In 1783, following the Revolutionary War, the Treaty of Paris established the Great Lakes as the boundary between the United States and Canada, with the exception of Lake Michigan, which was entirely in U.S. territory. However, the Great Lakes remained the "English Seas" until Oliver Hazard Perry defeated the British fleet in the Battle of Lake Erie during the War of 1812. The Battle of Lake Erie was the last naval engagement fought on the Great Lakes. Neither the United States nor Canada now maintains warships or fortifications on the lakes. Although the international boundary runs down the middle of the lakes, the two countries have granted admiralty and criminal jurisdiction to each other covering the entirety of the Great Lakes.

Canals Expand Great Lakes Trade. The Great Lakes and the St. Lawrence River were always connected by natural waterways, but not all of those waterways were navigable. Fur traders were able to portage around the spectacular falls on the Niagara River or the much smaller falls on the Saint Mary's River, which linked Lake Superior with Lake Huron. But larger ships of commerce were unable to sail the entire stretch of the Great Lakes or navigate the Lachine Rapids on the upper St. Lawrence River.

The Erie Canal, completed in 1825, was the first navigable waterway to link the Great Lakes with the

Atlantic Ocean. It connected the city of Buffalo, at the eastern edge of Lake Erie, to Albany, 363 miles away. From there, ships were able to reach the harbor at New York by sailing down the Hudson River. The *St. Clair* became the first ship to travel all the way from Detroit to the Atlantic, lowering its masts at Buffalo so it would fit under the bridges as it was towed down the canal by mules.

With the opening of the Erie Canal, the cost of transporting freight from Lake Erie to New York fell from \$120 a ton to \$4 a ton. Several other canals were also dug in the early nineteenth century, linking other inland waterways with the Great Lakes. The Ohio-Erie Canal, also opened in 1825, ran from Cleveland to Akron, Ohio, and then followed the Scioto River to the Ohio River. The Miami-Erie Canal linked the Great Toledo with the bustling Ohio River port at Cincinnati. The Illinois and Michigan Canal, completed in 1848, is often called the single most important factor in the development of the state of Illinois. It linked the growing port at Chicago with the Mississippi River.

In 1829, a Canadian company opened the Welland Ship Canal, which further encouraged trade on the Great Lakes by making it possible to sail between Lake Erie and Lake Ontario. The original canal linked Lake Ontario with the Welland River, which flowed into the Niagara River above the falls. A laborious system of 40 locks lifted and lowered the ships. In 1833, the canal was extended from Port Robinson on the Welland River to Port Colborne on Lake Erie, entirely bypassing the 25-mile-long Niagara River. Canal reconstruction conducted between 1873 and 1887 reduced the number of locks to 25; a new canal completed in 1932 further reduced the number of locks to eight.

The opening of the Welland Canal left only Lake Superior cut off from the rest of the Great Lakes, since the 42-mile-long Saint Mary's River contained several stretches of rapids and a 19-foot waterfall. In 1668, French trappers established a portage and trading post on the river at the city of Sault Sainte Marie. Then in 1797, the Northwest Fur Company, an English enterprise, built a single-lock canal around the falls, which allowed canoes and flat-bottomed boats to navigate the river. However, the canal was destroyed by American troops during the War of 1812. In 1850, John Jacob Aster's American Fur Company built a tramway to carry cargo between Lake Huron and Lake Superior, but the need remained for a navigable waterway. With the growing importance of Lake Superior trade, entire ships were sometimes dragged between the lakes on wooden rollers.

Soon after Michigan became a state in 1837, Governor Stevens T. Mason announced plans to build a canal on the American side of the Saint Mary's Falls. However, the proposed canal would have crossed the Fort Brady

military reservation, and a detachment of U.S. soldiers stopped the project less than a week after it was started. Michigan then began lobbying Congress for permission and a federal grant to build the canal. For years the request went nowhere, reportedly blocked by Henry Clay, the powerful senator from Kentucky, who declared Lake Superior "beyond the farthest bounds of civilization, if not the moon."

