help veterans attend college. After Nixon resigned in 1974, Congress overrode a veto by President Gerald Ford to increase educational benefits.

Poor administrators also contributed to the sorry reception offered to returning Vietnam War veterans. Nixon had appointed Donald Johnson, former national commander of the American Legion, to head the Vietnam-era VA. However, Johnson later resigned amid charges that he pressured employees into contributing to Nixon's reelection campaign. Johnson's replacement, Richard Roudebush, was so disliked by veterans that a

few weeks after he took office three of them sneaked into his office in Washington, D.C., nailed the door shut, and forced him to discuss plans to cut educational benefits in the hallway. When Jimmy Carter became president in 1977, he named Max Cleland, a Vietnam veteran and multiple amputee, to head the VA. But organizations like the Vietnam Veterans of America remained critical of government efforts to help soldiers who had fought in Southeast Asia.

U.S. Department of Veterans Affairs. In 1988, Congress approved legislation to elevate the VA to Cabinet level, which proponents argued would give veterans a stronger voice in government. The Department of Veterans Affairs came into existence in March 1989, with former Illinois Congressman Edward J. Derwinski sworn in as the first secretary. Derwinski was succeeded in 1993 by Jesse Brown, former executive director of the Disabled American Veterans and an ex-Marine who was seriously wounded in Vietnam.

The Veterans Education, Employment, and Training Amendments of 1991 provided educational and vocational counseling for veterans who were not eligible for other educational benefits, extended the deadline for Vietnam veterans to take advantage of employment assistance until 1994, and gave preference to veterans for federal jobs. After years of debate, in 1994, the Department of Veterans Affairs agreed to provide benefits to veterans who had been exposed to Agent Orange, a defoliant that had been used extensively in Vietnam.

Persian Gulf War. In 1991, Congress approved legislation extending GI Bill benefits, including educational benefits and home-loan guarantees, to servicemen and women who fought in the Persian Gulf War. It also passed legislation making Gulf War veterans eligible for non-service-connected pension benefits and authorized the U.S. Department of Veterans Affairs to provide readjustment counseling to veterans who served in armed conflicts since May 1975. The government continued to deny the existence of a distinct Gulf War syndrome, a variety of ailments that veterans' organizations claimed were the result of bacterial warfare in the Persian Gulf. But it agreed to provide benefits to suffering veterans, providing that they had become ill within two years of their return from the conflict. This deadline, which eliminated 95 percent of applicants from eligibility, was extended to 2001 in 1997. Public debate over the causes and treatment of these illnesses continued.

Cutting costs while improving service to its core constituency were the paramount concerns of the Department of Veterans Affairs in the early and mid-1990s. The Veterans Health Administration (VHA) was a particular focus of criticism and reform. Some observers called for the wholesale dismantling of the health care system. Bob

Helms of the American Enterprise Institute told *Insight on the News* magazine's Gayle M.B. Hanson that "If you took all of the money the VA spends on health care, and provided it directly to veterans in the form of vouchers, they would be getting much, much better service." And while veterans justifiably complained about long waits, poor service, and the deteriorating physical condition of many facilities, lobbying groups staunchly opposed privatization.

Under the leadership of Secretary for Health Care Dr. Kenneth Kizer, the VHA embarked on a vast reorganization dubbed the "Prescription for Change." In 1996, the organization was decentralized from a four-region system into 22 Veterans Integrated Service Networks (VISNs), in an effort to slim the bureaucracy. The VHA, as well as the VA as a whole, adopted a more businesslike approach to management, complete with "organizational goals," "performance measures," and "core values." Since 1986, in fact, the VA has published an "accountability report" laid out much like a corporate annual report. Whether these efforts result in real improvements in service and resource allocation remains to be seen.

On November 11, 1998, President Clinton signed into law the Veterans Programs Enhancement Act of 1998, representing the 105th Congress' joint efforts to improve benefits and services to veterans. Among its key provisions are an extension of the VA's authority to provide medical care to Persian Gulf veterans through December 31, 2001, and provisions for additional evaluation of evidence linking illnesses of veterans with service in the Persian Gulf War.

The VA-HUD Appropriations Act of 1999 increased the president's requested budget by \$439 million, to be applied to various programs. Another important piece of legislation was the Veterans Benefits Act of 1998, which increases the full-time GI Bill monthly rate from \$440 to \$528; increases education benefits for spouses and children of veterans killed on active duty; and allows surviving spouses of deceased disabled veterans to again be eligible for benefits if their subsequent remarriage ends. Still to be signed into law during the 106th Congress was the Arlington National Cemetery Burial Eligibility Act, overwhelmingly passed by the House.

CURRENT CONDITIONS

The president's budget for the VA in 2004 was about \$63.6 billion for veterans' benefits and services. Along with a significant increase in medical care, the budget also included \$225 million in new construction funding for VA's nationwide infrastructure initiative (CARES) and \$264.9 million to support VA's burial programs, including funds for activation and operation of five new national cemeteries. The three main goals of the VA were to increase focus on its health care system, provide for

timely claims processing, and ensure that the burial needs of veterans were met and national cemeteries were maintained as shrines.

The Veterans Affairs Department made significant progress in the technology realm in the early twenty-first century, combining its security, management, and budget systems under the direction of the CIO Office. The CIO office is now responsible for modernizing the telecommunications systems and increasing cybersecurity. The CIO also oversees the VA's VETSNET project, which is a \$40 million compensation and pension system. The VA also plans to consolidate its eight processes for veterans registration and link them to the Defense Department's Defense Manpower and Data Center and the Defense Enrollment Eligibility Reporting System. This step will allow a single access point for shared veteran and military personnel benefits information.

SIC 9511

AIR AND WATER RESOURCE AND SOLID WASTE MANAGEMENT

This category includes government agencies primarily engaged in regulation, planning, protection, and conservation of air and water resources; solid waste management; water and air pollution control and prevention; flood control; drainage development and consumption of water resources; coordination of these activities at inter-governmental levels; research necessary for air pollution abatement, and control and conservation of water resources. Water systems are classified in **SIC 4941: Water Supply**. Sewage and refuse systems and other sanitary services are classified in **SIC 4950: Sanitary Services**. Irrigation systems are classified in **SIC 4971: Irrigation Systems**.

NAICS CODE(S)

924110 (Air and Water Resource and Solid Waste Management)

INDUSTRY SNAPSHOT

Management of air and water resources and regulation of solid waste disposal is a broadly distributed function at all levels of municipal, state, and federal government. This category includes agencies within most Cabinet-level departments of the federal government, most notably the Departments of Agriculture, Interior, and Defense. However, the Environmental Protection Agency (EPA) became the lead federal agency involved in air and water resource and solid waste management when it was created in 1970. The total budget for the EPA was set at \$7.6 billion for 2003.

The EPA is an independent agency of the executive branch of the federal government that is charged with implementing environmental legislation passed by Congress, including the Clean Air Act, the Clean Water Act, and the Comprehensive Environmental Response, Compensation, and Liability Act, better known as "Superfund." Beginning in the early 1990s, the EPA focused on researching and establishing standards for acceptable levels of pollution, while delegating implementation to state environmental protection agencies. The EPA also administered low-interest loan and grant programs to encourage state compliance with federal antipollution legislation. By the early 2000s, the EPA continued in its commitment to protect the nation's land and keep its air and water clean. This was accomplished by a variety of initiatives, including Clean School Bus USA, which sought to lower emissions from school buses. In addition, the agency played a lead role in protecting U.S. water supplies and the chemical industry from the increased threat of terrorism in the wake of the September 11, 2001, terrorist attacks.

ORGANIZATION AND STRUCTURE

The EPA is organized principally along media lines. It included an Office of Water, which administered wastewater, ground water, and drinking water programs; an Office of Solid Waste and Emergency Response, which administered solid waste and toxic waste programs, including Superfund hazardous waste cleanup; an Office of Air and Radiation, which administered air-quality programs, including clean air and automobile exhaust reduction efforts; and an Office of Prevention, Pesticides, and Toxic Substances, which administered the agency's chemical pollution control programs.

In addition, the EPA also is organized functionally and geographically. It includes an Office of Enforcement and Compliance Assurance, Office of Research and Development, Office of the General Counsel, and several administrative divisions that support the media program offices. The EPA also operates 10 regional divisions that mirror the national organizational structure. The EPA is headed by an administrator nominated by the president

and confirmed by Congress. Christie Whitman, formerly the governor of New Jersey, was chosen by the administration of President George W. Bush to lead the EPA in January 2001. However, she planned to resign as of June 27, 2003.

BACKGROUND AND DEVELOPMENT

In 1899, Congress passed the Refuse Act, the first significant federal legislation directed at controlling the pollution of natural resources. The Refuse Act made it illegal to discharge "any refuse matter . . . other than that flowing from streets and sewers and passing therefrom in a liquid state" into any navigable waters of the United States unless authorized by the secretary of the Army. However, the Refuse Act was seldom enforced, and the federal government did little to control pollution for the next 60 years. For the first half of the twentieth century, pollution was considered primarily an urban problem to be dealt with by local officials. Federal efforts dealt primarily with conservation of wilderness spaces.

National outrage over environmental pollution often was traced to *Silent Spring*, the classic 1962 book by Rachel Carson that detailed the poisoning of people and nature with pesticides. Congress actually began to take more interest in the environment soon after World War II. In 1948, Congress passed the Water Pollution Control Act, which allowed the federal government to investigate sources of pollution. However, the Justice Department was required to obtain approval from state authorities before bringing suit against polluters. Because major employers were often the worst polluters, states often blocked legal action that could result in a loss of jobs, and the law was generally ineffectual.

In 1955, Congress passed the Air Pollution Control Act, which, for the first time, authorized federal funds to assist states in air-pollution research and technical training. The Act also acknowledged that automobile exhaust was a major source of air pollution. In 1956, Congress revised the earlier Water Pollution Control Act and for the first time gave the Public Health Service the authority to order the clean up of polluted waters. The Act also authorized \$500 million over 10 years to help cities build sewage treatment plants and provided \$15 million over five years for states to expand their pollution-control agencies.

In 1961, the U.S. Surgeon General appointed a Committee on Environmental Health Problems, which recommended establishing an Office of Environmental Health Sciences. The committee also called for extensive study of air and water pollution, urban crowding, food safety, and occupational health hazards from chemical pollutants. That same year, Stewart L. Udall, then secretary of the Interior, wrote *The Quiet Crisis*, which traced land management from colonial times to 1960. The book

opened with a warning: “America today stands poised on a pinnacle of wealth and power, yet we live in a land of vanishing beauty, of increasing ugliness, of shrinking open space, of an over-all environment that is diminished daily by pollution and noise and blight. This, in brief, is the quiet conservation crisis of the 1960s.”

Air Pollution Legislation. In 1963, Congress passed the first federal Clean Air Act, which gave the Public Health Service responsibility for establishing national air-quality standards, but again, enforcement was limited. The Public Health Service could regulate only interstate air pollution. As *Newsweek* noted, “If the smell of boiling chicken offal had not wafted across the nearby Delaware line from Maryland, the first prosecution under the Federal Clean Air Act of 1963 never would have gone to trial.”

In 1965, Congress moved cautiously to address the problem of automobile emissions by passing the Motor Vehicle Air Pollution Control Act, which allowed, but did not mandate, the Department of Health, Education, and Welfare (HEW) to establish emission standards for new motor vehicles. Later that year, Congress approved an amendment to the Clean Air Act that directed HEW to establish emission standards. Nevertheless, as late as 1966, meteorologists addressing the annual meeting of the Air Pollution Control Association characterized the atmosphere as “a free system, available for use as a dispersive mechanism,” and concluded that using the atmosphere for waste disposal “has been the traditional method since the caveman’s bonfire, and has been generally successful.”

In 1967, Congress passed the Air Quality Act, which required states to establish air-quality control regions that were to deal with common air pollution problems much as regional watersheds would deal with water pollution. The Act also directed HEW to publish research data on the adverse effects of air pollution on health so states could set their own air-quality standards, and it directed the National Center for Air Pollution Control, an agency of HEW, to develop pollution-control techniques.

Water Pollution Legislation. There also was growing concern in the mid-1960s over water pollution, especially the dumping of municipal sewage. In 1965, Congress passed the Water Quality Act, which provided funds for wastewater treatment demonstration projects at the municipal level. The law also required states to establish minimum water quality standards for portions of interstate waters lying within their borders. The following year, Congress passed the Clean Waters Restoration Act, which provided \$3.4 billion in federal aid for cities to construct sewage treatment plants. Meanwhile, the Department of the Interior established a Water Pollution Control Administration to provide federal coordination of pollution-control efforts.

In 1967, Interior Secretary Udall called on detergent makers to eliminate the use of phosphates, which were polluting rivers and lakes. In addition to a film residue, studies showed that phosphates contributed to eutrophication, the process by which freshwater lakes eventually became clogged with organic material, causing fish and other marine life to die. Although Udall had no authority to force compliance, several communities and states responded by banning phosphates.

Ironically, many of the first substitutes developed by detergent makers were more harmful to humans and the environment than phosphates. Eventually, environmentalists also came to agree that sewage was probably more to blame for eutrophication than phosphates, but the controversy over phosphates illustrated that people were concerned about water pollution and were willing to suffer some inconvenience to combat the problem.

National Environmental Policy Act. In 1967, a HEW task force urged Americans “to think of their planetary home as a kind of huge spacecraft.” “For thousands of years,” the task force said, “man has treated this planet as a dumping ground, boundless in its ability to absorb insults.” The task force also urged the government to establish a Council of Ecological Advisors to create a national policy on environmental management.

Two years later, President Richard Nixon created a Cabinet Committee on Environmental Quality, headed by Dr. Lee A. DuBridge, then director of the Office of Science and Technology. Nixon also asked Roy Ash, the founder of Litton Industries who was then heading a task force on executive organization, to consider whether all federal environmental activities should be consolidated in one agency.

As 1969 came to a close, Congress passed the National Environmental Policy Act (NEPA), which was to have a far-reaching effect. Barely five pages long, the Act directed the president to establish a permanent three-person Council on Environmental Quality and declared “a national policy that will encourage productive and enjoyable harmony between man and his environment and enrich the understanding of the ecological systems and natural resources important to the Nation.”

The National Environmental Policy Act clearly positioned the federal government as the protector of the environment. It also required federal agencies to prepare an environmental impact statement before taking any major action that could conceivably harm the environment. Although NEPA did not prevent federal agencies from going ahead with those actions, it ensured that they knew and acknowledged the consequences. Environmental impact statements would become a major weapon in public and private efforts to protect the environment.

Environmental Protection Agency. Nixon signed the National Environmental Policy Act on January 1, 1970,

and pledged his administration to a “now or never” fight against pollution. Nixon declared, “The 1970s absolutely must be the years when America pays its debt to the past by reclaiming the purity of its air, its waters, and our living environment.” On February 10, 1970, Nixon presented Congress with a 37-point proposal for cleaning up the environment, including a request for \$4 billion to construct municipal wastewater treatment facilities, the establishment of national air-quality standards, stringent guidelines on motor-vehicle emissions, and an end to the dumping of wastes in the Great Lakes.

However, Nixon stopped short of endorsing the creation of an independent agency within the executive branch to deal with environmental problems, as many congressional leaders were then urging. As the *New York Times* reported, “A formidable obstacle to an integrated attack on environmental problems is the absence of centralized responsibility. More than a dozen departments and agencies are involved in various environmental programs.” The newspaper noted that Senator Edmund Muskie “would rectify this situation by setting up an independent agency . . . that would be a ‘watchdog agency to exercise the regulatory functions associated with environmental protection.’”

By mid-summer, the Ash committee on executive organization had also joined the call for an independent agency, and on July 10, 1970, Nixon announced that he would create two new organizations within the executive branch. One, the National Oceanic and Atmospheric Administration, would be a part of the Department of Commerce and be responsible for scientific research involving the atmosphere and oceans. The other, the Environmental Protection Agency (EPA), would be an independent agency and consolidate all federal pollution control activities.

Both the Senate and House held hearings on the proposed EPA during the summer of 1970. The only serious objection was raised by Representative John Dingell, who wanted to create a Cabinet-level Department of Environmental Quality.

The EPA officially came into existence on December 2, 1970, with 6,673 employees and a budget of \$1.28 billion. It assumed the environmental responsibilities of 63 existing agencies, including the National Air Pollution Control Administration, the Bureau of Solid Waste Management, the Bureau of Water Hygiene, the Air Quality Advisory Board, portions of the Bureau of Radiological Health, and the pesticide control functions of the Food and Drug Administration—all previously part of the Department of Health, Education, and Welfare.

From the Department of the Interior, the EPA also gained responsibility for the Federal Water Quality Administration, Water Pollution Control Advisory Board, Gulf Breeze (Florida) Biological Laboratory managed by

the Bureau of Commercial Fisheries and pesticide research functions of the Fish and Wildlife Service. The EPA also assumed responsibility for setting environmental radiation standards from the Atomic Energy Commission, the pesticides registration program from the Department of Agriculture, all functions of the Federal Radiation Council, and the study of ecological systems from the Council on Environmental Quality, which continued in existence as a statutory agency.

Nixon nominated William D. Ruckelshaus, then an assistant attorney general, to head the EPA. He was confirmed by Congress on December 2, 1970, and sworn in as EPA administrator on December 4, 1970. Ruckelshaus, who guided the EPA from 1970 to 1973 and again from 1983 to 1985, later recalled that Nixon created the EPA “because of public outrage about what was happening to the environment. Not because Nixon shared that concern, but because he didn’t have any choice. People have often said, isn’t that a terrible motive. But that’s the way democracy is supposed to work.”

Enforcement. Seven days after becoming EPA administrator, Ruckelshaus delivered a speech to the annual Congress of Cities at which he announced that Atlanta, Detroit, and Cleveland were being given 180 days to stop violating federally sponsored state water quality standards. Although Ruckelshaus preferred negotiated settlements, the three cities were woefully behind on previous commitments to stop using waterways as waste dumps, and he made it clear that the EPA would be willing to call in the Department of Justice if the cities did not comply. In Ruckelshaus’ words, the EPA would be the “gorilla in the closet” to support state regulators who were attempting to enforce pollution-control laws. Although the cities were outraged by the EPA’s move, they were forced to comply.

The EPA referred 152 cases to the Department of Justice in 1971, but perhaps the most critical was that against Armco Steel. In September, several months after receiving the case, a federal district court judge found Armco guilty of dumping half a ton of toxic chemicals into the Houston Ship Canal on a daily basis. The judge ordered Armco to desist, which would have forced the company to shut down its blast furnaces. Armco responded by complaining to the White House, which tried to pressure the EPA into agreeing to a compromise. However, the *Washington Star* published a story about Armco’s contributions to President Nixon’s election campaign, which embarrassed the White House into backing down, and Armco agreed to install pollution-control equipment.

Another highly publicized battle of wills took place between the EPA and U.S. Steel in Gary, Indiana. In 1971, U.S. Steel agreed to replace its open-hearth fur-

naces with more modern equipment to reduce air pollution. But when the company failed to meet an EPA deadline, the agency ordered U.S. Steel to close down its last open-hearth furnace or pay a \$2,300-a-day fine. Vowing never to “pay tribute to the government,” U.S. Steel shut down the furnace, which put 500 people out of work. The EPA refused to rescind its order, and John Quarles, then EPA deputy administrator, told *Newsweek*, “In this job, you either stare down companies like U.S. Steel or lose the entire program.” In 1976, *Newsweek* reported the air over Gary, “once the classic example of massive industrial pollution . . . just about meets national standards designed to protect public health.”

Air Quality. With the Clean Air Act of 1970, the EPA became responsible for establishing and enforcing national air-quality standards. Those standards were issued in 1972, and cities were given until 1975 to reduce pollutants, including ozone and carbon monoxide, to acceptable levels. The EPA also set auto-emission standards and ordered manufacturers to reduce industrial pollution or shut down their factories. *Newsweek* reported, “it has become increasingly clear that the nation is committed to the environmental battle in a massive way. And nowhere is the battle being waged more fiercely than in EPA.”

However, as the enormity of the clean air challenge became clear, the EPA extended many of its deadlines. Strict enforcement of the air-quality standards could have banished automobiles from many major cities and forced a halt to economic development. In 1977, the agency formalized an “offset” policy that allowed development in areas that did not meet air-quality standards if other industrial sources of air pollution had reduced their emissions and the net effect was an overall improvement. In 1980, Administrator Douglas M. Costle told *Business Week* that the EPA’s history “has been one of trying to catch up with an overly ambitious legislative agenda.” EPA action also was often delayed by legal challenges, either from industrial polluters who believed the EPA standards were too strict or from environmentalists who believed the EPA was being too lax.

In 1987, the EPA reported that more than 70 municipalities still failed to meet minimum air-quality standards. In 1990, more than 100 urban areas failed to meet national standards for at least one of six pollutants, including sulfur dioxide, nitrogen oxide, carbon monoxide, lead, volatile organic compounds, and total suspended particulates. The major cause of urban air pollution continued to be motor vehicle exhaust. Per-vehicle emissions were cut by 90 percent between 1970 and 1990, but the number of vehicles doubled during the same period and Americans were driving more.

In 1990, Congress passed a revised Clean Air Act, which added 189 chemicals to the original list of air

pollutants regulated by the EPA. The Act also ordered the agency to reduce air pollution that was being blamed for acid rain, smog, and damage to the ozone. It directed the EPA to propose a strategy to reduce urban cancer risk from air pollutants by 75 percent and required the EPA to ban production of the five worst ozone-depleting chlorofluorocarbons (CFCs) by 2000.

When fully implemented, the Clean Air Act of 1990 was expected to reduce air-pollution emissions by 56 billion pounds annually, about 224 pounds of pollutants for every person in the United States. Most of the regulations were to take effect in the mid-1990s, with all regions of the country expected to attain national air-quality standards by 2010.

Water Quality. In 1972, Congress passed major revisions to the 1965 Water Pollution Control Act that made the EPA responsible for eliminating all discharge of pollutants into navigable streams and waterways by 1985. The Water Pollution Control Act also established a National Commission on Water Quality to study the technical, economic, social, and environmental ramifications of meeting the mandate. The commission issued its report in 1976, which led to the passage of the Clean Water Act of 1977. The Clean Water Act of 1977 strengthened controls on some toxic pollutants, but it also extended the deadlines for achieving water-quality standards.

In 1987, Congress again amended the Clean Water Act, extending federal aid for the construction of municipal sewage treatment facilities. However, the grant program was phased out in 1991 and replaced with state-managed revolving loan funds.

Meanwhile, in 1974 Congress made the EPA responsible for setting and enforcing drinking water standards for municipal water systems. The Safe Drinking Water Act, amended in 1986 to encompass 105 contaminants commonly found in drinking water, also made the EPA responsible for protecting aquifers from underground contamination. In 1987, the EPA issued standards for drinking water taken from lakes and rivers and released acceptable levels on the first eight contaminants contained in the Safe Drinking Water Act. However, in general, the EPA delegated responsibility for ensuring safe drinking water to state authorities. As of 1997, 71 percent of all rivers in the United States were deemed unsafe recreational areas.

Superfund. The federal government first became involved with the disposal of solid waste in 1965, when Congress passed the Solid Waste Disposal Act, which channeled money to the states for operating municipal dumps. During the early 1970s, attention turned to the disposal of toxic wastes, which resulted in the passage of the Resource Conservation and Recovery Act (RCRA) in 1976, an attempt to create a “cradle-to-grave manage-

ment system” for hazardous wastes. The law also established criteria for disposal of solid wastes.

However, in 1978 the nation learned just how ill prepared it was to deal with hazardous wastes when foul-smelling chemicals began seeping into the basements of houses in the Love Canal neighborhood of Niagara Falls, New York. An investigation showed that the residential complex and a nearby school had been built over an abandoned industrial dump that contained more than 21,000 tons of toxic wastes. The federal government declared a “health emergency” and relocated 237 families.

Another result of Love Canal was the passage of the Comprehensive Environmental Response, Compensation, and Liability Act, better known as Superfund, which put the EPA in the position of policing past acts of pollution as well as preventing future pollution. Under the 1980 law, the EPA was charged with determining who was responsible for dumping toxic wastes and forcing them to clean up the country’s worst hazardous waste sites, or for conducting its own clean-up actions and then suing the responsible parties. In 1984, Congress amended the law to bring more than 130,000 small sources of toxic wastes, previously exempted, under EPA jurisdiction. The revised law also covered more than 1 million underground storage tanks, many of which were leaking gasoline or other toxic fluids into the soil.

In 1985, in the largest settlement in EPA history, Westinghouse Electric Co. agreed to spend \$100 million to clean up six toxic waste sites near Bloomington, Indiana, that were contaminated with polychlorinated biphenyls (PCBs). The EPA also began requiring hazardous waste landfills to monitor the quality of water resources beneath the dumps. However, by the end of 1986, only 13 hazardous waste sites, out of more than 800 identified by the EPA, had been cleaned up under the Superfund program at a cost of \$780 million. In 1986, President Ronald Reagan signed the Superfund Amendments and Reauthorization Act, which directed the EPA to clean up at least 375 hazardous waste sites over the next five years and authorized \$9 billion for the effort. The law also affirmed the public’s right to know by requiring chemical companies to report emission levels to local authorities.

Through 1992, the EPA had identified more than 37,000 potentially hazardous waste sites, with 1,252 placed on the Superfund National Priorities List. However, only about 150 sites had been cleaned up under the Superfund program, with work underway on another 500. More than \$3.7 billion had been spent in the effort. As of 1996 one in four Americans lived within four miles of a Superfund site. The program did have the effect of forcing would-be polluters to more carefully select waste treatment and disposal methods to limit their future liability, however. More than 209 million tons of municipal solid waste are produced in the United States each year.

Part of the \$195.7 million assigned to the Hazardous Waste Program will be used in efforts to reduce that amount.

Anne Gorsuch. In 1981, President Reagan appointed Anne M. Gorsuch to head the EPA, which by then had grown to more than 12,000 employees and had a budget exceeding \$5 billion. Nicknamed the “Ice Queen” within the agency for her cold managerial style, Gorsuch also angered environmentalists by reaching lenient, out-of-court settlements with industrial polluters. Only 10 cases were referred to the Department of Justice in 1981, leading *Newsweek* to conclude, “EPA’s enforcement of Federal air- and water-pollution laws has slowed to a crawl. . . . After a decade of vigorous enforcement in most areas, [the] EPA seems to be taking a sharp right turn.”

The EPA’s budget was cut by \$30 million between 1981 and 1983, and the hazardous waste enforcement staff was reduced from more than 300 people to about 75. Under Gorsuch, the EPA also was hit with accusations of malfeasance against several high-ranking administrators, including Rita Lavelle, then chief of the toxic waste division, who was seen as being too cozy with the industries she was supposed to be regulating. There were also charges that the EPA had misused more than \$50 million earmarked for toxic waste clean up. James Scheuer, then a congressman from New York, told *Newsweek*, “At best, EPA officials have been sloppy and incompetent. At worst, they may have knowingly looted Superfund.”

When a House committee subpoenaed Superfund documents, Gorsuch, at Reagan’s direction, claimed executive privilege and refused to provide the information. However, as irregularities within the agency continued to surface, Reagan ordered Gorsuch to cooperate with Congress. He also fired Lavelle and ordered an investigation by the Department of Justice. By February 1983, the EPA was being investigated by six congressional committees, the Department of Justice, and the FBI. *Business Week* reported, “For all intents and purposes, the Environmental Protection Agency is no longer a functioning federal agency. Like a leaky drum of toxic waste, the infighting and backbiting that have torn the agency since Anne M. Gorsuch took command two years ago are now poisoning the whole operation.”

Gorsuch (then known as Anne Burford, after marrying Robert Burford, then head of the Bureau of Land Management) resigned in March. *Newsweek* reported, “Burford can . . . be faulted for presiding over a wide range of administrative actions that have hamstrung the EPA’s effectiveness: a budget cut of more than 30 percent in real dollars since 1980, a 50 percent reduction in research grants and the resignation or firing of so many career officials that critics say EPA has been stripped of considerable expertise. But these policies have been Re-

gan's, not simply Burford's." In all, a dozen top EPA officials resigned or were fired during the scandal. The EPA also lost about 3,500 employees.

Looking for someone of integrity to restore confidence in the EPA, Reagan tapped William D. Ruckelshaus, who had served as EPA's first administrator from 1970 to 1973. Ruckelshaus left the EPA initially to become acting director of the FBI, but he soon became assistant attorney general. He was fired in 1973 by then-President Nixon for refusing to fire special prosecutor Archibald Cox during the Watergate investigation. Since leaving government service, Ruckelshaus had become senior vice president of corporate and legal affairs at Weyerhaeuser Co., a timber and paper-products company. He returned to the EPA on May 5, 1983. Ruckelshaus later said, "What the Burford political appointees had done was terrible. I mean, it was really awful. If anything the press underplayed its seriousness."

Ruckelshaus once said, "There probably isn't enough money in the whole federal budget to do everything Congress assigns to the EPA." However, there was no doubt that the EPA played a significant role in improving the quality of air and water resources in the United States after it was formed in 1970. The EPA was also the lead agency in efforts to address the growing problem of solid waste disposal in the United States, setting standards for municipal dumps as well as toxic waste sites. As EPA Administrator Carol Browner said in 1994, "Perhaps no agency . . . has a greater impact on the lives and the livelihoods of Americans. Citizens across our nation are counting on the EPA to make their lives safer and healthier, and to ensure that economic development and environmental protection go hand in hand."

As the century came to a close, the EPA was making some headway in waste management—more waste was being recycled than disposed of, by a 60/40 ratio. In 1998, the EPA published a report that incorporated data from the National Sewage Sludge Survey (NSSS), the Needs Surveys, and the 1997 Water Environment Federation (WEF). The report estimated that 6.9 million U.S. dry tons of biosolids were generated in 1998. Of this, 60 percent was recycled in the form of fertilizer, compost, or pellets for soil enrichment. The remaining 40 percent was disposed of—50 percent by incineration and about 17 percent by landfill. The most important part of the study was the projection of waste use for the next 10 years. By 2005, the EPA projected that 66 percent would be put to beneficial use. By 2010, this number was expected to reach 70 percent. In the same 10-year period, the EPA projected that landfill disposal would diminish from 17 percent to 10 percent.

In November 1999, the EPA announced new action under the Clean Water Action Plan directed at storm water runoff—one of the greatest sources of water pollu-

tion. The runoff is comprised of rain or snow that runs off from city streets, buildings, and construction sites into nearby storm drains. These, in turn, discharge into local streams and waterways. The new rules would mandate the issuing of "discharge permits" limiting the storm water runoff permitted by land improvement. In its expanded stage, the program was expected to control the sediment discharges from 97.5 percent of new acreage under development across the country.

With respect to the Clean Air Act, in November 1999 the Justice Department, in an unprecedented action, filed several joint lawsuits against several utilities companies in Midwestern and southern states. The suits charged that the power plants released massive quantities of pollutants into the air—nearly 3 million tons per year—creating smog, acid rain, and soot that would take years to rectify. Such air emissions affect not only human health, but have been linked to forest degradation, reservoir contamination, and deterioration of stone and copper as well. In addition to money damages in the form of fines, which would assist clean-up measures, the department sought to force the utilities to install appropriate air-pollution control technology.

CURRENT CONDITIONS

By the early 2000s, the Bush administration had introduced the Clear Skies Act of 2003 to Congress. This major legislation sought to reduce power-plant pollution by approximately 70 percent. More specifically, the EPA explained that Clear Skies would involve a mandatory, market-based program that "would dramatically reduce and cap emissions of sulfur dioxide (SO₂), nitrogen oxides (NO_x), and mercury from electric power generation." The agency claimed that this legislation would build on and outperform the existing Clean Air Act by delivering health benefits in a more expedient and cost-effective manner. Clear Skies promised to "deliver unprecedented emissions reductions nationwide from the power sector without significantly affecting electricity prices for American consumers" and "deliver certainty and efficiency, achieving environmental protection while supporting economic growth."

In addition to supporting President Bush' Clear Skies legislation, the EPA was involved in other initiatives to improve air quality in the early 2000s. President Bush was supportive of using hydrogen as an energy source and requested \$1.2 billion to research the development of cost-effective and efficient hydrogen fuel cells. Along these lines, in 2003 the EPA partnered with UPS and DaimlerChrysler to test medium-duty, zero-emission vehicles powered by hydrogen in real-world scenarios. The program, based at the EPA's National Vehicle and Fuel Emissions Laboratory in Ann Arbor, Michigan, involved the Mercedes-Benz A-Class and Dodge Sprinter

van and sought to “continue evaluating fuel cell vehicle attributes such as fuel economy and driving performance under varying weather conditions.”

In May of 2003, the EPA announced a partnership with the National Oceanic and Atmospheric Administration (NOAA) to create a forecasting tool for predicting national air quality. High levels of ozone—a clear gas that forms when sunlight reacts with air pollutants—can adversely affect individuals with asthma or other pulmonary conditions. The EPA-NOAA partnership involved the creation of a numeric Air Quality Index that will be used to inform the public about the levels of ozone and particulate matter in the air, thus providing them with information that can be used to determine whether outdoor activities pose a health risk. The two agencies expected the new system to be in place for the northeastern United States by September 2004, with a complete nationwide rollout by 2009.

The EPA also was involved in ensuring the safety and security of the nation’s water supply in the early 2000s. Following the terrorist attacks against the nation on September 11, 2001, the circulation of mail tainted with deadly anthrax bacteria, and the U.S.-led war with Iraq in 2003, the United States was on heightened alert for terrorist activity. One month after the September 11 attacks, EPA Administrator Christie Whitman attempted to quiet public fears about the possibility of tainted water supplies, explaining that security at national reservoirs had been increased and that the likelihood of water supplies being compromised was low, given the large quantities of contaminants that would be needed. In addition, Whitman explained that the EPA had been working closely with the FBI so that local law enforcement agencies were informed of measures they could take to bolster security. By April of 2004, the EPA’s Office of Water had released suggested guidelines that states could use for protecting water supplies and sanitary systems. According to the EPA, the guidelines corresponded with the color-coded advisory system used by the Department of Homeland Security to inform the nation about terrorist attack risk levels.

SIC 9512

LAND, MINERAL, WILDLIFE, AND FOREST CONSERVATION

This industry includes government establishments primarily engaged in the regulation, supervision, and control of land use, including recreational areas; conservation and preservation of natural resources; control of wind and water erosion; pest control on public lands; and the administration and protection of publicly and privately owned forest lands. The planning, management, regulation, and conservation of game, fish, and wildlife populations, as well as refuges and other areas relating to their protection, are also classified here. Parks are classified in **SIC 7999: Amusement and Recreation Services, Not Elsewhere Classified**. Operators of forest property are classified in **SIC 0811: Timber Tracts**. Game preserves are classified **SIC 0971: Hunting and Trapping, and Game Propagation**. Fish preserves are classified in **SIC 0921: Fish Hatcheries and Preserves**.

NAICS CODE(S)

924120 (Land, Mineral, Wildlife and Forest Conservation)

INDUSTRY SNAPSHOT

An elaborate web of public and private establishments work together to manage and protect natural resources in the United States. Private membership groups, professional societies, industry representatives, and community groups voice a variety of concerns in their efforts to influence federal, state, and local policy on natural

resource management. The principal governmental agency charged with the management of land, mineral, wildlife and forest conservation is the U.S. Department of the Interior (DOI). As such, the DOI manages more than 500 million acres of federal land—approximately 20 percent of the nation's total land area—and is responsible for the collection and disbursement of all revenues generated from the use of public lands and the leasing of mineral deposits and offshore oil drilling sites.

An intensifying debate over the nation's economic and environmental interests shaped the increasingly complex and often incongruent governmental policies on environmental stewardship in the last half of the twentieth century and the early 2000s. One result of this debate has been a proliferation of bureaucracies designed to address the concerns of both industry leaders and environmentalists. By 2003 the U.S. government's federal budget allotted \$10.3 billion to the expansion and protection of America's national parks, wildlife refuges, forests, and other public lands under the auspices of the Department of the Interior. Excluding \$270.5 million in appropriations marked for civil service retirement benefits, that figure represented a \$12.7 million decrease from 2002. Key efforts undertaken by the DOI in recent years have included restoration projects in the Florida Everglades, California Bay Delta, and Appalachian Mountains; forestry management, especially in the Pacific Northwest; ongoing revisions of the Endangered Species Act of 1973; infrastructure improvement at national parks; and national biological research.

ORGANIZATION AND STRUCTURE

As the primary guardian of the nation's natural resources, the Department of the Interior's jurisdiction is enormous. The secretary of the Department of the Interior is appointed by the president and supervises all activities of the department. In addition to an assistant secretary responsible for the chief financial officer and issues regarding policy, management, and budget, responsibilities are divided among four assistant secretaries who manage eight bureaus within the DOI.

Fish and Wildlife. The assistant secretary for Fish and Wildlife and Parks is responsible for the conservation and use of fish, wildlife, recreational and historical sites, and the national parks. Under the assistant secretary's supervision, these duties are carried out by the U.S. Fish and Wildlife Service and the National Park Service.

Responsibilities of the Bureau of Fisheries, established as an independent agency in 1871, and the Bureau of Biological Survey, established in 1885 as part of the U.S. Department of Agriculture (USDA), were combined and transferred to the DOI in 1939 by Reorganization Plan 3. The two bureaus were consolidated into the Fish and Wildlife Service in 1940, and in 1956 the service was

divided into the Bureau of Commercial Fisheries and the Bureau of Sport Fisheries and Wildlife. The Bureau of Commercial Fisheries was transferred to the U.S. Department of Commerce in 1970, while the DOI maintained the responsibilities of the Bureau of Sport Fisheries and Wildlife. In 1974 the bureau was renamed the U.S. Fish and Wildlife Service.

The U.S. Fish and Wildlife Service is the principal bureau for the management of fish and wildlife and performs its responsibilities through an extensive infrastructure. It operates regional offices in the lower 48 states and Alaska and manages 540 National Wildlife Refuges on 95 million acres of land. In addition to maintaining 690 dams and some 3,000 miles of dikes, the bureau operates 69 National Fish Hatcheries and employs a nationwide network of wildlife enforcement agents.

According to the *U.S. Government Manual*, the U.S. Fish and Wildlife Service "assists in the development of an environmental stewardship ethic for our society based on ecological principles, scientific knowledge of wildlife, and a sense of moral responsibility. . . ." The service performs a variety of environmental assessment projects on fish and wildlife populations and their habitat areas in its efforts to protect species and ensure that the public enjoys continued benefits from these resources. The service also compiles the Endangered and Threatened Species List and coordinates national and international efforts on species protection and propagation. In 2003 the Fish and Wildlife Service's budget totaled \$1.9 billion.

Also under the direction of the assistant secretary for Fish and Wildlife and Parks is the National Park Service. Established in the U.S. Department of the Interior in 1916, the primary objective of the National Park Service is the preservation of natural scenic parks and historic and natural monuments for the enjoyment of future generations. The National Park Service maintains more than 388 parks, many of which contain campgrounds and visitor facilities. The service seeks to enhance the public enjoyment of wildlife and natural scenery through educational tours, films, and exhibits.

The Park Service is also responsible for the determination and preservation of historic sites and landmarks and maintenance of the National Register of Historic Places. The state portion of the Land and Water Conservation Fund is also under the Park Service's jurisdiction. The Park Service received \$1.6 billion of the DOI's budget in 2003.