Sentiment changed dramatically after 1844, when William Burt, a deputy U.S. government surveyor, accidentally discovered vast amounts of iron ore along the shores of Lake Superior. Jacob Houghton, a member of the surveying team, later wrote, "As we looked at the [compass], to our astonishment, the north end of the needle was traversing a few degrees to the south of west. Mr. Burt called out, 'Boys, look around and see what you can find.' We all left the line, some going to the east, some going to the west, and all of us returned with specimens of iron ore, mostly garnered from outcrops."

In his first State of the Union Address in 1851, President Millard Fillmore told Congress that a canal bypassing the Saint Mary's Falls "would be national in its purpose and benefits." In 1852, Congress granted Michigan a 400-foot right-of-way across the Fort Brady reservation. It also donated 750,000 acres of federally owned land in Michigan to pay for the project. In 1853, the Saint Mary's Falls Ship Canal Company broke ground on what would become the first of the Soo Locks.

The Saint Mary's Canal was completed in July of 1855. The brig *Columbia*, with six barrels of ore from the iron range at Marquette, became the first vessel to pass through the locks and sail down the river onto Lake Huron. More than 14,000 tons of ore were carried through the canal in 1856, the first full year of operation. That figure had risen to more than 153,000 tons by 1861, in time to play a major role in providing munitions for the North during the Civil War. In 1876, more than a million tons of iron ore, copper, grain, and other cargo passed through the canal, which by then had been expanded with a second lock to handle larger ships. In 1881, Michigan relinquished control of the canal to the federal government. The Canadian government opened the Sault Sainte Marie Canal on its side of the river in 1895. In 1900, 19 million tons of iron ore were shipped from the Great Lakes. By 1905, the tonnage had nearly doubled to 37 million tons. In 1855, the cost of hauling iron ore was \$3 a ton; by 1900, it was 60 cents.

A second canal was built on the U.S. side of the Saint Mary's River in the early 1900s, and the twin Davis and Sabin Locks were opened. The original South canal was expanded in 1943 with the MacArthur Lock. The largest of the Soo Locks, the 1,200-foot Poe, was opened on the South canal in 1969. The Soo Locks have been called the single most important development in the Great Lakes

shipping industry. Each new lock was bigger than the last and gave rise to bigger and wider freighters.

Great Lakes Freighters. Although steamships made their appearance on the Great Lakes in 1816, they were primarily engaged in passenger service or package delivery. A few masted steamers were used as cargo carriers in the mid-1800s, but nearly all freight was carried in wooden sailing ships. The most common freighters were known as Great Lakes schooners and were characterized by long, narrow beams. By one account, there were more than 1,700 schooners plying the Great Lakes in the 1870s, carrying grain, lumber, coal, and iron ore. The last full-rigged schooner ever built on the Great Lakes was the *Cora A*, launched in 1889 at Manitowoc, Wisconsin.

In the 1880s, however, shipbuilders began turning to steam and steel. The first Great Lakes freighter to be built of iron was the *Onoko*, launched in 1882. The *Onoko* was 300-feet in length, had a vast unobstructed cargo space, and could carry up to 3,000 tons. The *Onoko*, which operated for 33 years before being lost on Lake Superior, became the prototype for hundreds of Great Lakes freighters that would follow. Most freighters mimicked the *Onoko*'s long, low-riding cargo hold with a forecastle for crew and bridge and a housing at the stern for the engines.

The earlier Poe Lock, which opened on the Saint Mary's River in 1896, could handle ships with twice the cargo capacity of the *Onoko*, and the Great Lakes shipping industry was quick to take advantage. The 412-foot *Sir Henry Bessemer*, with a capacity of 6,700 tons, was launched the same year the lock opened. The 454-foot *Malietao*, launched in 1889, could carry 7,500 tons, a record that lasted until the 540-foot *Augustus B. Wolvin* took on 10,500 tons in 1904. More than 100 freighters the size of the *Wolvin* were launched in the first decade of the twentieth century, but even those giant ships were outclassed by 600-foot freighters with 15,000-ton capacities when the Davis and Sabin Locks opened in 1914 and 1919, respectively.