Indian Affairs. The assistant secretary for Indian Affairs heads the Bureau of Indian Affairs, which is intended to address the needs and concerns of Indian and Alaskan Native people. The bureau works directly with tribal governments in efforts to manage the use of resources on Indian lands and develop economic and social

programs for their people. In 2003, this office's budget request was \$2.3 billion.

Land and Minerals Management. The assistant secretary for Land and Minerals Management oversees the maintenance and planning of public land, and monitors the collection and disbursement of revenues from government leases of mineral sites and rent and royalty payments from lessees of Outer Continental Shelf drilling sites. The Bureau of Land Management, the Minerals Management Service, and the Office of Surface Mining Reclamation and Enforcement carry out these tasks under the direction of the assistant secretary.

The Bureau of Land Management (BLM) was established within the DOI in 1946. It performs the combined functions of two predecessor agencies—the General Land Office (created in 1812) and the U.S. Grazing Service (created in 1934). Most of the 262 million acres of federal land over which the BLM has total jurisdiction are located in the western states and Alaska, and are original public domain land that was acquired in the territory expansion purchases of the nineteenth century. The bureau is also responsible for the management of subsurface mineral resources found on an additional 300 million acres of public and private land, where the federal government maintains mineral rights. BLM policy is driven by the multiple use and sustained yield philosophies of resource management, which are designed to promote “utilitarian conservation” principles. These policies are implemented with the intent that the public will use resources to sustain production of crops or livestock indefinitely without environmental deterioration. The bureau also manages the issuance of energy and mineral leases and is responsible for monitoring compliance with the terms of these leases. The BLM's budget for 2003 totaled \$918.6 million.

The Minerals Management Service (MMS) was created in 1982 to manage the development of both onshore and offshore mineral resources, and was also given all leasing responsibilities of Outer Continental Shelf drilling sites. In 1983 management responsibilities of all onshore minerals were transferred to the Bureau of Land Management, while all royalty and mineral revenue management duties were given to the MMS. Through its Offshore Minerals Management Program, the MMS performs resource evaluation of existing reserves, completes environmental impact assessments, and publishes estimates of undiscovered offshore oil and gas deposits. According to the *U.S. Government Manual*, the MMS “works in consultation with the Congress, the 23 coastal States, local government, environmental groups, and the public” to develop five-year leasing programs of sites on the Outer Continental Shelf. Through the Royalty Management Program, the MMS collects and disburses all revenues generated from the development and extraction

of onshore, offshore, and Outer Continental Shelf mineral resources. This is the federal government's largest source of income other than the Treasury Department's tax revenues. According to *Oil and Gas Journal*, between 1953 and 1990 offshore oil royalties obtained by the MMS amounted to \$18.5 billion. In addition, the service collected more than \$21 billion in gas royalties. In 2003, the MMS administered a budget totaling \$435 million.

The Office of Surface Mining Reclamation and Enforcement (OSM), created in 1977, is also under the supervision of the assistant secretary for Land and Minerals Management. Through its 13 field offices and 8 area offices, the OSM coordinates efforts of state and federal government agencies to protect the public and the environment from the adverse effects of coal mining. As many states have assumed these primary responsibilities, much of OSM's activities involve the reclamation of mines abandoned prior to 1977. The OSM's 2003 budget totaled \$279.4 million.

Office of Insular Affairs. The Office of Insular Affairs is responsible for recommending public policies pertaining to the U.S. territories of Guam, American Samoa, the Virgin Islands, the Northern Mariana Islands, the Republic of the Marshall Islands, the Republic of Palau, and the Federated States of Micronesia.

Water and Science. The assistant secretary for Water and Science monitors the performance of the U.S. Geological Survey and the Bureau of Reclamation. The U.S. Geological Survey (USGS) was created in 1879 to classify public lands and examine the geological structure and mineral resources of the nation. Under the assistant secretary's direction, the USGS performs quality assessments of the nation's water supply, analyzes potential for such natural hazards as volcanoes, earthquakes, and landslides, studies energy and mineral resources, and is responsible for the National Mapping Program. The USGS has water resource offices in all 50 states, Puerto Rico, and Guam. In 1962 the USGS was given authorization to perform geological research beyond the boundaries of U.S. jurisdiction. The USGS administered a budget of \$867.3 million in 2003.

The Bureau of Reclamation was initially established as the Reclamation Service within the U.S. Geological Survey in 1902. Its original objective was to ensure a year-round water supply and irrigation system for the 17 contiguous western states. In 1907 the service was established as an independent department and renamed the Bureau of Reclamation. The bureau's responsibilities have expanded to meet the growing demands of the West's increasing population. Its main functions include the generation of hydroelectric power, flood control, and planning for the design and construction of dam systems. The bureau also provides technical assistance to foreign

countries that are working to improve their water management systems. According to the Bureau of Reclamation, it was responsible for the operation of 348 storage reservoirs; 8.6 million acres of land; and 58 hydroelectric power plants in the early 2000s. Its 2003 budget totaled \$844.9 million.

Established in 1910, the Bureau of Mines was for more than 80 years a research-oriented agency concerned with the extraction, use, and recycling of non-fuel mineral deposits. The bureau also provided statistical data and economic information on resource availability. The federal government's downsizing efforts virtually eliminated this office in 1995, cutting about 1,200 employees from the DOI roster. Some of its operations and personnel were transferred to the Department of Energy's Fossil Energy Office, while other functions moved to the U.S. Geological Survey's newly created Office of Minerals Information.

BACKGROUND AND DEVELOPMENT

Along with the nation's enormous territory acquisitions of the nineteenth century came the daunting task of establishing a system of resource and land management. Federal bureaus were created to manage such concerns as mineral extraction, timber production, water resources, Indian affairs, and railroad land grants. As America's settlers reached the Pacific Ocean, and California was petitioning for statehood, land distribution issues and the realization that the nation's resources were finite prompted a coalition of Whigs and public-land state Democrats to create the Department of the Interior as an umbrella agency charged with the supervision of the nation's natural resources. Upon its creation in 1849, the Department of the Interior was given jurisdiction over the General Land Office, the Office of Indian Affairs, the Pension Office, and the Patent Office. The DOI was then divided into three units, each headed by a unit chief, that focused on Lands and Railroads, Indians, and Patents and Miscellaneous programs. The Patents and Miscellaneous division quickly expanded, and the DOI was given responsibility for supervision of the commissioner of Public Buildings, the warden of the Penitentiary of the District of Columbia, the Census Bureau, and the Labor and Education Departments. By the end of the nineteenth century, the DOI had become a sprawling repository for miscellaneous governmental bureaus.

The Department of the Interior was in a state of extreme disarray in the early twentieth century. Over the next 50 years, the DOI underwent dramatic organizational and administrative changes that shaped its current role as steward of the nation's natural resources. Major administrative reforms were implemented by James R. Garfield in 1907, Hubert Work during the 1920s, and Julius Krug and Oscar Chapman during the Truman administration. According to Thomas G. Alexander in *The*

Greenwood Encyclopedia of American Institutions: Government Agencies, Krug's reforms were instrumental in facilitating contact between various interest group representatives and the department. Alexander also notes that departmental restructuring since the Truman administration has built on the reforms initiated by Interior Secretary Krug and his successor, Oscar Chapman.

Although the Department of the Interior was an extremely amorphous agency in its early years, the management of public lands has been one of the DOI's principal functions throughout its existence. Increasingly in the nineteenth and twentieth centuries, the Department has faced two significant policy problems in resource management. The first predicament stemmed from its responsibilities for managing resources that were covered by conflicting legislation. The Department was unable to dispense land to settlers for livestock grazing and agriculture because such large land tracts had to be purchased from railroads and other grantees. Meanwhile, the Department's hesitancy to allocate more land to industry indirectly slowed the subletting of that same land to settlers. The passage of the Taylor Grazing Act of 1935 gave the DOI authority to establish and manage, rather than simply sell off, land leases and grazing districts to industry and private citizens. The Federal Land Policy and Management Act of 1976 increased the Department's responsibilities in managing the nation's natural resources.

The second policy dilemma concerned differing opinions on the necessity and methods of resource preservation. A conservation movement driven by two differing rationales began in the nineteenth century and has continued to shape DOI policy through the twentieth century. "Utilitarian conservation" was promoted by John Wesley Powell and William E. Smyth in the nineteenth century, and Gifford Pinchot and Theodore Roosevelt in the twentieth century. Preservation of resources for the aesthetic enrichment of the nation was espoused by conservationists such as George Perkins Marsh, John Muir, and Aldo Leopold. The General Revision Act of 1891 has been described as the most important first step in steering the Department toward the promotion of conservation. The Act repealed the Timber Culture and Preemption Acts and allowed the Interior Department to establish forest reserves.

Since the passage of the Wilderness Act in 1964 and the National Environmental Policy Act in 1970, the Department of the Interior's responsibilities in the area of resource conservation have continued to expand. The DOI, because of its status as an arbiter of what constitutes a fair balance between environmental and economic concerns, is often a subject of controversy. Conservationists harshly criticized the DOI during the 1980s, a period that they felt was marked by the sacrifice of environmental needs to satisfy various industrial desires. Conversely,

many members of manufacturing and other industries decried what they perceived as the inordinate and growing influence of the agency, whose budget increased by more than 36 percent in the late 1980s, from \$6.2 billion in 1986 to nearly \$8.5 billion in 1990.

The expanding influence of government institutions involved in the conservation of America's natural resources has rippling effects on the profits and growth of many industries. The logging, oil, fishing, and real estate industries have become increasingly embroiled in conflicts over resource use. Government establishments such as the U.S. Department of Agriculture and the U.S. Department of Energy, involved in resource use, rather than conservation, have also been pressured to incorporate conservation strategies into their policies. According to the Energy Information Administration, increased conservation measures, coupled with the passage of the Energy Policy Act of 1992, are expected to slow the growth rate of energy demand to less than 1.5 percent per year till 2021.

Disputes between conservationists and the logging industry drew national attention in the late 1980s and early 1990s. Conservationists waged a campaign against the lumber industry in an effort to ensure the protection of the endangered spotted owl and old growth forests in the Pacific Northwest. The dispute between industry leaders, government representatives, and conservation groups erupted in an intense national controversy over the use of timberlands in 1988. Lumber industry representatives tried to sway public opinion and government policy in their favor by emphasizing that increased regulation will result in increased worker lay-offs. In fact, the National Forest Products Association (NFPA) reported that more than 100 sawmills in the Pacific Northwest closed in the early 1990s. In the short term, this has resulted in substantially higher profits for surviving logging companies, as lumber prices rose dramatically due to environmentalists' success in limiting logging on millions of acres of government timberlands. Permanently higher wood prices are the likely result of continued logging bans and pressures from environmental groups. The NFPA projects that an estimated 60 percent of logging on government lands will ultimately be suspended.

Likewise, the oil industry has been seriously affected by disputes over resource conservation. The leasing of oil drilling sites located in the Arctic National Wildlife Refuge and off the Florida and California coastlines has prompted intense debate. Conservationists tried to prohibit all oil drilling in the Arctic National Wildlife Refuge, but the federal government has approved limited leasing in the area. Threats of targeted product boycotts from private conservation groups in Florida and California have resulted in fewer lease bids from oil companies.

Extensive environmental damage to Prince William Sound and the Gulf of Alaska resulting from the March

1989 oil spill of the Exxon *Valdez* has added to the controversy over the expansion of oil drilling sites. Conservationists argue that potential costs in environmental damage outweigh the benefits of continued expansion of oil drilling sites. The \$900 million Exxon *Valdez* settlement was the largest resource damage settlement in history. The monies were applied to several projects, including the restoration of Prince William Sound and its environs; the North American Wetlands Conservation Fund; and for land acquisition to augment Alaska's Kodiak Island wildlife habitat.

Under the direction of former Arizona Governor Bruce Babbitt during the Clinton administration, the Department of the Interior continued to tread a fine line between environmentalists and economic interests. Babbitt envisioned himself not only as the nation's chief conservator, but also as a modern-day King Solomon who would use science to find solutions to the nation's resource dilemmas. During the first four years of his tenure, Babbitt faced ongoing disputes over grazing fees in the West, oil and gas leases on public property, and—after the Republican Party gained control of Congress in 1994—threats to reform environmental regulations.

In late 1999 the Clinton Administration announced that some 40 million acres of protected national forests would gain additional protections by the prohibition of any roads going through them. It was also announced that the nonprofit Wildlands Conservancy had donated to the nation an additional 14,000 acres within Southern California's Joshua Tree National Park, where multimillion acres of land in the Mojave and Colorado Deserts are likewise protected. It was hoped that this would secure protection from further development in the area. Also purchased was the 95,000-acre Baca Ranch in New Mexico's Jemez Mountains, west of Santa Fe. Located on the ranch's acreage is the world-renowned Valles Caldera, a collapsed crater from an ancient volcano. The ranch is also home to one of the nation's largest herds of wild elk.

Unfortunately, there were casualties as well: some of the controversies surrounding Babbitt's tenure at the end of 1999 included: allowing major oil companies to pay below-market royalties for oil taken from federal lands; the environmental impact of oil drilling off the coast of California (a Babbitt legacy); and diminished funds for the Florida Everglades National Park and some earmarked Civil War Battlefields. Another 425 oil-rich tracts on 3.9 million acres of Alaskan wilderness were offered in a lease sale by the Bureau of Land Management on May 5, 1999. Six major oil companies purchased the bulk of them.

Following a study conducted by the Office of the Inspector General, which found that Indian schools were in worse shape than inner-city schools, the fiscal year (FY) 2000 budget request for the Bureau of Indian Af-

fairs was increased by \$155 million from 1999. Indian school children represented the seventh generation of Native Americans to occupy reserved land since the system began, and in 1999 there were 53,000 students in 185 Indian schools within the reservation system. Also included in the FY 2000 budget was a \$100 million appropriation for a "Bring Back the Bison" campaign.

In October 1999 the U.S. Fish and Wildlife Service published its Candidate Notice of Review, naming 258 plant and animal species considered likely to warrant protection under the Endangered Species Act. This was the first update since 1997.

September 25, 1999, was National Public Lands Day. Over 30,000 volunteers across America dedicated their time and energy for one day to make needed improvements in some 200 parks, wildlife refuges, forests, lakes and recreation areas around the country. Of inspiration was the dramatic growth of this popular program—from just 1,700 volunteers in 1996. The 1999 event was sponsored by Toyota, but is actually a partnership event shared by NEETF and several of DOI's departments. The program listed a toll-free number for volunteering, 800-VOL-TEER (1-800-865-8337) or a Web site address of www.npld.com.

CURRENT CONDITIONS

By the early 2000s, the nation faced a number of conservation-related challenges. In 2003, DOI Secretary Gail Norton unveiled *Water 2025: Preventing Crises and Conflict in the West*, a proposal that aimed to help communities facing water shortages in the western United States. Supported by proposed 2004 funding of \$11 million, the DOI said that Norton's plan sought to provide assistance by "concentrating existing federal financial and technical resources in key western watersheds and in critical research and development, such as water conservation and desalinization, that will help to predict, prevent, and alleviate water supply conflicts." More specifically, *Water 2025* involved strategies like the modernization of water supply structures, including canals, pipelines, reservoirs, dams, and pumping stations.

By mid-2003, friction between environmental groups and companies interested in logging on federal land raged on. The Bush Administration proposed to make substantial changes to rules established by the Clinton Administration regarding the use of more than 190 million acres of federal land in 44 states for commercial endeavors like logging. This was to be accomplished by giving forest managers a greater degree of freedom and control when approving the use of federal land for commercial endeavors such as logging. Environmental groups criticized the proposal for catering to the logging industry, while the American Forest & Paper association downplayed negative environmental implications. The

association also praised the Bush plan for allowing forest managers to better control wildfire outbreaks.

Indeed, wildfire outbreaks were a major concern by the early 2000s. In 2002 more than 7 million acres of land in federal forests had burned as a result of forest fires. While this was an obvious problem, the best way to address it remained a point of debate. Through its Healthy Forest Initiative, the Bush Administration sought to support forest-thinning and streamline environmental reviews in certain areas, a position that drew fire from environmentalists.

Another effort to improve the safety of American woodlands was the Healthy Forests Restoration Act of 2003. According to the U.S. House of Representatives, which passed the bill in May of 2003, this legislation sought to "improve the capacity of the Secretary of Agriculture and the Secretary of the Interior to plan and conduct hazardous fuels reduction projects on National Forest System lands and Bureau of Land Management lands aimed at protecting communities, watersheds, and certain other at-risk lands from catastrophic wildfire, to enhance efforts to protect watersheds and address threats to forest and rangeland health, including catastrophic wildfire, across the landscape, and for other purposes."

AMERICA AND THE WORLD

America has developed an extensive network of conservation establishments since the mid-nineteenth century. However, it has done so only after incurring significant resource depletion and wildlife extinctions. Consequently, the United States' pleas that Third World countries begin to focus more on conservation have been largely ignored, as the people of undeveloped nations try to improve their economic conditions. At the same time, the United States has been harshly criticized by the international community for its refusal to sign a biodiversity treaty that every other attending nation signed at 1991's international Earth Summit in Rio de Janeiro. The treaty was intended to encourage developing nations via financial incentives to protect their natural resources.

Despite an increasing international acknowledgment of the necessity for conservation, global land, mineral, wildlife, and forest resources are continually imperiled by reckless exploitation. The cultivation of rain forest plants with medicinal properties is one strategy that could prove enormously lucrative for several nations. For example, two alkaloids produced by the rosy periwinkle of Madagascar have been proven to cure Hodgkin's disease and lymphocytic leukemia. By destroying unknown species of plants in the rain forest, South American people may be depriving themselves of future wealth. The creation of an ecotourism industry that promotes the enjoyment of interesting fauna and flora endemic to rain forests

may provide other economic incentives for rain forest conservation.

Contributions from government organizations are essential for the initiation of conservation-oriented strategies. One of the most significant organizations involved in the promotion of conservation in undeveloped nations is the Global Environment Facility (GEF). The United Nations Development Program, the World Bank, and the United Nations Environmental Program established GEF in 1990. By 2003 the organization had committed more than \$4 billion in grants to set up national parks, promote sustainable forestry, and establish conservation trust funds in more than 140 developing countries.

Prospects for the Future. Increasingly sophisticated technology has yielded more detailed information on the state of natural resources and environmental conditions around the world. Environmentalists charge that this information has overwhelmingly revealed that the world's resources and wildlife have been critically depleted. An increased sense of urgency has thus characterized the conservation debate. The number of conflicts between developers and conservationists is likely to increase as researchers classify more and more species as endangered. Continued advances made by scientists may help enlarge the framework of economic and environmental debate. A growing number of environmental economists and scientists are working together to explore prospects that would allow industries to thrive through conservation-oriented use of land, minerals, and wildlife. Innovative arbitration techniques will have to be implemented by governments to promote a compatible relationship between economic growth and resource conservation.

SIC 9531

ADMINISTRATION OF HOUSING PROGRAMS

This category covers government establishments engaged in the administration, planning, and development of housing programs. The category also includes government building standards agencies and nonoperating government housing agencies and housing authorities. Insurance and finance areas are classified in Finance, Division H. The operation and rental of apartments and houses is classified in Finance, Insurance, and Real Estate **SIC 6510: Real Estate Operators (Except Developers) and Lessors**. **SIC 9532: Administration of Urban Planning and Community and Rural Development** covers government agencies and commissions, with the private establishments engaged in this work classified in services in the major group for engineering, accounting, research, management, and related services.

NAICS CODE(S)

925110 (Administration of Housing Programs)

INDUSTRY SNAPSHOT

Administration of housing programs is the central task of the Department of Housing and Urban Development (HUD), which was created by an act of Congress in 1965. Other governmental housing programs include the Veterans Administration housing program and the Farmers Home Administration, which are overseen by the Department of Veterans Affairs and the Department of Agriculture, respectively. The original legislation broadly mandated HUD to administer federal housing programs, promote the solution of urban problems, and provide funding for housing via private institutions. Consistent with that mandate, HUD's major focus continues to be on increasing homeownership across the country, providing

assistance for the homeless, improving public housing, and administering block grants for economic and urban development of targeted areas. Major issues for the organization have been lack of funding, inconsistent presidential support, and conflicting congressional directives.

ORGANIZATION AND STRUCTURE

The secretary of housing and urban development is assisted by a deputy secretary. Together they oversee a chief of staff, as well as assistant secretaries for administration, community planning and development, congressional and intergovernmental relations, fair housing and equal opportunity, housing and federal housing, policy development and research, public and Native American housing, and public affairs, in addition to an overall support staff of several thousand employees. HUD deals with approximately 3,100 public housing agencies that disperse around 80 percent of all HUD funds and manage 1.3 million housing units. The Federal Housing Administration (FHA) and the Government National Mortgage Association, or Ginnie Mae, operate within HUD, but do so with considerable autonomy. The private Federal National Mortgage Association, or Fannie Mae, is the corporate “sister” of Ginnie Mae and is subject to regulation by HUD.

BACKGROUND AND DEVELOPMENT

Since the birth of the nation, government has been concerned with the growth and distribution of its population. During the mid-nineteenth century the Department of Agriculture was created to address the many needs of farming families and agricultural laborers, who then constituted two-thirds of American society. A century later, the United States had largely completed its transition from a predominantly agrarian to a predominantly urban economy and population. With this transition came a growing demand for an agency, or agencies, to address the many problems associated with urban expansion.

New Deal Era. The economic disaster caused by the Great Depression forced urban and housing problems to a federal level for the first time in American history. In 1932, under Herbert Hoover, the Federal Home Loan Bank system was created in an attempt to shore up the housing industry and keep savings and loan associations above water. With Franklin Delano Roosevelt’s inauguration came the New Deal, a massive series of programs that, among other things, restructured the country’s housing finance and regulatory system. In 1934 the FHA was created to provide mortgage insurance to banks and other financial institutions. In 1935 the Resettlement Administration was created to begin a number of housing and resettlement projects, including those related to eliminating unproductive farms. Two years later the U.S. Housing Authority was created to support and oversee public housing.

In the 1940s the federal government’s foray into urban policy was also driven by pressing national problems. The National Housing Agency (NHA) was created to provide housing for World War II workers. Once the war ended, the agency began housing planning but soon became a casualty in a new political war, for in 1946 a Republican-led congress denied permanent status to the NHA. So instead of becoming an independent department, housing was placed under the Housing and Home Finance Agency (HHFA). The HHFA was not strongly positioned in the structure of the federal government and continued to shift with the political winds of the day. Nonetheless, the FHA by itself played a fundamental postwar role in managing suburban housing growth and freeing up money for new, lower-income homeowners.

The federal housing policy was at last clearly stated under the Housing Act of 1949, which said there should be “a decent home in a suitable living environment for every American family.” This law was closely tied to the Employment Act of 1946, but neither was ever made part of a larger, cohesive national policy for both promoting and controlling urban growth.

Legislation for a cabinet-level department to deal with urban renewal problems was first introduced in 1954, but it lacked necessary support of the public and the Eisenhower administration to become law. Yet momentum continued to gather within the National Housing Conference (NHC), a liberal organization devoted to the expansion of federal redevelopment and housing policies. William L.C. Wheaton, once with the NHA, was an avid supporter of the NHC proposals and understood the need to tie them to a strong constituency. He knew that it had to be a segment that already had some clout in Washington, like the private sector groups that were already involved in housing: thrift institutions, realtors, home builders, and mortgage bankers. Wheaton also was aware that there was a tide of support in Congress for new suburban housing and development that also would assist the cause.

John F. Kennedy’s election in 1960 further increased the momentum toward the creation of the department. Kennedy planned to work with Robert Weaver, his new administrator of the HHFA, toward that end. However, according to Rachel G. Bratt and W. Dennis Keating in *Urban Affairs Quarterly*, “conservative southern opposition to the likely appointment of Weaver as the first black cabinet officer resulted in rejection of the administration’s legislation in January 1962 by the House Rules Committee.” Other efforts under Kennedy also failed.

Original Legislation. By 1965, with Lyndon Johnson in office, political and public support was finally in place. The real estate industry was the last group that strongly opposed the creation of a department of housing. Congress passed the legislation in August of 1965 just as a

period of widespread urban unrest (1965 to 1968) was ignited, first in the Watts neighborhood of Los Angeles. Weaver was appointed to be the first HUD Secretary the following January, after the passage of ground-breaking civil rights legislation. In 1968, some concrete goals were established for HUD. These included the creation over the next 10 years of 26 million new and rehabilitated housing units, 6 million of which were to be for low- and moderate-income Americans.

HUD made its mark on the urban environment in the 1960s and early 1970s through the development of multifamily housing in inner city areas where whole blocks were razed under the auspices of urban renewal and slum clearance. The federal government encouraged local nonprofit agencies and residents to join in the process. The FHA, the government's mortgage insurance underwriter and a part of HUD, opposed the role the inexperienced nonprofits were playing. The FHA had a history of conservative underwriting that clashed with the social mission of getting housing into low-income, high-risk areas. In addition, as William Harris wrote in the *Journal of Housing*, "The issue of who controlled the delivery of the Department's program at the regional and local levels became a critical element in determining how these programs would be administered—HUD vs. FHA, liberal voice vs. conservative." This was a conflict that paralyzed the organization's history.

Richard Nixon, elected in 1968, set the tone for how HUD money would be used to build housing by supporting a "supply-side" housing strategy. The construction of low-rent housing was spurred on by such subsidized interest programs as Section 235 (homeownership) and Section 236 (rental). Interest rates as low as 1 percent were available for builders of low-income housing projects. Subsidies would be handled through the newly formed Ginnie Mae, and private investment would be stimulated through the National Corporation for Housing Partnerships and the Federal Home Loan Mortgage Association, or Freddie Mac. Yet, according to Bratt and Keating, "the infusion of funds, without sufficient federal safeguards and oversight, created a situation prone to disaster. In numerous congressional hearings, a string of scandals, and abuses on the part of private real estate brokers, home builders, mortgage lenders, and FHA appraisers was disclosed, constituting the first major scandal to rock the young agency."

HUD's subsidized housing programs were put on hold in 1973, and the department was realigned by the Housing and Community Development Act of 1974. Section 236 was replaced by Section 8 rent subsidies for multiunit housing. Also under this act, the Community Development Block Grant program was developed to consolidate urban development grants for water and sewer, streets, and other public service improvement pro-

jects. The result was a separation of the housing and community development units.

The support that successfully brought HUD into existence was not there to sustain the agency in reaching its ten-year goal, which ended in 1978. Although 80 percent of the units outlined in the goal were created (when including mobile homes in that count), only 45 percent of the 6 million low- and moderate-income units were actually built or rehabilitated. Some speculated that part of the reason low-income public housing programs failed to be fully implemented was due to the contemporary social views regarding public housing and the costs involved with the Vietnam War. In addition, the initial urgency of the mission fueled by the urban unrest of the time died down with the cessation of violence and the election of conservative presidents. As it turned out, HUD housing production peaked in 1972.

Section 8 Housing. Developed under the administrations of Richard Nixon and Gerald Ford, Section 8 housing was intended to reduce government housing assistance costs by shifting money away from long-term to short-term rent subsidies. Instead, the funding for additional public housing fell on Section 221 money that was loaned at 3 percent interest. Not only did Section 8 ultimately cost much more than Section 236, but the philosophical differences—sound fiscal policy voice and social responsibility—still raged on within the department.

Section 8 was unpopular due to its cost and also due to its "spatial concentration" provision. Johnson's Great Society programs were implemented in a manner that perpetuated racial and economic segregation by razing and then rebuilding whole neighborhoods. Section 8 provided economic incentives for builders and local governments to bring low-income housing to a broader diversity of neighborhoods and not just to concentrate them in poor non-white areas.

HUD under Reagan. Support for many social change programs was dramatically reduced during the Reagan years. Eric Addison in the *Journal of Housing* wrote, "Perhaps no federal agency was more affected by the Reagan administration's attempt to reduce federal spending than the Department of Housing and Urban Development (HUD). Between 1981 and 1988, the department's spending authority dropped from \$33.4 billion to just over \$15 billion per year." Rather than focusing on subsidizing new rental unit construction, as had been done previously, the Reagan administration directed HUD to rehabilitate existing housing and assist tenants through a housing voucher system and rent subsidies. The administration also sponsored Enterprise Zones, a program that encouraged businesses to locate within economically depressed areas in exchange for tax and regulatory breaks.

Unfortunately, in 1989 another HUD scandal came to light. Just as in the early 1970s, the scandal revolved around realtors, mortgage lenders, and the co-insured. A general lack of supervision of federal contracting, according to some critics, allowed for discretionary funds to be funneled to favored developers. Samuel R. Pierce, Jr., head of HUD under Ronald Reagan, took the Fifth Amendment, refusing to testify at the hearings regarding the misuse of funds. However, in 1992 two of Pierce's assistants were indicted in what appeared to be an influence-peddling conspiracy.

Indications that something was amiss in HUD were ignored in spite of early warning signs. "A GAO report in 1984—five years before the scandals—should have alerted Congress and HUD to the severity of its problems," reported *Financial World*. The article went on to quote Judy England-Joseph, director of housing and community development issues at the General Accounting Office (GAO): "Until you have a smoking gun, people don't understand what's at stake when you don't have the right information systems in place or the right financial management systems. People aren't willing to spend a lot of money to bring a department like HUD on track."

The HUD Reform Act of 1989 followed the disclosure of the HUD abuses of the 1980s. One of the changes was the addition of a chief financial operator and a comptroller for each major operating division. In addition, the secretary's discretionary fund was eliminated and waivers of HUD rules became subject to disclosure. Improvements implemented by HUD Secretary Jack Kemp, under the George Bush administration, included a system to track the sale of single-family homes and a plan to improve the information and financial management systems. All improvements were related to preventing a repeat of past abuses. The primary focus of HUD during the Bush years was damage repair. And there were a lot of problems with image control as well. For many, HUD had become virtually synonymous with mismanaged and misdirected big government programs.

Long-term problems still remained in spite of Kemp's actions; Kemp himself was hampered from fully implementing such promising ideas as revamping HUD operations through tenant ownership of public housing. In general, poor financial and data management systems and an organizational structure that allowed for too much freedom in the local and regional offices were cited as reasons for HUD's poor performance. Examples of the severity of the problems were illustrated by the fact that contracts of rent records had not been reconciled for 15 years. HUD's 1991 financial statement was so inaccurate and lacking in current financial information that the auditor, Price Waterhouse, could not file an opinion.

Nonetheless, wrote Addison, "in the public mind, HUD is public housing. Media descriptions of HUD as

the federal agency responsible for public housing have led many to believe that the reports of scandal referred to the activities of local housing and development officials. In that respect, the real victims of the HUD abuses have been the local officials, managers, and administrators—those far removed from the machinations at HUD Central." Addison claimed the real HUD scandal was the emphasis put on the unethical practices of the few and neglect of the success of the department. "Indeed, when it comes to providing housing for low- and moderate-income people, no other group, not even the private sector, has been shown to perform as effectively and efficiently as the public housing industry."

Reinventing HUD. In July of 1993 a *National Journal* article described the task facing the new HUD secretary, Henry G. Cisneros, and his staff as follows: "The mission: Bring order out of management chaos. Turn a frustrated, cynical, and defensive bureaucracy into an active partner in urban innovation. Recast controversial old programs such as public housing into models of new Democratic effectiveness, while creating and implementing forward-looking programs such as empowerment zones. And, by the way, don't spend any more money."

During Cisneros' first few months as HUD secretary, much was written about his commitment to social change via federal housing and urban development policy. When Los Angeles was devastated by riots in 1992 following the acquittal of L.A. police officers on trial for beating motorist Rodney King, Cisneros, though out of public office at the time, was on the scene calling for changes in urban policy. Laurie McGinley, in an April 1993 *Wall Street Journal* article, described the hopes Cisneros brought with him to HUD. "In his first months in office, Mr. Cisneros has developed 'principles' for retooling urban programs, including reducing the concentration of the poor in the inner city; using housing policy to provide 'an economic ladder'; and trying to change 'self destructive behaviors on both sides of the racial divide.'" In September of 1993 William Fulton wrote in *Planning* that Cisneros "recommended that public housing regulations be reformed to support four values he believes HUD should promote: community, family, economic 'lift,' and individual rights and responsibilities." And at the end of 1993, Cisneros issued a memo to President Bill Clinton calling for "a multifaceted urban policy," with tax and housing credits for the working poor, expanded home-ownership programs, and economic empowerment zones to encourage business investment.

Actions taken by Cisneros in 1993, as part of his "Reinventing HUD" initiative, included: fostering cooperation, through the National Community Development Training Institute, among local governments and community organizations for better delivery of services; launching a \$100 million public-private initiative to create a

leadership fund; and generating half a billion dollars in pension money for Section 8 housing, through a joint program with the AFL-CIO.

Wavering support in Washington, not to mention around the country, has been tied directly to HUD's generally poor performance record. As Bruce Reed, deputy assistant to the president for domestic policy, said in an April 1993 *Wall Street Journal* article, "This country has spent billions and billions over the last 30 years with relatively little impact. Our goal is to empower communities to develop their own recovery plans and become economically viable." Empowerment Zones, the Clinton administration's \$5 billion, four-year plan for inner-city areas such as south central Los Angeles, was preceded by Truman's Urban Renewal, Kennedy's War on Poverty, Johnson and Nixon's Model Cities, Ford's Community Development Block Grants, Jimmy Carter's Urban Development Action Grants, and Reagan and Bush's Enterprise Zones. Nicholas Lemann has posited that all such programs have promised the illusion of wholesale economic development when, in fact, such basic social services as housing and day care for ghetto dwellers have been the most urgently needed and the most easily provided. As he wrote for *New York Times Magazine* in January 1994, "Economic revitalization efforts pass every test but one, the reality test. They are popular among all the key players in antipoverty policy; they sound good; they have bipartisan appeal; they are based on tax breaks rather than on spending so are easier to pass. The only problem is that so far they haven't worked—which creates a larger problem."

HUD problems are perhaps rooted essentially in the broadness of the departmental goals as set forth in the 1965 legislation, but perhaps also in the very structure of the agency, which lacks interdepartmental control over such related federal agencies as the Farmers Home Administration, the Veterans Administration housing program, and the Federal Home Loan Bank Board. HUD, the department that in Cisneros' words "has the explicit responsibility for America's cities and urban places," has virtually no control over farm and veterans housing or thrift financing and has always had limited control over its public-private partnerships and relationships with state and local agencies.

It is this very type of government inefficiency and inadequacy that was the subject of *The Gore Report on Reinventing Government*, which offered broad restructuring recommendations for a number of departments, including HUD. In particular, the report placed a new emphasis on competition among public housing managers and creating market-rate housing that would serve both publicly subsidized and market-rate tenants. Vice President Al Gore, as chairman of the newly created Community Enterprise Board, promised to play a key

role in implementing the Clinton administration's housing policy, which in 1994 was focused on targeting a number of impoverished inner-city areas for economic revitalization through tax breaks and other incentives. In addition, HOME, a matching grant program for state and local governments that was created by the 1990 housing act, was being allowed greater latitude and authority to make its own contributions toward reinventing the housing administration industry.

A government financial analysis of HUD completed in 1996 showed that FHA cumulative losses with both General Insurance (GI) and Special Risk Insurance (SRI) mortgage insurance funds was greater than the appropriated capital in both 1994 and 1995. During 1995, the FHA and Ginnie Mae loss reserves amounted to \$11.5 billion. This was a decrease of approximately \$1.1 billion from 1994. Still, premiums generated by GI and SRI funds will not be enough to offset these losses. Mutual Mortgage Insurance showed a loss of approximately \$318 billion; Cooperative Management Housing Insurance, \$298 million; GI almost \$75 billion; and SRI more than \$10 billion.

During Clinton's second term as president, Andrew Cuomo took over as the secretary of HUD. With Cuomo at the helm, the president pledged a goal of 67.5 percent homeownership by 2000. The 1997 national homeownership rate was a record 66 percent. By the end of 1998, HUD was "back in business" with the best budget (for fiscal year 1999) it had seen in a decade: \$24.5 billion. Key provisions of the budget legislation were the creation of 50,000 new housing vouchers under Section 8, the raising of loan limits on home mortgages insured by FHA, an increase in funding for Community Development Block Grants (CDBGs), and expanding HUD's award-winning "Continuum of Care Program" for the homeless. The budget was increased by 33 percent over the previous year for Fair Housing activities as well.

Again in the fall of 1999, Congress appropriated major increases for HUD programs in its fiscal year 2000 budget. A total of 60,000 new Section 8 vouchers were to be funded (10,000 more than had been appropriated by the fiscal year 1999 budget), and public housing funds were increased from \$2.8 billion to \$3.1 billion. Another increase of \$45 million for the homeless ensured the uninterrupted success of the Continuum of Care Program. There also was a \$7 million increase in funds for the Housing for Persons With AIDS Program (HOPWA).

CURRENT CONDITIONS

HUD, with 80 field offices in the United States, had a budget of \$30 billion in 2002, which increased 7 percent to \$31.5 billion in 2003. Some of the many HUD pro-

grams receiving additional funding included the Self-Help Homeownership Opportunity Program. The program was designed to help community organizations and faith-based programs that help people with low incomes become homeowners. The American Dream Down Payment Fund presidential initiative was designed to give about 40,000 first-time homebuyers a year to overcome down payment and closing costs that hinder many first-time buyers. Developers of affordable, single-family housing would receive a tax credit. Another important HUD initiative would allow low-income families to put up to a year's worth of Section 8 rental vouchers toward a home down payment. Other initiatives would support affordable housing for the elderly.

The housing market was strong in 2001, experiencing record highs in homeownership. An estimated 70 percent of all Americans own their own homes. However, less than half of African Americans and Hispanic families are homeowners. About 4.8 million low- to moderate-income working families had critical housing needs—meaning they pay more than half of their income for housing and/or live in substandard conditions—up 24 percent from 3.9 million in 1999.

During the presidency of George W. Bush, Mel Martinez was the secretary of HUD. In the wake of the terrorist attacks of September 11, he announced in 2002 that unlike many private companies the FHA would not require insurance coverage against acts of terrorism in connection with its multihousing mortgage insurance. That meant if any act of terrorism destroyed or damaged a FHA-insured multihousing property, HUD would pay the partial or full claim to the lender, which promised to reduce costs and assure continuation of new projects. Additional insurance protecting against terrorist acts could cost a multiunit project owner up to \$5,000 per year. In 2001, FHA allocated \$1.5 billion toward multihousing programs, increasing to \$2.8 billion in 2002.

SIC 9532

ADMINISTRATION OF URBAN PLANNING AND COMMUNITY AND RURAL DEVELOPMENT

This category covers government establishments primarily engaged in planning, administration, and research for the development of urban and rural areas, including programs for slum clearance, community redevelopment, urban renewal, and land clearance. Also included are zoning boards and commissions. Private establishments primarily engaged in urban planning, rural planning, and community development planning are covered by several SICs in the Engineering, Accounting, Research, Management, and Related Services category.

NAICS CODE(S)

92512 (Administration of Urban Planning and Community and Rural Development)

INDUSTRY SNAPSHOT

In *U.S. Metropolitan Economies: The Engines of America's Growth*, the role that U.S. cities have played in generating national and global economic growth could not have been emphasized more. It is generally understood that the United States is first-named on any list of the world's largest economies. What is less known is that, if an urban equivalent to "gross domestic product" (referred to in the study as *gross metropolitan product*) were used as the primary ranking criterion, 46 of the world's top 100 economies would be U.S. metropolitan areas. Thus, the health of America's cities and metropolitan communities remains vital to the health of this country.

Accordingly, each year Congress allocates billions of dollars to ensure the continued well-being and development of urban and rural communities, through economic incentive programs such as block grants, matching funds, and the creation of "empowerment zones," selected areas deemed worthy of special attention, either for renewal or stimulated growth. Another area of focus is the "enterprise zone." An enterprise zone program targets economically distressed areas and cuts the taxes of businesses within those areas to attract investment, raise employment, and foster economic development.

ORGANIZATION AND STRUCTURE

The phrases "community development" and "planning" refer to the processes by which cities, towns, and rural communities consciously shape the course of their physical and economic growth to improve their economic health and the quality of their residents' lives. Commu-

nity development is used to describe a wide range of strategies for improving conditions within a community, whereas planning usually describes the process of managing the details of a community's physical environment so that they conform to a comprehensive scheme for the community's future development. The planning and development process involves many different governmental activities, from constructing streets to regulating banks; therefore, it is conducted by a variety of separate, loosely coordinated governing bodies and agencies.

Government administration of planning and development takes place at the federal, state, and local levels. At every level, government agencies must work closely with organizations outside of the government—from private companies and trade organizations to neighborhood associations. In the 1990s there were approximately 3,500 special governmental districts devoted to housing and community development in the United States, the vast majority at the local level.

At the federal level, agencies and cabinet departments in the executive branch put into practice policies mandated by acts of Congress or by the president. While the Department of Housing and Urban Development (HUD) enacts most national community development programs, a wide variety of development activities are conducted by administrative entities outside of HUD. The U.S. Department of Agriculture, for example, runs the Rural Electrification Administration, which provides loans for the creation of power supply systems, telephone services, and job development projects in rural areas. The Appalachian Regional Commission and the Tennessee Valley Authority conduct development programs targeted at specific geographic regions.

Federal agencies can implement planning and development initiatives primarily through either loans and grants, or legislation and regulation. Loans and grants may be given to private individuals (home buyers or real estate developers, for example) or to state or local governments and involve varying degrees of restrictions on the uses of funds. HUD's Rental Rehabilitation program, for example, grants funds to residential property owners specifically for improving the stock of low-income housing. HUD therefore specifies that program funds must be used to rehabilitate housing in neighborhoods whose residents have a median income no higher than 80 percent of the median income for the region surrounding the neighborhood. Community Development Block Grants, in contrast, are provided to state and local governments with few restrictions on use. Some loan programs involve collaboration between government and private financial institutions. Through its coinsurance program, for example, HUD aimed to encourage private lending for development purposes by offering to help private lenders absorb the cost of defaulted loans.

In addition to distributing financial aid, the federal government can shape community development through direct regulation. The Community Reinvestment Act of 1977 (CRA) was designed to penalize banks that drain capital away from economically distressed or minority neighborhoods by refusing to extend credit to the residents of these neighborhoods (a practice known as red-lining). Under CRA, banks are required to serve "the convenience and needs" of their communities by providing credit services tailored to suit the needs of low-income community residents. The Board of Governors of the Federal Reserve System, the Office of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the Office of Thrift Supervision enforce the act through regular examinations of financial institutions. These agencies can, if necessary, deny a financial institution permission to open, relocate, merge, or acquire a deposit facility on the basis of that institution's CRA record.

Through the allocation of aid and the creation of regulations, the federal government can try to guide communities toward very general goals, such as universal access to housing and equitable distribution of credit. But the U.S. national government has little power to decide where to locate public housing projects, which slums to demolish and rebuild, whether to devote a given area to industrial uses or to residences, what the direction of a city's growth will be, or any of the more detailed questions involved in a community's development. With the exception of a few experiments in national and regional planning, responsibility for resolving questions such as these falls on local governments' planning process.

In a typical community, the state or local government grants a local planning commission the power to create a master plan that makes proposals concerning the city's growth, the purposes for which its various sections of land will be used, how utilities such as water and electricity will be provided, where to build schools and libraries, how to lay out new streets, and other similar issues. The planning commission then recommends the master plan to the local governing body, which decides whether or not to adopt the plan. Once a plan has been adopted, it becomes a guideline for policy and a blueprint for possible municipal legislation. Parks, roads, and other facilities constructed by the city often must be approved by the planning commission to insure that all municipal construction follows the master plan.

To harmonize private development with the master plan, subdividers are frequently required to gain the approval of the planning commission before dividing their property into streets, lots, and blocks. The master plan also provides guidelines for municipal zoning ordinances, which designate whether or not particular areas of land can be used for residential construction, industrial development, or other specific uses.

Municipal governments are not limited to guiding the course of future development. They may also compel property owners to sell developed land to the local governing body so that existing construction can be demolished and redeveloped—a procedure known as urban redevelopment or urban renewal. It is frequently used to replace substandard or unsightly slum housing, in which case it is called slum clearance.

Municipalities frequently delegate responsibility for redevelopment to limited-dividend corporations—corporations that agree both to limit their investment returns and to abide by the regulations of the agency in charge of the renewal project in exchange for tax breaks and mortgage credits. Once a property has been redeveloped, the limited-dividend corporation can usually then sell it or lease it. Limited-dividend housing corporations have been created and operated by cooperatives, unions, reform groups, and private entrepreneurs.

BACKGROUND AND DEVELOPMENT

The first city planners in America were the Puritans, who anticipated zoning restrictions by requiring that all residences be within a mile and a half of the town church. Contemporary methods of urban planning and community development originated in the nineteenth century, however. Planning experiments in private industry preceded any extensive effort on the part of federal or local government to solve the problems posed by urban development. Industrialists such as Francis Cabot Lowell (1775-1817) planned and built factory towns designed to provide a morally uplifting, rural environment for factory workers. Ultimately, however, the fate of the factory town of Lowell, Massachusetts, simply illustrated the difficulty of yoking the public welfare to private interests. As Lowell grew, and as the economic pressures of the 1837-40 depression diverted resources away from the project of moral reform, it became more and more difficult to distinguish the planned factory town from the urban industrial environment it was intended to replace.

Ultimately, urban social problems prompted government intervention in urban development. In 1858 Frederick Law Olmstead and Calvert Vaux pioneered public urban planning by offering their own solution to the problems of urban industrialization: New York City's Central Park. Olmstead believed that the growth of cities should be carefully planned to protect the public interest rather than guided solely by market forces. In the case of Central Park, he hoped that a public park accessible to all of a city's residents would exert a moral influence on the city by providing urbanites with a pastoral escape from the hectic city street. For the first 12 years of its existence, an independent board of commissioners devoted to preserving Olmstead's moral purpose oversaw the park's maintenance. In 1870, however, the political machine of

“Boss” William M. Tweed replaced the board with the Department of Public Parks, bringing Central Park under the city's system of management through political patronage. This sort of management proved much more characteristic of early municipal urban development efforts than Olmstead's ideal of careful planning for the public good. Informal systems of political influence, bribery, and covert cooperation between businesses and city officials managed to organize a makeshift response to the increasing need for transportation, utilities, and other public services in a time of ballooning urban growth.

Toward the end of the nineteenth century, municipal governments began to develop more systematic approaches to the management of community growth. Reform organizations such as the Tenement House Commission managed to move some cities toward more formal development policies, using fact-finding missions and statistical studies of tenement life to lobby for the municipal regulation of housing standards. These reformers achieved their most significant contributions to planning methods when they joined forces with the business sector. The increasing importance of scientific management techniques in industry gave rise to a distaste among industrialists for the informal planning procedures of political machines and attracted business leaders to the statistical methods of early social workers and sociologists. Some industrialists joined organizations like the League for Social Service to promote social reform through planning in the hope that improved planning and community development would improve the economic health of cities.

While reform-minded business leaders and business-minded reformers rarely advocated direct government intervention in community development, they did create model residential communities that set important patterns for future government planning by pioneering zoning and championing suburbanization. Corporations building company towns could give planners a centralized power unavailable to most city governments, and planners often used that power to experiment with zoning. Many reform groups advocated moderate-cost suburban housing as an escape from the city's ills. The New York City and Suburban Homes Company, a limited-dividend corporation formed for reform purposes, built the prototype suburban development of Homewood, believing that the privacy of a single-family dwelling removed from the urban environment would foster the individualistic values required for a successful capitalist economy. To insure this morally elevating privacy, the company created rudimentary zoning regulations that excluded saloons, factories, and multiple-family residences from the area.

Municipal governments soon began implementing similar plans for separating residential neighborhoods from other types of land use. In 1909 Los Angeles enacted the first zoning legislation, an ordinance that divided land

into heavy industrial, light industrial, and residential areas. In the landmark 1926 Supreme Court case *Village of Euclid v. Ambler Realty Company*, an Ohio town successfully defended its right to use zoning ordinances to reserve neighborhoods exclusively for single-family residential housing. By the end of the decade, 981 American communities were using zoning ordinances.

In addition to excluding industrial development from residential neighborhoods, early attempts to shape patterns of residential development frequently involved efforts to exclude racial minorities from designated areas. In 1917 the Supreme Court ruled that municipal governments could not enforce segregation. After this decision, segregationists were forced to rely on contracts between private individuals (such as a home buyer and a seller) that placed racial restrictions on future real estate transactions within particular neighborhoods. These “restrictive covenants” were struck down by the Supreme Court in 1948.

During the 1920s the Hoover administration helped promote the suburban ideal, and the use of zoning to enforce it, by creating a system of government agencies designed to help local communities guide and control their own development. The Bureau of Home Economics, the Advisory Committee on Building Codes, the Division of Building and Housing, and other agencies contributed to an increasing federal involvement in community development issues while avoiding direct federal intervention. Rather than regulating or funding development, these agencies served as information sources for municipal governments and private organizations. The Division of Building and Housing, for example, developed hypothetical zoning legislation for state and municipal governments, which these governments could then use as blueprints for their own legislation. By chairing the advisory council of Better Homes in America, Inc., a private organization devoted to improving moderate-income housing standards, President Hoover hoped to realize his ideal of a collaboration between government and the private sector for development purposes. Like many advocates of suburban development, Better Homes in America saw ethnic and racial homogeneity as an important element of the suburban neighborhood and approved of the use of restrictive covenants to shape the demographic profiles of suburban communities.

The New Deal programs of the 1930s gave the U.S. government a much more direct role in community planning and development, setting the stage for future federal aid programs. President Franklin D. Roosevelt created extensive public works programs in an effort to relieve the massive unemployment of the Depression, and many of these programs involved urban redevelopment and the construction of planned communities. New Deal community development policy tended to encourage migration out of urban areas while trying to shore up decaying central

cities. Forty out of 99 communities developed under the New Deal were in rural or suburban areas. The Subsistence Homestead Division funded experimental farm communities while moving industrial workers to rural communities planned, constructed, and managed by the U.S. government. The Resettlement Administration, run by Rex Tugwell, constructed planned communities named “greenbelt” towns after the band of deliberately undeveloped land that surrounded them. The planners of greenbelt towns like Greenbelt, Greendale, and Greenhills (located in Maryland, Wisconsin, and Ohio, respectively) were influenced by the ideas of pioneering British planner Ebenezer Howard, who saw the ideal community as a combination of urban and rural environments. In 1937 the newly created Farm Security Administration (FSA) absorbed the Resettlement Administration and undertook rural development programs designed to help tenant farmers become land owners. After the 1937 Dust Bowl, the FSA provided housing, health care, cooperative stores, and a variety of community services to migrant farm workers.

Meanwhile, the Public Works Administration (PWA) was conducting urban redevelopment projects. For a time the PWA itself bought and demolished slums in order to replace them with public housing, but a 1935 court ruling eventually prohibited the federal government from condemning private lands. After 1935 the PWA handed over to local housing authorities the task of purchasing slum property for urban redevelopment. The Wagner-Steagall Housing Act of 1937 further continued this trend toward local control of urban redevelopment by replacing federal government ownership of public housing projects with ownership by local government. Under Wagner-Steagall, the federal government restricted its involvement in public housing and urban redevelopment to regulatory guidance and financial assistance administered through the U.S. Housing Authority.

Federally assisted urban redevelopment, renamed “urban renewal” by the Housing Act of 1954, remained a widespread development strategy long after the New Deal. While members of the private sector had objected to the public housing projects of the PWA as a step toward socialism, some businessmen saw investment potential in the urban redevelopment initiatives of the Housing Act of 1949 and the Urban Renewal Act of 1954. Developers could take advantage of federal funds to turn “blighted” urban neighborhoods into upscale housing, office buildings, or other profitable projects. City governments benefited from this approach to redevelopment, for it turned decayed neighborhoods into sources of tax revenue.

The stock of low-income housing often suffered from this sort of urban renewal, however, and dislocated slum residents faced the difficult task of finding new housing that was as cheap as their previous dwellings. The 425,000 units of low-income housing destroyed for redevelopment

from 1949 to 1968 far outweighed the 125,000 new units constructed during the same period. Faced with a shortage of low-income housing and a federal public housing budget depleted by the Korean War, many urban communities in the 1950s opted for large high-rise public housing projects that offered economies of scale.

Relocation of displaced slum-dwellers remained a problem, however. In the late 1960s, the Johnson administration emphasized the need to make low-income housing an integral part of all urban renewal projects, and the Housing Acts of 1968 and 1969 required that one low- or moderate-income housing unit be constructed for every unit that was demolished. In an effort to give a voice to residents of areas affected by urban renewal, HUD made local renewal agencies create and consult Project Area Committees composed of neighborhood representatives.

In the process of trying to create the comprehensive network of social services that he called the "Great Society," President Johnson also increased funding to community development programs and attempted to restructure them. Through umbrella organizations such as the Office of Economic Opportunity and the Model Cities Administration, the Johnson administration tried to coordinate a wide variety of federal development programs. In theory, such a coordinated development strategy would be able to address urban decay as part of a web of interrelated social problems rather than as an isolated crisis, and so would be able to deal with it more effectively. In practice, however, the complexity and politicized nature of the relations between different agencies and levels of government precluded a coordinated effort. The Vietnam War further weakened Great Society programs by draining away funds.

The simplification of the bureaucratic structure of federal social programs became an important element of the Nixon administration's domestic policy. Nixon's primary solution to bureaucratic complexity was to give state and local governments greater control over the allocation of federal funds, a proposal known as revenue sharing. The Community Development Block Grant (CDBG) proved to be the primary vehicle for revenue sharing in community development programs. The CDBG remained an important source of federal community development aid into the 1990s.

The Reagan administration cut back sharply on community development outlays in the early 1980s. The Reagan administration also saw a wave of scandals undermine the credibility of HUD. Ineffective management and accounting procedures allowed HUD employee Marilyn Louise Harrell—dubbed "Robbin HUD" by the press—to embezzle \$5 million from the agency.

Abuses of HUD loan programs by private financial institutions were perhaps more significant than the highly

publicized Robbin HUD scandal. The coinsurance program, for example, allowed irresponsible financial institutions to profit from large high-risk loans while leaving the federal government responsible for the bulk of the losses from defaulted loans. The program was designed to encourage private lending for development purposes by helping lenders absorb the risk while shifting the bureaucratic burden for processing loans off of HUD and onto the private lender. But because the private lenders handled the processing of coinsured loans, HUD had no way of assessing the risk of the loans it was guaranteeing. As a result, lenders like DRG Funding could make huge, obviously dangerous loans, profit from the fees involved, and lose relatively little when the borrower failed to repay the loan. President Bush's Secretary of Housing and Urban Development sought to reform the management methods of the department to prevent such abuses. Supported by the president, he also lobbied for an approach to federal community development assistance, which became the premise for the later development of empowerment zone and enterprise zone legislation.

President Clinton proposed a community development plan that adapted the enterprise zone proposals of the Bush administration. Initially, Clinton advocated both enterprise zones and a network of community development banks designed to foster economic development in distressed neighborhoods. The comprehensive development proposal presented by the Clinton administration on May 4, 1993, however, abandoned the community development bank idea. Instead, it outlined a system of grants and tax incentives to be offered to 10 "empowerment zones" and 100 "enterprise neighborhoods." The empowerment zones would receive the most heavily concentrated aid, primarily in the form of wage-tax credits. According to the May 4 proposal, a company within a zone could receive a \$5,000 tax credit for the first \$20,000 of wages paid to a zone resident employed by the company. Businesses outside of the zone could receive a \$2,400 credit for every employee living in the zone. This emphasis on wage credits represented a departure from the Bush administration's enterprise zone proposals, which focused instead on cuts in capital gains taxes for companies in the zones. President Clinton's plan would also try to attract small and medium-sized businesses to the empowerment zones by allowing companies within the zones to deduct as much as \$75,000 worth of equipment purchases from their taxes in the first year. Six of the empowerment zones would be in urban areas, three would be in rural areas, and one would be on a Native American reservation.

The winning cities were announced in late 1994, and by early 1997 the Clinton administration was calling its program an unqualified success. In Detroit, for example, more than \$2 billion had been pledged by private inves-

tors toward redevelopment of that city's 18-square-mile zone. Critics questioned how successful such programs really were; they pointed out that other public and private redevelopment efforts over the years, from urban renewal in the 1950s to downtown pedestrian malls in the 1970s, had failed to eradicate poverty, which indeed was worse by some measures in the 1990s than 20 years earlier. But there was no denying the enthusiasm in designated cities for the empowerment zone policy.

Notwithstanding congressional appropriation of substantial funds for three fiscal years in a row (1998, 1999, 2000), pockets of problem areas remained. In April 1999 HUD released a report, *Now Is the Time: Places Left Behind in the New Economy*, which identified several communities still struggling with poverty, unemployment, and population depletion. The Year 2000 Census will have tremendous impact on future funding of all programs dealing with urban and rural community development, as such funds are tied to census results and other demographic data. (The 1999 budget for the Bureau of the Census was approximately \$1.24 billion.) One of the anticipated findings of the Census Report is expected to be the growth of large communities of immigrant populations clustered near major metropolitan areas. For example, in 1999 the city of Lowell, Massachusetts, not far from Boston, was home to the country's second largest population of Cambodian immigrants. Demands on social services and educational needs in cities like these are far different than those needed in communities such as those found in the Plains states. Thus, the interrelationship and interdependency of social and educational programs with urban planning and development initiatives are all too apparent.

In President Clinton's 1999 State of the Union Address, he drew attention to the urban challenges that still remain in many of our historically prosperous regions, such as Boston and New York. While Sun Belt states experienced great increases in population (with commensurate growing pains related to water, sewage, and transportation needs), the Northeast region of the United States was losing its urban populations by an average of more than 5 percent. As population declines, so also does funding, thereby creating a circular problem facing many large metropolises across the country.

Between 1992 and 1998, unemployment in central cities dropped overall from 8.5 to 5.1 percent. During the same time frame, 14.3 million new jobs (comprising 84 percent) were created in major metropolitan areas. Again, the importance of maintaining the health and vitality of urban communities is readily apparent. The Department of Commerce spent approximately \$438 million in 1999 on its Economic Development Administration, and another \$32 million on its Minority Business Development Agency. HUD's *State of the Cities 1999* report incorpo-

rated the Clinton administration's "21st Century Agenda for Cities and Suburbs," which outlined a formula for expanded home ownership, employment stimulus, affordable rental housing, and regional problem solving to ensure an investment return on America's cities.

The National Rural Development Partnership (NRDP) represents a collaborative effort between government and private sector interests working toward improving the quality of life for rural communities. In 1999 NRDP had 36 State Rural Development Councils, a National Council representing over 40 federal agencies in addition to private sector organizations, and the National Partnership Office as its administrative center. Examples of NRDP activities include those of the FORVM for Rural Maryland, which in 1999 worked with state legislators to ensure that rural communities would share in the benefits of the \$4.9 billion settlement fund from the tobacco industry's national class action settlement. In Michigan, the Rural Development Council sponsored a five-day tour of 163,000 acres of farmland in Maryland, Pennsylvania, and New Jersey, highlighting successful farming preservation projects and other leading land-use efforts in order to bring back new ideas for their own communities.

CURRENT CONDITIONS

The terrorist attacks of September 11, 2001, destroyed the World Trade Center and many nearby buildings and left New York in a state that required what some insurers were calling a "Marshall Plan for Manhattan." President Bush, along with Congress, began steps to create a \$40 billion fund to cover the costs of responding to the attacks and repairing facilities and transit systems, among other things. A measure to provide tax relief for victims was also passed. The insurance industry expected the federal government to take the lead in recovering losses, especially in New York where damage was the greatest. Insured losses were an estimated \$20 billion, possibly the largest insured loss in world history.

With the economy still recovering, President Bush announced a growth and jobs plan to boost the U.S. economy. Part of the plan would mean more than \$4 billion in tax relief to farm households, benefiting about 85 percent of farmers and ranchers in 2003. That year, Agriculture Secretary Ann M. Veneman announced the selection of 21 loan and grant recipients in 10 states that would receive more than \$12.8 million in rural economic and community development loan and grant funds. Texas led the group, which would receive about \$6.7 billion of the fund designed to create jobs and aid business growth in the rural United States. Another \$1.4 billion initiative announced in 2003 would help bring or improve telecommunication technology to farmers and rural residents.

In early 2002, HUD specified 40 areas in the United States as renewal communities and eligible to share in

some \$17 billion in tax incentives to stimulate jobs, develop affordable housing, and foster economic development. The areas were chosen by poverty rate, unemployment rate, and median income. Of the 40 renewal areas, 12 were required to be in rural areas. Cities named by HUD as renewal communities included Los Angeles; Detroit; San Diego; San Francisco; Chicago; Philadelphia; Newark, New Jersey; Buffalo, New York; and Rochester, New York. Selected communities would be able to apply for an allocation to issue qualified zone academy bonds (QZAB) allowing state and local governments to match no-interest loans with private funding sources for the purpose of financing public school renovations and programs. Buyers of QZABs receive a tax credit from the U.S. government.

industry. Included are establishments responsible for the development of general statistical data and analyses and promotion of general economic well-being.

NAICS CODE(S)

926110 (Administration of General Economic Programs)

At the end of the 1990s, the five largest economies in the world were the United States, China, Japan, Germany, and India. The primary U.S. federal agency supporting general economic programs is the Department of Commerce (DOC). Established in 1931, the DOC encourages and serves the nation's international trade, economic growth, and technological advancement. In 1999, the DOC had a budget of \$5.5 billion dollars and 47,200 (full-time equivalent) employees.

Within the context of fostering competitive free enterprise, the DOC administers a wide variety of social and economic programs. For instance, it conducts research for technological advancements, grants patents, encourages growth of minority-owned businesses, works to improve the utilization of natural resources, and promotes travel to the United States by foreigners. The Secretary of Commerce oversees more than 30 offices and bureaus.

In 1997, the DOC published its "Strategic Plan for 1997-2002," addressing its five-year priorities. In that Plan, it identified three basic areas of focus, which it referred to as "themes." Theme 1 of the Plan addressed the nation's economic infrastructure, and DOC's role in developing jobs to support our economy. Theme 2 focused on the promotion of science and technology, and their roles in contributing to a competitive global economy. Finally, Theme 3 outlined the DOC's responsibilities for the management of national resources and assets, such as intellectual property rights, the radio frequency spectrum, and ocean and coastal resources.

To better manage these objectives and responsibilities, the Department of Commerce is charged with the periodic conducting of the national census. In preparation for the 2000 census, an additional 80,000 (mostly temporary) employees were hired for the Bureau of the Census, bringing its total employment to 104,900 for the year. Its budget also jumped from \$1.3 million in 1999 to \$4.7 million in 2000.

The DOC's Economic Development Administration (EDA) was created to generate new jobs, to protect existing jobs, and to stimulate commercial and industrial growth in economically distressed areas of the United States. It provides loan guarantees, public works grants, land and resource planning grants, and specialized technical assistance and consultation programs. It particularly concentrates on rural and urban areas of high unemploy-

SIC 9611

ADMINISTRATION OF GENERAL ECONOMIC PROGRAMS

This group covers government establishments primarily engaged in promoting and developing economic resources of all kinds, including tourism, business, and

ment, low income, and severe economic distress. EDA's 2000 budget was \$387 million, with approximately 270 employees.

Conversely, the DOC's International Trade Administration (ITA) promotes world trade and investments in the interests of the United States. It advises the president on international economic policy, enforces fair import trade practices, works to foster U.S. export competitiveness, and gathers data and conducts research. In 1999, ITA maintained several U.S. Export Assistance Centers, 99 domestic Commercial Service Offices, and 138 worldwide posts and commercial centers in 70 countries. Its biggest challenge, possibly to date, was the U.S.-China WTO (World Trade Organization) Accession Deal. The ITA's 2000 budget was \$307.0 million, with 2,400 employees.

Other commerce responsibilities are administered under numerous offices, such as the National Oceanic & Atmospheric Administration, and the National Telecommunications and Information Administration, which advises the president on telecommunications policy and promotes U.S. communications interests globally, among other activities.

The Patent and Trademark Office (PTO), also a responsibility of the Commerce Department, was created by the U.S. Constitution. It protects inventors' rights to the results of their creative efforts. In 1999, the PTO granted 169,154 patents, including 153,493 for inventions and 14,732 for design. Of these, 55.6 percent went to U.S. inventors, with California and New York claiming the highest numbers. The 2000 budget for the PTO was \$115.0 million, with 7,200 employees.

The National Institute of Standards and Technology assists industry in developing technology to improve products and manufacturing processes. Several other DOC offices collect data, provide technical assistance to various industries, and work to increase minority commerce.

Like the DOC, the Federal Trade Commission (FTC) strives to sustain the economic health of the nation. But its duties center around protecting the free enterprise system from monopolies, unnecessary trade restraints, and unfair or deceptive trade practices. Specifically, it regulates price-fixing, boycotting, and other competitive market influences; pricing discrimination; truth in advertising and labeling; and consumer credit policies. It also conducts research, enforces laws, and issues various trade regulations.

Besides the DOC and FTC, several smaller federal and state offices work to promote economic activity, protect consumers and businesses from fraud and negligence, and promote fair world trade. Within the Department of Energy, for instance, are several offices that work

to develop energy programs, and to conserve resources for future economic goals.

Likewise, the U.S. International Development Cooperation Agency devises and coordinates international economic policy to ensure that development goals are considered in executive branch trade policies affecting less-developed nations, and provides strong direction for U.S. economic policies toward the developing world.

Similarly, the U.S. International Trade Commission furnishes studies, reports, and recommendations to the president, Congress, and other government entities regarding international trade and tariffs. It also conducts related investigations and public hearings.

SIC 9621

REGULATION AND ADMINISTRATION OF TRANSPORTATION PROGRAMS

This group covers government establishments primarily engaged in regulation, licensing, planning, inspection, and investigation of transportation services and facilities. Motor vehicle and operator licensing is classified here. Establishments of the Coast Guard that perform functions related to the regulation, administration, and operation of transportation are likewise included. Also included in this industry are civilian government air traffic control and aircraft inspection establishments. Parking authorities are classified here, but the operators of lots and garages are classified in **SIC 7521: Automobile Parking**. Operators of railroads, subways, depots, ports, toll roads and bridges, and other transportation facilities are classified in the Transportation, Communications, Electric, Gas, and Sanitary Services division. Highway construction and maintenance are classified in **SIC 1611:**

Highway and Street Construction, Except Elevated Highways. Military establishments primarily engaged in air traffic control operations are classified in **SIC 9711: National Security** and private establishments engaged in air traffic control operations are classified in **SIC 4581: Airports, Flying Fields, and Airport Terminal Services.**

NAICS CODE(S)

488110 (Air Traffic Control)

926120 (Regulation and Administration of Transportation Programs)

The regulation and administration of transportation programs includes numerous offices and agencies at the federal, state, and local levels. These offices build roadways, railways, canals, and other transportation routes; manage vehicle licensing and safety programs; collect data; inspect vehicles and equipment; regulate traffic; and enforce and propose laws. In 2002, the federal government budgeted \$60.2 billion for transportation. The Department of Transportation has more than 60,000 employees throughout the world.

DOT. The Department of Transportation (DOT) was the main transportation arm of the U.S. government. Formed in April of 1967, this massive bureaucracy encompassed several major government functions and wielded significant influence over state governments that relied on its transportation funds. The DOT was comprised of eight administrations, the Surface Transportation Board, the Bureau of Transportation Statistics, the Saint Lawrence Seaway Development Corp., and the Office of the Secretary. The DOT was charged with establishing the nation's overall transportation policy, and was organized into major task groups that oversaw railroads; aviation; safety of waterways, ports, highways, and oil and gas pipelines; highway planning, development, and construction; and urban mass transit.

The Federal Aviation Administration (FAA), under the auspices of the DOT, was established in 1958 to regulate air commerce, control the use of navigable U.S. airspace, promote and encourage civil aeronautics, maintain navigation facilities, develop and operate an air traffic control system, conduct research, and regulate the environmental effects of aviation, such as noise. The FAA has offices throughout the world. The FAA's budget for 2002 was \$13.5 billion.

In 1967, the giant Federal Highway Administration (FHA) administered a number of transportation programs related to the total operation and environment of highway systems and motor carriers. For example, the FHA tried to create uniform state trucking standards and implement trucking safety programs. The 2002 budget for the FHA was \$34.3 billion.

The FHA's notable Federal-Aid Highway Program (FAHP), established in 1968 as the Urban Mass Transportation Administration, promoted mass transportation initiatives. The Federal Transit Administration (FTA) helped to develop technology and plans for new systems and carriers, encouraged the planning and creation of urban transit systems, provided financial assistance and consultation to state and local governments, and strove to implement national goals related to people who were elderly, handicapped, or economically disadvantaged. It operated largely through grant programs that disbursed federal dollars. The goal of the FTA is to provide public transit to all Americans. More than 10 million people utilize some form of public transit each working day. The budget for the FTA was set at \$9.8 billion for 2002.

The Federal Railroad Administration, formed in 1966, enforced rail safety, administered railway financial assistance programs, and generally supported rail transportation activities. Its eight regional offices conducted a variety of safety, freight, research, and policy programs related to railroads. In the 2002 budget, the Federal Railroad Administration received \$1 billion.

The National Highway Traffic Safety Administration (NHTSA) supports numerous federal and state governmental entities served to fulfill American transportation-related needs. The 2002 budget for the NHTSA was set at \$422 million.

The Federal Maritime Commission regulated waterborne foreign and domestic offshore commerce to assure that international trade was open to all nations. It also discouraged unauthorized activities and enforced equitable carrier rates.

The Interstate Commerce Commission (ICC) was established in 1979, and operated, maintained, and improved the Panama Canal in an effort to ensure safe, efficient, and economical transit service for the benefit of global commerce. It ceded its duties to the Republic in 2000.

U.S. Coast Guard. When President George W. Bush signed the Homeland Security Act of 2002 into law on November 25, 2002, the Transportation Security Administration and the U.S. Coast Guard were moved from the DOT to the newly formed U.S. Department of Homeland Security. The Coast Guard, which becomes part of the Department of the Navy during wartime, enforces maritime laws; sets standards for and inspects commercial vessels; investigates marine accidents and misconduct, including pollution; and enforces port safety. According to the DOT, the Coast Guard's mission is to "protect the public, U.S. economic interests and the environment—at sea, along the nation's coasts, in U.S. ports and waterways, and internationally." The Coast Guard also ran boating safety programs, operated icebreaking vessels, and trained military reserves. One of its chief responsibil-

ities was maintaining a navigation system, which included long-range satellite radio-navigation aids positioned around the globe. Similar to but separate from the Coast Guard was the Maritime Administration, established in 1950, which helped to develop and promote the U.S. merchant marine.

CURRENT CONDITIONS

Overall expenditures for transportation have increased in recent years, as the nation has sought to revitalize and maintain its aging highways and roads. Federal spending on all transportation-related programs totaled \$31 billion in 1991. However, the DOT's 2003 budget request totaled \$53.7 billion, and it was marked at \$54.2 billion for 2004.

In June of 1998, the Transportation Equity Act for the 21st Century became Public Law 105-178. It authorized the federal surface transportation programs for highways, highway safety, and transit for the six-year period from 1998 to 2003. Some of the department's stated goals were to increase seat belt use to 86 percent (from 70 percent in 1998); to reduce the percent of alcohol-related highway fatalities from 38 percent in 1998 to 34 percent; to increase Amtrak ridership from 21 million to 25 million; to decrease mobile source emissions from on-road vehicles; and to decrease the number of U.S. residents exposed to significant aircraft noise levels.

The NHTSA published its 2001 statistics in 2003, showing a slight nationwide increase (0.4 percent) in traffic fatalities (42,116) from the previous year. The number of fatalities rose in 30 states. While some states only saw levels rise by 1 percent, others experienced spikes as high as 22 percent. Sadly, an average of 115 people died in motor vehicle accidents each day in 2001. This amounted to one person every 12 minutes. Some 41 percent of all fatalities involved alcohol use, an improvement from 1991 when this number was 49 percent. Those aged 16 to 20 had the most fatalities. At 66 percent, fatalities were higher for drivers than for passengers, and male fatalities outnumbered female fatalities.

Forty-nine states and the District of Columbia had seat belt laws in effect in 2003. According to NHTSA data, more than 147,000 lives were saved by seat belts between 1975 and 2001. Of these, more than 12,000 people were saved in 2001 alone. However, the NHTSA estimates that this number could have been greater than 21,300 if all passengers (over the age of four) had been wearing seat belts. Motor vehicle accidents remained the leading cause of death for people between the ages of 4 and 33. While these statistics are sobering, positive strides have been made in recent years, thanks in part to higher national seat belt use (73 percent in 2001). Given the significant loss of human lives, as well as significant economic costs (\$230.6

billion in 2001), the effort to reduce automobile accidents and improve transportation will continue to be an important issue into the foreseeable future.

SIC 9631

REGULATION AND ADMINISTRATION OF COMMUNICATIONS, ELECTRIC, GAS AND OTHER UTILITIES

The primary participants in this industry grouping are government establishments which regulate, license and inspect utilities. The utility operations include the generation and delivery of electricity regardless of fuel, and the delivery of gas, water and sewer services.

NAICS CODE(S)

926130 (Regulation and Administration of Communications, Electric, Gas, and Other Utilities)

INDUSTRY SNAPSHOT

Utility operations directly affect almost everyone in the United States. The way they do business and how much they charge for their services is determined by federal, state and municipal commissions through a complex series of often overlapping regulations. Utility services include water, sewer facilities, electricity, natural gas, telephone, and cable television. The industry participants also monitor and regulate air and water quality and nuclear reactors. The U.S. Department of Energy's spending totaled \$21.8 billion in 2002. Of this amount, \$2.7 billion was earmarked for energy resources and \$3.3 billion for science and technology. Spending in these categories was expected to remain relatively constant in 2003 and 2004. These dollars include, but are not limited to, regulation, monitoring, and research for alternative energy.

Of increasing interest and concern over the years is whether commodities which, at one time, were optional indulgences to make life easier or more enjoyable, but which now have become absolute necessities in today's

world, should be regulated by any government entity, or should be left alone to operate within the free enterprise system upon which capitalism is built. The answer lies somewhere in between. In recent years, governmental “deregulation” of utilities has been both contentious and problematic in many areas. However, it has ostensibly served to control price gouging and unfair market practices by utilities owners and suppliers.

ORGANIZATION AND STRUCTURE

The following organizations are the main national regulatory commissions:

The Federal Energy Regulatory Commission (FERC), which was established in 1977, replaced the Federal Power Commission (FPC) which was formed in 1935. FERC controls all electric generation, distribution, and transmission involving wholesale transactions.

The Nuclear Regulatory Commission (NRC), which replaced the Atomic Energy Commission, was established in 1975. The NRC regulates all nuclear generation power plants and the transport and disposal of nuclear waste.

The Federal Communications Commission (FCC) consolidated the telecommunications authority of the Federal Radio Commission (1927) and the Interstate Commerce Commission in 1934. The FCC regulates telephone and telegraph services, satellites, broadcast and cable television, and newspapers.

The Environmental Protection Agency came into being in 1970 as an independent agency of the federal executive. It consolidated all federal environmental laws into a single administrative body.

The National Association of Regulatory Utility Commissioners (NARUC) provides a forum for state and municipal regulators.

BACKGROUND AND DEVELOPMENT

The evolution of the current regulatory system began with a concept referred to by Paul Gioia in an April 1989 issue of *Public Utilities Fortnightly* as “the regulatory compact.” By the beginning of the twentieth century, utility services were seen as essential to the welfare of the public and the growth of the economy. Since their intricate distribution systems required large investments of capital and public lands for right-of-ways, control of such early utilities became concentrated in a few hands. This tendency toward a “natural monopoly” prompted experiments in utility regulation that continue today.

The extensive land requirements of transmission systems gave control of most gas, water and electric utilities to municipal governments before the turn of the century. This was primarily because, by 1880, most states turned over control of public streets to their cities. However,

U.S. law required special permits or franchises for the use of such public property. Consequently, the municipalities controlled the privately owned utilities by granting franchises and sought to maintain control through competition by issuing overlapping franchises. This system predominated between 1879 and 1907, but complaints of excessively high prices, poor service, discriminatory marketing practices, and unsafe systems sparked public investigations that resulted in regulatory changes.

Matters came to a head in New York State when Charles Evans Hughes was elected governor. Despite the findings of his own investigation a year earlier, which confirmed all the charges against private utilities, Hughes favored continuing the system and adding a strong regulatory oversight commission manned with a professional staff. He had been opposed by William Randolph Hearst who proposed public ownership of all utilities. By 1907, however, Hughes established the first public utility commission. Wisconsin did the same and was followed by 27 other states between 1907 and 1914.

These policies shifted power away from the municipalities into the hands of state regulatory commissions and insulated legislators from the influence of utility operators. Consequently, legislators were able to enforce more uniform regulation and stem corruption and competitive waste. State regulations granted monopoly powers to utilities in specific regions in exchange for the ability to protect the public by setting price schedules which yielded a “fair rate of return” to the companies, while pushing costs down by taking advantage of the natural monopoly. Here, the important characteristic of the natural monopoly was that one company could operate more efficiently than two, thus minimizing costs for both the utility and the public.

However, current moves to deregulate utilities have prompted reexaminations of such concepts. Gregg A. Jarrell examined prices and profits for electric utilities around 1917. His study showed utilities in states which adopted regulation before 1917 were already the most efficient in the industry. The move to state regulation brought them, on average, a 25 percent increase in price and 40 percent increase in profits. In a 1992 article in *Regulation*, R. Richard Geddes quoted Jarrell and argued that the municipal system of overlapping franchises did foster competition and proved more effective than state regulation in controlling utilities. In fact, the move to state regulation actually insulated utilities from competition and allowed them to operate more freely as monopolies.

By 1925, the move to state regulation essentially was complete, but the abuses continued. In 1928, Congress reacted by ordering the Federal Trade Commission to investigate the gas and electric utilities and their holding companies. It found that such companies typically had a pyramid structure: the operating utility was at the bottom

and was owned by intermediate holding companies, which were in turn held by another parent company. Apparently, the arrangement provided operating capital for the utility, but in reality the parent companies were siphoning off profits with imaginative bookkeeping techniques. Parent companies were able to make far more profits than the utilities alone, because regulations essentially stipulated a limit on utility profits.