The first freighter to carry 20,000 tons was the *Wilfred S. Sykes*, launched in 1949, following completion of the MacArthur Lock. The *Sykes*, owned by the Inland Steel Corporation and still in operation in 1993, was nearly 700 feet long and 70 feet wide and had a draft of 37 feet. The largest of the U.S. locks, also named Poe for the one it replaced, was dedicated in 1969 and opened the way for the latest generation of Great Lakes freighters—1,000-foot supercarriers capable of taking on loads of 60,000 tons or more.

St. Lawrence Seaway. The St. Lawrence River is the second longest river in Canada. It flows northeast from its headwaters at the eastern end of Lake Ontario to the Bay of St. Lawrence, 800 miles away. Part of the river forms

the boundary between the province of Quebec and New York State. Navigating the lower St. Lawrence, from Montreal to Quebec, was always relatively easy. However, between Lake Ontario and Montreal, the upper St. Lawrence drops from 245 feet above sea level to 20 feet in a series of rapids, making access difficult.

In 1895, Canada and the United States began discussing the possibility of deepening the upper St. Lawrence and constructing a series of locks to open the river to international trade. In 1929, the International Joint Commission, established 20 years earlier to administer the boundary waters, recommended a combined navigation and power-generation project. In 1932, Canada and the United States signed the St. Lawrence Deep Waterway Treaty, which called for building a 27-foot-deep waterway between Lake Erie and Montreal, plus the construction of four hydroelectric plants. Several commercial interests opposed the project, including the railroads and coal companies, and the U.S. Senate rejected the treaty in 1934.

In 1941, the war in Europe revived interest in the proposed seaway, and the two countries signed the Great Lakes-St. Lawrence Basin Agreement, which added a power plant at Niagara Falls to the original proposal. The proposal still needed Congressional approval, but when the United States entered World War II a few months later, the issue was set aside. In 1942, power shortages in Ontario and New York delayed production of war materials, and President Franklin D. Roosevelt considered an executive order to begin the St. Lawrence project. He dropped the idea because it would take at least three years to bring the first power plant on line. The proposal languished in Congress until 1951, when Canada announced plans to proceed on its own. Congress then began serious discussions and approved U.S. participation in the project in 1954.

The St. Lawrence Seaway opened officially on June 26, 1959. Parts of the seaway lie entirely within Canada, whereas other sections lie within the United States. Although the St. Lawrence Seaway opened the Great Lakes to international trade, Great Lakes freighters and most ocean-going vessels built after 1970 were too large to use the locks.

The Dangers of Great Lakes Shipping. Hundreds of ships and thousands of lives have been lost during violent storms on the Great Lakes. As Jacques Marquette, one of the first white men to explore the region, wrote in the seventeenth century, "The winds from the Lake of the Illinois no sooner subside than they are hurled back by the Lake of the Hurons, and those from Lake Superior are the fiercest of all. In the winter months there is a succession of storms; and with these mighty waters all about us, we seem to be living in the heart of a hurricane." In one

terrible storm alone, in November 1913, more than 235 sailors were killed and 10 Great Lakes freighters lost. But the most famous shipwreck in Great Lakes history was the *Edmund Fitzgerald*.

In November 1975, the *Edmund Fitzgerald*, a freighter loaded with 26,000 tons of taconite iron pellets, was nearing the safety of Whitefish Bay, north of the Soo Locks. A brutal storm with hurricane-force winds and 30-foot waves had been battering the *Edmund Fitzgerald* for hours. The captain, a 44-year veteran of the Great Lakes, radioed a ship not far behind that the *Edmund Fitzgerald* was taking on water, but that there was no immediate danger. Suddenly, the *Edmund Fitzgerald* disappeared from the other ship's radar. The next day, searchers found some debris, but no sign of the ship or any of its 29 crew members.

Initial reports suggested the *Edmund Fitzgerald* was lifted by two waves, one at the stern and one at the bow, causing the unsupported weight of its cargo to snap the 729-foot ship in two, sending it instantly to the bottom of the lake. However, after locating and photographing the ship several months later, a Coast Guard investigation determined the most likely cause of the disaster was flooding of the cargo holds, which caused the *Edmund Fitzgerald* to suddenly dive bow first below the water, much like a submarine. The Great Lakes Association presented a third possibility. The industry position was that the ship hit a shoal when it came too close to an island, which tore open the hull. Whatever the cause, the ship broke in two, coming to rest in 525 feet of water with the stern half upside down.