The Public Utility Holding Company Act of 1935 (PUHCA) attacked the pyramid structure for the electric and gas utilities, but left the telephone holding companies alone. The act requires all such companies to register with the Securities and Exchange Commission (SEC) and file reports on their organization, financial structure, and operations. The SEC then broke up the large companies with interests in several states, requiring all surviving companies to operate as coordinated, integrated systems within a confined geographic area. This reorganization, however, was not completed until 1960.

The effect of PUHCA was to overlay federal authority onto state regulation of electric and gas utilities. It also established control of wholesale power distribution with the creation of the FPC in 1935. The FPC became the FERC in 1977. Wholesale electricity sales are transactions between the producer and the utility, and often involve interstate transmission of power. The federal government also began producing its own power with the Tennessee Valley Authority (TVA) and promoted the spread of electric services outside of cities with the Rural Electrification Administration (REA). That program provided farm cooperatives with subsidized loans and access to federal power.

Between 1925 and 1970, the cost of generating electricity dropped steadily as technology and economies of scale improved. In response, the utilities regularly requested and received rate decreases from regulators, but decreases took time to implement because of the regulatory process itself. The "regulatory lag" allowed utilities to realize returns on investment which exceeded their cost of capital.

In the early 1970s, the system suffered its first major challenge and failed. During the 1960s, growing public concerns about the environment prompted increased environmental regulation, which escalated the cost of power plant and transmission line construction and the average construction time. Technological innovation had slowed and nuclear power was proving far more expensive and unreliable than first thought. Subsequently, the OPEC oil embargo of 1974 doubled the cost of oil and affected the plants directly by dramatically increasing the price of all fossil fuels and the cost of generating electricity. It also affected the economy as a whole, slowing economic activity and reducing demand for electricity. Still operating on optimistic demand forecasts of the

1950s and 1960s, however, the utilities continued to replace inefficient oil and gas turbine plants with modern coal and nuclear facilities. The industry moved from a position of no-excess generation capacity in 1973 to 12-percent excess in 1975. Moreover, during this period electric rates increased 49 percent. This resulted in increasing rate-payer hostility and a growing tendency on the part of regulators to resist further price jumps. New construction began to tail off by the end of the decade when the second OPEC oil shock hit. Between 1972 and 1982, utilities canceled 100 nuclear plants.

The traditional rate-setting practice that allowed utilities to earn a fair rate of return on their operations began to unravel as consumers demanded an accounting of management practices. In 1985, regulatory commissions began to impose "prudence reviews" on new plant construction. Under these reviews, any questionable decisions that resulted in waste in the form of construction delays or cost overruns could come back to haunt the utility. The cost of these mistakes had to be absorbed by the utility company and were not allowed to be passed on to consumers through rate increases. This became particularly important to companies involved in nuclear plant construction. Changes in safety regulations mandated by the NRC forced utilities to make expensive alterations or sometimes complete reconstruction of plant facilities. Regulators also adopted the "used-and-useful rule" to bar the inclusion of abandoned plants in the rate base. This policy penalized utilities for stopping construction on plants and in many cases disallowed some or all of the output from new plants because a surplus of generating capacity existed. By 1991, utilities had been forced to write off about \$14.7 billion worth of new generating capacity. That figure represents about 13 percent of all shareholder investment in utilities. As Gioia points out, this policy satisfied rate-payers by keeping current costs down, but it also convinced utilities to not engage in long-term capital investments like new generating equipment. Gioia believes that this situation foreshadows the possibility of shortages and reductions in service levels early in the twenty-first century.

This policy also created an opening for the increasingly important non-utility generators (NUGS). NUGS are small producers of electricity, usually industrial users, who supply their own power and sell the excess to utilities. Utilities always have viewed the NUGS' contributions as unreliable and too expensive compared to their own large scale operations. The Carter administration's Public Utility Regulatory Policies Act of 1978 (PURPA) has led many in the industry to consider NUGS as the wave of the future. The original intent of the act was to encourage the development of alternate fuels like solar, wind, hydroelectric, and garbage, as well as promoting cogeneration and other conservation initiatives. Utilities

were required to buy power from these small generators at a rate equal to their avoided costs, which are costs associated with producing or buying power normally available to the utility.

Initially, the utilities objected to the NUGS incursion into the generating domain. Subsequently, however, they discovered they could use the act to build small plants in other franchise areas. The strategy allowed them to make higher profits because these new plants were not subject to regulatory rate approval. It also answered the capacity problem. By 1990, the amount of new generating capacity brought into service by the utilities through the traditional rate base construction programs dipped to less than that built by independent producers. By 1992, non-utility generating capacity amounted to 45,000 Mw, or 5 percent of all U.S. generating capacity, and displaced the equivalent output of 40 nuclear plants.

Until the mid-1980s, gas pipeline companies bought gas on long-term contracts, and sold it to local distribution customers under "take-or-pay" contracts. In the early 1980s, the supply of natural gas turned into a glut and resulted in the creation of a low-priced spot market. In response, the FERC abolished the take-or-pay arrangements and mandated open transmission access for the pipelines. Local distributors were no longer financially prohibited from abandoning long term contracts in favor of spot market purchases, and pipelines were required to transport the gas for them at a reasonable rate.

Similar developments occurred in the communications sector of the industry. Regulation in this segment began with the Manns-Elkins Act, which placed control of telephones and telegraphs into the hands of the Interstate Commerce Commission in 1910. The move, supported by AT&T, reduced competition from local telephone companies and reestablished AT&T's predominance, especially in the long-distance market, after its major Bell telephone patents expired. In 1934, the Commissions Act transferred regulatory authority to the FCC. As the FCC allowed private users to obtain transmission licenses in the late 1950s, AT&T's monopoly position began to erode. In the 1960s and 1970s, the courts forced the FCC to end the AT&T equipment monopoly by allowing clients to attach their own equipment to phone lines. Finally, in 1984, an antitrust decree forced AT&T to divest from all its local operating companies.

For the cable companies, the FCC control began to slip in 1984 with the Cable Communications Policy Act. The act deregulated pricing in competitive markets which were deemed to comprise all but the very smallest. It also prohibited phone companies from offering cable television services on their lines. When the average cost of cable service rose more than 40 percent, Congress, in 1992, allowed states and municipalities to reestablish rate regulation.

In the early 1990s, the movement toward deregulation was picking up steam as more utility operations faced competitive challenges. However, critics warned that deregulation policies would jeopardize supplies, quality, and safety. They have pointed out that base-load electric generating facilities like nuclear plants and large coal-fired plants are not being built. Instead, gas turbines are becoming popular because natural gas is relatively inexpensive. Such systems are less efficient than the base-load plants and consequently, the price of gas could rise. More importantly, unlike utilities which are able to switch fuels, gas turbines cannot operate if the supply of gas is curtailed.

Electric companies also found themselves embroiled in deregulation controversies. A bill was introduced to Congress in 1996 that would mandate federal retail wheeling of electric power by December 15, 2000. According to Eastern Maine Electric, "generation utilities will no longer have ownership or control of transmission and/or distribution facilities." The new legislation is intended to break up "vertical monopolies," which control generation, transmission, and distribution of electricity. Basically, the new proposal will lead to competition between retail electric companies. Consumers will have the right to choose which company they will purchase electricity from. Critics worried utility companies will no longer be able to initiate new development because of the uncertainty of the number of base clients.

Also in 1996, Congress passed the Telecommunications Reform Act. This act substantially deregulated the cable TV industry, along with other services. One of its key components was the introduction of the V-chip for TV sets, which allows parents to block programs they feel are inappropriate for their children.

By the late 1990s, electric power generation had become an industry twice the size of the global auto industry, bringing in an estimated \$800 billion in revenues annually. As such, it is no wonder that the century ended without the complicated and contentious deregulation that many had hoped for. Notwithstanding, Congress appeared poised to act soon thereafter on a bill which would, in fact, deregulate the industry. In 1999, Congress accelerated activity on issues attendant to deregulation: viability of competition to drive prices down; antitrust concerns; and the reality of electricity restructuring in a deregulated industry. As of late November, 1999, H.R. 2944, the Electricity Competition and Reliability Act of 1999, had gone through its second draft and was headed for a full legislative hearing. Studies by consumer advocate groups and academia assert that utility companies have held back on power output to control prices, and that the industry could realize between 13 to 25 percent more output annually without adding any more equipment. They believe that deregulation of the industry

would equate to a real-world savings of about \$30 per month on the average household electric bill.

In the communications arena, antitrust concerns over the pending mergers between AT&T and Tele-Communications Inc., Bell Atlantic and GTE, and Am-ritech with SBC Communications Inc. dominated the 1999 calendar. To be avoided were the “vertical monopolies” so characteristic of the electricity industry. There were an estimated 65 million mobile phone users by early 1999, and 70 million Internet users. As fast as fiber-optic technology hit the global market, its biggest competitor, satellite communications technology, also entered the arena of soon-to-be-deregulated industries.

CURRENT CONDITIONS

During the late 1990s, California became one of the first states to open its electric power markets to competition. Initially successful, this ultimately led to problems. In 2000, prices soared and power supplies were strained when the state failed to add enough capacity to meet rapid economic growth that was taking place. Subsequently, a combination of weather- and market-related conditions exacerbated the situation. As the FERC explained in its *2001 Annual Report*, a hot summer was proceeded by a cold winter, hydropower generation was hindered by a significant drought, and demand was relatively unchanged due in part to fixed rates. Taking action to avert further problems, the FERC “acted to mitigate the sharp price increases of electricity and natural gas in the Western states. These measures provided customers with relief from the most extreme spot market prices. The Commission also removed a series of regulatory obstacles to expedite providing increased energy supplies to the West.” Following the FERC’s intervention, prices stabilized in the western United States.

In order to increase vigilance and enforcement over the operation of gas and electric markets, the FERC established the Office of Market Oversight and Investigations (OMOI) in January 2002. The new entity, which called for a staff of 110 employees in fiscal year 2003, issues regular surveillance reports concerning market conditions to the FERC chairman and commissioners. One of OMOI’s objectives concerns the prevention of anti-competitive business practices. The office was involved in the investigation of illegal trading at energy firm Enron, as well as “gas price anomalies” in New York. As part of its operations, OMOI works in tandem with other government agencies, including the U.S. Department of Justice, the Securities and Exchange Commission, and the Commodity Futures Trading Commission. Each agency specializes in different aspects of an investigation.

Natural gas consumption is expected to continue growing at about 2 percent per year, and according to EOG Resources, growth is expected to nearly double by

2020. The Gas Research Institute predicts that the natural gas share of the total energy market will jump from 24 percent in 1997 to 28 percent in 2015. The largest demand growth is in the electric power generation sector.

By the early 2000s, mergers and acquisitions had occurred at a rapid pace within the telecommunications segment of the industry. For example, by 2003 only four of the seven regional Bell holding companies created by the breakup of AT&T in 1984 remained: Verizon Communications, Inc.; SBC Communications, Inc.; BellSouth Corp.; and Qwest Communications International, Inc. Three of these companies—BellSouth, SBC (Cingular), and Verizon (Verizon Wireless)—benefited from ownership stakes in the nation’s two leading wireless telephone companies. Verizon and SBC also had obtained FCC approval to offer traditional long distance service in certain states.

SIC 9641

REGULATION OF AGRICULTURAL MARKETING AND COMMODITIES

This category covers government establishments primarily engaged in the planning, administration, and coord-

dination of agricultural programs for production, marketing, and utilization, including related research, education, and promotion activities. Establishments responsible for regulation and control of the grading, inspection, and warehousing of agricultural products; the grading and inspection of foods; and the handling of plants and animals are classified here. This government group also includes such entities as agricultural extension services, fair boards, marketing, and consumer services.

NAICS CODE(S)

926140 (Regulation of Agricultural Marketing and Commodities)

Government establishments primarily engaged in the administration of programs for developing economic data about agriculture and trade in agricultural products are classified in **SIC 9611: Administration of General Economic Programs**. Government establishments primarily engaged in programs for conservation of agricultural resources are classified in **SIC 9512: Land, Mineral, Wildlife, and Forest Conservation**. Government establishments primarily engaged in programs to provide food to people are classified in **SIC 9441: Administration of Social, Human Resource, and Income Maintenance Programs**.

INDUSTRY SNAPSHOT

The major federal agency in this category is the U.S. Department of Agriculture (USDA). This cabinet-level agency, established in 1862, works to improve and maintain farms, to cultivate markets for U.S. agricultural exports, and to regulate the integrity of farm commodities. These goals are accomplished through its various programs (e.g., loans and subsidy payments), marketing and outreach efforts, research, and regulations. The USDA works in conjunction with agriculture departments in states and territories.

BACKGROUND AND DEVELOPMENT

While many of the early U.S. presidents considered themselves farmers, a cabinet department to address the needs of the country's largely agrarian society did not come into existence until the mid-nineteenth century. In 1839, Congress appropriated \$1,000 for the collection of agriculture-related statistics and the distribution of seeds; this function was assigned to the U.S. Patent Office because Commissioner of Patents Henry L. Ellsworth supported aid to agriculture and the number of agricultural patents being handled by that office was larger than any other category of inventions.

Farming in America gradually shifted from subsistence cultivation to more commercial operations by the mid 1800s, and at the urging of the U.S. Agricultural Society (organized in 1852), a formal agriculture agency

(not a cabinet department) was established on May 15, 1862. The first commissioner of the new agency was Isaac Newton, a personal friend of President Lincoln and a farmer. It was during this time the department began to regularly publish statistical and research reports, send scientists to Europe and Asia to observe agriculture abroad, and take some initial steps toward regulation of commodities. In 1887, passage of the Hatch Act authorized experimental stations in the states, and in 1989, raised the agriculture bureau to cabinet status.

Much of the Department of Agriculture's proactive work began during the Great Depression, when farmers faced tremendous challenges and hard times. In 1933, the Agricultural Adjustment Act was passed, its purpose being to adjust production to meet demand, and ultimately establish marketing conditions that would raise farm prices to parity. While this legislation was declared unconstitutional by the U.S. Supreme Court in 1936, many of the functions assigned to the Agricultural Adjustment Administration were incorporated into USDA operations. In the post-World War II period, farmers and the USDA began addressing the problems of crop surpluses, subsidies, and development of new opportunities to maintain farmer income.

Divisions within the USDA that are involved with the marketing and regulation of commodities are the following:

- The Agricultural Marketing Service. Established on April 2, 1972, the service concerns itself with grading, inspection, certification, market news, marketing orders, and the research and promotion of regulatory programs. Grading standards are in place for nearly 240 agricultural commodities. These standards are developed to certify quality of the commodities being purchased.
- Animal and Plant Health Inspection Service. Established in 1977, this service conducts regulatory and control programs designed to protect and improve animal and plant health. Working with state agencies, the inspection service is concerned with humane treatment of animals, the control and elimination of pests and diseases, and animal and plant quarantines. This agency also is involved in border inspection of agricultural products coming in to the United States.
- Grain Inspection, Packers, and Stockyards Administration. The former Federal Grain Inspection Service and the former Packers and Stockyards Administration were merged to form this USDA office. The agency is responsible for establishing standards for grains and other assigned commodities and for administering a nationwide inspection and weighing system.
- Cooperative State Research, Education, and Extension Service. This agency works closely with re-

search colleges and universities, agricultural stations, and state agencies, focusing on research, extension, and higher education in the food and agricultural sciences and in related environmental and human sciences. Among this agency's concerns are improvement of agricultural productivity, creation of new products, and addressing of agriculture-related problems as they surface. It has been involved in plant and animal genome, food safety, and sustainable agriculture research projects throughout the country.

One of the most important developments in commodities and price regulation has no direct connection to the USDA — the closing of the National Cheese Exchange. Located in Green Bay, Wisconsin, the cheese exchange was a nonprofit organization that helped to determine the price of cheese throughout the nation. In response to complaints from Wisconsin farmers about declining prices, and following a research study conducted by the University of Wisconsin that suggested the exchange was being inappropriately dominated by large traders such as Kraft Foods, Wisconsin's two U.S. senators (Russ Feingold and Herb Kohl) called for an investigation into the exchange's operations. Kraft Foods denied charges of cheese "dumping" in order to lower milk prices, and the Federal Trade Commission's 1996 investigation found no evidence of antitrust violations. But rather than fight what it labeled "assaults from farmers' organizations, politicians, and the media," the cheese exchange's functions have been shifted to the Chicago Mercantile Exchange. Although cheese futures trading was adopted by a New York commodity exchange several years ago, it has had little impact on pricing.

CURRENT CONDITIONS

In 1999, the USDA had a budget of more than \$65 billion and employed 110,000 persons. It continued to serve the nation's 2 million farmers and 69 million rural residents. The agency also was responsible for providing 25 million lunches to the nation's school children each day. The USDA estimated that in 1999, the number of U.S. commercial farms was between 300,000 and 500,000. Commercial grain storage was estimated at approximately 8 billion bushels, with another 11 billion bushels stored on the farms.

Although there was a one-year increase in 1999 (for emergency funding to address the farm economic crisis and the President's Food Aid Initiative), the USDA's budget outlays have declined steadily from \$63.1 billion in 1993 to an estimated \$55.2 billion for 2000. The department's stated strategic goals for the FY 2000 budget were to expand economic and trade opportunities for agricultural producers; to ensure food for the hungry and an accessible supply of safe, nutritious, and affordable

food; and to promote sensible management of our natural resources. In furthering these goals, early in 2000 the USDA announced new criteria for the labeling of "organic foods," eliminating from that category all genetically-engineered products and those which have been irradiated.

Highlights of specific program budgets for 2000 included \$25.0 billion for the Farm Service Agency, \$6.4 billion for the Foreign Agricultural Service, \$1.7 billion for the Risk Management Agency, \$10.9 billion for rural development programs, \$21.7 billion for the Food Stamp Program, \$742.0 million for the Food Safety and Inspection Service, \$4.9 billion for natural resources and environment, \$825.0 million for marketing and regulatory programs, and \$2.1 billion for research and education.

SIC 9651

REGULATION, LICENSING, AND INSPECTION OF MISCELLANEOUS COMMERCIAL SECTORS

This category covers government establishments primarily engaged in regulation, licensing, and inspection of other commercial sectors, such as retail trade, professional occupations, manufacturing, mining, construction, and services. Also covered are physical standards, regulating hazardous conditions not elsewhere classified, and alcoholic beverage control.

NAICS CODE(S)

926150 (Regulation and Inspection of Miscellaneous Commercial Sectors)

ORGANIZATION AND STRUCTURE

The primary purpose of regulation is to prevent harm — either physical, pecuniary, or restrictive — to persons or entities. It follows that statistical data on harm, damage, or injury is necessary to amend, delete, or provide regulatory structure to an industry. Analysis and application of data provide justification for agencies and regulatory boards to exercise jurisdiction over private and public sectors in order to reduce such injuries. Examples include vehicular safety belt and speeding laws, minimum age requirements for tobacco and alcohol products, maximum weight loads in elevators, airplanes, and freight trucks, nutritional analysis on food packages, and control of pharmaceuticals by prescription only.

From the federal regulations commercial truck drivers must meet, to the deposit requirements banks must follow, government agencies — at both the state and national level — present a mosaic of requirements that promote safety and stability for the general public and for the employees in regulated industries. Regulatory responsibilities are assigned to a wide range of federal agencies. Following are some of the most active and high-profile agencies.

The U.S. Occupational Safety and Health Administration (OSHA). This agency, part of the U.S. Department of Labor, came into being in 1970. Its stated mission is “to assure so far as possible every working man and woman in the nation safe and healthful working conditions.”

OSHA, working in conjunction with state agencies, utilizes 2,100 inspectors and additional complaint-discrimination investigators, engineers, physicians, educators, standards writers, and other technical and support personnel throughout the country. The agency’s regulations generally do not apply to miners, transportation workers, the self-employed, and some public employees.

Through its investigations and its enforcement of regulations and standards, and through its public outreach and training efforts, OSHA works to reduce workplace injuries and deaths. An estimated 6,000 Americans die each year from injuries sustained at their places of work. An additional 50,000 people die from illnesses brought on by chemical exposures in the workplace, and an estimated 6 million people suffer nonfatal workplace injuries — injuries that carry a \$110 billion price tag annually.

OSHA strictly monitors: asbestos in the workplace, bloodborne pathogens, and carbon monoxide poisoning, as well as control of hazardous energy sources, cotton dust, employee rights and responsibilities, lead exposure, exposure to formaldehyde, safety of video display terminals, and workplace fire safety.

A recent study of the impact of OSHA inspections showed the positive impact such regulation efforts have had. According to the study, in the three years following an

OSHA inspection, penalties, injuries, and illnesses fell an average of 22 percent. In addition, overall injury and illness rates dropped in industries where OSHA has concentrated its attention but remained unchanged or actually increased in industries where OSHA had less presence. OSHA’s 1999 budget was estimated at \$349 million.

The Federal Deposit Insurance Corporation (FDIC). This agency is an independent organization created by Congress as part of the 1933 Banking Act. Along with its related regulatory agency, the Federal Savings and Loan Insurance Corporation (and, to a lesser degree, the Federal Reserve), the FDIC’s mission is “to maintain stability and public confidence” in the nation’s banking system.

Issues connected to banking have played integral roles in American history: the stock market collapse of 1929 and its effect on banks prompted the establishment of the FDIC. During Franklin D. Roosevelt’s first 100 days in office, legislation establishing the FDIC was passed by Congress, as a way to stave off the collapse of banks and the loss of depositor savings.

The big news in 1999, following a record-breaking stock market boom lasting for several months, was the historic restructuring of banking law by Congress and the White House in October-November 1999. Intended to dissolve restrictions placed upon banks, insurance companies, and stockbrokerages by the Glass-Steagall Act of 1933, the new legislation was promoted as an offensive rather than defensive measure to meet the rising global economy. It essentially allows integration of commerce and banking — mutually exclusive industries following the market collapse of the Great Depression. Banks and financial firms may engage in commercial activities such as the marketing of insurance and investment portfolios, and commercial firms will be allowed to purchase banks and financial entities.

The FDIC requires banks and other financial institutions included in its regulatory purview to protect their money supplies through the provision of insurance coverage for bank deposits. Accounts are protected up to \$100,000. The FDIC also conducts periodic examinations of banks that do not belong to the Federal Reserve System. In 1998 and 1999, the Department of the Treasury’s Bureau of Engraving and Printing issued new paper currency for all but the dollar bill, intended to ensure the continued containment of high-tech counterfeiting, which costs billions of dollars each year.

The Bureau of Alcohol, Tobacco, and Firearms (ATF). This agency is part of the U.S. Treasury Department. While the portion of its mission dealing with the reduction of crime and provision of law enforcement assistance to local entities receives the greatest public attention, ATF also enforces regulations dealing with the sale of alcohol, tobacco, and firearms; in particular, ATF

is concerned with the fair and proper collection of revenues and taxes on those items.

The history of ATF goes back to the beginnings of U.S. history. The taxing of alcohol has generally been seen as a way to generate needed revenue. But not surprisingly, those required to pay the tax weren't always supportive of those efforts. The Whiskey Rebellion of 1794 (when farmers vigorously protested the imposition of a federal excise tax on whiskey) was only one in a continuing series of episodes in which the federal government met the resistance of general citizens. With the end of Prohibition, alcohol was once again seen as a possible revenue source. In 1934, the Alcohol Tax Unit within the Bureau of Internal Revenue was created. In 1935, the Federal Alcohol Administration Act was passed, creating licensing and permit requirements and establishing regulations to ensure an open and fair marketplace for the legal manufacturers of distilled spirits and their customers. In 1940, the Federal Alcohol Administration merged with ATF; that merger combined law enforcement and regulatory authority into one agency. Firearms became a part of the organization's responsibilities, and oversight of tobacco taxes was added in 1951. From the mid 1960s into the 1980s, ATF's mission came to include law enforcement duties.

While it may appear that its regulatory functions have taken a back seat to its law enforcement activities, ATF, which regulates some of the most important and controversial industries in this country, collected more than \$18.2 billion in revenues in 1998. The agency also conducts seminars to ensure the market and product integrity of alcoholic beverages. And, consistent with its history, ATF is expected to expand into the area of electronic commerce. A 1995 test project that allowed industries to electronically submit and monitor applications for non-beverage alcohol formula was deemed successful and will likely be expanded to include other areas under ATF jurisdiction. The 1999 budget for the ATF was approximately \$743 million.

The issue of industry regulation in general has prompted considerable political debate. A key theme of the Clinton administration has been the need to get rid of regulations and requirements that are "burdensome" to U.S. industry, particularly to small businesses. The movement from regulation to deregulation or self-regulation came to a head during the Reagan administration. And while federal agencies continued to enunciate their desire to move away from "over-regulation," or at least make the regulations more user-friendly, a trend appears to be emerging that would increase the federal government's regulatory role.

For example, the U.S. Environmental Protection Agency ranks as a priority the reduction of tiny air particles believed to pose risks to children. Nelson Litterst, a lobbyist for the National Federation of Independent Busi-

ness suggests such rules could cost \$16 billion annually, double the EPA's estimate. Also, OSHA recognized its need to respond to public perceptions that it has been an agency enmeshed in red tape and a "one-size-fits-all" approach to regulation. At the same time, OSHA continued its efforts to require workplace ergonomic standards, in order to reduce back injuries and problems resulting from repetitive stress syndrome. However, a GOP-controlled Congress blocked OSHA's move in 1995, but that ban was not renewed in 1996. Thomas J. Donahue, president of the American Trucking Association, has said the kinds of regulations being considered would cost truckers \$6.4 billion a year. OSHA's estimate of costs in this area was \$257 million. Furthermore, it was expected that OSHA would be turning its attention toward convenience stores and fast-food restaurants in an attempt to reduce nighttime crime. With the National Highway Traffic Safety Administration developing new standards for automobile airbags and the Food and Drug Administration offering new regulations to prevent a U.S. outbreak of mad-cow disease, the pendulum may be swinging back toward regulation.

CURRENT CONDITIONS

The National Safety Council released its annual report in November 1999, *Report on Injuries in America*, containing highlights from its 1999 edition of *Injury Facts*. According to the report, in 1998 alone, there were 19.4 million injuries from unintentional causes which resulted in disability. During the same year, 92,200 people died of fatal injuries.

The leading causes for injury-related fatalities in 1998 were motor vehicle accidents, falls, poisonings, drownings, and burns by fire. The leading causes of noninjury related fatalities were heart disease, cancer, stroke, and pulmonary disease. At the workplace, a fatality occurs every 103 minutes and a disabling injury every 8 seconds. A total of 3.8 million workers suffered disabling injuries in 1998 alone, costing Americans \$125.1 billion. At home, the leading cause of death was by falling, resulting in 10,700 fatalities for 1998 alone. Deaths and injuries in public places (including sports, recreation, and building access) totaled 20,100 in 1998.

The total cost to the American public of medical expenses, property loss, and employer expense was an estimated \$480.5 billion, or the equivalent of 59 cents for every one dollar spent on food in 1998. It is from statistical data such as this that regulatory entities decide whether to further regulate, deregulate, or leave intact the controlling laws and rules that govern major industries across the nation.

SIC 9661

SPACE RESEARCH AND TECHNOLOGY

This category includes government establishments primarily engaged in programs for manned and unmanned space flights and space exploration. Research and development laboratories operated by the National Aeronautics and Space Administration (NASA) are classified as auxiliaries to this industry. Private establishments primarily engaged in operation of space flights on their own account are classified in **SIC 4789: Transportation Services, Not Elsewhere Classified**.

NAICS CODE(S)

927110 (Space Research and Technology)

INDUSTRY SNAPSHOT

The National Aeronautics and Space Administration (NASA) is the primary U.S. government agency involved in space research and technology. The Department of Defense also operates extensive space research programs, many of them classified.

Other government agencies involved in space research include the Department of Commerce, which operates the National Institute of Standards and Technology and the Office of Space Commercialization; the National Science Foundation, which operates several Earth-based observatories; and the Smithsonian Institution, which operates the Smithsonian Astrophysical Observatory and the Center for Earth and Planetary Studies.

The federal space program came to prominence during the 1960s as a result of the “space race,” which pitted the United States against the Soviet Union in a contest to be first to land a man on the moon. Over the years, the space program has enjoyed spectacular successes, but also suffered several disappointments, including the tragic explosion of the Challenger shuttle and the loss of the Space Shuttle Columbia in 2003.

ORGANIZATION AND STRUCTURE

NASA, the government’s largest space research organization, is divided into several “enterprises,” each responsible for a different aspect of the U.S. space program. In addition to enterprises devoted to Education, as well as Safety and Mission Assurance, NASA accomplishes its objectives via five main enterprises: Aerospace Technology, Space Science, Earth Science, Biological and Physical Research, and Space Flight.

Aerospace Technology Enterprise. The Aerospace Technology Enterprise is primarily involved in aeronautical research, including development of high-speed aircraft and air-traffic control aids for civil transport, rather than space flight. According to NASA, this office is driven by four main themes: the administration’s Space Launch Initiative, aeronautics technology, mission and science measurement technology, and innovative technology transfer partnerships. The Aerospace Technology Enterprise also manages the Ames Research Center, Dryden Flight Research Facility, Langley Research Center, and the Glenn Research Center.

The Ames Research Center in Mountain View, California, was established in 1939 by the National Advisory Committee for Aeronautics (NACA) to conduct aircraft research. It was named for Dr. Joseph S. Ames, NACA chairman from 1927 to 1939. The center became part of NASA in 1958. The center has continued to conduct a broad range of research, including computer space-flight simulations.

The Hugh L. Dryden Flight Research Facility at the Edwards Air Force Base in Edwards, California, was established in 1946. Dryden is involved in testing high-speed aircraft and wingless lifting bodies. Dryden developed the Lunar Landing Research Vehicle during the Apollo program and was involved in developing and testing the space shuttle Enterprise. Space shuttles that land at Edwards Air Force Base were supported by the Dryden Research Facility.

The NASA John H. Glenn Research Center at Lewis Field in Cleveland, Ohio, was established in 1941. It formerly was named the Lewis Research Center for George W. Lewis, NACA director of research from 1924 to 1947. However, on March 1, 1999, this facility was renamed to also reflect legendary astronaut John Glenn.

The research center is best known for its work in jet propulsion, although it also was instrumental in developing liquid hydrogen as a fuel for space flight in the 1960s. It was responsible for developing an electrical power system for the space station program, and also includes the Microgravity Science Division, which is responsible for experimenting with microgravity science technology.

Located on an 800-acre site in Hampton, Virginia, the NASA Langley Research Center was established in 1917 as the United States' first civil aeronautics laboratory. More than 50 percent of the center's work is devoted to the field of civil and military aeronautics. In addition, its other areas of concentration include the development of next-generation spaceships, as well as aviation safety. The Center for Excellence for Structures and Materials also is located at Langley.

Space Sciences Enterprise. The Space Sciences Enterprise is primarily responsible for programs involving the unmanned scientific investigation of the solar system and deep space. NASA's Space Science Program seeks to understand the nature of the Universe, to explore the solar system, to better understand the relationship between the Earth and sun, and to study the origin and possible distribution of life in the Universe.

The Space Sciences Enterprise conducts many of its projects at the Jet Propulsion Laboratory (JPL) in Pasadena, California. NASA operates the JPL under contract with the California Institute of Technology. Founded in 1944, JPL built the first U.S. satellite, Explorer I, in 1958. JPL also was responsible for the Ranger probes that provided the first close-up pictures of the moon between 1964 and 1965. Since then, probes launched by JPL have explored every planet in the solar systems except Pluto. Projects under its direction have included Voyager, Galileo, Magellan, Mars Observer, and Ulysses. JPL also developed a wide-field planetary camera for the Hubble Space Telescope that was launched in 1990. The Office of Space Sciences continued to manage the Hubble telescope into the early 2000s. In recent years, it has outfitted the device with a Near Infrared Camera and Multi-Object Spectrometer (NICMOS) and the Space Telescope Imaging Spectrograph (STIS). These enhancements extended HST's wavelength range into the near infrared and greatly enhanced its ability for ultraviolet spectroscopy.

Earth Science Enterprise. As its name suggests, the Earth Science Enterprise is responsible for NASA's earth science and environmental programs, which include space-based research. The division also has responsibility for the Goddard Space Flight Center. The center, located in Greenbelt, Maryland, has boasted the largest scientific staff of all NASA centers. It was named for Robert H. Goddard, considered the father of modern rocketry. In the early 1990s, the Goddard center was responsible for mon-

itoring more than 20 major space projects, including the Cosmic Background Explorer, which was launched in 1989 to investigate the origins of the universe, and the Hubble Space Telescope. Other projects managed by Goddard included the Compton Gamma Ray Observatory, the International Ultraviolet Explorer, and the Upper Atmosphere Research Satellite, launched in 1991 as part of the U.S. Global Change Research Program. The center also operated the Goddard Institute for Space Studies in New York.

Earth Science has funded research projects including: Synthesis and Modeling Project of the U.S. Joint Global Ocean Flux Study; Satellite Remote Sensing Measurement, Accuracy, Variability, and Validation Studies; The Effects of Tropical Forest Conversion: Ecological Research in the Large-Scale Biosphere-Atmosphere Experiment in Amazonia (LBA); and Remote Sensing Research—Biological Oceanography.

Biological and Physical Research Enterprise. This NASA office is responsible for researching the effect of zero gravity and space flight on humans and other biological organisms.

Space Flight Enterprise. The Space Flight Enterprise is responsible for the operation of the space shuttle. It also is responsible for the International Space Station, which serves as a habitable space laboratory where scientists can conduct a wide array of experiments. The Space Flight Enterprise oversees all space and flight support, including advanced systems, space communications, and rocket propulsion testing. Finally, it has managerial oversight for the Kennedy Space Center, Marshall Space Flight Center, Johnson Space Center, and the Stennis Space Center.

The Kennedy Space Center on Florida's Cape Canaveral is NASA's primary launch facility. The Air Force established a missile test center on Cape Canaveral in 1949, and the first U.S. manned space flights were launched from there. The Kennedy Space Center, named for President John F. Kennedy, was built in the early 1960s for the Apollo program. The main complex was on Merritt Island, separated from Cape Canaveral by the Banana River, but the actual launch sites were on the cape. The first space shuttle was launched from the Kennedy Space Center in 1981.

The Marshall Space Flight Center at the Army's Redstone Arsenal in Huntsville, Alabama, was NASA's primary rocket research center and played a key role in the development of the space shuttle. The center continued to be responsible for the space shuttle's main engines and operated the Spacelab Mission Operations Control Center. Marshall also managed the Michoud Assembly Facility, the Slidell Computer Complex, and the Advanced Rocket Motor program. Originally part of the

Army Ballistic Missile Agency, Marshall became part of NASA in 1960. It was named for George C. Marshall, who served as Army chief of staff during World War II and later as secretary of both Defense and State.

The Johnson Space Center in Houston, Texas, is NASA's primary center for the design and testing of spacecraft for manned flight. Mission Control for all manned space flights is also located at the Johnson Space Center, as are most astronaut training facilities. The center also is responsible for operation of the White Sands Test Facility at Las Cruces, New Mexico. The center was established in 1961, and later named for President Lyndon B. Johnson.

Stennis Space Center in Hancock County, Mississippi, is responsible for testing the space shuttle's main engines, the same role it filled for the Saturn V rocket during the Apollo space program. The center was named for Congressman John C. Stennis.

BACKGROUND AND DEVELOPMENT

Robert H. Goddard. The U.S. government took its first tentative step into space research in 1916, when the federally chartered Smithsonian Institute began to subsidize the work of physicist Robert Hutchings Goddard. During World War I, Goddard engaged in weapons research for the U.S. military, working primarily with solid-fuel rockets. After the war, he returned to experimenting with liquid-fuel rockets, which seemed to hold greater promise. He continued to receive \$100 a month from the Navy Bureau of Ordnance.

In 1920, the Smithsonian published a treatise by Goddard entitled "A Method of Reaching Extreme Altitudes." The Smithsonian also issued a press release mentioning the possibility that rockets developed for atmospheric research might one day land a magnesium flare on the moon that would be visible from Earth.

Later that same year, the Smithsonian published another treatise by Goddard entitled "Report on Further Developments of the Rocket Method of Investigating Space." In the treatise, Goddard discussed such visionary topics as the control of unmanned space vehicles, ion propulsion, and a "solar sail"—a giant mirror up to 600 feet square—that could be unfurled in space to collect solar energy. He also suggested that spacecraft carrying metal plates engraved with diagrams of the solar system could be sent into deep space in search of extraterrestrial life—a plan that was carried out in 1972 with Pioneer 10. At the time, however, many influential newspapers openly ridiculed Goddard's ideas.

Goddard severed his relationship with the U.S. military in 1923 and returned to Clark University, in Massachusetts, where he was professor of physics. In 1926, Goddard launched the world's first liquid-fuel rocket on a

farm near Auburn, Massachusetts. The awkward-looking mechanism of tanks and tubes reached a height of 41 feet and traveled 184 feet down range. The flight lasted just 2.5 seconds.

In 1929, Goddard was introduced to Charles Lindbergh, the celebrated American pilot who had made the first solo nonstop flight across the Atlantic two years earlier. Lindbergh later persuaded both the Guggenheim Foundation and the Carnegie Institute to back Goddard, which enabled him to leave his teaching position and devote full-time to rocket research at a ranch near Roswell, New Mexico. In 1935, Goddard launched a rocket that reached an altitude of 7,500 feet and flew faster than the speed of sound.

When the United States entered World War II, Goddard again turned his attention to developing rockets for the military. He died in 1945. Although little known outside the research community, Goddard was the first to develop the mathematics of rocket action and prove that rockets would work in a vacuum. He also was the first to develop a gyroscope-based control mechanism. In 1960, NASA and the U.S. military awarded \$1 million to Goddard's estate and the Guggenheim Foundation for use of his patents. NASA also named its primary research and engineering facility the Goddard Space Flight Center.

Wernher von Braun. About 1930, a group of rocket enthusiasts who had formed the German space society, known as the Verein für Raumschiffahrt or VFR, approached the German government with a proposal to develop the rockets as an alternative to traditional artillery. One of those enthusiasts was Wernher von Braun, who later would be responsible for developing the Saturn V rocket that would take U.S. astronauts to the moon.

Under the Treaty of Versailles, which ended World War I, the German military was reduced to little more than a police force. Among the restrictions, Germany was prohibited from developing heavy artillery, building tanks, or possessing an air force. Rockets, however, were not mentioned in the treaty, and in 1932 von Braun became an advisor to the fledgling German rocket program.

During World War II, a team of scientists led by von Braun developed the V-2 rocket that was used to bomb England. They also began developing a larger rocket that would have been able to reach the United States. However, by early 1945, it was clear that Germany was losing the war, and von Braun began to prepare for the future.

At the time, von Braun's research facility was on an isolated peninsula near the Baltic Sea, and it appeared likely that he would be captured by the Russian army. However, von Braun and most of his team preferred to be captured by American forces. Von Braun convinced the beleaguered German military that he needed to move the

research center to Mittelwerk in the central German highlands, where the scientists buried tons of documents and waited to be captured. In what became known as Operation Paperclip, von Braun, more than 100 of his staff members, most of the documents, and about 100 V-2 rockets were eventually taken to the United States.

Space Race. Von Braun and most of the other German scientists became part of various U.S. military research programs. However, following World War II, the United States placed more emphasis on developing long-range bombers than intercontinental ballistic missiles (ICBM), which many military leaders felt would never be able to deliver warheads the size of an atomic bomb. Even when the Soviet Union launched the first Sputnik satellite in 1957, most U.S. military leaders were unconcerned. President Dwight D. Eisenhower told the news media, "One small ball in the air . . . does not raise my apprehensions, not one iota."

However, the public outcry at being bested by the Soviet Union did cause the military to step up rocket research. In 1955, the Navy had initiated Project Vanguard, basically a civilian research program, to develop a rocket for launching unmanned satellites for the International Geophysical Year. Late in 1957, a month after Sputnik 2 was launched with the dog Laika aboard, the Navy attempted to quiet public concerns about Soviet superiority by sending its own satellite into orbit. However, the Vanguard rocket rose only a few feet before exploding.

Attention then turned to the Redstone rocket, which the Army was developing at Huntsville, Alabama, under the direction of von Braun. Initially, the Redstone was to be a long-range ICBM, and the Army was under orders from the Pentagon not to interfere with Project Vanguard by attempting to launch a satellite. However, following the launch of Sputnik 1, von Braun was given the go-ahead to develop a rocket capable of reaching outer space.

In January 1958, a modified Redstone rocket, known as the Jupiter-C, lifted off with Explorer 1, the first U.S. satellite to successfully reach orbit. Almost immediately, Explorer 1 made a startling discovery when it sent back evidence of two regions of electrically charged particles high above the Earth, which became known as the Van Allen Belts. Although still trailing the Soviet Union, the Army and von Braun had taken the clear lead in the U.S. space program.

NASA. By 1958 two things had become clear: the Soviet Union was planning to put a man into orbit, and most Americans favored the United States joining the space race. Although the Navy's Vanguard succeeded in carrying a satellite into orbit in March 1958, the rocket was clearly too small and too unreliable for a manned space program. Only 3 of the 11 Vanguard rockets were

ever launched successfully. The Air Force proposed a "Man in Space Soonest" program using supersonic aircraft that could reach outer space, but would not be able to go into orbit. Meanwhile, von Braun and the Army began developing a rocket known as the Saturn that would be more powerful than either the Vanguard or the Redstone.

However, President Eisenhower and his scientific advisor, James Killian, then president of the Massachusetts Institute of Technology, believed the space program should be a civilian effort focused on scientific exploration rather than military purposes. To achieve that goal, they turned to the National Advisory Committee for Aeronautics (NACA), a panel of scientists created by Congress in 1915 to promote development of civilian aircraft. In the mid-1950s, NACA was operated two aeronautical laboratories and the Jet Propulsion Laboratory in Pasadena, California. Then chaired by General Jimmy Doolittle, NACA also moved into space research and was in the process of building the first hydrogen-fueled rocket engine. In 1957, one-fifth of NACA's budget was devoted to space research.

In April 1958 NACA was renamed the National Aeronautics and Space Agency. Six months later, the organization was absorbed by the National Aeronautics and Space Administration (NASA), created when Congress passed the National Aeronautics and Space Act. NASA was charged with the peaceful exploration of space "for the benefit of all mankind," which included the efforts to put a man into space that had been started by the military. NASA also was given control of the Jet Propulsion Laboratory. NASA's budget in 1959, its first full year of operation, was \$331 million.

Manned Space Program. During its first three years, the U.S. space agency achieved little success. Of 28 satellites sent aloft, only eight achieved orbit, including the first communications satellite, Project Score, launched in December 1958. The manned space program, Project Mercury, was equally unsuccessful. The first unmanned test of a Mercury-Redstone rocket lasted just 58 seconds before the rocket failed. The second Mercury-Redstone rocket never left the launching pad. Meanwhile, in 1959, the Soviet Union launched Luna 2, the first probe to reach the moon, and Luna 3, which took the first pictures of the far side of the moon. In 1960, the Soviet Union launched several dogs into space aboard Sputnik 5 and returned them safely to the Earth.

Although Eisenhower had opposed manned space flight as too expensive, the pressure mounted for NASA to match the Soviet Union. In January 1961, Ham, a chimpanzee who had been taught to perform simple tasks, was launched into space on a sub-orbital flight. NASA then scheduled the first manned flight for the

middle of March. However, von Braun cautiously decided the Mercury-Redstone rocket needed further testing and postponed the flight until May. On April 12, Soviet cosmonaut Yuri Gagarin became the first man in space, less than a month before astronaut Alan B. Shepard, Jr., rocketed into space on May 5.

Three weeks later, on May 25, President John F. Kennedy addressed Congress and declared, "I believe that this nation should commit itself to achieving the goal, before the decade is out, of landing a man on the moon and returning him safely to Earth." NASA's budget was nearly doubled from \$964 million in 1961 to \$1.8 billion in 1962. The Department of Defense budget for space activities also increased by more than 50 percent, from \$814 million to \$1.3 billion.

Nine years later, on July 20, 1969, astronauts Neil A. Armstrong and Edwin E. "Buzz" Aldrin, Jr., eased a spidery-looking craft known as the Lunar Module 3 onto the surface of the moon, while astronaut Michael Collins continued to orbit above them in Apollo 11. Armstrong and Aldrin spent nearly 24 hours on the moon, including more than two hours outside their spacecraft. The three astronauts returned to Earth on July 24. A total of 14 men have set foot on the moon.

Between Shepard's 15-minute suborbital flight in 1961 and the historic, eight-day Apollo 11 mission to the moon in 1969 there were many spectacular moments. For example, during the flight of Apollo 8 in 1968, astronaut Frank Borman read from the Book of Genesis while orbiting the moon on Christmas Eve. The space program also experienced tragedy in 1976 when astronauts Virgil I. Grissom, Edward H. White II, and Roger Chaffee were killed in a fire during a pre-flight test of the Apollo capsule. NASA's budget averaged \$5 billion a year from 1964 through 1968.

As Apollo 11 was on its way to the moon in 1969, then-Vice President Spiro T. Agnew announced that NASA's next goal would be to land men on Mars, and the Space Task Group was created to formulate a plan. However, less than a year later, in the midst of the Vietnam War, President Richard Nixon issued a statement that shocked NASA officials. After a decade of spectacular achievements in space, Nixon declared, "Space must take its place with other national priorities."

By the time the Apollo program ended in 1972, NASA's budget had dropped to \$3.3 billion. There were only six more missions to the moon, beginning with Apollo 12 in November 1969 and ending with Apollo 17 in December 1972. The Apollo 13 mission was aborted when an oxygen tank aboard the service module exploded, disabling the spacecraft en route to the moon. The astronauts averted disaster by using the moon's gravity to slingshot the spacecraft back to Earth. The last men

to walk on the moon were astronauts Eugene A. Cernan and Harrison H. Schmitt. Although often talked about, there still were no manned missions to Mars planned in the mid-1990s.

Skylab. When Apollo ended, NASA turned its attention to Skylab. Conceived in 1969, the 85-ton Skylab, the first U.S. space station, actually consisted of the third stage of a Saturn V rocket modified to provide workspace and living quarters for three astronauts who would stay in orbit for extended periods of time. Skylab, considered the first serious opportunity to conduct industrial research in space, was launched in May 1973.

However, a heat shield and one of two solar panels that would produce electricity for Skylab were lost during launch, and a second solar panel only partially opened once Skylab was in orbit. The first astronauts to use the space station, Charles Conrad, Joseph P. Kerwin, and Paul J. Weitz, who followed Skylab into space a few days later, had to erect a large aluminum "parasol" to protect the area of Skylab where the heat shield had been torn away from the heat of the sun. They also repaired the remaining solar panel.

Eventually, Skylab demonstrated that humans could live and work in space for extended periods of time without harmful effects. Three teams of astronauts ultimately spent a total of 171 days aboard Skylab, with the last crew staying 84 days. The astronauts also conducted significant astrological research, including observations of the stars and planets without the visually distorting effect of the Earth's atmosphere. The industrial research was less successful. For example, in the gravity-free environment of Skylab, the astronauts were able to create perfectly round ball bearings. However, they were unable to remove the bearings from the crucible without producing a tail.

In 1978, NASA discovered Skylab, abandoned since 1974, was in a deteriorating orbit and eventually would fall back to Earth. Several unsuccessful attempts were made to trigger Skylab's thrusters from Earth and boost the space station into a more stable orbit. NASA also considered a manned rescue mission using the shuttle spacecraft then under development. However, the shuttle was not completed in time, and on July 11, Skylab plunged into the Earth's atmosphere and broke up over the South Pacific and Indian Ocean.

Unmanned Space Research. While the manned space program captured most of the public's attention, NASA also launched numerous unmanned planetary probes. The first of these probes to successfully complete its mission was Mariner II, launched in 1962, which passed within 22,000 miles of Venus. It revealed that the planet's surface was about 800 degrees Fahrenheit—too hot for any earthly plants or animals to survive.

Mariner IV, launched in 1964, discovered that Mars had a thin atmosphere, and sent back pictures as it passed within 6,120 miles of the planet. Mariner V, launched in 1967, was another mission to Venus, while Mariners VI and VII, launched in 1969, and Mariner IX, launched in 1971, provided more information about Mars.

In 1972, two more unmanned probes, Viking I and II, landed softly on the surface of Mars, where they sent back photographs and analyzed the planet's soil and atmosphere. In 1972, NASA also launched Pioneer X, a nuclear-powered probe that reached Jupiter 21 months later. After flying past Jupiter, Pioneer X continued toward Uranus. Pioneer XI, launched in 1973, also flew by Jupiter, but used the planet's gravity in a slingshot effect to send it on toward Saturn. Mariner X, also launched in 1973, flew by Venus and then used the planet's gravity to send it on to Mercury.

Perhaps the most ambitious probes were Voyagers I and II, both launched in 1977. They reached Jupiter in 1979 and transmitted spectacular pictures revealing, among other things, a ring similar to the one around Saturn and giant active volcanoes on Io, one of Jupiter's moons. They also took time-lapse motion pictures of the swirling gases surrounding the planet. As they left Jupiter, both probes headed for Saturn, where they revealed more information about the planet's rings and took pictures of previously unknown moons. Voyager I then headed out into the universe, while Voyager II headed for Uranus, which it reached in 1986; and Neptune, which it reached in 1989. Voyager II came within 3,000 miles of Neptune, 2.8 billion miles from Earth, and revealed for the first time six new moons and four rings circling the planet.

Space Shuttle. In 1972, Congress approved NASA's plan to build a reusable spacecraft that came to be known as the shuttle. The shuttle was a four-piece launch vehicle that consisted of a delta-winged orbiter, a strap-on fuel tank, and two solid-fuel boosters. The 122-foot long orbiter would be launched into space as a rocket, but would return to the Earth as an airplane.

It took almost as long to develop the shuttle as it did to put a man on the moon, but on April 12, 1981, the twentieth anniversary of Soviet cosmonaut Yuri Gagarin's first flight into space, the shuttle Columbia lifted off from Cape Kennedy with astronauts John Young and Robert Crippen aboard. After one orbit, the shuttle landed at Edwards Air Force Base in the Mojave Desert.

In July 1982, after two more test flights and a classified mission for the military, the shuttle Columbia was declared operational. In November 1982, Columbia carried two privately owned communications satellites aloft in its cargo bay and placed them into orbit. A year later,

Columbia lifted off with Spacelab, a research laboratory built by the European Space Agency, tucked neatly into its cargo bay. Spacelab could be removed between flights and prepared for the next research mission.

By 1985, NASA had added three more shuttles to the Space Transportation System—Challenger (1983), Discovery (1984), and Atlantis (1985). The cost of the program since its inception in the early 1970s was more than \$13 billion. NASA's budget had climbed steadily from a post-Apollo low of \$3 billion in 1974 to \$7.5 billion in 1985. NASA also completed nine shuttle missions in 1985 and announced the sale of the first products made in space—perfectly round, microscopic bits of plastic. James M. Beggs, then NASA administrator, announced, "This material is the first of what we expect will be a long line of products to carry the made-in-space label."

However, NASA, which once predicted nearly 60 shuttle flights per year by 1990, was forced to cut back to less than a dozen flights because of higher costs and greater preparation time. In addition, NASA, which had hoped to support the shuttle program by carrying commercial satellites into orbit, began to face competition from the European Space Agency and other space programs. The United States also began to emphasize its military space program, and by 1986 the \$14.1 billion budgeted for military space activities was almost twice the \$7.2 billion allocated to NASA.

Challenger. Less than two minutes after liftoff from the Kennedy Space Center on January 28, 1986, the space shuttle Challenger exploded, killing all seven crew members. NASA had scheduled 13 more shuttle flights for 1986, but it immediately shut down the program until the cause of the explosion was determined. An official investigation later found that a rubber seal on one of the shuttle's two booster rockets had failed because of unusually cool temperatures at the launch site. But the investigation also placed blame for the tragedy on mismanagement at NASA and Morton Thiokol, Inc., which built the booster.

According to the Rogers Commission report, NASA and Morton Thiokol had been aware of the effect cool temperatures could have on the rubber seals for some time, but had done nothing to correct the problem. The investigation also found that more than a dozen engineers at Morton Thiokol attempted to warn NASA about the dangers immediately preceding the launch, but had been blocked by poor internal communications at NASA. The report criticized the political and economic pressure on NASA to schedule frequent shuttle flights, and more than a dozen senior executives at NASA and Morton Thiokol ultimately resigned because of the Challenger disaster.

To reduce the number of shuttle flights, President Ronald Reagan directed NASA to stop carrying commer-

cial payloads and to concentrate on scientific missions. The Air Force was given responsibility for unmanned military launches, while commercial payloads were to be carried aloft by private corporations.

The shuttle program remained grounded until late 1988, when both Discovery and Atlantis flew successful missions. There were only four shuttle missions in 1989, but two were especially significant for space research. In May, astronauts aboard the Atlantis achieved the first launch of a planetary probe, the Venus-bound Magellan, from the shuttle's cargo bay. In October, the Atlantis launched the Galileo on a six-year mission to Jupiter. In 1990, radar signals from Magellan began penetrating the thick clouds surrounding Venus and transmitting clear images of the surface back to Earth.

Fuel leaks discovered aboard Columbia and Atlantis grounded the space shuttles for much of 1990. As a result, the National Space Council reversed the policy instituted in 1986 that NASA concentrate on manned space flight. The Council recommended that NASA develop new unmanned launch vehicles and reduce its dependence on the space shuttles.

Hubble Telescope. In January 1990, astronauts aboard the shuttle Columbia successfully retrieved a satellite, known as the Long Duration Exposure Facility, which had been launched in 1984 to test the long-term effect of space on various materials. In April, the shuttle Discovery lifted-off with the long-delayed Hubble Space Telescope. The \$1.5 billion telescope, named for American astronomer Edwin P. Hubble, was to provide the clearest views ever of stars, galaxies, and other space phenomenon. However, the images sent back to Earth were blurred, and scientists discovered that the main 95-inch mirror had been ground to the wrong optical specifications.

NASA was able to restore some clarity, producing images beyond the capability of Earth-based telescopes, by using a computer technique known deconvolution, but the Hubble Space Telescope remained an embarrassing disappointment. An official investigation criticized both the manufacturer and management at NASA. In 1993, astronauts aboard the shuttle Endeavor were able to correct many of the problems with the Hubble telescope by installing new optics.

Mars Observer. After the Hubble telescope embarrassment, NASA appeared back on track in 1992, which was celebrated worldwide as "International Space Year." There were several successful shuttle flights involving military and scientific missions, including experiments aboard the International Microgravity Laboratory carried aloft in Discovery's cargo bay in January. On the Endeavor's maiden voyage in May, astronauts retrieved a communications satellite that had been stranded in a useless orbit since 1990 and boosted it into the proper orbit.

NASA also used an unmanned Titan 3 rocket to launch the Mars Observer, a probe designed to spend a full Martian year, or 687 earth days, orbiting the planet and mapping its surface. However, after making the 450-million mile trip in 11 months, the Mars Observer stopped transmitting, and NASA speculated it might have exploded when the braking rockets fired.

In 1993, the White House also instructed NASA to redesign the proposed space station to reduce the cost over the next three years from an estimated \$17 billion to \$9 billion or less. More than \$8 billion already had been spent on the program since 1984, when the project was endorsed by then-President Ronald Reagan.

In 1994, President Bill Clinton reduced NASA's budget by about \$250 million for 1995, from \$15.55 billion to \$14.3 billion—the first reduction in the agency's budget since 1972. Most of the reduction came in space shuttle operations, which were pegged at \$3.3 billion. Under the proposal, there was a slight increase in science programs, which would account for about 24 percent of the total NASA budget.

In 1996, NASA stunned the world by announcing that they had discovered evidence of life on Mars. Earlier, in 1984, scientists discovered the remnants of an asteroid that struck the Earth approximately 13,000 years ago. Analysis of gas trapped in the rock indicated a Martian origin; and unusual mineral compounds surrounding carbonate globules indicate biological activity. Various dating methods placed the rock's age at 4.5 billion years, and the carbonate globules at 3.6 billion years. Critics remained skeptical, saying that these minerals could also be formed by inorganic processes. They wanted to see evidence of cell division and life cycles. NASA is continuing its investigation.

Shuttle missions have continued, but with more focus on scientific and defense missions. Throughout the 1990s, NASA has faced increasing competition from foreign competitors for commercial payloads.

In 1996, NASA awarded a contract to Lockheed Martin to develop a new reusable launch vehicle, the X-33. NASA expected that this vehicle would eventually replace the space shuttle as their primary manned spacecraft.

NASA has been developing new ways to remote planetary surfaces. By combining a Full Immersion Telepresence Testbed (FITT) and a Dexterous Anthropomorphic Robotic Testbed (DART) technologies, NASA hopes to accomplish more ambitious surveys of Mars. A DART robot could travel the surface of Mars carrying its own laboratory, while a person sits in a safe, remote location controlling the robot with the FITT gear.

NASA's successes for 1998 included the in-orbit assembly of two units for the International Space Station (ISS), two launches to Mars, and a Space Shuttle science

research mission that put Senator John Glenn back in orbit. At the same time, NASA was reorganizing and reducing the number of its full-time employees, dropping 440 FTEs (full-time equivalents) in fiscal year 1998 and an estimated 350 more for fiscal year 1999. At the end of 1998, the NASA workforce totaled 18,924 FTEs.

In 1999, NASA continued its efforts to develop and refine a next-generation Reusable Launch Vehicle. It also focused on support for logistics launches and the launch of the Russian Service Module. MEIT activities for Z1 truss, the photovoltaic arrays on P6, MEIT for the Lab, and the Space Station Remote Manipulator System (SSRMS) were also priorities. Seven additional U.S. assembly and logistics flights were planned for FY 2000.

A growing use of NASA's space force has been in the area of medical research. Scientists have been growing antibody crystals aboard the Space Shuttle, which effectively treat many viral illnesses of humans such as the common cold and flu. Because of the weightless environment, known as microgravity, protein crystals grow larger and are of better quality than those grown on earth. In late 1999, NASA announced that it was working on another protein crystal to combat human diabetes, not associated with viral infection.

Another important use of space technology has been in the tracking of weather. The U.S.-France collaboration known as the TOPEX/Poseidon Satellite was used to track the 1997 to 1998 El Nino event, from a distance of 800 miles above earth.

Disappointing news came in September 1999, when NASA's Mars Climate Orbiter, launched in December 1998, smashed into Mars after a final rocket firing intended to put the spacecraft in orbit around Mars. The Orbiter was supposed to relay signals from the Mars Polar Lander, scheduled to land on Mars in December 1999. In early November, NASA issued a press release, identifying human error as the cause of the loss: failure to convert English measures into metric values.

CURRENT CONDITIONS

During the early 2000s, America's space program experienced an unfortunate setback. In the wake of other national challenges—including the September 11 terrorist attacks and war with Iraq—the Space Shuttle Columbia was lost on February 1, 2003, bursting into flames as it re-entered the Earth's atmosphere. On board were seven astronauts: Commander Rick Husband; Pilot Willie McCool; Mission Specialists David Brown, Kalpana Chawla, and Laurel Clark; Payload Commander Michael Anderson; and Payload Specialist Ilan Ramon of the Israel Space Agency.

Most of the debris from the incident was strewn across a wide area of Texas, spanning some 2,400 square

miles. However, recovery efforts reached as far away as California. To assist in the recovery of shuttle material, NASA relied on thousands of individuals including citizen volunteers, state and local law enforcement, and officials from the Federal Emergency Management Agency (FEMA), the Environmental Protection Agency (EPA), and the U.S. and Texas Forest Services. By mid-April, some 70,000 items with a combined weight of 78,000 pounds had been recovered and delivered to the Kennedy Space Center. According to NASA, this represented 37 percent of the Shuttle Columbia by weight.

As NASA conducted an official investigation into the crash, a number of different theories emerged as to what caused it. These included faulty hardware, software glitches, human mistakes, and even acts of sabotage. Questions emerged about the future of the agency's remaining three space shuttles. Some observers speculated as to whether they would be replaced by a new generation of space vehicles. In addition, speculation emerged about next steps for the International Space Station (ISS), the construction of which remained incomplete.

On June 4, 2003, NASA released a joint statement made by President Bush and Russian President Vladimir Putin. The statement revealed that, through international cooperation, the two nations would continue to support the ISS project. It also affirmed that, just as NASA had done 17 years before in the wake of the Space Shuttle Challenger tragedy, America would continue to carry out its mission. The statement read: "The loss of the Space Shuttle Columbia has underscored the historic role of the United States and Russia as partners in space exploration, who have persevered despite tragedy and adversity. During this challenging time, our partnership has deepened and the International Space Station (ISS) program remains strong. The extraordinary efforts of our countries continue."

"The United States is committed to safely returning the Space Shuttle to flight, and the Russian Federation is committed to meeting the ISS crew transport and logistics resupply requirements necessary to maintain our joint American astronaut and Russian cosmonaut teams on board the ISS until the Space Shuttle returns to flight."

"We confirm our mutual aspiration to ensure the continued assembly and viability of the International Space Station as a world-class research facility, relying on our unprecedented experience of bilateral and multilateral interaction in space. We reaffirm our commitment to the mission of human space flight and are prepared to take energetic steps to enhance our cooperation in the application of space technology and techniques."

AMERICA AND THE WORLD

Representing a massive collaboration between the United States, Russia, and 14 other nations, the Interna-

tional Space Station (ISS) has been going through assembly stages since 1998 and is scheduled for completion by 2004. The ISS is a permanent space research laboratory, the size of a football field, which will orbit the earth at 17,500 miles per hour with a minimum life expectancy of 10 years. Boeing North America is the sole contractor for the project, managed by NASA's Johnson Space Center. When completed, the \$40-billion spacecraft will house up to seven astronauts at a time, for as long as six months. It has been dubbed "the window to the universe." It represents the world's largest peace time engineering effort.

ships, and other military goods are classified in the manufacturing division. Service academies are classified in **SIC 8221: College, Universities, and Professional Schools**, but military training schools are classified here. Military hospitals are classified in **SIC 8060: Hospitals**. Establishments of the Coast Guard primarily engaged in administration, operation, or regulation of transportation are classified in **SIC 9621: Regulation and Administration of Transportation Programs**.

NAICS CODE(S)

928110 (National Security)

INDUSTRY SNAPSHOT

National security depends not only on the latest defense technology, but also more importantly, upon the human workforce that creates and develops the technology and carries it into action to defend our country. The United States has one of the only major armed forces in world history that has never been used against its own citizens or to permanently annex other nations.

ORGANIZATION AND STRUCTURE

The U.S. Department of Defense is charged with providing the military force needed to deter war and protect the security and interests of the United States and its citizens. Besides its defensive role, the military is the country's largest employer. It provides important training that its employees often utilize in the private sector. The Department of Defense is also a primary source of research and development funding for private sector technology efforts.

The major components of its force are the Army, Air Force, Navy, and Marine Corps. The President of the United States is the Commander in Chief of the armed forces. The Secretary of Defense serves under the President and controls the Department of Defense. Under the Secretary and his Deputy are the Joint Chiefs of Staff, who provide military advice to the President and Secretary. Subordinate to the Chairman of the Joint Chiefs of Staff are the Chiefs of Staff for the Army, Air Force, and Navy, as well as the Commandant of the Marine Corps. Also under the immediate direction of the Secretary of Defense and Deputy are the Department of the Army, U.S. Department of the Air Force, and Department of the Navy. Each department is headed by a Secretary. The Marine Corps is under the jurisdiction of the Secretary of the Navy.

When a person enters one of the armed forces, he or she forfeits many rights granted by the U.S. Constitution. Military personnel are governed under a legal system that is completely different from that in the private sector. Personnel are subject to the Uniform Code of Military Justice, though the Department of Justice and other fed-

SIC 9711

NATIONAL SECURITY

This classification covers establishments of the armed forces, including the National Guard, primarily engaged in national security and related activities. Establishments primarily engaged in manufacturing ordnance,

eral and state agencies may become involved with some legal matters.

Divisions of the Armed Forces. The Army is recognized as the major land fighting division of the U.S. armed forces and is the largest segment of the military. Besides combat-related functions, it conducts intelligence gathering and counterintelligence, formulation of strategy, and numerous other responsibilities. In peacetime, the Army's sole duty is to train its reserves and plan for mobilization in the event of a war. The Army has 12 active and eight reserve divisions. The Army also administers environmental management and construction programs and provides disaster relief assistance. The Army employed 481,266 of all active duty military personnel in 2002.

The Navy is the dominant sea-based fighting division, though it also represents a major share of U.S. air power. The second largest armed forces division, it had about 381,901 members in 2002. The Air Force, which specializes in air and space defense functions, had about 362,330 members. The Marine Corps, which had 172,741 members in 2002, fights on land, sea, and in the air. This elite combat division is usually the "first to fight" on land in a military conflict.

The two types of employees in the military are enlisted personnel and officers. Each service has nine enlisted grades and ten officer ranks. Officers account for approximately 15 percent of the armed forces. Only a fraction of the enlisted personnel are designated combat troops.

In addition to a large fighting force, the Department of Defense oversees the largest arsenal of weaponry and equipment in the world. Tens of thousands of tanks, jets, bombers, missiles, guns, armored personnel carriers, and other equipment complement its troops. Furthermore, its nuclear arsenal is the largest in the world.

Reserve Forces. In addition to active duty personnel and Department of Defense employees, the U.S. military is backed by 1.4 million reserve and guard forces in the National Guard and Coast Guard. During times of peace, the Coast Guard operates under the Department of Homeland Security. It promotes marine safety and enforces federal maritime laws. In the event of war, the President can place the Coast Guard under the jurisdiction of the Navy.

The National Guard consists of the Army Guard and the Air Force Guard. Although the Guard utilizes many part-time personnel with military training, it is a major component of the U.S. defense force. The Army Guard, for example, represented about 47 percent of the Army's fighting capability in 2002. The Guard is commanded by state or territory governors during peacetime and is commonly used in state emergencies or civil disturbances. During a war, the President or Congress can call the Guard into active duty.

Military Academies. There are five major U.S. military academies. The U.S. Military Academy (West Point) enrolls about 1,200 candidates each year in its elite institution. Candidates must be unmarried U.S. citizens between the ages of 17 and 22 and must present a nomination from a U.S. Representative or Senator. After graduation, officers must serve in the Army for six years. Similarly, the U.S. Naval Academy in Annapolis and the U.S. Air Force Academy in Denver each have about 4,500 students. Entrance requirements are much like those at West Point, though slightly less selective.

Like the Naval and Air Force academies, the U.S. Coast Guard Academy and the U.S. Merchant Marine Academy in Kings Point, New York, require at least four years of active duty service after graduation. Candidates are admitted to the Coast Guard Academy via a highly competitive national competition. Like those at West Point, Merchant Marine applicants must be nominated by a U.S. Senator or Representative.

BACKGROUND AND DEVELOPMENT

Organized defense forces in North America can be traced to the early 1600s. The Continental Congress established the first U.S. army in 1775. The U.S. National Guard originated in 1636, when isolated regiments of North, South, and East Massachusetts combined forces to defend their new-found territory. The National Guard is commonly recognized as the oldest U.S. fighting force and has served the nation in every major conflict since colonial times.

The first national military defense force founded by the United States was the New England Armies—later called the Continental Army. The Continental Congress established this army on June 14, 1775 to fight Britain. The U.S. Navy and Marine Corps were concurrently started in late 1775 to complement the Continental Army's efforts. General George Washington commanded the group of colonial volunteers, which essentially consisted of a band of slightly trained rebels. The Navy started with two vessels.

During the Revolutionary War, which lasted from 1775 to 1783, 4,435 U.S. soldiers died, and more than 6,000 were seriously wounded. A band of only 700 soldiers was left after the war to form a standing army. This force was increased in the early 1790s to meet threats from Native Americans and to defend against French aggression. Congress authorized the construction of six navy frigates in 1794, and launched its first ship, the United States, on May 10, 1797. The Revenue Marine was also established in the 1790s with ten boats; it was renamed the Coast Guard in 1915. In 1802, Congress established the U.S. Military Academy at West Point.

The first major U.S. military conflict after the Revolution was the War of 1812, when the United States

resisted British interference with sea trade. The U.S. Constitution sank a British frigate, and the United States gained more independence as a result of that conflict. Besides the Mexican American War (1846 to 1848), in which 1,700 U.S. service people died, the next war of consequence was the Civil War (1861 to 1865). By the time General Lee surrendered to General Grant at Appomattox, the Civil War had taken 365,000 lives, or about 17 percent of the total number of soldiers who fought in that war.

Although World War I (1917 to 1918) involved nearly five million U.S. service people and resulted in 116,516 American deaths, World War II (1941 to 1946) soon overshadowed that war's statistics. It was during World War II that the Marines, Navy, and Air Force grew in importance in relation to the Army. As the Army tripled in size over World War I levels, the Navy and Marine Corps swelled about 700 percent and 850 percent, respectively. The Air Force, which was part of the Army, grew so much that it became its own division in 1947. World War II engaged 16 million U.S. service people, 405,399 of whom were killed.

The Cold War. World War II put an end to global military conflicts in the twentieth century, and the United States reduced its active military forces to only 1.5 million people. But the Cold War between the Soviet Union and the United States, with its war-ravaged allies, soon necessitated American military leadership. By 1950, U.S. services were again engaged in battle. This time they were countering Communist expansion in Korea. In the Korean War, 5.7 million Americans served in the armed forces, and 54,246 were killed. To discourage future Communist aggression, the United States maintained a force of about three million troops throughout the 1950s.

After World War II, the United States began to reduce its emphasis on military manpower and started to stress high-tech armaments. As the U.S. military budget escalated during the next three decades, the number of Americans employed in the armed forces dwindled. Even the war in Vietnam during the late 1960s through 1975 had only a modest effect on troop numbers in comparison to previous conflicts. More importantly, American forces utilized new aircraft, including jet-powered fighters and bombers, which had been developed and tested since the Korean War. As a result, U.S. casualties as a percentage of soldiers engaged in battle declined dramatically. Nevertheless, 58,135 of the 8.7 million soldiers sent to Vietnam were killed.

After the Vietnam War, no major military conflicts confronted U.S. forces through the 1980s. The number of U.S. troops remained steady during the late 1970s and 1980s, at about two million. By this time, U.S. forces had been deployed across the globe. Most of them were

strategically positioned to thwart Soviet aggression. Indeed, more than 25 percent of U.S. military personnel lived outside U.S. borders by the 1980s.

Despite stable troop strength during the 1980s, the U.S. military budget continued to balloon. Spending on high-tech armaments and nuclear weaponry pushed annual defense expenditures to a staggering \$300 billion annually by the late 1980s. In an effort to foil the Soviet nuclear threat, the United States proposed massive expenditures for its Strategic Defense Initiative (SDI). In the early 1990s, U.N. allies hammered Iraqi ground forces with air strikes. Four days after the commencement of a ground war on February 24, 1991, Iraqi troops fled Kuwait. High-tech weaponry and advanced military training contributed to the lowest casualty rate in U.S. war history. Of 532,000 U.S. forces deployed in the Gulf, only 374 were killed.

The Department of Defense planned to retain military dominance through the development of high-tech weapons. While personnel and nuclear warheads had been reduced, spending on advanced armaments continued at relatively high levels in 1996. The Department of Defense continued the development and testing of new jet fighters, for example, and was also engaged in the creation of new satellite and missile systems.

U.S. service men and women now are well educated and trained. Despite the Department of Defense's increased emphasis on technology, its people remained the centerpiece of the U.S. military machine, and they were becoming even more qualified, as 1996 proved. In contrast to the soldiers in Vietnam, who often suffered from low pay, weak morale, and poor leadership, military personnel in the 1990s more closely reflected the private sector work force. In addition, the armed forces were comprised solely of volunteers, resulting in a highly motivated force.

The move to higher standards began in the early 1980s, when about 65 percent of all incoming military personnel were high school dropouts. Congress boosted military pay and benefits and upped the entry requirements. By the early 1990s, 96 percent of new enlistees had a high school diploma, compared to just 82 percent of entrants into the civilian work force. The number of recruits scoring in the highest categories on the government's aptitude test doubled between 1980 and 1987.

In addition to payroll cutbacks, the Department of Defense was also conducting a significant reduction in its nuclear arsenal. For the first time, the Army and Marines will not control nuclear weapons. The Navy and Air Force will split the arsenal. U.S. nuclear warheads were already being dismantled at a rapid pace in the early 1990s. Although 11,500 warheads remained in stock in 1992, 7,000 nuclear devices had been retired since 1990.

Furthermore, the total stockpile is scheduled to be reduced to 6,300 by the late 1990s. As of 1997, no new nuclear warheads had been produced in the United States since 1990.

Notwithstanding such a powerful presence in the world, in October 1999, the U.S. Commission on National Security/21st Century advised the House Armed Services Committee that in the twenty-first century, superiority in size will not insulate U.S. citizens from attack. The Committee warned that increased resentment toward the United States and its overseas involvement may hasten attacks on civilians, at home and abroad. Overseas deployments will become more difficult as alliances with other countries shifts. It also warned that the number of troops will not serve to deter cyber attacks and the use of biotechnology by adversaries.

CURRENT CONDITIONS

By the early 2000s, the issue of national security was garnering significant attention. A number of important developments led the government to ramp up efforts to protect U.S. interests at home and abroad. On September 11, 2001, the worst terrorist attacks in U.S. history took place when hijacked commercial airliners were used to destroy the World Trade Center towers in New York. Other attacks that day involved a hijacked jet that damaged the Pentagon, as well as the crash of another hijacked jet in Pennsylvania. Subsequently, mail tainted with deadly anthrax bacteria was circulated in the U.S. postal system, causing several deaths and forcing the U.S. Postal Service to implement a number of security measures.

Conditions such as these led Congress to create the U.S. Department of Homeland Security (DHS). A number of government agencies were transferred to the DHS, including the United States Coast Guard. Along with the Homeland Security Council, this new government agency created the Homeland Security Advisory System that used five warning levels to communicate perceived terrorism “threat conditions” to the American people. These levels were: Low (green), Guarded (blue), Elevated (yellow), High (orange), and Severe (red). As the potential for an attack increased, state and local law enforcement agencies, as well as National Guard units, were increasingly involved in security efforts coordinated by various federal agencies.

The DHS was only one way the United States addressed a new national security landscape. In addition to the DHS, the U.S. Military was forced to take a different approach in protecting the nation. This was evident in the government’s budget document for fiscal year 2004, which cited a passage from the National Security Strategy of the United States of America. Beneath a headline entitled “New Enemies—New Threats,” the passage

read: “Defending our nation against its enemies is the first and fundamental commitment of the federal government. Today, that task has changed dramatically. Enemies in the past needed great armies and great industrial capabilities to endanger America. Now, shadowy networks of individuals can bring great chaos and suffering to our shores for less than it costs to purchase a single tank.”

In March of 2003, the United States embarked upon Operation Iraqi Freedom, an invasion of Iraq that sought to topple the regime of Iraqi dictator Saddam Hussein and eliminate “weapons of mass destruction” that Hussein was believed to be stockpiling. The operation involved a vast array of high-tech weaponry in the air and on the ground, included precision-guided bombs that helped to lessen unwanted casualties. It involved the deployment of nearly 424,000 military personnel who worked in tandem with approximately 43,000 coalition forces over the course of 720 hours. During this time, roughly 1,800 aircraft flew 41,400 sorties. While 20 aircraft were destroyed, only seven of these were attributed to enemy fire. Allied forces were ultimately successful in securing the city of Baghdad and removing Hussein from power. However, they were unable to confirm whether or not Hussein had been killed in their assault.

In addition to no evidence of Hussein’s demise, the reported stockpiles of chemical and biological weapons that were used as a primary basis for the attacks had yet to materialize as of June 2003. This was a point of criticism from many observers; some argued that oil was the real basis for the U.S.-led attacks. U.S. officials claimed that, given their ease of mobility, the weapons identified by U.S. intelligence had likely been moved to other locations. Therefore, their strategy became one of capturing and interrogating Iraqi officials and citizens who could lead them to weapon sites, as opposed to searching blindly for such sites themselves. In addition to devoting 3,000 troops to the hunt, the Pentagon made \$200,000 bounties available for uncovered weapons. Immediate payments of \$2,500 also were offered for those with information. These costs were part of what amounted to a very costly operation. According to the May 26, 2003 issue of *Newsweek*, a brief military analysis of Operation Iraqi Freedom revealed that the war had cost an estimated \$917.7 million.

After peaking at nearly 12 million during World War II, total military employment in all areas of the armed forces stood at approximately 2.8 million in 2002. Of that amount, 1.4 million were working for the Department of Defense, and 1.4 million belonged to reserve and guard forces. The defense budget for fiscal year 2002 was \$344.4 billion. Moreover, the Department of Defense maintained fixed facilities covering 30 million acres in approximately 140 countries.

WORKFORCE

As the largest American employer, the U.S. military recently employed about 1.7 percent of the nation's workforce in active duty positions. It is an important source of training for individuals who eventually enter the nation's civilian workforce, and it helps millions of recruits and veterans pay to attend college. More than 2,000 occupational specialties are available for enlisted personnel, along with 1,600 for officers. In addition, more than 75 percent of these occupations have civilian counterparts offering opportunities for trained veterans.

Infantrymen, gun crews, and seamanship specialists are the heart of the armed forces. Combat officers plan and direct military actions and lead troops. Among other jobs, enlisted personnel engage in hand-to-hand combat, drive tanks and other combat equipment, demolish enemy equipment and infrastructure, and serve as aircraft crew members. Combat jobs accounted for about 12 percent of all enlisted personnel and 15 percent of officers in the early 2000s.

Electronic equipment repair personnel maintain avionics, missile, radio, navigation, data processing, telephone, and other equipment. Mechanical equipment repair people work with tanks, personnel carriers, planes, and other machines. Together, electrical and mechanical repair people made up about 25 percent of the armed forces in recent years. Communications and intelligence specialists accounted for 8 percent of military workers. These enlisted personnel often work as air traffic controllers, computer programmers, radar and sonar operators, interpreters and translators, intelligence gatherers, and cryptologists.

About 25 percent of all military jobs were classified as administrative and functional support. This group includes many traditional private sector occupations, such as lawyers, accountants, hospital administrators, chaplains, typists, and storekeepers. Health care specialists and medical officers are another large part of the military, representing approximately 7 percent of active duty forces. This group includes doctors, dentists, veterinarians, optometrists, and other medical professionals and assistants. Other occupational groups include craftsmen, supply handlers, scientists, and numerous technical specialists.