As the size of ships operating on the Great Lakes grew, their numbers decreased. In the early 1950s, there were more than 300 U.S. flagged ships operating on the Great Lakes, but that number fell to about 120 by the end of the 1970s. A nationwide recession took a further toll on shipping in the 1980s, reducing the number of vessels to just 45 by 1986. By 1995, the number had increased to 59 ships in operation on the Great Lakes. It must be noted, however, that modern Great Lakes freighters carry substantially larger cargoes than their smaller predecessors. In 1995, for instance, the fleet boasted 13 self-unloaders that were 1,000 feet long. These 13 ships had the same carrying capacity as 65 of the older 600-foot vessels.

Iron ore for the steel industry has long been the primary cargo for U.S. flagged ships on the Great Lakes. Therefore, the Great Lakes shipping industry was seriously affected by economic conditions that crippled Midwestern steelmakers in the 1980s, especially the influx of cheap foreign steel and a general economic recession. In bullish economies, United States and Canadian Lakes freighters carried as much as 100 million tons of ore in a single season, generally from late March to early January,

before ice closed the Soo Locks. However, from 1983 until the early 1990s, the Great Lakes fleet averaged about 60 million tons per year. In 1995 the Great Lakes vessels carried 70.6 million net tons of iron ore as compared to 64.3 million net tons in 1991.

Coal was the second largest cargo for Great Lakes shippers. Most of the coal was mined in the Appalachian regions of West Virginia, Kentucky, Pennsylvania, and Ohio and shipped by rail to ports on Lake Erie. From there, it was distributed by freighters to utilities and industries throughout the Great Lakes region. Midwest coal also was loaded at Chicago and Thunder Bay, Ontario. Low-sulfur coal from the Powder River Basin in Wyoming and Montana was loaded at Superior, Wisconsin, which shared a harbor with Duluth, Minnesota. Low-sulfur coal was used by utilities on the Lower Great Lakes because burning it produced less sulfur dioxide, a major cause of air pollution. In 1995, coal shipments totaled 32.9 million net tons, down from 35.3 million in 1991.

Other Great Lakes cargoes included limestone and gypsum for the steel industry, cement, and liquid bulk products such as asphalt, gasoline, and light heating oil. In 1995 Great Lakes freighters carried 34.6 million net tons of limestone and gypsum, 4.6 million tons of cement, and 4.7 million tons of liquid bulk products. In the same year, 18.8 million net tons of grain were carried on the Great Lakes. This represented the most U.S. grain shipped on the Great Lakes since 1984 and was fueled by strong overseas markets and ample stocks from a good growing season. Dry and liquid-bulk commerce on the Great Lakes totaled 173.6 million net tons in 1995.

The 1995 navigation season on the Great Lakes was blessed by favorable weather and a favorable economic climate. The season opened on March 25 and by May 1 all 59 U.S. flag self-unloaders available for service were in operation. The season closed on January 15, 1996, for a total of 297 days. The 1996 season was expected to be a repeat of the 1995 season. This optimistic prediction was based on select sectors of a strong U.S. economy. Especially important was a growing foreign market for steel, which was expected to boost iron ore shipments, long a mainstay of Great Lakes commerce. By early 1996, industry insiders were hopeful about the year's grain shipments, but by mid-year optimism had turned to pessimism. A quick drop in grain shipments forced shipping concerns to tie up some of their vessels. Winnipeg-based Seaway Bulk Carriers was forced to sideline 12 of their 24 grain carriers. Canadian movement of grain through the end of June was down by 1.4 million metric tons as compared to 1995, while U.S. shipments were down 1.7 million metric tons compared to a year earlier. The drop was blamed on low grain supplies, not low demand or low prices. The low supply of grain was due to a late

winter and wet spring, which delayed the planting of wheat in many regions.

The Jones Act. Passed in 1920, the Jones Act required that cargo shipped between U.S. ports be carried in vessels that were owned, crewed, and built by U.S. citizens. Other cabotage laws set similar standards for passenger service, towing in U.S. harbors, and salvage operation in territorial waters. Initially, the Jones Act was passed to ensure the safety of U.S. ports and guarantee that the United States would maintain a strong merchant marine. In lobbying for continued enforcement, the Lake Carriers' Association also pointed out that by protecting the Great Lakes fleet from foreign competition, the Jones Act provided the assurance that shippers needed to invest in safe, modern vessels that are manned by seaman who are certified by the U.S. Coast Guard.