Getting Hired. To qualify as an enlistee, you must be between the ages of 17 and 35 (the Marine Corps only accepts enlistees aged 17 to 24). In addition, you must pass a physical exam and have no felony convictions. Most divisions of the armed forces accept applications only from U.S. citizens with high school diplomas or equivalencies. Enlisted personnel typically sign up for an eight-year stint. At least two years must be served on active duty, the remainder in the reserves.

Most commissioned officer positions require a college degree. There are several routes to obtaining a com-

mission. The best way to become an officer is to graduate from one of the military service academies. Those institutions provide recruits with free education and a monthly stipend, and graduates are practically guaranteed a commission. In return, students typically sign a contract to serve five years or more after graduation.

The most common route to a commission, however, is through the Reserve Officer Training Corps (ROTC) at one of 400 colleges in the United States. For example, the ROTC program at Texas A&M, College Station, has produced more military officers than West Point. ROTC programs also offer free tuition and monthly stipends for qualified students. Enlistees who qualify can leave the military, get a free college education, and return as officers. College graduates who do not participate in ROTC can go through Officer Candidate School (OCS) in any of the six military branches to obtain a commission. Finally, some health professionals may qualify for a direct appointment as an officer.

Minority Opportunities. The policy of the U.S. military is to offer equal opportunity to its members. In the early 2000s, about 34.4 percent of all armed forces personnel were minorities. Specifically, more than 20 percent were black, nearly 8 percent were Hispanic, and more than 6 percent belonged to other minority groups.

Women have also availed themselves of military opportunities. Although there were only 41,500 active duty women in the armed forces in 1970, their numbers had ballooned to almost 200,000 by the early 2000s. Women are eligible to enter about 90 percent of all military specialties. They serve as mechanics, heavy equipment operators, technicians, and intelligence personnel, for example. Although federal law has traditionally barred women from direct combat, the military was skirting that restriction in 1994 by allowing women to fly combat aircraft and serve at sea on Navy ships. Women have challenged the combat restriction, pointing out that combat experience is often a factor in promotions.

The armed forces recruit more than 365,000 officers and enlisted personnel per year to replace those leaving the service or retiring. Educational requirements will continue to rise as the military seeks enlisted personnel with some college training. For those who meet the necessary qualifications, opportunities are expected to remain strong through 2010.

AMERICA AND THE WORLD

The United States spends more money on defense and is better equipped than any other armed force in the world, although some nations, such as China and the former Soviet Union, have larger forces. The United States also has the most geographically diverse military machine.

The Department of Defense began implementing overseas force reductions in the early 1990s. It planned significant withdrawals of European NATO forces, for example, and shifted its focus to the development of a U.S. regional defense system. A principal Department of Defense objective in the 1990s was the development of significant force that could be quickly deployed anywhere in the world.

In June of 2003, the United States and South Korea announced that they had agreed to remove U.S. troops from the Demilitarized Zone (DMZ) that serves as a buffer between North Korea and South Korea. The DOD indicated that some troops would be shifted to an area farther south, while some might return to the United States or see deployment in other nations as part of a "global realignment" strategy. The withdrawal announcement was historic in that it was the first time since the Korean War ended in 1953 that American soldiers would not be stationed near the DMZ.

RESEARCH AND TECHNOLOGY

Several separate agencies within the Department of Defense serve to develop and promote new military technologies. Through the Defense Advanced Research Projects Agency's (DARPA) efforts and expenditures, the United States maintains a significant technological lead in weapons and defense systems. This advantage allowed them to vanquish most of their adversaries since World War II, and to literally dominate, with few casualties, every military conflict since the Vietnam War. When the arms race escalated during the 1980s, America's technological superiority increased as Soviet military investments lagged. By the early 2000s, the United States maintained a lethal arsenal of high-tech weaponry.

Some of the most impressive weapons were utilized in 2003's Operation Iraqi Freedom and in the Persian Gulf War during the 1990s. In fact, General Norman Schwarzkopf once dubbed the latter conflict "the technology war," and some observers hailed it as the transition from the traditional bloody ground war to a new era of combat strategy. For the first time, a warring nation was able to directly attack its adversary's political and military infrastructure from long range with pinpoint accuracy. This tactic essentially guaranteed U.N. air superiority in the Gulf and reduced the probability of a protracted ground war.

High-Tech Weapons. The M-1 Abrams Main Battle Tank is among the Army's most powerful land-based vehicles. Developed at a cost of \$20.4 billion, the tank was designed to absorb direct hits from certain armor-piercing shells and is powered by a turbine engine that allows the massive vehicle to cruise at 60 miles per hour. A damper allows the 120 mm cannon to "float" as the tank plows across the terrain so that the operator can fire

laser-aimed projectiles with accuracy. Tank operators can wear infrared headgear for night vision, an option also available to some ground forces and pilots.

Another important weapon of the Gulf War was the HARM Air-To-Ground Antiradar Missile. These missiles are designed to lock in on an enemy radar signal and follow the beam to the target. U.S. planes can then enter enemy territory undetected. The Tomahawk Sea-Launched Cruise Missile also proved effective. Originally designed to deliver nuclear warheads to the Soviet Union, the missiles can be retrofitted to carry large conventional payloads to small targets. Designed just in time for the Persian Gulf War, the Patriot Missile utilized state-of-the-art homing and propulsion technology to chase and destroy enemy missiles in the air.

The Gulf War also gave U.S. forces an opportunity to test the AW-64 Apache Attack Helicopter. This jet-powered contraption is capable of cruising through battlefields at high speeds and simultaneously launching a barrage of cannon fire, rockets, and laser-guided missiles in multiple directions. The Apache's fatal Hellfire missile system allows a pilot to unleash an armor piercing missile that is aimed and guided by a soldier on the ground, thus allowing the Apache pilot to seek other targets. Similarly, the F-117A Stealth Fighter, allows pilots to enter enemy territory and deliver its bombs before being detected on radar.

In addition to its high-tech weaponry, some of the most advanced U.S. defense devices include high-flying planes and satellite systems that gather intelligence and help ground forces communicate. Advanced military imaging satellites, for example, are capable of reading a car's license plate from space. The armed forces' early warning satellite systems detect launched missiles and relay their flight patterns to observers on the ground. Importantly, the Airborne Warning & Control System (AWACS) is used to monitor and control air battles from a plane in the air.

INTERNATIONAL AFFAIRS

This industry consists of establishments of U.S. and foreign governments primarily engaged in international affairs and programs related to other nations and peoples.

NAICS CODE(S)

928120 (International Affairs)

INDUSTRY SNAPSHOT

The sovereign states of the world, with their mutual inter-dependence in the midst of economic and political forces, have put new emphasis on the need for friendly relations among nations. The creation of the United Nations at the end of World War II has facilitated consultations and negotiations between the community of states; nevertheless, bilateral contacts through U.S. consular and diplomatic missions remain a key force in official relations between governments. The Department of State works concurrently with U.S. consular and diplomatic missions to represent U.S. interests abroad.

ORGANIZATION AND STRUCTURE

Three main organizations comprise and assist United States foreign relations: the United Nations, the Diplomatic Mission, and Consular Officers and Consular Posts. The United Nations (UN) formally came into existence on October 24, 1945. It was created as a union of nations working to maintain international peace and security and cooperating in establishing political, economic, and social security. The adoption of the 1961 Vienna Convention on Diplomatic Relations established diplomatic relations, by mutual consent, for one person to act as the envoy of two or more states. An envoy, or diplomatic agent, represents the home state, acts as a government agent, and is an official channel of communication be-

tween the governments of the sending and receiving state. The Consular Officer is a representative of the sending state and is primarily concerned with the improvement of commercial and economic relations between the sending and receiving state.

The United Nations. Membership in the UN is open to all peace-loving states that accept the obligations of the United Nations Charter. The purposes of the United Nations, as set forth in the Charter, are to develop friendly relations among nations; to maintain international peace and security; to cooperate internationally to promote respect for human rights; and to solve international economic, social, and humanitarian problems.

The UN functions in accordance with the following principles: members are sovereign and equal; members are to act according to their charter obligations; members are to refrain in the use of force against any other state; members are to settle international disputes without endangering international peace; members shall not work against the UN in its efforts to act in accordance with the charter; the UN shall ensure that states, which are not members, act accordingly to ensure international peace; and the UN may not interfere within the domestic jurisdiction of any state.

The UN is composed of six principal organs—the General Assembly, the Security Council, the Economic and Social Council, the Trusteeship Council, the International Court of Justice, and the Secretariat.

The General Assembly consists of all the representatives of the member states. Each member has one vote, and decisions on important matters require a two-thirds majority vote. The General Assembly considers principles of cooperation in the maintenance of international peace and security; works with the UN budget; elects the non-permanent members of the Security Council and the members of the Economic and Social Council; jointly elects with the Security Council the judges of the International Court of Justice; and appoints the Secretary-General. In addition, the General Assembly makes recommendations for the peaceful settlement of situations that might impede friendly relations among nations. The Assembly also discusses and makes recommendations on questions relating to international peace and security and international political cooperation.

The Security Council consists of five permanent members and 10 members elected by the General Assembly for two terms. The five permanent members are China, France, Russia, the United Kingdom, and the United States. Each state has one vote. The functions and powers of the Security Council are to take military action against an aggressor; to maintain international peace and security; to formulate plans to regulate armaments; and to recommend action when there is a threat to peace. The

Security Council also investigates disputes that might threaten international peace; recommends terms of settlement to such disputes; proposes economic sanctions in order to prevent aggression; recommends the admission of new members; utilizes the trusteeship functions in strategic areas; recommends to the General Assembly the appointment of the Secretary-General; and elects the judges of the International Court.

The Economic and Social Council is responsible for carrying out the functions of the UN with regard to international economic, social, cultural, educational, and health matters. The functions and powers of the Economic and Social Council are making reports and recommendations on international economic, social, cultural, educational, and health matters; serving as the primary forum for the discussion of international economic and social issues; promoting human rights; and consulting with nongovernmental groups concerned with the matters of the council.

The Trusteeship Council consists of one member administering trust territories—the United States. This council provides for an international trusteeship system to protect the interests of the inhabitants of territories that are not yet self-governing. The primary function of the Trusteeship Council is to promote the advancement of the inhabitants of the Trust Territories and their development toward self-government.

The International Court of Justice consists of 15 judges elected by the General Assembly and the Security Council. No two judges can be nationals of the same state. In deciding disputes, the International Court of Justice applies international conventions—establishing rules recognized by the contesting states, the general principles of law recognized by nations, international custom as evidence of general practice accepted as law, and judicial decisions and teachings of qualified publicists—as means for determining the rules of law.

The Secretariat is composed of the secretary-general and an international staff appointed under regulations of the General Assembly. The Secretariat carries out the daily work of the UN both at its headquarters in New York and in its offices abroad. The Secretariat administers peace-keeping operations; monitors international economic and social trends; organizes conferences on international problems and concerns; prepares studies on human rights, disarmament, and development; and translates information about the UN and supplies that information to the world media.

Special Agencies. The United Nations system has created 15 specialized agencies to assist in providing international economic, social, and technical services. These organizations have separate budgets, statutes, and memberships, but they are all tied to the UN with a varying

degree of affiliation. The UN family of organizations includes the International Bank for Reconstruction and Development (IBRD); International Civil Aviation Organization (ICAO); International Development Association (IDA); Inter-Governmental Maritime Consultative Organization (IMCO); International Monetary Fund (IMF); International Telecommunications Union (ITU); World Meteorological Organization (WMO); World Intellectual Property Organization (WIPO); World Health Organization (WHO); Universal Postal Union (UPU); UN Educational, Scientific, and Cultural Organization (UNESCO); Food and Agriculture Organization of the United Nations (FAO); International Labor Organization (ILO); International Finance Corporation (IFC); and the International Fund for Agricultural Development (IFAD).

Embassies. A U.S. diplomatic mission is classified as an embassy if the chief of the mission holds the rank of ambassador. Members of the Foreign Service and the Department of State staff U.S. embassies. The ambassador, as head of the diplomatic mission, represents the diplomat's native country by acting as a representative of his or her government and as an official channel of communication between the government and the state to which he has been assigned. The diplomatic agent must report on conditions and developments in the appointed state; protect the interests of his or her home state and its nationals in that state; promote friendly relations between the represented state and the host state; and help develop economic, cultural, and scientific relations.

The heads of a U.S. diplomatic mission are the chief of the mission—ambassador, minister, or charge d'affaires—and the deputy of the mission. Many diplomats are successful business people who offer specialized expertise and understanding of their countries, cultures, and societies.

Consular Officers. In the 1990s, separate consular services were abolished in favor of combined foreign service for both diplomatic and consular officers. Although many traditional functions of the consular have been taken by diplomatic agents, the consular plays an important role in connection with trading and commercial interests of the sending state. According to the 1963 Vienna Convention on Consular Relations, consular functions are concerned with promoting the development of commercial, economic, cultural, and scientific relations; protecting the interests of the state he or she represents and its nationals; issuing passports and travel documents to persons wishing to travel to the consular's native state; assisting nationals, both individuals and corporations, in their interactions with the host state; acting as notary and civil registrar; arranging appropriate representation for nationals before the authorities of the host state in order to preserve the rights and interests of the nationals; and exercising rights of supervision and inspection in

respect to vessels and aircraft having the nationality of the state the consular represents.

Consular officers are appointed with the host government's permission and may be withdrawn at any time. They hold the rank of consul-general, consul, or vice-consul and are divided into two categories—career consular officers and honorary consular officers. Career consular officers are full time employees of their government and are appointed by their head of state. Conversely, honorary consular officers are non-career officials for whom consular functions are usually a part-time occupation.

BACKGROUND AND DEVELOPMENT

The organizations that comprise U.S. foreign relations derive their power and authority from the executive branch of the government. The Constitution of the United States grants the president the authority to negotiate treaties and appoint diplomatic and consular officials. Foreign policy is conducted primarily through the U.S. Department of State. The Secretary of State, as head of the department, is the primary advisor to the president on foreign affairs issues.

Consular and diplomatic missions had a small role in world affairs for the first 100 years of the existence of the United States. In 1893, the United States and several European countries began ambassador reciprocity. President Woodrow Wilson had attempted to reduce U.S. involvement abroad during the isolationist period after World War I, but that policy gradually disappeared during the terms of successive presidents. In 1924, the Rogers Act combined consular and diplomatic service into the Foreign Service.

With the start of World War II, international conditions demanded that the United States take a leading role in world affairs. Under the direction of President Franklin D. Roosevelt, the United States proceeded with a program of foreign aid designed to promote world trade and cooperation. The Foreign Service Act of 1946 reorganized the Foreign Service, raised pay, and launched a promotion system based on merit.

As international responsibilities grew and world affairs became more complex, the responsibilities of the foreign relations departments increased. The Department of Defense—along with the Departments of Agriculture, Commerce, and Treasury—took on new responsibilities in world affairs. Under the direction of the Secretary of State, the Agency for International Development and the International Development Cooperation Agencies were created to assist in controlling and directing foreign aid.

During the mid-1990s, Madeleine K. Albright succeeded Warren Christopher as Secretary of State, and the presidency of William (Bill) Clinton continued into its

second term. Secretary Albright reiterated the Clinton Administration's aim of making commercial affairs and the promotion of American business interests abroad one of the highest priorities of foreign relations policies and officers. During this time, significant changes occurred in several important areas that affected U.S. foreign policy and international relations. Key among them were changes to the U.S. Immigration and Naturalization Service's provisions regarding illegal immigrants; U.S.-proposed changes to the United Nations system; changes and expansions of international trade agreements that affected U.S. global trade policies; and a focused and structured effort to include policies and programs to advance opportunities for women throughout the world.

The Immigration and Naturalization Service (INS). In September 1996, President Clinton signed into law the Illegal Immigration Reform and Immigrant Responsibility Act. The 1996 Act was targeted at reducing the flood of illegal immigrants along the U.S.-Mexico border. The Act contained provisions to increase the number of border agents and to strengthen enforcement efforts; increase penalties for alien smuggling and document fraud; enhance inspection, capture, retention, status review, and deportation of aliens; decrease the numbers of illegal aliens; restrict alien benefits; and implement new parole and safe haven procedures. Many of the Act's provisions—particularly those pertaining to retention, deportation, and to persons seeking safe haven—became effective April 1, 1997.

The United States and the United Nations. The United States played a pivotal role in the formation of the UN after World War II and was the UN's single largest contributor; total U.S. contributions to the UN in 1995 was \$1.84 billion. The Clinton Administration took the lead during the mid-1990s to propose changes to the UN system to increase overall efficiency and effectiveness. U.S. proposed changes targeted more effective use of UN funds, greater accountability to UN members, and tighter focus on key UN objectives. In addition, the U.S. revised its decades-long history of participation in multilateral peace operations. These changes resulted in President Clinton's Presidential Decision Directive (PDD 25), which emphasizes that the President will never give up command of U.S. troops. Changes focused on peacekeeping activities as one means of serving U.S. interests abroad by promoting international security, democracy, and economic growth. Within this framework, several changes were to be made. These changes would affect decisions concerning which peacekeeping missions to support; the increased goal of reducing the U.S. cost burden from 31.7 percent down to 25 percent; re-examination of the circumstances under which U.S. troops would be under operational command of a foreign commander; provisions to improve the UN's ability to

manage peacekeeping missions; and improving communications between Congress, the Executive Office, and the American public concerning U.S. participation in such missions.

U.S. Trade Policy. Building on the goal of promoting American commercial and business interests abroad as a cornerstone of American foreign policy, the United States became an active participant in the World Trade Organization (WTO), which succeeded the General Agreement on Tariffs and Trade (GATT) as the legal basis of the multilateral trading system. Formed in January 1995, WTO made provisions to open national markets, administer and monitor trade relations among countries, and served as a forum for settlement of trade-related disputes covered under its jurisdiction. WTO incorporated the structure of GATT and also consolidated governmental trade policies with regard to trade in goods, services, and intellectual property rights. Associated multilateral agreements focused on environmental, health, and safety issues. By mid-1996, 120 countries were WTO members, and an additional 30 countries were in the process of joining.

Big Emerging Markets (BEMs). Having historically focused its foreign commercial policies on Europe and Japan during the mid-1990s, the United States started shifting focus to 12 countries dubbed the “Big Emerging Markets” (BEMs). These countries consisted of Argentina; Brazil; the Chinese Economic Area, which included China, Hong Kong, and Taiwan; India; Indonesia; Mexico; Poland; South Africa; South Korea; and Turkey. The U.S. Department of Commerce, International Trade Administration anticipated that the BEMs’ average gross domestic product (GDP) growth rate would increase by 6.5 percent from 1995 to 2000, in comparison to an average of 2.9 percent among the developed countries. In addition, BEMs’ imports of goods and services were expected to increase by 75 percent over the same timeframe, compared to a 38 percent expected rise among the developed countries.

The U.S. Commercial Service. Today U.S. diplomatic officers work in accord with private organizations to develop strong and aggressive trade policies. New laws and greater cooperation between government agencies and private interests help promote U.S. business by increasing exports and appealing unfair trade practices. Diplomatic officers work with commercial officers at the U.S. Commercial Service—part of the United States International Trade Administration—to ensure that U.S. business interests are a central part of their embassy and consulate operations. The Commercial Service maintains more than 70 U.S. offices and operates in nearly 70 countries. The result of a collaboration among the Commercial Service, the Small Business Administration, and

the Export-Import Bank, U.S. Export Assistance Centers are located throughout the United States and provide consulting services, market research, and trade information. A recent addition to the Commercial Service family of programs and initiatives is the creation of commercial centers—usually located outside U.S. embassies and within key business districts. They offer full business services, such as office space and equipment, when conducting business abroad. In addition, commercial officers serve the financial assistance needs of American businesses through a network of five multilateral development banks: the European Bank for Reconstruction and Development, Asian Development Bank, the World Bank, African Development Bank, and the Inter-American Development Bank. The National Trade Data Bank (NTDB) supports the efforts of U.S. diplomatic and commercial officers and American businesses and serves as the U.S. Government’s premier source of global trade information contained in more than 130 separate databases from more than 20 federal sources.

Ambassadors assist the U.S. business community by lending their time at trade events, interceding on behalf of U.S. bidders for major contracts, providing current foreign market information, and informing business leaders of new opportunities in foreign markets. During the 1990s, ambassadors focused their negotiating efforts on three areas in which the United States was a major international competitor: services, agriculture, and intellectual property rights. Two multilateral agreements: the Information Technology Agreement (ITA) and the Agreement on Basic Telecommunications were expected to reduce global trade barriers in these high-technology industries, significantly reduce international taxes, increase U.S. jobs, and save American consumers billions of dollars. By 1999, U.S. ambassadors expected to be entrenched in negotiations to further open the \$526-billion global agricultural market, considered to be a key component on the U.S. trade agenda. Negotiations to further open the \$1.2-trillion global financial services market were expected to begin in January 2000.

Intellectual Property Rights. Increasingly aware of the international tensions created and exacerbated by differing global standards, protection, and enforcement of intellectual property rights, the World Trade Organization’s (WTO) agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) was implemented to address these issues. Among its numerous provisions were the recognition of computer programs as literary works and the rights of authors of computer programs and audio recordings to authorize or prohibit commercial rental of their work to the public. In addition, the agreement protected industrial designs for ten years and patents for 20 years in nearly all fields of technology, whether for a product or a process. TRIPS was to apply to

existing as well as new intellectual property, and a council monitored countries' timely implementation of the new agreement and their compliance with it. Further negotiations to protect the interests of U.S. copyright industries, which exported over \$400 billion annually, were to be continued into the year 2000.

Women. Reflecting the rapidly increasing integration, contributions, and growing acceptance of women into all aspects of the global community, Secretary of State Albright included the advancement of women throughout the world as another integral part of America's foreign relations policies. During the mid-1990s, the President's Interagency Council on Women was formed to coordinate and implement the Platform for Action adopted at the UN's Fourth World Conference on Women held in Beijing in early fall 1995. Following up on the Beijing conference, the Clinton Administration outlined additional specific commitments in areas pertaining to working women, violence against women, discrimination, women entrepreneurs, health, women's political participation, and education. In 1997, the UN launched an Internet site called "Womenwatch" as an entry into its vast array of information pertaining to women throughout the globe. The three UN organizations that created Womenwatch—the Division for the Advancement of Women in the Department for Policy Coordination and Sustainable Development (DPCSD), the United Nations Development Fund for Women (UNIFEM), and the International Research and Training Institute for the Advancement of Women (INSTRAW)—also launched Internet sites accessible via the Womenwatch gateway.

The decision on whether or not to pay its long outstanding dues to the UN was a politically polarized controversy for the United States in the late 1990s. Congress had been fighting to continue withholding the payments in arrears—conditioning payment on contentious anti-abortion restrictions ("riders") attached to the bill authorizing payment. President Clinton, eager to have his Administration remembered for cleaning up debts, fought to have the dues paid. Consequences of continued non-payment included the loss of voting rights in the General Assembly.

Another polarizing issue in 1999 was the admission of China into the World Trade Organization. China ranked second of the world's largest economies, based on gross domestic product. The ostensibly-accidental bombing of the Chinese embassy in May 1999, coupled with the Report of the House Select Committee on U.S. National Security ("The Cox Report"), which cited recent and repeated incidence of Chinese espionage at U.S. nuclear laboratories, kept scholars and politicians uncertain of the propriety of continuing fortification of Chinese capability. China remained the only nation to have its nuclear warheads aimed at the United States.

Finally, the U.S. refused to join other nations in ratifying the Comprehensive Test Ban Treaty, a decision the consequences of which were too early to gauge.

CURRENT CONDITIONS

By the early 2000s, the United States remained at the center of the world stage. A number of unfortunate events—including the infamous terrorist attacks against the nation on September 11, 2001; the bombing of the U.S.S. Cole in Aden, Yemen; and U.S. mail tainted with deadly anthrax bacteria—signified the beginning of a frightening new era. Following these occurrences, it became evident that the gravest threats to national security came not from a massive enemy invasion, but from individuals or small groups of terrorists with malicious intentions.

Amidst heightened sensitivity about terrorism, mounting concern emerged over "weapons of mass destruction," which the United States claimed were being stockpiled by Iraqi dictator Saddam Hussein. A team of UN weapons inspectors led by Hans Blix searched a number of sites in Iraq, but failed to uncover any substantial evidence of chemical or biological weapons. However, U.S. intelligence provided by Secretary of State Colin Powell suggested that these weapons did exist. Eventually, the UN Security Council issued UN Resolution 1441, which instructed Iraq to disarm or face serious consequences.

When Iraq failed to comply with this resolution, the UN similarly failed to act or support U.S. military action. As Mortimer B. Zuckerman explained in the April 21, 2003 issue of *U.S. News & World Report*, while China, France, and Russia—all permanent members of the UN Security Council—gave their endorsement of Resolution 1441, they "refused to give it effect when Iraq breached its material obligations." Labeling the UN's past behavior concerning Iraq as "execrable," Zuckerman remarked that "For a dozen years, France, Russia, and China sought to weaken inspections for banned Iraqi weapons. This pattern continued right up until the commencement of war." Ultimately, the United States proceeded with Operation Iraqi Freedom, its initiative to attack Iraq and disband Hussein's regime. This successful military action was taken despite opposition from many other nations. This especially was true of European countries, which have exerted a great deal of effort in recent years to seek peaceful resolutions and avoid war.

Many observers argued that the United States' decision to attack Iraq undermined the UN's credibility as an international peacekeeping organization. Others debated about its future role in international affairs. A number of experts predicted that the UN would revert to focusing primarily on humanitarian causes, such as providing healthcare services, assistance to refugees, and disaster relief in nations like Asia and Africa. However, one thing remained clear: the United States would need assistance

from the UN to rebuild Iraq following the war, and possibly to deal with other looming international challenges. As Andrew C. Schneider said in the March 19, 2003 issue of *Kiplinger Business Forecasts*, the United States' decision to bypass the UN meant it would "have far less scope for building global alliances to combat future security threats. This is sure to complicate [President] Bush's aim of reforming Iraq, stamping out global terrorism and containing other 'axis of evil' states such as North Korea and Iran."

By late May of 2003, significant international attention was focused on rebuilding Iraq. The UN Security Council voted 14 to 0 to lift trade sanctions that had been in place over Iraq for some 13 years. This opened a market for U.S. commodities like cereal, corn, and rice that some analysts valued at \$100 million. In addition, *Country ViewsWire* explained that the vote led to the creation of the Development Fund for Iraq, which was "designed to take the place of the UN in managing Iraq's oil revenues as well as managing frozen Iraqi financial assets held abroad." This effectively gave great power to the United States and the United Kingdom to control different aspects of Iraq's economy, especially its oil industry.

NAICS TO SIC CONVERSION GUIDE

*The following guide cross-references six-digit 1997 North American Industry Classification System (NAICS) codes with four-digit 1987 Standard Industrial Classification (SIC) codes. Because the systems differ in specificity, some NAICS categories correspond to more than one SIC category. Please refer to the **Introduction** under “About Industry Classification” for more information.*

AGRICULTURE, FORESTRY, FISHING, & HUNTING

- 11110 Soybean Farming *see* SIC 0116: Soybeans
- 11120 Oilseed (except Soybean) Farming *see* SIC 0119: Cash Grains, NEC
- 11130 Dry Pea and Bean Farming *see* SIC 0119: Cash Grains, NEC
- 11140 Wheat Farming *see* SIC 0111: Wheat
- 11150 Corn Farming *see* SIC 0115: Corn
- 11150 Corn Farming *see* SIC 0119: Cash Grains, NEC
- 11160 Rice Farming *see* SIC 0112: Rice
- 11191 Oilseed and Grain Combination Farming *see* SIC 0119: Cash Grains, NEC
- 11199 All Other Grain Farming *see* SIC 0119: Cash Grains, NEC
- 11211 Potato Farming *see* SIC 0134: Irish Potatoes
- 11219 Other Vegetable (except Potato) and Melon Farming *see* SIC 0139: Field Crops, Except Cash Grains, NEC; SIC 0161: Vegetables and Melons
- 11310 Orange Groves *see* SIC 0174: Citrus Fruits
- 11320 Citrus (except Orange) Groves *see* SIC 0174: Citrus Fruits
- 11331 Apple Orchards *see* SIC 0175: Deciduous Tree Fruits

- SIC 2759: Commercial Printing, NEC; SIC 2771: Greeting Cards; SIC 2782: Blankbooks, Loose-leaf Binders and Devices; SIC 3999: Manufacturing Industries, NEC
- 323114 Quick Printing *see* SIC 2752: Commercial Printing, Lithographic; SIC 2759: Commercial Printing, NEC
- 323115 Digital Printing *see* SIC 2759: Commercial Printing, NEC
- 323116 Manifold Business Form Printing *see* SIC 2761: Manifold Business Forms
- 323117 Book Printing *see* SIC 2732: Book Printing
- 323118 Blankbook, Loose-leaf Binder and Device Manufacturing *see* SIC 2782: Blankbooks, Loose-leaf Binders and Devices
- 323119 Other Commercial Printing *see* SIC 2759: Commercial Printing, NEC; SIC 2771: Greeting Cards; SIC 2782: Blankbooks, Loose-leaf Binders and Devices; SIC 3999: Manufacturing Industries, NEC
- 323121 Tradebinding and Related Work *see* SIC 2789: Book-binding and Related Work
- 323122 Prepress Services *see* SIC 2791: Typesetting; SIC 2796: Platemaking and Related Services

PETROLEUM & COAL PRODUCTS MANUFACTURING

- 324110 Petroleum Refineries *see* SIC 2911: Petroleum Refining
- 324121 Asphalt Paving Mixture and Block Manufacturing *see* SIC 2951: Asphalt Paving Mixtures and Blocks
- 324122 Asphalt Shingle and Coating Materials Manufacturing *see* SIC 2952: Asphalt Felts and Coatings
- 324191 Petroleum Lubricating Oil and Grease Manufacturing *see* SIC 2992: Lubricating Oils and Greases
- 324199 All Other Petroleum and Coal Products Manufacturing *see* SIC 2999: Products of Petroleum and Coal, NEC; SIC 3312: Steel Works, Blast Furnaces (Including Coke Ovens), and Rolling Mills

CHEMICAL MANUFACTURING

- 325110 Petrochemical Manufacturing *see* SIC 2865: Cyclic Organic Crudes and Intermediates, and Organic Dyes and Pigments; SIC 2869: Industrial Organic Chemicals, NEC
- 325120 Industrial Gas Manufacturing *see* SIC 2813: Industrial Gases; SIC 2869: Industrial Organic Chemicals, NEC
- 325131 Inorganic Dye and Pigment Manufacturing *see* SIC 2816: Inorganic Pigments; SIC 2819: Industrial Inorganic Chemicals, NEC
- 325132 Organic Dye and Pigment Manufacturing *see* SIC 2865: Cyclic Organic Crudes and Intermediates, and Organic Dyes and Pigments
- 325181 Alkalies and Chlorine Manufacturing *see* SIC 2812: Alkalies and Chlorine
- 325182 Carbon Black Manufacturing *see* SIC 2816: Inorganic Pigments; SIC 2895: Carbon Black
- 325188 All Other Inorganic Chemical Manufacturing *see* SIC 2819: Industrial Inorganic Chemicals, NEC; SIC 2869: Industrial Organic Chemicals, NEC
- 325191 Gum and Wood Chemical Manufacturing *see* SIC 2861: Gum and Wood Chemicals
- 325192 Cyclic Crude and Intermediate Manufacturing *see* SIC 2865: Cyclic Organic Crudes and Intermediates, and Organic Dyes and Pigments

325193 Ethyl Alcohol Manufacturing *see* SIC 2869: Industrial Organic Chemicals, NEC

325199 All Other Basic Organic Chemical Manufacturing *see* SIC 2869: Industrial Organic Chemicals, NEC; SIC 2899: Chemicals and Chemical Preparations, NEC

325211 Plastics Material and Resin Manufacturing *see* SIC 2821: Plastics Material Synthetic Resins, and Nonvulcanizable Elastomers

325212 Synthetic Rubber Manufacturing *see* SIC 2822: Synthetic Rubber

325221 Cellulosic Manmade Fiber Manufacturing *see* SIC 2823: Cellulosic Manmade Fibers

325222 Noncellulosic Organic Fiber Manufacturing *see* SIC 2824: Manmade Organic Fibers, Except Cellulosic

325311 Nitrogenous Fertilizer Manufacturing *see* SIC 2873: Nitrogenous Fertilizers

325312 Phosphatic Fertilizer Manufacturing *see* SIC 2874: Phosphatic Fertilizers

325314 Fertilizer (Mixing Only) Manufacturing *see* SIC 2875: Fertilizers, Mixing Only

325320 Pesticide and Other Agricultural Chemical Manufacturing *see* SIC 2879: Pesticides and Agricultural Chemicals, NEC

325411 Medicinal and Botanical Manufacturing *see* SIC 2833: Medicinal Chemicals and Botanical Products

325412 Pharmaceutical Preparation Manufacturing *see* SIC 2834: Pharmaceutical Preparations; SIC 2835: In Vitro and In Vivo Diagnostic Substances

325413 In-Vitro Diagnostic Substance Manufacturing *see* SIC 2835: In Vitro and In Vivo Diagnostic Substances

325414 Biological Product (except Diagnostic) Manufacturing *see* SIC 2836: Biological Products, Except Diagnostic Substances

325510 Paint and Coating Manufacturing *see* SIC 2851: Paints, Varnishes, Lacquers, Enamels, and Allied Products; SIC 2899: Chemicals and Chemical Preparations, NEC

325520 Adhesive and Sealant Manufacturing *see* SIC 2891: Adhesives and Sealants

325611 Soap and Other Detergent Manufacturing *see* SIC 2841: Soaps and Other Detergents, Except Specialty Cleaners; SIC 2844: Perfumes, Cosmetics, and Other Toilet Preparations

325612 Polish and Other Sanitation Good Manufacturing *see* SIC 2842: Specialty Cleaning, Polishing, and Sanitary Preparations

325613 Surface Active Agent Manufacturing *see* SIC 2843: Surface Active Agents, Finishing Agents, Sulfonated Oils, and Assistants

325620 Toilet Preparation Manufacturing *see* SIC 2844: Perfumes, Cosmetics, and Other Toilet Preparations

325910 Printing Ink Manufacturing *see* SIC 2893: Printing Ink

325920 Explosives Manufacturing *see* SIC 2892: Explosives

325991 Custom Compounding of Purchased Resin *see* SIC 3087: Custom Compounding of Purchased Plastics Resins

325992 Photographic Film, Paper, Plate and Chemical Manufacturing *see* SIC 3861: Photographic Equipment and Supplies

325998 All Other Miscellaneous Chemical Product Manufacturing *see* SIC 2819: Industrial Inorganic Chemicals, NEC; SIC 2899: Chemicals and Chemical Preparations, NEC;

SIC 3952: Lead Pencils, Crayons, and Artist's Materials; SIC 3999: Manufacturing Industries, NEC

PLASTICS & RUBBER PRODUCTS MANUFACTURING

326111 Unsupported Plastics Bag Manufacturing *see* SIC 2673: Plastics, Foil, and Coated Paper Bags

326112 Unsupported Plastics Packaging Film and Sheet Manufacturing *see* SIC 2671: Packaging Paper and Plastics Film, Coated and Laminated

326113 Unsupported Plastics Film and Sheet (except Packaging) Manufacturing *see* SIC 3081: Unsupported Plastics Film and Sheet

326121 Unsupported Plastics Profile Shape Manufacturing *see* SIC 3082: Unsupported Plastics Profile Shapes; SIC 3089: Plastics Products, NEC

326122 Plastics Pipe and Pipe Fitting Manufacturing *see* SIC 3084: Plastic Pipe; SIC 3089: Plastics Products, NEC

326130 Laminated Plastics Plate, Sheet, and Shape Manufacturing *see* SIC 3083: Laminated Plastics Plate, Sheet, and Profile Shapes

326140 Polystyrene Foam Product Manufacturing *see* SIC 3086: Plastics Foam Products

326150 Urethane and Other Foam Product (except Polystyrene) Manufacturing *see* SIC 3086: Plastics Foam Products

326160 Plastics Bottle Manufacturing *see* SIC 3085: Plastics Bottles

326191 Plastics Plumbing Fixtures Manufacturing *see* SIC 3088: Plastics Plumbing Fixtures

326192 Resilient Floor Covering Manufacturing *see* SIC 3069: Fabricated Rubber Products, NEC; SIC 3996: Linoleum, Asphalted-Felt-Base, and Other Hard Surface Floor Coverings, NEC

326199 All Other Plastics Product Manufacturing *see* SIC 3089: Plastics Products, NEC; SIC 3999: Manufacturing Industries, NEC

326211 Tire Manufacturing (except Retreading) *see* SIC 3011: Tires and Inner Tubes

326212 Tire Retreading *see* SIC 7534: Tire Retreading and Repair Shops

326220 Rubber and Plastics Hoses and Belting Manufacturing *see* SIC 3052: Rubber and Plastics Hose and Belting

326291 Rubber Product Manufacturing for Mechanical Use *see* SIC 3061: Molded, Extruded, and Lathe-Cut Mechanical Rubber Products

326299 All Other Rubber Product Manufacturing *see* SIC 3069: Fabricated Rubber Products, NEC

NONMETALLIC MINERAL PRODUCT MANUFACTURING

327111 Vitreous China Plumbing Fixture and China and Earthenware Fitting and Bathroom Accessories Manufacturing *see* SIC 3261: Vitreous China Plumbing Fixtures and China and Earthenware Fittings and Bathroom Accessories

327112 Vitreous China, Fine Earthenware and Other Pottery Product Manufacturing *see* SIC 3262: Vitreous China Table and Kitchen Articles; SIC 3263: Fine Earthenware (Whiteware) Table and Kitchen Articles; SIC 3269: Pottery Products, NEC

- 327113 Porcelain Electrical Supply Manufacturing *see* SIC 3264: Porcelain Electrical Supplies
- 327121 Brick and Structural Clay Tile Manufacturing *see* SIC 3251: Brick and Structural Clay Tile
- 327122 Ceramic Wall and Floor Tile Manufacturing *see* SIC 3253: Ceramic Wall and Floor Tile
- 327123 Other Structural Clay Product Manufacturing *see* SIC 3259: Structural Clay Products, NEC
- 327124 Clay Refractory Manufacturing *see* SIC 3255: Clay Refractories
- 327125 Nonclay Refractory Manufacturing *see* SIC 3297: Non-clay Refractories
- 327211 Flat Glass Manufacturing *see* SIC 3211: Flat Glass
- 327212 Other Pressed and Blown Glass and Glassware Manufacturing *see* SIC 3229: Pressed and Blown Glass and Glassware, NEC
- 327213 Glass Container Manufacturing *see* SIC 3221: Glass Containers
- 327215 Glass Product Manufacturing Made of Purchased Glass *see* SIC 3231: Glass Products, Made of Purchased Glass
- 327310 Cement Manufacturing *see* SIC 3241: Cement, Hydraulic
- 327320 Ready-Mix Concrete Manufacturing *see* SIC 3273: Ready-Mixed Concrete
- 327331 Concrete Block and Brick Manufacturing *see* SIC 3271: Concrete Block and Brick
- 327332 Concrete Pipe Manufacturing *see* SIC 3272: Concrete Products, Except Block and Brick
- 327390 Other Concrete Product Manufacturing *see* SIC 3272: Concrete Products, Except Block and Brick
- 327410 Lime Manufacturing *see* SIC 3274: Lime
- 327420 Gypsum and Gypsum Product Manufacturing *see* SIC 3275: Gypsum Products; SIC 3299: Nonmetallic Mineral Products, NEC
- 327910 Abrasive Product Manufacturing *see* SIC 3291: Abrasive Products
- 327991 Cut Stone and Stone Product Manufacturing *see* SIC 3281: Cut Stone and Stone Products
- 327992 Ground or Treated Mineral and Earth Manufacturing *see* SIC 3295: Minerals and Earths, Ground or Otherwise Treated
- 327993 Mineral Wool Manufacturing *see* SIC 3296: Mineral Wool
- 327999 All Other Miscellaneous Nonmetallic Mineral Product Manufacturing *see* SIC 3272: Concrete Products, Except Block and Brick; SIC 3292: Asbestos Products; SIC 3299: Nonmetallic Mineral Products, NEC
- PRIMARY METAL MANUFACTURING**
- 331111 Iron and Steel Mills *see* SIC 3312: Steel Works, Blast Furnaces (Including Coke Ovens), and Rolling Mills; SIC 3399: Primary Metal Products, NEC
- 331112 Electrometallurgical Ferroalloy Product Manufacturing *see* SIC 3313: Electrometallurgical Products, Except Steel
- 331210 Iron and Steel Pipes and Tubes Manufacturing from Purchased Steel *see* SIC 3317: Steel Pipe and Tubes
- 331221 Cold-Rolled Steel Shape Manufacturing *see* SIC 3316: Cold-Rolled Steel Sheet, Strip, and Bars
- 331222 Steel Wire Drawing *see* SIC 3315: Steel Wire Drawing and Steel Nails and Spikes
- 331311 Aluminum Refining *see* SIC 2819: Industrial Inorganic Chemicals, NEC
- 331312 Primary Aluminum Production *see* SIC 3334: Primary Production of Aluminum
- 331314 Secondary Smelting and Alloying of Aluminum *see* SIC 3341: Secondary Smelting and Refining of Nonferrous Metals; SIC 3399: Primary Metal Products, NEC
- 331315 Aluminum Sheet, Plate, and Foil Manufacturing *see* SIC 3353: Aluminum Sheet, Plate, and Foil
- 331316 Aluminum Extruded Product Manufacturing *see* SIC 3354: Aluminum Extruded Products
- 331319 Other Aluminum Rolling and Drawing, *see* SIC 3355: Aluminum Rolling and Drawing, NEC; SIC 3357: Drawing and Insulating of Nonferrous Wire
- 331411 Primary Smelting and Refining of Copper *see* SIC 3331: Primary Smelting and Refining of Copper
- 331419 Primary Smelting and Refining of Nonferrous Metals (except Copper and Aluminum) *see* SIC 3339: Primary Smelting and Refining of Nonferrous Metals, Except Copper and Aluminum
- 331421 Copper (except Wire) Rolling, Drawing, and Extruding *see* SIC 3351: Rolling, Drawing, and Extruding of Copper
- 331422 Copper Wire Drawing *see* SIC 3357: Drawing and Insulating of Nonferrous Wire
- 331423 Secondary Smelting, Refining, and Alloying of Copper *see* SIC 3341: Secondary Smelting and Refining of Nonferrous Metals; SIC 3399: Primary Metal Products, NEC
- 331491 Nonferrous Metal (except Copper and Aluminum) Rolling, Drawing, and Extruding *see* SIC 3356: Rolling, Drawing, and Extruding of Nonferrous Metals, Except Copper and Aluminum; SIC 3357: Drawing and Insulating of Nonferrous Wire
- 331492 Secondary Smelting, Refining, and Alloying of Nonferrous Metals (except Copper and Aluminum) *see* SIC 3313: Electrometallurgical Products, Except Steel; SIC 3341: Secondary Smelting and Refining of Nonferrous Metals; SIC 3399: Primary Metal Products, NEC
- 331511 Iron Foundries *see* SIC 3321: Gray and Ductile Iron Foundries; SIC 3322: Malleable Iron Foundries
- 331512 Steel Investment Foundries *see* SIC 3324: Steel Investment Foundries
- 331513 Steel Foundries (except Investment) *see* SIC 3325: Steel Foundries, NEC
- 331521 Aluminum Die-Castings *see* SIC 3363: Aluminum Die-Castings
- 331522 Nonferrous (except Aluminum) Die-Castings *see* SIC 3364: Nonferrous Die-Castings, Except Aluminum
- 331524 Aluminum Foundries *see* SIC 3365: Aluminum Foundries
- 331525 Copper Foundries *see* SIC 3366: Copper Foundries
- 331528 Other Nonferrous Foundries *see* SIC 3369: Nonferrous Foundries, Except Aluminum and Copper
- FABRICATED METAL PRODUCT MANUFACTURING**
- 332111 Iron and Steel Forging *see* SIC 3462: Iron and Steel Forgings
- 332112 Nonferrous Forging *see* SIC 3463: Nonferrous Forgings

- 332114 Custom Roll Forming *see* SIC 3449: Miscellaneous Structural Metal Work
- 332115 Crown and Closure Manufacturing *see* SIC 3466: Crowns and Closures
- 332116 Metal Stamping *see* SIC 3469: Metal Stamping, NEC
- 332117 Powder Metallurgy Part Manufacturing *see* SIC 3499: Fabricated Metal Products, NEC
- 332211 Cutlery and Flatware (except Precious) Manufacturing *see* SIC 3421: Cutlery; SIC 3914: Silverware, Plated Ware, and Stainless Steel Ware
- 332212 Hand and Edge Tool Manufacturing *see* SIC 3423: Hand and Edge Tools, Except Machine Tools and Handsaws; SIC 3523: Farm Machinery and Equipment; SIC 3524: Lawn and Garden Tractors and Home Lawn and Garden Equipment; SIC 3545: Cutting Tools, Machine Tool Accessories, and Machinists' Precision Measuring Devices; SIC 3799: Transportation Equipment, NEC; SIC 3999: Manufacturing Industries, NEC
- 332213 Saw Blade and Handsaw Manufacturing *see* SIC 3425: Saw Blades and Handsaws
- 332214 Kitchen Utensil, Pot and Pan Manufacturing *see* SIC 3469: Metal Stamping, NEC
- 332311 Prefabricated Metal Building and Component Manufacturing *see* SIC 3448: Prefabricated Metal Buildings and Components
- 332312 Fabricated Structural Metal Manufacturing *see* SIC 3441: Fabricated Structural Metal; SIC 3449: Miscellaneous Structural Metal Work
- 332313 Plate Work Manufacturing *see* SIC 3443: Fabricated Plate Work (Boiler Shops)
- 332321 Metal Window and Door Manufacturing *see* SIC 3442: Metal Doors, Sash, Frames, Molding, and Trim Manufacturing; SIC 3449: Miscellaneous Structural Metal Work
- 332322 Sheet Metal Work Manufacturing *see* SIC 3444: Sheet Metal Work
- 332323 Ornamental and Architectural Metal Work Manufacturing *see* SIC 3446: Architectural and Ornamental Metal Work; SIC 3449: Miscellaneous Structural Metal Work; SIC 3523: Farm Machinery and Equipment
- 332410 Power Boiler and Heat Exchanger Manufacturing *see* SIC 3443: Fabricated Plate Work (Boiler Shops)
- 332420 Metal Tank (Heavy Gauge) Manufacturing *see* SIC 3443: Fabricated Plate Work (Boiler Shops)
- 332431 Metal Can Manufacturing *see* SIC 3411: Metal Cans
- 332439 Other Metal Container Manufacturing *see* SIC 3412: Metal Shipping Barrels, Drums, Kegs and Pails; SIC 3429: Hardware, NEC; SIC 3444: Sheet Metal Work; SIC 3499: Fabricated Metal Products, NEC; SIC 3537: Industrial Trucks, Tractors, Trailers, and Stackers
- 332510 Hardware Manufacturing *see* SIC 3429: Hardware, NEC; SIC 3499: Fabricated Metal Products, NEC
- 332611 Steel Spring (except Wire) Manufacturing *see* SIC 3493: Steel Springs, Except Wire
- 332612 Wire Spring Manufacturing *see* SIC 3495: Wire Springs
- 332618 Other Fabricated Wire Product Manufacturing *see* SIC 3315: Steel Wire Drawing and Steel Nails and Spikes; SIC 3399: Primary Metal Products, NEC; SIC 3496: Miscellaneous Fabricated Wire Products
- 332710 Machine Shops *see* SIC 3599: Industrial and Commercial Machinery and Equipment, NEC
- 332721 Precision Turned Product Manufacturing *see* SIC 3451: Screw Machine Products
- 332722 Bolt, Nut, Screw, Rivet, and Washer Manufacturing *see* SIC 3452: Bolts, Nuts, Screws, Rivets, and Washers
- 332811 Metal Heat Treating *see* SIC 3398: Metal Heat Treating
- 332812 Metal Coating, Engraving, and Allied Services (except Jewelry and Silverware) to Manufacturing *see* SIC 3479: Coating, Engraving, and Allied Services, NEC
- 332813 Electroplating, Plating, Polishing, Anodizing, and Coloring *see* SIC 3399: Primary Metal Products, NEC; SIC 3471: Electroplating, Plating, Polishing, Anodizing, and Coloring
- 332911 Industrial Valve Manufacturing *see* SIC 3491: Industrial Valves
- 332912 Fluid Power Valve and Hose Fitting Manufacturing *see* SIC 3492: Fluid Power Valves and Hose Fittings; SIC 3728: Aircraft Parts and Auxiliary Equipment, NEC
- 332913 Plumbing Fixture Fitting and Trim Manufacturing *see* SIC 3432: Plumbing Fixture Fittings and Trim
- 332919 Other Metal Valve and Pipe Fitting Manufacturing *see* SIC 3429: Hardware, NEC; SIC 3494: Valves and Pipe Fittings, NEC; SIC 3499: Fabricated Metal Products, NEC
- 332991 Ball and Roller Bearing Manufacturing *see* SIC 3562: Ball and Roller Bearings
- 332992 Small Arms Ammunition Manufacturing *see* SIC 3482: Small Arms Ammunition
- 332993 Ammunition (except Small Arms) Manufacturing *see* SIC 3483: Ammunition, Except for Small Arms
- 332994 Small Arms Manufacturing *see* SIC 3484: Small Arms
- 332995 Other Ordnance and Accessories Manufacturing *see* SIC 3489: Ordnance and Accessories, NEC
- 332996 Fabricated Pipe and Pipe Fitting Manufacturing *see* SIC 3498: Fabricated Pipe and Pipe Fittings
- 332997 Industrial Pattern Manufacturing *see* SIC 3543: Industrial Patterns
- 332998 Enameled Iron and Metal Sanitary Ware Manufacturing *see* SIC 3431: Enameled Iron and Metal Sanitary Ware
- 332999 All Other Miscellaneous Fabricated Metal Product Manufacturing *see* SIC 3291: Abrasive Products; SIC 3432: Plumbing Fixture Fittings and Trim; SIC 3494: Valves and Pipe Fittings, NEC; SIC 3497: Metal Foil and Leaf; SIC 3499: Fabricated Metal Products, NEC; SIC 3537: Industrial Trucks, Tractors, Trailers, and Stackers; SIC 3599: Industrial and Commercial Machinery and Equipment, NEC; SIC 3999: Manufacturing Industries, NEC

MACHINERY MANUFACTURING

- 333111 Farm Machinery and Equipment Manufacturing *see* SIC 3523: Farm Machinery and Equipment
- 333112 Lawn and Garden Tractor and Home Lawn and Garden Equipment Manufacturing *see* SIC 3524: Lawn and Garden Tractors and Home Lawn and Garden Equipment

- 334510 Electromedical and Electrotherapeutic Apparatus Manufacturing *see* SIC 3842: Orthopedic, Prosthetic, and Surgical Appliances and Supplies; SIC 3845: Electromedical and Electrotherapeutic Apparatus
- 334511 Search, Detection, Navigation, Guidance, Aeronautical, and Nautical System and Instrument Manufacturing *see* SIC 3812: Search, Detection, Navigation, Guidance, Aeronautical, and Nautical Systems and Instruments
- 334512 Automatic Environmental Control Manufacturing for Regulating Residential, Commercial, and Appliance Use *see* SIC 3822: Automatic Controls for Regulating Residential and Commercial Environments and Appliances
- 334513 Instruments and Related Product Manufacturing for Measuring Displaying, and Controlling Industrial Process Variables *see* SIC 3823: Industrial Instruments for Measurement, Display, and Control of Process Variables; and Related Products
- 334514 Totalizing Fluid Meter and Counting Device Manufacturing *see* SIC 3824: Totalizing Fluid Meters and Counting Devices
- 334515 Instrument Manufacturing for Measuring and Testing Electricity and Electrical Signals *see* SIC 3825: Instruments for Measuring and Testing of Electricity and Electrical Signals
- 334516 Analytical Laboratory Instrument Manufacturing *see* SIC 3826: Laboratory Analytical Instruments
- 334517 Irradiation Apparatus Manufacturing *see* SIC 3844: X-Ray Apparatus and Tubes and Related Irradiation Apparatus; SIC 3845: Electromedical and Electrotherapeutic Apparatus
- 334518 Watch, Clock, and Part Manufacturing *see* SIC 3495: Wire Springs; SIC 3579: Office Machines, NEC; SIC 3873: Watches, Clocks, Clockwork Operated Devices and Parts
- 334519 Other Measuring and Controlling Device Manufacturing *see* SIC 3829: Measuring and Controlling Devices, NEC
- 334611 Software Reproducing *see* SIC 7372: Prepackaged Software
- 334612 Precorded Compact Disc (Except Software), Tape and Record Reproducing *see* SIC 3652: Phonograph Records and Precorded Audio Tapes and Disks; SIC 7819: Services Allied to Motion Picture Production
- 334613 Magnetic and Optical Recording Media Manufacturing *see* SIC 3695: Magnetic and Optical Recording Media

ELECTRICAL EQUIPMENT, APPLIANCE, & COMPONENT MANUFACTURING

- 335110 Electric Lamp Bulb and Part Manufacturing *see* SIC 3641: Electric Lamp Bulbs and Tubes
- 335121 Residential Electric Lighting Fixture Manufacturing *see* SIC 3645: Residential Electric Lighting Fixtures; SIC 3999: Manufacturing Industries, NEC
- 335122 Commercial, Industrial, and Institutional Electric Lighting Fixture Manufacturing *see* SIC 3646: Commercial, Industrial, and Institutional Electric Lighting Fixtures
- 335129 Other Lighting Equipment Manufacturing *see* SIC 3648: Lighting Equipment, NEC; SIC 3699: Electrical Machinery, Equipment, and Supplies, NEC
- 335211 Electric Houseware and Fan Manufacturing *see* SIC 3634: Electric Housewares and Fans
- 335212 Household Vacuum Cleaner Manufacturing *see* SIC 3635: Household Vacuum Cleaners; SIC 3639: Household Appliances, NEC
- 335221 Household Cooking Appliance Manufacturing *see* SIC 3631: Household Cooking Equipment
- 335222 Household Refrigerator and Home and Farm Freezer Manufacturing *see* SIC 3632: Household Refrigerators and Home and Farm Freezers
- 335224 Household Laundry Equipment Manufacturing *see* SIC 3633: Household Laundry Equipment
- 335228 Other Household Appliance Manufacturing *see* SIC 3639: Household Appliances, NEC
- 335311 Power, Distribution, and Specialty Transformer Manufacturing *see* SIC 3548: Electric and Gas Welding and Soldering Equipment; SIC 3612: Power, Distribution, and Specialty Transformers
- 335312 Motor and Generator Manufacturing *see* SIC 3621: Motors and Generators; SIC 7694: Armature Rewinding Shops
- 335313 Switchgear and Switchboard Apparatus Manufacturing *see* SIC 3613: Switchgear and Switchboard Apparatus
- 335314 Relay and Industrial Control Manufacturing *see* SIC 3625: Relays and Industrial Controls
- 335911 Storage Battery Manufacturing *see* SIC 3691: Storage Batteries

- 335912 Dry and Wet Primary Battery Manufacturing *see* SIC 3692: Primary Batteries, Dry and Wet
- 335921 Fiber Optic Cable Manufacturing *see* SIC 3357: Drawing and Insulating of Nonferrous Wire
- 335929 Other Communication and Energy Wire Manufacturing *see* SIC 3357: Drawing and Insulating of Nonferrous Wire
- 335931 Current-Carrying Wiring Device Manufacturing *see* SIC 3643: Current-Carrying Wiring Devices
- 335932 Noncurrent-Carrying Wiring Device Manufacturing *see* SIC 3644: Noncurrent-Carrying Wiring Devices
- 335991 Carbon and Graphite Product Manufacturing *see* SIC 3624: Carbon and Graphite Products
- 335999 All Other Miscellaneous Electrical Equipment and Component Manufacturing *see* SIC 3629: Electrical Industrial Apparatus, NEC; SIC 3699: Electrical Machinery, Equipment, and Supplies, NEC

TRANSPORTATION EQUIPMENT MANUFACTURING

- 336111 Automobile Manufacturing *see* SIC 3711: Motor Vehicles and Passenger Car Bodies
- 336112 Light Truck and Utility Vehicle Manufacturing *see* SIC 3711: Motor Vehicles and Passenger Car Bodies
- 336120 Heavy Duty Truck Manufacturing *see* SIC 3711: Motor Vehicles and Passenger Car Bodies
- 336211 Motor Vehicle Body Manufacturing *see* SIC 3711: Motor Vehicles and Passenger Car Bodies; SIC 3713: Truck and Bus Bodies; SIC 3714: Motor Vehicle Parts and Accessories
- 336212 Truck Trailer Manufacturing *see* SIC 3715: Truck Trailers
- 336213 Motor Home Manufacturing *see* SIC 3716: Motor Homes
- 336214 Travel Trailer and Camper Manufacturing *see* SIC 3792: Travel Trailers and Campers; SIC 3799: Transportation Equipment, NEC
- 336311 Carburetor, Piston, Piston Ring and Valve Manufacturing *see* SIC 3592: Carburetors, Pistons, Piston Rings and Valves
- 336312 Gasoline Engine and Engine Parts Manufacturing *see* SIC 3714: Motor Vehicle Parts and Accessories
- 336321 Vehicular Lighting Equipment Manufacturing *see* SIC 3647: Vehicular Lighting Equipment
- 336322 Other Motor Vehicle Electrical and Electronic Equipment Manufacturing *see* SIC 3679: Electronic Components, NEC; SIC 3694: Electrical Equipment for Internal Combustion Engines; SIC 3714: Motor Vehicle Parts and Accessories
- 336330 Motor Vehicle Steering and Suspension Components (except Spring) Manufacturing *see* SIC 3714: Motor Vehicle Parts and Accessories
- 336340 Motor Vehicle Brake System Manufacturing *see* SIC 3292: Asbestos Products; SIC 3714: Motor Vehicle Parts and Accessories
- 336350 Motor Vehicle Transmission and Power Train Part Manufacturing *see* SIC 3714: Motor Vehicle Parts and Accessories
- 336360 Motor Vehicle Fabric Accessories and Seat Manufacturing *see* SIC 2396: Automotive Trimmings, Apparel Findings, and Related Products; SIC 2399: Fabricated Textile Products, NEC; SIC 2531: Public Building and Related Furniture
- 336370 Motor Vehicle Metal Stamping *see* SIC 3465: Automotive Stamping
- 336391 Motor Vehicle Air Conditioning Manufacturing *see* SIC 3585: Air-Conditioning and Warm Air Heating Equipment and Commercial and Industrial Refrigeration Equipment
- 336399 All Other Motor Vehicle Parts Manufacturing *see* SIC 3519: Internal Combustion Engines, NEC; SIC 3599: Industrial and Commercial Machinery and Equipment, NEC; SIC 3714: Motor Vehicle Parts and Accessories
- 336411 Aircraft Manufacturing *see* SIC 3721: Aircraft
- 336412 Aircraft Engine and Engine Parts Manufacturing *see* SIC 3724: Aircraft Engines and Engine Parts
- 336413 Other Aircraft Part and Auxiliary Equipment Manufacturing *see* SIC 3728: Aircraft Parts and Auxiliary Equipment, NEC
- 336414 Guided Missile and Space Vehicle Manufacturing *see* SIC 3761: Guided Missiles and Space Vehicles
- 336415 Guided Missile and Space Vehicle Propulsion Unit and Propulsion Unit Parts Manufacturing *see* SIC 3764: Guided Missile and Space Vehicle Propulsion Units and Propulsion Unit Parts
- 336419 Other Guided Missile and Space Vehicle Parts and Auxiliary Equipment Manufacturing *see* SIC 3769: Guided Missile Space Vehicle Parts and Auxiliary Equipment, NEC
- 336510 Railroad Rolling Stock Manufacturing *see* SIC 3531: Construction Machinery and Equipment; SIC 3743: Railroad Equipment
- 336611 Ship Building and Repairing *see* SIC 3731: Ship Building and Repairing
- 336612 Boat Building *see* SIC 3732: Boat Building and Repairing
- 336991 Motorcycle, Bicycle, and Parts Manufacturing *see* SIC 3751: Motorcycles, Bicycles, and Parts; SIC 3944: Games, Toys, and Children's Vehicles, Except Dolls and Bicycles
- 336992 Military Armored Vehicle, Tank, and Tank Component Manufacturing *see* SIC 3711: Motor Vehicles and Passenger Car Bodies; SIC 3795: Tanks and Tank Components
- 336999 All Other Transportation Equipment Manufacturing *see* SIC 3799: Transportation Equipment, NEC

FURNITURE & RELATED PRODUCT MANUFACTURING

- 337110 Wood Kitchen Cabinet and Counter Top Manufacturing *see* SIC 2434: Wood Kitchen Cabinets; SIC 2541: Wood Office and Store Fixtures, Partitions, Shelving, and Lockers; SIC 5712: Furniture Stores
- 337121 Upholstered Wood Household Furniture Manufacturing *see* SIC 2512: Wood Household Furniture, Upholstered; SIC 2515: Mattresses, Foundations, and Convertible Beds; SIC 5712: Furniture Stores
- 337122 Nonupholstered Wood Household Furniture Manufacturing *see* SIC 2511: Wood Household Furniture, Except Upholstered; SIC 5712: Furniture Stores
- 337124 Metal Household Furniture Manufacturing *see* SIC 2514: Metal Household Furniture

- 337125 Household Furniture (except Wood and Metal) Manufacturing *see* SIC 2519: Household Furniture, NEC
- 337127 Institutional Furniture Manufacturing *see* SIC 2531: Public Building and Related Furniture; SIC 2599: Furniture and Fixtures, NEC; SIC 3952: Lead Pencils, Crayons, and Artist's Materials; SIC 3999: Manufacturing Industries, NEC
- 337129 Wood Television, Radio, and Sewing Machine Cabinet Manufacturing *see* SIC 2517: Wood Television, Radio, Phonograph and Sewing Machine Cabinets
- 337211 Wood Office Furniture Manufacturing *see* SIC 2521: Wood Office Furniture
- 337212 Custom Architectural Woodwork, Millwork, and Fixtures *see* SIC 2541: Wood Office and Store Fixtures, Partitions, Shelving, and Lockers
- 337214 Nonwood Office Furniture Manufacturing *see* SIC 2522: Office Furniture, Except Wood
- 337215 Showcase, Partition, Shelving, and Locker Manufacturing *see* SIC 2426: Hardwood Dimension and Flooring Mills; SIC 2541: Wood Office and Store Fixtures, Partitions, Shelving, and Lockers; SIC 2542: Office and Store Fixtures, Partitions Shelving, and Lockers, Except Wood; SIC 3499: Fabricated Metal Products, NEC
- 337910 Mattress Manufacturing *see* SIC 2515: Mattresses, Foundations, and Convertible Beds
- 337920 Blind and Shade Manufacturing *see* SIC 2591: Drapery Hardware and Window Blinds and Shades
- 339932 Game, Toy, and Children's Vehicle Manufacturing *see* SIC 3944: Games, Toys, and Children's Vehicles, Except Dolls and Bicycles
- 339941 Pen and Mechanical Pencil Manufacturing *see* SIC 3951: Pens, Mechanical Pencils and Parts
- 339942 Lead Pencil and Art Good Manufacturing *see* SIC 2531: Public Building and Related Furniture; SIC 3579: Office Machines, NEC; SIC 3952: Lead Pencils, Crayons, and Artist's Materials
- 339943 Marking Device Manufacturing *see* SIC 3953: Marking Devices
- 339944 Carbon Paper and Inked Ribbon Manufacturing *see* SIC 3955: Carbon Paper and Inked Ribbons
- 339950 Sign Manufacturing *see* SIC 3993: Signs and Advertising Specialties
- 339991 Gasket, Packing, and Sealing Device Manufacturing *see* SIC 3053: Gaskets, Packing, and Sealing Devices
- 339992 Musical Instrument Manufacturing *see* SIC 3931: Musical Instruments
- 339993 Fastener, Button, Needle, and Pin Manufacturing *see* SIC 3131: Boot and Shoe Cut Stock and Findings; SIC 3965: Fasteners, Buttons, Needles, and Pins
- 339994 Broom, Brush and Mop Manufacturing *see* SIC 2392: Housefurnishings, Except Curtains and Draperies; SIC 3991: Brooms and Brushes
- 339995 Burial Casket Manufacturing *see* SIC 3995: Burial Caskets
- 339999 All Other Miscellaneous Manufacturing *see* SIC 2499: Wood Products, NEC; SIC 3999: Manufacturing Industries, NEC

MISCELLANEOUS MANUFACTURING

- 339111 Laboratory Apparatus and Furniture Manufacturing *see* SIC 3821: Laboratory Apparatus and Furniture
- 339112 Surgical and Medical Instrument Manufacturing *see* SIC 3829: Measuring and Controlling Devices, NEC; SIC 3841: Surgical and Medical Instruments and Apparatus
- 339113 Surgical Appliance and Supplies Manufacturing *see* SIC 2599: Furniture and Fixtures, NEC; SIC 3842: Orthopedic, Prosthetic, and Surgical Appliances and Supplies
- 339114 Dental Equipment and Supplies Manufacturing *see* SIC 3843: Dental Equipment and Supplies
- 339115 Ophthalmic Goods Manufacturing *see* SIC 3851: Ophthalmic Goods; SIC 5995: Optical Goods Stores
- 339116 Dental Laboratories *see* SIC 8072: Dental Laboratories
- 339911 Jewelry (including Precious Metal) Manufacturing, *see* SIC 3469: Metal Stamping, NEC; SIC 3479: Coating, Engraving, and Allied Services, NEC; SIC 3911: Jewelry, Precious Metal
- 339912 Silverware and Plated Ware Manufacturing *see* SIC 3479: Coating, Engraving, and Allied Services, NEC; SIC 3914: Silverware, Plated Ware, and Stainless Steel Ware
- 339913 Jewelers' Material and Lapidary Work Manufacturing *see* SIC 3915: Jewelers' Findings and Materials, and Lapidary Work
- 339914 Costume Jewelry and Novelty Manufacturing *see* SIC 3479: Coating, Engraving, and Allied Services, NEC; SIC 3499: Fabricated Metal Products, NEC; SIC 3961: Costume Jewelry and Costume Novelties, Except Precious Metals
- 339920 Sporting and Athletic Good Manufacturing *see* SIC 3949: Sporting and Athletic Goods, NEC
- 339931 Doll and Stuffed Toy Manufacturing *see* SIC 3942: Dolls and Stuffed Toys

WHOLESALE TRADE

- 421110 Automobile and Other Motor Vehicle Wholesalers *see* SIC 5012: Automobiles and Other Motor Vehicles; SIC 5013: Motor Vehicle Supplies and New Parts
- 421130 Tire and Tube Wholesalers *see* SIC 5014: Tires and Tubes
- 421140 Motor Vehicle Part (Used) Wholesalers *see* SIC 5015: Motor Vehicle Parts, Used

SIC TO NAICS CONVERSION GUIDE

The following guide cross-references four-digit 1987 Standard Industrial Classification (SIC) codes with six-digit 1997 North American Industry Classification System (NAICS) codes. Because the systems differ in specificity, some SIC categories correspond to more than one NAICS category. Please refer to the **Introduction** under “About Industry Classification” for more information.

AGRICULTURE, FORESTRY & FISHING

0111	Wheat <i>see</i> NAICS 111140: Wheat Farming	0181	Ornamental Floriculture and Nursery Products <i>see</i> NAICS 111422: Floriculture Production; NAICS 111421: Nursery and Tree Production
0112	Rice <i>see</i> NAICS 111160: Rice Farming	0182	Food Crops Grown Under Cover <i>see</i> NAICS 111411: Mushroom Production; NAICS 111419: Other Food Crops Grown Under Cover
0115	Corn <i>see</i> NAICS 111150: Corn Farming	0191	General Farms, Primarily Crop <i>see</i> NAICS 111998: All Other Miscellaneous Crop Farming
0116	Soybeans <i>see</i> NAICS 111110: Soybean Farming	0211	Beef Cattle Feedlots <i>see</i> NAICS 112112: Cattle Feedlots
0119	Cash Grains, NEC <i>see</i> NAICS 111130: Dry Pea and Bean Farming; NAICS 111120: Oilseed (except Soybean) Farming; NAICS 111150: Corn Farming; NAICS 111191: Oilseed and Grain Combination Farming; NAICS 111199: All Other Grain Farming	0212	Beef Cattle, Except Feedlots <i>see</i> NAICS 112111: Beef Cattle Ranching and Farming
0131	Cotton <i>see</i> NAICS 111920: Cotton Farming	0213	Hogs <i>see</i> NAICS 112210: Hog and Pig Farming
0132	Tobacco <i>see</i> NAICS 111910: Tobacco Farming	0214	Sheep and Goats <i>see</i> NAICS 112410: Sheep Farming; NAICS 112420: Goat Farming
0133	Sugarcane and Sugar Beets <i>see</i> NAICS 111991: Sugar Beet Farming; NAICS 111930: Sugarcane Farming	0219	General Livestock, Except Dairy and Poultry <i>see</i> NAICS 112990: All Other Animal Production
0134	Irish Potatoes <i>see</i> NAICS 111211: Potato Farming	0241	Dairy Farms <i>see</i> NAICS 112111: Beef Cattle Ranching and Farming; NAICS 112120: Dairy Cattle and Milk Production
0139	Field Crops, Except Cash Grains, NEC <i>see</i> NAICS 111940: Hay Farming; NAICS 111992: Peanut Farming; NAICS 111219: Other Vegetable (except Potato) and Melon Farming; NAICS 111998: All Other Miscellaneous Crop Farming	0251	Broiler, Fryers, and Roaster Chickens <i>see</i> NAICS 112320: Broilers and Other Meat-Type Chicken Production
0161	Vegetables and Melons <i>see</i> NAICS 111219: Other Vegetable (except Potato) and Melon Farming	0252	Chicken Eggs <i>see</i> NAICS 112310: Chicken Egg Production
0171	Berry Crops <i>see</i> NAICS 111333: Strawberry Farming; NAICS 111334: Berry (except Strawberry) Farming	0253	Turkey and Turkey Eggs <i>see</i> NAICS 112330: Turkey Production
0172	Grapes <i>see</i> NAICS 111332: Grape Vineyards	0254	Poultry Hatcheries <i>see</i> NAICS 112340: Poultry Hatcheries
0173	Tree Nuts <i>see</i> NAICS 111335: Tree Nut Farming	0259	Poultry and Eggs, NEC <i>see</i> NAICS 112390: Other Poultry Production
0174	Citrus Fruits <i>see</i> NAICS 111310: Orange Groves; NAICS 111320: Citrus (except Orange) Groves	0271	Fur-Bearing Animals and Rabbits <i>see</i> NAICS 112930: Fur-bearing Animal and Rabbit Production
0175	Deciduous Tree Fruits <i>see</i> NAICS 111331: Apple Orchards; NAICS 111339: Other Noncitrus Fruit Farming	0272	Horses and Other Equines <i>see</i> NAICS 112920: Horse and Other Equine Production
0179	Fruits and Tree Nuts, NEC <i>see</i> NAICS 111336: Fruit and Tree Nut Combination Farming; NAICS 111339: Other Noncitrus Fruit Farming		

0273	Animal Aquaculture <i>see</i> NAICS 112511: Finfish Farming and Fish Hatcheries; NAICS 112512: Shellfish Farming; NAICS 112519: Other Animal Aquaculture	1021	Copper Ores <i>see</i> NAICS 212234: Copper Ore and Nickel Ore Mining
0279	Animal Specialties, NEC <i>see</i> NAICS 112910: Apiculture; NAICS 112990: All Other Animal Production	1031	Lead and Zinc Ores <i>see</i> NAICS 212231: Lead Ore and Zinc Ore Mining
0291	General Farms, Primarily Livestock and Animal Specialties <i>see</i> NAICS 112990: All Other Animal Production	1041	Gold Ores <i>see</i> NAICS 212221: Gold Ore Mining
0711	Soil Preparation Services <i>see</i> NAICS 115112: Soil Preparation, Planting and Cultivating	1044	Silver Ores <i>see</i> NAICS 212222: Silver Ore Mining
0721	Crop Planting, Cultivating and Protecting; NAICS 481219: Other Nonscheduled Air Transportation; NAICS 115112: Soil Preparation, Planting, and Cultivating	1061	Ferroalloy Ores, Except Vanadium <i>see</i> NAICS 212234: Copper Ore and Nickel Ore Mining; NAICS 212299: Other Metal Ore Mining
0722	Crop Harvesting, Primarily by Machine <i>see</i> NAICS 115113: Crop Harvesting, Primarily By Machine	1081	Metal Mining Services <i>see</i> NAICS 213114: Support Activities for Metal Mining; NAICS 541360: Geophysical Surveying and Mapping Services
0723	Crop Preparation Services For Market, except Cotton Ginning <i>see</i> NAICS 115114: Postharvest Crop Activities (except Cotton Ginning)	1094	Uranium-Radium-Vanadium Ores <i>see</i> NAICS 212291: Uranium-Radium-Vanadium Ore Mining
0724	Cotton Ginning <i>see</i> NAICS 115111: Cotton Ginning	1099	Miscellaneous Metal Ores, NEC <i>see</i> NAICS 212299: Other Metal Ore Mining
0741	Veterinary Service For Livestock <i>see</i> NAICS 541940: Veterinary Services	1221	Bituminous Coal and Lignite Surface Mining <i>see</i> NAICS 212111: Bituminous Coal and Lignite Surface Mining
0742	Veterinary Services for Animal Specialties <i>see</i> NAICS 541940: Veterinary Services	1222	Bituminous Coal Underground Mining <i>see</i> NAICS 212112: Bituminous Coal Underground Mining
0751	Livestock Services, Except Veterinary <i>see</i> NAICS 311611: Animal (except Poultry) Slaughtering NAICS 115210: Support Activities for Animal Production	1231	Anthracite Mining <i>see</i> NAICS 212113: Anthracite Mining
0752	Animal Specialty Services, Except Veterinary; NAICS 115210: Support Activities for Animal Production; NAICS 812910: Pet Care (except Veterinary) Services	1241	Coal Mining Services <i>see</i> NAICS 213113: Support Activities for Coal Mining
0761	Farm Labor Contractors and Crew Leaders <i>see</i> NAICS 115115: Farm Labor Contractors and Crew Leaders	1311	Crude Petroleum and Natural Gas <i>see</i> NAICS 211111: Crude Petroleum and Natural Gas Extraction
0762	Farm Management Services <i>see</i> NAICS 115116: Farm Management Services	1321	Natural Gas Liquids <i>see</i> NAICS 211112: Natural Gas Liquid Extraction
0781	Landscape Counseling and Planning <i>see</i> NAICS 541690: Other Scientific and Technical Consulting Services; NAICS 541320: Landscape Architectural Services	1381	Drilling Oil and Gas Wells <i>see</i> NAICS 213111: Drilling Oil and Gas Wells
0782	Lawn and Garden Services <i>see</i> NAICS 561730: Landscaping Services	1382	Oil and Gas Field Exploration Services <i>see</i> NAICS 541360: Geophysical Surveying and Mapping Services; NAICS 213112: Support Activities for Oil and Gas Field Exploration
0783	Ornamental Shrub and Tree Services <i>see</i> NAICS 561730: Landscaping Services	1389	Oil and Gas Field Services, NEC <i>see</i> NAICS 213112: Support Activities for Oil and Gas Field Exploration
0811	Timber Tracts <i>see</i> NAICS 111421: Nursery and Tree Production; NAICS 113110: Timber Tract Operations	1411	Dimension Stone <i>see</i> NAICS 212311: Dimension Stone Mining and Quarry
0831	Forest Nurseries and Gathering of Forest Products; NAICS 111998: All Other Miscellaneous Crop Farming; NAICS 113210: Forest Nurseries and Gathering of Forest Products	1422	Crushed and Broken Limestone <i>see</i> NAICS 212312: Crushed and Broken Limestone Mining and Quarrying
0851	Forestry Services <i>see</i> NAICS 115310: Support Activities for Forestry	1423	Crushed and Broken Granite <i>see</i> NAICS 212313: Crushed and Broken Granite Mining and Quarrying
0912	Finfish <i>see</i> NAICS 114111: Finfish Fishing	1429	Crushed and Broken Stone, NEC <i>see</i> NAICS 212319: Other Crushed and Broken Stone Mining and Quarrying
0913	Shellfish <i>see</i> NAICS 114112: Shellfish Fishing	1442	Construction Sand and Gravel <i>see</i> NAICS 212321: Construction Sand and Gravel Mining
0919	Miscellaneous Marine Products <i>see</i> NAICS 114119: Other Marine Fishing; NAICS 111998: All Other Miscellaneous Crop Farming	1446	Industrial Sand <i>see</i> NAICS 212322: Industrial Sand Mining
0921	Fish Hatcheries and Preserves <i>see</i> NAICS 112511: Finfish Farming and Fish Hatcheries; NAICS 112512: Shellfish Farming	1455	Kaolin and Ball Clay <i>see</i> NAICS 212324: Kaolin and Ball Clay Mining
0971	Hunting, Trapping, and Game Propagation <i>see</i> NAICS 114210: Hunting and Trapping	1459	Clay, Ceramic, and Refractory Minerals, NEC <i>see</i> NAICS 212325: Clay and Ceramic and Refractory Minerals Mining
		1474	Potash, Soda, and Borate Minerals <i>see</i> NAICS 212391: Potash, Soda, and Borate Mineral Mining
		1475	Phosphate Rock <i>see</i> NAICS 212392: Phosphate Rock Mining

MINING INDUSTRIES

1011 Iron Ores *see* NAICS 212210: Iron Ore Mining

- 1479 Chemical and Fertilizer Mineral Mining, NEC *see* NAICS 212393: Other Chemical and Fertilizer Mineral Mining
- 1481 Nonmetallic Minerals Services Except Fuels *see* NAICS 213115: Support Activities for Non-metallic Minerals, (except Fuels); NAICS 541360: Geophysical Surveying and Mapping Services
- 1499 Miscellaneous Nonmetallic Minerals, Except Fuels *see* NAICS 212319: Other Crushed and Broken Stone Mining and Quarrying; NAICS 212399: All Other Non-Metallic Mineral Mining