In 1996, however, the Coastal Shipping Competition Act (H.R. 4006) was introduced in the U.S. House of Representatives. This bill was similar to legislation introduced in the U.S. Senate earlier in the year. These bills, if passed, would allow foreign-flag, foreign-built vessels to carry U.S. products between U.S. ports. Adherents of the legislation claim that the lack of adequate waterborne transportation vessels had a negative effect on the movement of American products between American ports. In other words, existing American flag vessels were inadequate to meet the demand. This forced businesses and consumers to purchase foreign goods that could be moved between U.S. ports on foreign vessels. Opponents of the legislation, which included the Lake Carrier's Association, believed that repealing the Jones Act would result in the loss of 125,000 American jobs on the Great Lakes and decimate the domestic shipbuilding industry.

Winter Navigation. When the Soo Canal was opened in 1855, the weather controlled the navigation season. Fierce gales would begin whipping across Lake Superior in November, sending most Great Lakes schooners scurrying for port. By mid-December, ice closed the canal completely, and shipping did not resume until the spring thaw. The steel-hulled steamers that began replacing the schooners in the 1880s were better suited to challenge the weather. As bigger and more powerful ships were able to break through the ice, the closing date was pushed back steadily to as late as mid-January. From 1974 to 1979, the locks were open year-round.

Environmentalists raised concerns in the 1980s that year-round operation might have adverse affects on water levels in Lake Superior and the lower Great Lakes and that ships forcing their way through ice-covered channels might cause damage to the shoreline. Such concerns prompted the Soo Canal to revert to a navigation season based on the formation of ice. In 1990, the Army Corps of Engineers said it found no evidence of environmental

damage and set January 15 as the official closing date. In 1993, although environmental groups still objected, the Corps recommended March 21 as the official date to open the locks. The Lake Carriers' Association supported establishment of a fixed navigational season. In early 1996, however, the U.S. Army Corps of Engineers published a notice in the Federal Register proposing that the Soo Locks open on March 25, fixing the Great Lakes navigation season from that date until January 15. The Lake Carrier's Association saw this set season as a compromise they could live with.

Another issue on the Lake Carriers' Association agenda was the status of the Coast Guard's icebreaker, the *U.S.S. Mackinaw*. As the navigational season above the Soo Locks lengthened, freighters occasionally needed the *Mackinaw* to free them from unusually heavy ice build-up and to keep the shipping lanes open. For example, gale-force winter winds on Lake Superior have been known to create six-foot-high windrows of ice at the Duluth/Superior harbor in a matter of hours. The *Mackinaw* was also needed to break up ice in the St. Clair River north of Detroit twice in the 1980s. In the late 1980s, the Coast Guard announced that it would decommission the *Mackinaw* because of budget problems, but the Lake Carriers' Association convinced Congress to save the icebreaker. A modernization program that the association said would cut the *Mackinaw's* \$3 million operating expense in half was scheduled to begin in 1993. In its annual report for 1992, the Lake Carriers' Association said, "The March 21-January 15 navigation season so necessary to the continued health of the Great Lakes economy can be attained with certainty only if the *Mackinaw* is primed and ready for the ice seasons that accompany the opening and closing of navigation."

By 1996, however, the Lake Carrier's Association was beginning to modify its stand on the *Mackinaw*. Christened in 1944 the *Mackinaw*, was the most powerful of the nine Coast Guard icebreakers operating on the Great Lakes. Capable of generating 10,000 shaft horsepower and displacing 5,000 tons, no windrow of ridged ice on the Lakes proved too much for the *Mackinaw*. Although recognizing that the 51-year-old cutter was structurally sound and internal modernization could be cost-effective, the Association questioned the economic viability of year-round maintenance on a vessel used only during the winter shipping season. Members of the Association noted that an off-season use for the vessel could not be found and that the *Mackinaw* was "under utilized" during the summer months. They noted that it was perhaps time to "plan for a post-*Mackinaw* world." One option was the possible leasing of an icebreaker. In the interim, the Association planned to continue to support the operation of the *Mackinaw*, and if a replacement was ever planned, the Association felt it should be a multipur-

pose vessel adaptable to a variety of year-round tasks. In late 1999 the Coast Guard officially announced that the *Mackinaw* would be decommissioned following the 2005 to 2006 season. Renovating it would have cost \$147 million, but a new vessel would only cost an estimated \$128 million. As of 1999, the *Mackinaw* averaged 134 days out of port per year; it was hoped that her replacement would sail 185 days per year.

Industry Concerns. Twenty-two of the U.S. flagged ships operating on the Great Lakes in 1993, representing almost 70 percent of the American fleet's total cargo capacity, were called Poe-class vessels. This meant they were too large to use any of the locks at Sault Sainte Marie except the Poe Lock, which was opened in 1969. In 1986, Congress authorized the construction of a second Poe-sized lock as part of the Water Resources Development Act. However, the law required that local funding pay 35 percent of the cost, and the lock was never built.

In 1992 the Lake Carriers' Association estimated a new Poe-sized lock would cost \$400 million, with local costs of \$140 million. In lobbying for full federal funding, the association warned that any lengthy closure of the Poe Lock would bring much of the U.S.-flag shipping on the Great Lakes to a standstill. Canadian ships and other foreign-flagged vessels small enough for the locks on the St. Lawrence Seaway would not be affected.

Another environmental concern for Great Lakes carriers was the disposal of materials dredged from ports and navigation channels. Each inch of reduced draft in waterways reduced the amount of cargo that could be carried by a 1,000-foot freighter by roughly 270 tons. With shoreline erosion, storm runoff, and airborne dirt, dredging was an ongoing requirement. Until 1970, sediment was disposed of by dumping it in deep water areas. But sediment, especially from industrial ports, was often contaminated with petroleum products and other chemicals. In the 1970s, the federal government began requiring that material dredged from harbors be stored in government-built confined disposal facilities. As a result, in the early 1990s, some harbors had not been dredged in nearly 20 years. According to the Lake Carriers' Association, disposal facilities at Duluth and Cleveland would be full by the end of the century, and all but two of the remaining 24 disposal facilities would be full by 2006.

The Association urged the federal government to allow non-polluted sediment to be dumped in deep water or used constructively for projects such as beach replenishment. Under the Association's plan, disposal facilities would be reserved for contaminated sediment. The Association also urged the federal government to pay part of the cost of dredging and for the construction of new disposal facilities where containment was necessary.

In 1999, the estimated capacity of the U.S. Flag Great Lakes fleet (in excess of 1,000 gross registered tonnage) was 732,403 deadweight tons (DWT.) for dry bulk active carriers (plus another 222,968 DWT. for inactive laid-up carriers); 78,465 DWT. for active (plus 3,413 DWT. for inactive) ITB bulk carriers; and 9,758 DWT. for the active tanker (and 8,150 DWT. for the inactive tanker). Total 1999 DWT. capacity was 1,060,157. As of September 1999, rate hikes for cargo shipments on the Great Lakes had varied less than 0.4 percent overall from those of 1998. (This statistic was controlled by supply and demand.) However, 1998 business had been significantly better than 1997, with a 4 to 6 percent increase overall.

CURRENT CONDITIONS

In the early 2000s, the Lake Carriers' Association—which represents the majority of U.S. flag ships transporting freight on the Great Lakes—was comprised of 12 member companies. Together, their ships had a combined capacity of nearly two million gross tons. Of the 162.3 million net tons of dry bulk cargo shipped during 2002 (a decrease of 1.4 percent from 2001), 36 percent was iron ore, followed by coal (26 percent) and stone (22 percent). The remainder consisted of salt, cement, potash, and grain.

The total number of active vessels in the U.S. Flag Great Lakes Fleet has been declining steadily in recent years. From 66 vessels in 1998, the fleet's size fell to 63 vessels in 1999 and 2000, and 58 in 2001 and 2002. According to the Lake Carriers' Association, this decrease was attributable to downturns in the U.S. steel industry. With the exception of intra-territory traffic, the U.S. Army Corps of Engineers revealed that all categories of domestic U.S. waterborne traffic declined from 2000 to 2001. However, lake-wise traffic saw the largest year-to-year decline from 2000, falling 12.6 percent on a tonnage basis.