CONSTRUCTION INDUSTRIES

- 1521 General Contractors-Single-Family Houses *see* NAICS 233210: Single-Family Housing Construction
- 1522 General Contractors-Residential Buildings *see* NAICS 233320: Commercial and Institutional Building Construction; NAICS 233220: Multi-Family Housing Construction
- 1531 Operative Builders *see* NAICS 233210: Single-Family Housing Construction; NAICS 233220: Multi-Family Housing Construction; NAICS 233310: Manufacturing and Light Industrial Building Construction; NAICS 233320: Commercial and Institutional Building Construction
- 1541 General Contractors-Industrial Buildings and Warehouses *see* NAICS 233320: Commercial and Institutional Building Construction; NAICS 233310: Manufacturing and Light Industrial Building Construction
- 1542 General Contractors-Nonresidential Buildings, Other than Industrial Buildings and Warehouses *see* NAICS 233320: Commercial and Institutional Building Construction
- 1611 Highway and Street Construction, Except Elevated Highways *see* NAICS 234110: Highway and Street Construction
- 1622 Bridge, Tunnel, and Elevated Highway Construction *see* NAICS 234120: Bridge and Tunnel Construction
- 1623 Water, Sewer, Pipeline, and Communications and Power Line Construction *see* NAICS 234910: Water, Sewer and Pipeline Construction; NAICS 234920: Power and Communication Transmission Line Construction
- 1629 Heavy Construction, NEC *see* NAICS 234930: Industrial Nonbuilding Structure Construction; NAICS 234990: All Other Heavy Construction
- 1711 Plumbing, Heating, and Air-Conditioning *see* NAICS 235110: Plumbing, Heating and Air-Conditioning Contractors
- 1721 Painting and Paper Hanging *see* NAICS 235210: Painting and Wall Covering Contractors
- 1731 Electrical Work *see* NAICS 561621: Security Systems Services (except Locksmiths); NAICS 235310: Electrical Contractors
- 1741 Masonry, Stone Setting and Other Stone Work *see* NAICS 235410: Masonry and Stone Contractors
- 1742 Plastering, Drywall, Acoustical and Insulation Work *see* NAICS 235420: Drywall, Plastering, Acoustical and Insulation Contractors
- 1743 Terrazzo, Tile, Marble, and Mosaic Work *see* NAICS 235420: Drywall, Plastering, Acoustical and Insulation Contractors; NAICS 235430: Tile, Marble, Terrazzo and Mosaic Contractors

- 1751 Carpentry Work *see* NAICS 235510: Carpentry Contractors
- 1752 Floor Laying and Other Floor Work, NEC *see* NAICS 235520: Floor Laying and Other Floor Contractors
- 1761 Roofing, Siding, and Sheet Metal Work *see* NAICS 235610: Roofing, Siding, and Sheet Metal Contractors
- 1771 Concrete Work *see* NAICS 235420: Drywall, Plastering, Acoustical and Insulation Contractors; NAICS 235710: Concrete Contractors
- 1781 Water Well Drilling *see* NAICS 235810: Water Well Drilling Contractors
- 1791 Structural Steel Erection *see* NAICS 235910: Structural Steel Erection Contractors
- 1793 Glass and Glazing Work *see* NAICS 235920: Glass and Glazing Contractors
- 1794 Excavation Work *see* NAICS 235930: Excavation Contractors
- 1795 Wrecking and Demolition Work *see* NAICS 235940: Wrecking and Demolition Contractors
- 1796 Installation or Erection of Building Equipment, NEC *see* NAICS 235950: Building Equipment and Other Machinery Installation Contractors
- 1799 Special Trade Contractors, NEC *see* NAICS 235210: Painting and Wall Covering Contractors; NAICS 235920: Glass and Glazing Contractors; NAICS 562910: Remediation Services; NAICS 235990: All Other Special Trade Contractors

FOOD & KINDRED PRODUCTS

- 2011 Meat Packing Plants *see* NAICS 311611: Animal (except Poultry) Slaughtering
- 2013 Sausages and Other Prepared Meats *see* NAICS 311612: Meat Processed From Carcasses
- 2015 Poultry Slaughtering and Processing *see* NAICS 311615: Poultry Processing; NAICS 311999: All Other Miscellaneous Food Manufacturing
- 2021 Creamery Butter *see* NAICS 311512: Creamery Butter Manufacturing
- 2022 Natural, Processed, and Imitation Cheese *see* NAICS 311513: Cheese Manufacturing
- 2023 Dry, Condensed, and Evaporated Dairy Products *see* NAICS 311514: Dry, Condensed, and Evaporated Dairy Product Manufacturing
- 2024 Ice Cream and Frozen Desserts *see* NAICS 311520: Ice Cream and Frozen Dessert Manufacturing
- 2026 Fluid Milk *see* NAICS 311511: Fluid Milk Manufacturing
- 2032 Canned Specialties *see* NAICS 311422: Specialty Canning; NAICS 311999: All Other Miscellaneous Food Manufacturing
- 2033 Canned Fruits, Vegetables, Preserves, Jams, and Jellies *see* NAICS 311421: Fruit and Vegetable Canning
- 2034 Dried and Dehydrated Fruits, Vegetables, and Soup Mixes *see* NAICS 311423: Dried and Dehydrated Food Manufacturing; NAICS 311211: Flour Milling
- 2035 Pickled Fruits and Vegetables, Vegetables Sauces and Seasonings, and Salad Dressings *see* NAICS 311421: Fruit and Vegetable Canning; NAICS 311941: Mayonnaise, Dressing, and Other Prepared Sauce Manufacturing

- 2037 Frozen Fruits, Fruit Juices, and Vegetables *see* NAICS 311411: Frozen Fruit, Juice, and Vegetable Processing
- 2038 Frozen Specialties, NEC *see* NAICS 311412: Frozen Specialty Food Manufacturing
- 2041 Flour and Other Grain Mill Products *see* NAICS 311211: Flour Milling
- 2043 Cereal Breakfast Foods *see* NAICS 311920: Coffee and Tea Manufacturing; NAICS 311230: Breakfast Cereal Manufacturing
- 2044 Rice Milling *see* NAICS 311212: Rice Milling
- 2045 Prepared Flour Mixes and Doughs *see* NAICS 311822: Flour Mixes and Dough Manufacturing from Purchased Flour
- 2046 Wet Corn Milling *see* NAICS 311221: Wet Corn Milling
- 2047 Dog and Cat Food *see* NAICS 311111: Dog and Cat Food Manufacturing
- 2048 Prepared Feed and Feed Ingredients for Animals and Fowls, Except Dogs and Cats *see* NAICS 311611: Animal (except Poultry) Slaughtering; NAICS 311119: Other Animal Food Manufacturing
- 2051 Bread and Other Bakery Products, Except Cookies and Crackers *see* NAICS 311812: Commercial Bakeries
- 2052 Cookies and Crackers *see* NAICS 311821: Cookie and Cracker Manufacturing; NAICS 311919: Other Snack Food Manufacturing; NAICS 311812: Commercial Bakeries
- 2053 Frozen Bakery Products, Except Bread *see* NAICS 311813: Frozen Bakery Product Manufacturing
- 2061 Cane Sugar, Except Refining *see* NAICS 311311: Sugarcane Mills
- 2062 Cane Sugar Refining *see* NAICS 311312: Cane Sugar Refining
- 2063 Beet Sugar *see* NAICS 311313: Beet Sugar Manufacturing
- 2064 Candy and Other Confectionery Products *see* NAICS 311330: Confectionery Manufacturing from Purchased Chocolate; NAICS 311340: Non-Chocolate Confectionery Manufacturing
- 2066 Chocolate and Cocoa Products *see* NAICS 311320: Chocolate and Confectionery Manufacturing from Cacao Beans
- 2067 Chewing Gum *see* NAICS 311340: Non-Chocolate Confectionery Manufacturing
- 2068 Salted and Roasted Nuts and Seeds *see* NAICS 311911: Roasted Nuts and Peanut Butter Manufacturing
- 2074 Cottonseed Oil Mills *see* NAICS 311223: Other Oilseed Processing; NAICS 311225: Fats and Oils Refining and Blending
- 2075 Soybean Oil Mills *see* NAICS 311222: Soybean Processing; NAICS 311225: Fats and Oils Refining and Blending
- 2076 Vegetable Oil Mills, Except Corn, Cottonseed, and Soybeans *see* NAICS 311223: Other Oilseed Processing; NAICS 311225: Fats and Oils Refining and Blending
- 2077 Animal and Marine Fats and Oils *see* NAICS 311613: Rendering and Meat By-product Processing; NAICS 311711: Seafood Canning; NAICS 311712: Fresh and Frozen Seafood Processing; NAICS 311225: Fats and Oils Refining and Blending
- 2079 Shortening, Table Oils, Margarine, and Other Edible Fats and Oils, NEC *see* NAICS 311225: Fats and Oils Refining and Blending; NAICS 311222: Soybean Processing; NAICS 311223: Other Oilseed Processing
- 2082 Malt Beverages *see* NAICS 312120: Breweries
- 2083 Malt *see* NAICS 312123: Malt Manufacturing
- 2084 Wines, Brandy, and Brandy Spirits *see* NAICS 312130: Wineries
- 2085 Distilled and Blended Liquors *see* NAICS 312140: Distilleries
- 2086 Bottled and Canned Soft Drinks and Carbonated Waters *see* NAICS 312111: Soft Drink Manufacturing; NAICS 312112: Bottled Water Manufacturing
- 2087 Flavoring Extracts and Flavoring Syrups NEC *see* NAICS 311930: Flavoring Syrup and Concentrate Manufacturing; NAICS 311942: Spice and Extract Manufacturing; NAICS 311999: All Other Miscellaneous Food Manufacturing
- 2091 Canned and Cured Fish and Seafood *see* NAICS 311711: Seafood Canning
- 2092 Prepared Fresh or Frozen Fish and Seafoods *see* NAICS 311712: Fresh and Frozen Seafood Processing
- 2095 Roasted Coffee *see* NAICS 311920: Coffee and Tea Manufacturing; NAICS 311942: Spice and Extract Manufacturing
- 2096 Potato Chips, Corn Chips, and Similar Snacks *see* NAICS 311919: Other Snack Food Manufacturing
- 2097 Manufactured Ice *see* NAICS 312113: Ice Manufacturing
- 2098 Macaroni, Spaghetti, Vermicelli, and Noodles *see* NAICS 311823: Pasta Manufacturing
- 2099 Food Preparations, NEC *see* NAICS 311423: Dried and Dehydrated Food Manufacturing; NAICS 111998: All Other Miscellaneous Crop Farming; NAICS 311340: Non-Chocolate Confectionery Manufacturing; NAICS 311911: Roasted Nuts and Peanut Butter Manufacturing; NAICS 311991: Perishable Prepared Food Manufacturing; NAICS 311830: Tortilla Manufacturing; NAICS 311920: Coffee and Tea Manufacturing; NAICS 311941: Mayonnaise, Dressing, and Other Prepared Sauce Manufacturing; NAICS 311942: Spice and Extract Manufacturing; NAICS 311999: All Other Miscellaneous Food Manufacturing

TOBACCO PRODUCTS

- 2111 Cigarettes *see* NAICS 312221: Cigarette Manufacturing

3086 Plastics Foam Products *see* NAICS 326150: Urethane and Other Foam Product (except Polystyrene) Manufacturing; NAICS 326140: Polystyrene Foam Product Manufacturing

3087 Custom Compounding of Purchased Plastics Resins *see* NAICS 325991: Custom Compounding of Purchased Resin

3088 Plastics Plumbing Fixtures *see* NAICS 326191: Plastics Plumbing Fixtures Manufacturing

3089 Plastics Products, NEC *see* NAICS 326122: Plastics Pipe and Pipe Fitting Manufacturing; NAICS 326121: Unsupported Plastics Profile Shape Manufacturing; NAICS 326199: All Other Plastics Product Manufacturing

LEATHER & LEATHER PRODUCTS

3111 Leather Tanning and Finishing *see* NAICS 316110: Leather and Hide Tanning and Finishing

3131 Boot and Shoe Cut Stock and Findings *see* NAICS 321999: All Other Miscellaneous Wood Product Manufacturing; NAICS 339993: Fastener, Button, Needle, and Pin Manufacturing; NAICS 316999: All Other Leather Good Manufacturing

3142 House Slippers *see* NAICS 316212: House Slipper Manufacturing

3143 Men's Footwear, Except Athletic *see* NAICS 316213: Men's Footwear (except Athletic) Manufacturing

3144 Women's Footwear, Except Athletic *see* NAICS 316214: Women's Footwear (except Athletic) Manufacturing

3149 Footwear, Except Rubber, NEC *see* NAICS 316219: Other Footwear Manufacturing

3151 Leather Gloves and Mittens *see* NAICS 315992: Glove and Mitten Manufacturing

3161 Luggage *see* NAICS 316991: Luggage Manufacturing

3171 Women's Handbags and Purses *see* NAICS 316992: Women's Handbag and Purse Manufacturing

3172 Personal Leather Goods, Except Women's Handbags and Purses *see* NAICS 316993: Personal Leather Good (except Women's Handbag and Purse) Manufacturing

3199 Leather Goods, NEC *see* NAICS 316999: All Other Leather Good Manufacturing

STONE, CLAY, GLASS, & CONCRETE PRODUCTS

3211 Flat Glass *see* NAICS 327211: Flat Glass Manufacturing

3221 Glass Containers *see* NAICS 327213: Glass Container Manufacturing

3229 Pressed and Blown Glass and Glassware, NEC *see* NAICS 327212: Other Pressed and Blown Glass and Glassware Manufacturing

3231 Glass Products, Made of Purchased Glass *see* NAICS 327215: Glass Product Manufacturing Made of Purchased Glass

3241 Cement, Hydraulic *see* NAICS 327310: Cement Manufacturing

3251 Brick and Structural Clay Tile *see* NAICS 327121: Brick and Structural Clay Tile Manufacturing

3253 Ceramic Wall and Floor Tile *see* NAICS 327122: Ceramic Wall and Floor Tile Manufacturing

3255 Clay Refractories *see* NAICS 327124: Clay Refractory Manufacturing

3259 Structural Clay Products, NEC *see* NAICS 327123: Other Structural Clay Product Manufacturing

3261 Vitreous China Plumbing Fixtures and China and Earthenware Fittings and Bathroom Accessories *see* NAICS 327111: Vitreous China Plumbing Fixture and China and Earthenware Fitting and Bathroom Accessories Manufacturing

3262 Vitreous China Table and Kitchen Articles *see* NAICS 327112: Vitreous China, Fine Earthenware and Other Pottery Product Manufacturing

3263 Fine Earthenware (Whiteware) Table and Kitchen Articles *see* NAICS 327112: Vitreous China, Fine Earthenware and Other Pottery Product Manufacturing

3264 Porcelain Electrical Supplies *see* NAICS 327113: Porcelain Electrical Supply Manufacturing

3269 Pottery Products, NEC *see* NAICS 327112: Vitreous China, Fine Earthenware, and Other Pottery Product Manufacturing

3271 Concrete Block and Brick *see* NAICS 327331: Concrete Block and Brick Manufacturing

3272 Concrete Products, Except Block and Brick *see* NAICS 327999: All Other Miscellaneous Nonmetallic Mineral Product Manufacturing; NAICS 327332: Concrete Pipe Manufacturing; NAICS 327390: Other Concrete Product Manufacturing

- 3273 Ready-Mixed Concrete *see* NAICS 327320: Ready-Mix Concrete Manufacturing
- 3274 Lime *see* NAICS 327410: Lime Manufacturing
- 3275 Gypsum Products *see* NAICS 327420: Gypsum and Gypsum Product Manufacturing
- 3281 Cut Stone and Stone Products *see* NAICS 327991: Cut Stone and Stone Product Manufacturing
- 3291 Abrasive Products *see* NAICS 332999: All Other Miscellaneous Fabricated Metal Product Manufacturing; NAICS 327910: Abrasive Product Manufacturing
- 3292 Asbestos Products *see* NAICS 336340: Motor Vehicle Brake System Manufacturing; NAICS 327999: All Other Miscellaneous Nonmetallic Mineral Product Manufacturing
- 3295 Minerals and Earths, Ground or Otherwise Treated *see* NAICS 327992: Ground or Treated Mineral and Earth Manufacturing
- 3296 Mineral Wool *see* NAICS 327993: Mineral Wool Manufacturing
- 3297 Nonclay Refractories *see* NAICS 327125: Nonclay Refractory Manufacturing
- 3299 Nonmetallic Mineral Products, NEC *see* NAICS 327420: Gypsum and Gypsum Product Manufacturing; NAICS 327999: All Other Miscellaneous Nonmetallic Mineral Product Manufacturing

PRIMARY METALS INDUSTRIES

- 3312 Steel Works, Blast Furnaces (Including Coke Ovens), and Rolling Mills *see* NAICS 324199: All Other Petroleum and Coal Products Manufacturing; NAICS 331111: Iron and Steel Mills
- 3313 Electrometallurgical Products, Except Steel *see* NAICS 331112: Electrometallurgical Ferroalloy Product Manufacturing; NAICS 331492: Secondary Smelting, Refining, and Alloying of Nonferrous Metals (except Copper and Aluminum)
- 3315 Steel Wiredrawing and Steel Nails and Spikes *see* NAICS 331222: Steel Wire Drawing; NAICS 332618: Other Fabricated Wire Product Manufacturing
- 3316 Cold-Rolled Steel Sheet, Strip, and Bars *see* NAICS 331221: Cold-Rolled Steel Shape Manufacturing
- 3317 Steel Pipe and Tubes *see* NAICS 331210: Iron and Steel Pipes and Tubes Manufacturing from Purchased Steel
- 3321 Gray and Ductile Iron Foundries *see* NAICS 331511: Iron Foundries
- 3322 Malleable Iron Foundries *see* NAICS 331511: Iron Foundries
- 3324 Steel Investment Foundries *see* NAICS 331512: Steel Investment Foundries
- 3325 Steel Foundries, NEC *see* NAICS 331513: Steel Foundries (except Investment)
- 3331 Primary Smelting and Refining of Copper *see* NAICS 331411: Primary Smelting and Refining of Copper
- 3334 Primary Production of Aluminum *see* NAICS 331312: Primary Aluminum Production
- 3339 Primary Smelting and Refining of Nonferrous Metals, Except Copper and Aluminum *see* NAICS 331419: Primary Smelting and Refining of Nonferrous Metals (except Copper and Aluminum)
- 3341 Secondary Smelting and Refining of Nonferrous Metals *see* NAICS 331314: Secondary Smelting and Alloying

- of Aluminum; NAICS 331423: Secondary Smelting, Refining, and Alloying of Copper; NAICS 331492: Secondary Smelting, Refining, and Alloying of Nonferrous Metals (except Copper and Aluminum)
- 3351 Rolling, Drawing, and Extruding of Copper *see* NAICS 331421: Copper (except Wire) Rolling, Drawing, and Extruding
- 3353 Aluminum Sheet, Plate, and Foil *see* NAICS 331315: Aluminum Sheet, Plate, and Foil Manufacturing
- 3354 Aluminum Extruded Products *see* NAICS 331316: Aluminum Extruded Product Manufacturing
- 3355 Aluminum Rolling and Drawing, NEC *see* NAICS 331319: Other Aluminum Rolling and Drawing
- 3356 Rolling, Drawing, and Extruding of Nonferrous Metals, Except Copper and Aluminum *see* NAICS 331491: Nonferrous Metal (except Copper and Aluminum) Rolling, Drawing, and Extruding
- 3357 Drawing and Insulating of Nonferrous Wire *see* NAICS 331319: Other Aluminum Rolling and Drawing; NAICS 331422: Copper Wire Drawing; NAICS 331491: Nonferrous Metal (except Copper and Aluminum) Rolling, Drawing, and Extruding; NAICS 335921: Fiber Optic Cable Manufacturing; NAICS 335929: Other Communication and Energy Wire Manufacturing
- 3363 Aluminum Die-Castings *see* NAICS 331521: Aluminum Die-Castings
- 3364 Nonferrous Die-Castings, Except Aluminum *see* NAICS 331522: Nonferrous (except Aluminum) Die-Castings
- 3365 Aluminum Foundries *see* NAICS 331524: Aluminum Foundries
- 3366 Copper Foundries *see* NAICS 331525: Copper Foundries
- 3369 Nonferrous Foundries, Except Aluminum and Copper *see* NAICS 331528: Other Nonferrous Foundries
- 3398 Metal Heat Treating *see* NAICS 332811: Metal Heat Treating
- 3399 Primary Metal Products, NEC *see* NAICS 331111: Iron and Steel Mills; NAICS 331314: Secondary Smelting and Alloying of Aluminum; NAICS 331423: Secondary Smelting, Refining and Alloying of Copper; NAICS 331492: Secondary Smelting, Refining, and Alloying of Nonferrous Metals (except Copper and Aluminum); NAICS 332618: Other Fabricated Wire Product Manufacturing; NAICS 332813: Electroplating, Plating, Polishing, Anodizing, and Coloring

FABRICATED METAL PRODUCTS, EXCEPT MACHINERY & TRANSPORTATION EQUIPMENT

- 3411 Metal Cans *see* NAICS 332431: Metal Can Manufacturing
- 3412 Metal Shipping Barrels, Drums, Kegs and Pails *see* NAICS 332439: Other Metal Container Manufacturing
- 3421 Cutlery *see* NAICS 332211: Cutlery and Flatware (except Precious) Manufacturing
- 3423 Hand and Edge Tools, Except Machine Tools and Hand-saws *see* NAICS 332212: Hand and Edge Tool Manufacturing
- 3425 Saw Blades and Handsaws *see* NAICS 332213: Saw Blade and Handsaw Manufacturing

TRANSPORTATION EQUIPMENT

- 3711 Motor Vehicles and Passenger Car Bodies *see* NAICS 336111: Automobile Manufacturing; NAICS 336112: Light Truck and Utility Vehicle Manufacturing; NAICS 336120: Heavy Duty Truck Manufacturing; NAICS 336211: Motor Vehicle Body Manufacturing; NAICS 336992: Military Armored Vehicle, Tank, and Tank Component Manufacturing
- 3713 Truck and Bus Bodies *see* NAICS 336211: Motor Vehicle Body Manufacturing
- 3714 Motor Vehicle Parts and Accessories *see* NAICS 336211: Motor Vehicle Body Manufacturing; NAICS 336312: Gasoline Engine and Engine Parts Manufacturing; NAICS 336322: Other Motor Vehicle Electrical and Electronic Equipment Manufacturing; NAICS 336330: Motor Vehicle Steering and Suspension Components (except Spring) Manufacturing; NAICS 336340: Motor Vehicle Brake System Manufacturing; NAICS 336350: Motor Vehicle Transmission and Power Train Part Manufacturing; NAICS 336399: All Other Motor Vehicle Parts Manufacturing
- 3715 Truck Trailers *see* NAICS 336212: Truck Trailer Manufacturing
- 3716 Motor Homes *see* NAICS 336213: Motor Home Manufacturing
- 3721 Aircraft *see* NAICS 336411: Aircraft Manufacturing
- 3724 Aircraft Engines and Engine Parts *see* NAICS 336412: Aircraft Engine and Engine Parts Manufacturing
- 3728 Aircraft Parts and Auxiliary Equipment, NEC *see* NAICS 332912: Fluid Power Valve and Hose Fitting Manufacturing; NAICS 336413: Other Aircraft Part and Auxiliary Equipment Manufacturing
- 3731 Ship Building and Repairing *see* NAICS 336611: Ship Building and Repairing
- 3732 Boat Building and Repairing *see* NAICS 811490: Other Personal and Household Goods Repair and Maintenance; NAICS 336612: Boat Building
- 3743 Railroad Equipment *see* NAICS 333911: Pump and Pumping Equipment Manufacturing; NAICS 336510: Railroad Rolling Stock Manufacturing
- 3751 Motorcycles, Bicycles, and Parts *see* NAICS 336991: Motorcycle, Bicycle, and Parts Manufacturing
- 3761 Guided Missiles and Space Vehicles *see* NAICS 336414: Guided Missile and Space Vehicle Manufacturing
- 3764 Guided Missile and Space Vehicle Propulsion Units and Propulsion Unit Parts *see* NAICS 336415: Guided Missile and Space Vehicle Propulsion Unit and Propulsion Unit Parts Manufacturing
- 3769 Guided Missile Space Vehicle Parts and Auxiliary Equipment, NEC *see* NAICS 336419: Other Guided

- Missile and Space Vehicle Parts and Auxiliary Equipment Manufacturing
- 3792 Travel Trailers and Campers *see* NAICS 336214: Travel Trailer and Camper Manufacturing
- 3795 Tanks and Tank Components *see* NAICS 336992: Military Armored Vehicle, Tank, and Tank Component Manufacturing
- 3799 Transportation Equipment, NEC *see* NAICS 336214: Travel Trailer and Camper Manufacturing; NAICS 332212: Hand and Edge Tool Manufacturing; NAICS 336999: All Other Transportation Equipment Manufacturing

MEASURING, ANALYZING, & CONTROLLING INSTRUMENTS

- 3812 Search, Detection, Navigation, Guidance, Aeronautical, and Nautical Systems and Instruments *see* NAICS 334511: Search, Detection, Navigation, Guidance, Aeronautical, and Nautical System and Instrument Manufacturing
- 3821 Laboratory Apparatus and Furniture *see* NAICS 339111: Laboratory Apparatus and Furniture Manufacturing
- 3822 Automatic Controls for Regulating Residential and Commercial Environments and Appliances *see* NAICS 334512: Automatic Environmental Control Manufacturing for Regulating Residential, Commercial, and Appliance Use
- 3823 Industrial Instruments for Measurement, Display, and Control of Process Variables; and Related Products *see* NAICS 334513: Instruments and Related Product Manufacturing for Measuring Displaying, and Controlling Industrial Process Variables
- 3824 Totalizing Fluid Meters and Counting Devices *see* NAICS 334514: Totalizing Fluid Meter and Counting Device Manufacturing
- 3825 Instruments for Measuring and Testing of Electricity and Electrical Signals *see* NAICS 334416: Electronic Coil, Transformer, and Other Inductor Manufacturing; NAICS 334515: Instrument Manufacturing for Measuring and Testing Electricity and Electrical Signals
- 3826 Laboratory Analytical Instruments *see* NAICS 334516: Analytical Laboratory Instrument Manufacturing
- 3827 Optical Instruments and Lenses *see* NAICS 333314: Optical Instrument and Lens Manufacturing
- 3829 Measuring and Controlling Devices, NEC *see* NAICS 339112: Surgical and Medical Instrument Manufacturing; NAICS 334519: Other Measuring and Controlling Device Manufacturing
- 3841 Surgical and Medical Instruments and Apparatus *see* NAICS 339112: Surgical and Medical Instrument Manufacturing
- 3842 Orthopedic, Prosthetic, and Surgical Appliances and Supplies *see* NAICS 339113: Surgical Appliance and Supplies Manufacturing; NAICS 334510: Electromedical and Electrotherapeutic Apparatus Manufacturing
- 3843 Dental Equipment and Supplies *see* NAICS 339114: Dental Equipment and Supplies Manufacturing
- 3844 X-Ray Apparatus and Tubes and Related Irradiation Apparatus *see* NAICS 334517: Irradiation Apparatus Manufacturing
- 3845 Electromedical and Electrotherapeutic Apparatus *see* NAICS 334517: Irradiation Apparatus Manufacturing;

- NAICS 334510: Electromedical and Electrotherapeutic Apparatus Manufacturing
- 3851 Ophthalmic Goods *see* NAICS 339115: Ophthalmic Goods Manufacturing
- 3861 Photographic Equipment and Supplies *see* NAICS 333315: Photographic and Photocopying Equipment Manufacturing; NAICS 325992: Photographic Film, Paper, Plate and Chemical Manufacturing
- 3873 Watches, Clocks, Clockwork Operated Devices and Parts *see* NAICS 334518: Watch, Clock, and Part Manufacturing

MISCELLANEOUS MANUFACTURING INDUSTRIES

- 3911 Jewelry, Precious Metal *see* NAICS 339911: Jewelry (Including Precious Metal) Manufacturing
- 3914 Silverware, Plated Ware, and Stainless Steel Ware *see* NAICS 332211: Cutlery and Flatware (except Precious) Manufacturing; NAICS 339912: Silverware and Plated Ware Manufacturing
- 3915 Jewelers' Findings and Materials, and Lapidary Work *see* NAICS 339913: Jewelers' Material and Lapidary Work Manufacturing
- 3931 Musical Instruments *see* NAICS 339992: Musical Instrument Manufacturing
- 3942 Dolls and Stuffed Toys *see* NAICS 339931: Doll and Stuffed Toy Manufacturing
- 3944 Games, Toys, and Children's Vehicles, Except Dolls and Bicycles *see* NAICS 336991: Motorcycle, Bicycle, and Parts Manufacturing; NAICS 339932: Game, Toy, and Children's Vehicle Manufacturing
- 3949 Sporting and Athletic Goods, NEC *see* NAICS 339920: Sporting and Athletic Good Manufacturing
- 3951 Pens, Mechanical Pencils, and Parts *see* NAICS 339941: Pen and Mechanical Pencil Manufacturing
- 3952 Lead Pencils, Crayons, and Artist's Materials *see* NAICS 337127: Institutional Furniture Manufacturing; NAICS 325998: All Other Miscellaneous Chemical Product Manufacturing; NAICS 339942: Lead Pencil and Art Good Manufacturing
- 3953 Marking Devices *see* NAICS 339943: Marking Device Manufacturing
- 3955 Carbon Paper and Inked Ribbons *see* NAICS 339944: Carbon Paper and Inked Ribbon Manufacturing
- 3961 Costume Jewelry and Costume Novelties, Except Precious Metals *see* NAICS 339914: Costume Jewelry and Novelty Manufacturing
- 3965 Fasteners, Buttons, Needles, and Pins *see* NAICS 339993: Fastener, Button, Needle and Pin Manufacturing
- 3991 Brooms and Brushes *see* NAICS 339994: Broom, Brush and Mop Manufacturing
- 3993 Signs and Advertising Specialties *see* NAICS 339950: Sign Manufacturing
- 3995 Burial Caskets *see* NAICS 339995: Burial Casket Manufacturing
- 3996 Linoleum, Asphalted-Felt-Base, and Other Hard Surface Floor Coverings, NEC *see* NAICS 326192: Resilient Floor Covering Manufacturing
- 3999 Manufacturing Industries, NEC *see* NAICS 337127: Institutional Furniture Manufacturing; NAICS 321999: All

Other Miscellaneous Wood Product Manufacturing; NAICS 316110: Leather and Hide Tanning and Finishing; NAICS 335121: Residential Electric Lighting Fixture Manufacturing; NAICS 325998: All Other Miscellaneous Chemical Product Manufacturing; NAICS 332999: All Other Miscellaneous Fabricated Metal Product Manufacturing; NAICS 326199: All Other Plastics Product Manufacturing; NAICS 323112: Commercial Flexographic Printing; NAICS 323111: Commercial Gravure Printing; NAICS 323110: Commercial Lithographic Printing; NAICS 323113: Commercial Screen Printing; NAICS 323119: Other Commercial Printing; NAICS 332212: Hand and Edge Tool Manufacturing; NAICS 339999: All Other Miscellaneous Manufacturing

TRANSPORTATION, COMMUNICATIONS, ELECTRIC, GAS, & SANITARY SERVICES

- 4011 Railroads, Line-haul Operating *see* NAICS 482111: Line-Haul Railroads
- 4013 Railroad Switching and Terminal Establishments *see* NAICS 482112: Short Line Railroads; NAICS 488210: Support Activities for Rail Transportation
- 4111 Local and Suburban Transit *see* NAICS 485111: Mixed Mode Transit Systems; NAICS 485112: Commuter Rail Systems; NAICS 485113: Bus and Motor Vehicle Transit Systems; NAICS 485119: Other Urban Transit Systems; NAICS 485999: All Other Transit and Ground Passenger Transportation
- 4119 Local Passenger Transportation, NEC *see* NAICS 621910: Ambulance Service; NAICS 485410: School and Employee Bus Industry; NAICS 487110: Scenic and Sightseeing Transportation; NAICS 485991: Special Needs Transportation; NAICS 485999: All Other Transit and Ground Passenger Transportation; NAICS 485320: Limousine Service
- 4121 Taxicabs *see* NAICS 485310: Taxi Service
- 4131 Intercity and Rural Bus Transportation *see* NAICS 485210: Interurban and Rural Bus Lines
- 4141 Local Bus Charter Service *see* NAICS 485510: Charter Bus Industry
- 4142 Bus Charter Service, Except Local *see* NAICS 485510: Charter Bus Industry
- 4151 School Buses *see* NAICS 485410: School and Employee Bus Industry
- 4173 Terminal and Service Facilities for Motor Vehicle Passenger Transportation *see* NAICS 488490: Other Support Activities for Road Transportation
- 4212 Local Trucking Without Storage *see* NAICS 562111: Solid Waste Collection; NAICS 562112: Hazardous Waste Collection; NAICS 562119: Other Waste Collection; NAICS 484110: General Freight Trucking, Local; NAICS 484210: Used Household and Office Goods Moving; NAICS 484220: Specialized Freight (except Used Goods) Trucking, Local
- 4213 Trucking, Except Local *see* NAICS 484121: General Freight Trucking, Long-Distance, Truckload; NAICS 484122: General Freight Trucking, Long-Distance, Less Than Truckload; NAICS 484210: Used Household and Office Goods Moving; NAICS 484230: Specialized Freight (except Used Goods) Trucking, Long-Distance

4214	Local Trucking with Storage <i>see</i> NAICS 484110: General Freight Trucking, Local; NAICS 484210: Used Household and Office Goods Moving; NAICS 484220: Specialized Freight (except Used Goods) Trucking, Local	4522	Air Transportation, Nonscheduled <i>see</i> NAICS 621910: Ambulance Services; NAICS 481212: Nonscheduled Chartered Freight Air Transportation; NAICS 481211: Nonscheduled Chartered Passenger Air Transportation; NAICS 487990: Scenic and Sightseeing Transportation
4215	Couriers Services Except by Air <i>see</i> NAICS 492110: Couriers; NAICS 492210: Local Messengers and Local Delivery	4581	Airports, Flying Fields, and Airport Terminal Services <i>see</i> NAICS 488111: Air Traffic Control; NAICS 488119: Other Airport Operations; NAICS 561720: Janitorial Services; NAICS 488190: Other Support Activities for Air Transportation
4221	Farm Product Warehousing and Storage <i>see</i> NAICS 493130: Farm Product Storage Facilities	4612	Crude Petroleum Pipelines <i>see</i> NAICS 486110: Pipeline Transportation of Crude Oil
4222	Refrigerated Warehousing and Storage <i>see</i> NAICS 493120: Refrigerated Storage Facilities	4613	Refined Petroleum Pipelines <i>see</i> NAICS 486910: Pipeline Transportation of Refined Petroleum Products
4225	General Warehousing and Storage <i>see</i> NAICS 493110: General Warehousing and Storage Facilities; NAICS 531130: Lessors of Mini-warehouses and Self Storage Units	4619	Pipelines, NEC <i>see</i> NAICS 486990: All Other Pipeline Transportation
4226	Special Warehousing and Storage, NEC <i>see</i> NAICS 493120: Refrigerated Storage Facilities; NAICS 493110: General Warehousing and Storage Facilities; NAICS 493190: All Other Warehousing and Storage Facilities	4724	Travel Agencies <i>see</i> NAICS 561510: Travel Agencies
4231	Terminal and Joint Terminal Maintenance Facilities for Motor Freight Transportation <i>see</i> NAICS 488490: Other Support Activities for Road Transportation	4725	Tour Operators <i>see</i> NAICS 561520: Tour Operators
4311	United States Postal Service <i>see</i> NAICS 491110: Postal Service	4729	Arrangement of Passenger Transportation, NEC <i>see</i> NAICS 488999: All Other Support Activities for Transportation; NAICS 561599: All Other Travel Arrangement and Reservation Services
4412	Deep Sea Foreign Transportation of Freight <i>see</i> NAICS 483111: Deep Sea Freight Transportation	4731	Arrangement of Transportation of Freight and Cargo <i>see</i> NAICS 541618: Other Management Consulting Services; NAICS 488510: Freight Transportation Arrangement
4424	Deep Sea Domestic Transportation of Freight <i>see</i> NAICS 483113: Coastal and Great Lakes Freight Transportation	4741	Rental of Railroad Cars <i>see</i> NAICS 532411: Commercial Air, Rail, and Water Transportation Equipment Rental and Leasing; NAICS 488210: Support Activities for Rail Transportation
4432	Freight Transportation on the Great Lakes-St. Lawrence Seaway <i>see</i> NAICS 483113: Coastal and Great Lakes Freight Transportation	4783	Packing and Crating <i>see</i> NAICS 488991: Packing and Crating
4449	Water Transportation of Freight, NEC <i>see</i> NAICS 483211: Inland Water Freight Transportation	4785	Fixed Facilities and Inspection and Weighing Services for Motor Vehicle Transportation <i>see</i> NAICS 488390: Other Support Activities for Water Transportation; NAICS 488490: Other Support Activities for Road Transportation
4481	Deep Sea Transportation of Passengers, Except by Ferry <i>see</i> NAICS 483112: Deep Sea Passenger Transportation; NAICS 483114: Coastal and Great Lakes Passenger Transportation	4789	Transportation Services, NEC <i>see</i> NAICS 488999: All Other Support Activities for Transportation <i>see</i> NAICS 487110: Scenic and Sightseeing Transportation, Land; NAICS 488210: Support Activities for Rail Transportation
4482	Ferries <i>see</i> NAICS 483114: Coastal and Great Lakes Passenger Transportation; NAICS 483212: Inland Water Passenger Transportation	4812	Radiotelephone Communications <i>see</i> NAICS 513321: Paging; NAICS 513322: Cellular and Other Wireless Telecommunications; NAICS 513330: Telecommunications Resellers
4489	Water Transportation of Passengers, NEC <i>see</i> NAICS 483212: Inland Water Passenger Transportation; NAICS 487210: Scenic and Sightseeing Transportation, Water	4813	Telephone Communications, Except Radiotelephone <i>see</i> NAICS 513310: Wired Telecommunications Carriers; NAICS 513330: Telecommunications Resellers
4491	Marine Cargo Handling <i>see</i> NAICS 488310: Port and Harbor Operations; NAICS 488320: Marine Cargo Handling	4822	Telegraph and Other Message Communications <i>see</i> NAICS 513310: Wired Telecommunications Carriers
4492	Towing and Tugboat Services <i>see</i> NAICS 483113: Coastal and Great Lakes Freight Transportation; NAICS 483211: Inland Water Freight Transportation; NAICS 488330: Navigational Services to Shipping	4832	Radio Broadcasting Stations <i>see</i> NAICS 513111: Radio Networks; NAICS 513112: Radio Stations
4493	Marinas <i>see</i> NAICS 713930: Marinas	4833	Television Broadcasting Stations <i>see</i> NAICS 513120: Television Broadcasting