According to the January 6, 2002, issue of the *Chicago Tribune*, declining water levels across the Great Lakes have caused concern within the industry in recent years. The publication reported that levels fell to 35-year lows in the early 2000s due to mild winters and dry weather conditions. Revealing the consequences for shippers, U.S. Great Lakes Shipping Association Executive Director Helen Brohl explained: "for every inch of water Lake Michigan loses, a cargo ship must reduce its load by 90 to 115 metric tons. Per barge, that means a loss of between \$22,000 and \$28,000—costs that are typically passed on to the consumer—for every inch the water drops."

INDUSTRY LEADERS

American Steamship Company. The American Steamship Company was founded in 1907 by Adam E. Cornelius, Sr. and John J. Borland, Sr. The Oswego

Shipping Company purchased American Steamship in the 1960s and sold the company in the 1970s to the GATX Corporation. The company's headquarters are in Williamsville, New York. American Steamship's 770-foot *St. Clair* set a record in 1997 by delivering the largest coal cargo (45,411 tons) to a Canadian Great Lakes port west of the Welland Canal (Nanticoke).

In 2003, American Steamship operated 11 self-unloading freighters with a combined capacity of 479,100 gross tons. In cargo capacity, American Steamship has ranked as the largest of the U.S. flagged Great Lakes shipping companies in recent years. Seven of the company's lakers were Poe-class vessels, including the 1,000-foot *Indiana Harbor*, which carried a U.S. flag record 64,390 tons of iron ore in one trip through the Soo Canal in 1986. In the 1990s, American Steamship carried about 50 percent of the coal shipped on the Great Lakes. It also carried iron ore and stone.

Interlake Steamship Company. The Interlake Steamship Company, headquartered in Cleveland, Ohio, was another leading Great Lakes freight company in the early 2000s. In 2001, the company operated 10 vessels with a total capacity of almost 364,000 tons. In May of 1998, its *Elton Hoyt 2nd*, at 698 feet, became the longest vessel to ever navigate the Federal Channel in Cleveland's Cuyahoga River, known for its twisting path. In 1999, Interlake moved its Great Lakes office from Cleveland to a new \$5.2 million building in Richfield.

Oglebay Norton Company. The Oglebay Norton Company was founded in 1890 by Earl W. Oglebay and David Z. Norton. Oglebay was an experienced shipping agent and Norton was a former bank head cashier acting on behalf of oil magnate John D. Rockefeller, who had purchased iron-bearing land in the Mesabi range of Minnesota. Both Oglebay and Rockefeller were associated with the Tuttle family, pioneers in iron-ore shipping on the Great Lakes. As a teenager in the 1850s, Rockefeller worked for shipping agents Isaac Hewitt and Henry Tuttle. The firm of Hewitt & Tuttle later became H.B. Tuttle & Company. In the 1880s, Oglebay became acquainted with Horace Tuttle, who was then running the company founded by his father. In 1884, Tuttle & Company became Tuttle, Oglebay and Company. Horace Tuttle died in an accident in 1889 and in the following year Tuttle, Oglebay and Company was dissolved and succeeded by Oglebay Norton.

Oglebay Norton managed sales and shipping for Rockefeller's Lake Superior Consolidated Iron Mines until 1901, when Rockefeller sold his ships and mining interests to the U.S. Steel Corporation. Oglebay Norton continued as a shipping agent for other mining interests, eventually acquiring a fleet of ships and forming the Columbia Steamship Company in 1920. The *Edmund Fitz-*

gerald was the flagship for the Columbia fleet from 1958 until it sank in 1975. More recently, the company's 1,000-foot *Columbia Star* set a coal cargo long-haul record of 70,903 net tons on July 6, 1997.

In 1928, the company also began manufacturing equipment for the steel-making industry. The company began shipping coal in 1936. In 1939, Oglebay Norton formed the Reserve Mining Company and began mining taconite, a low-grade iron ore previously considered useless. As high-quality iron ore reserves dwindled, taconite grew in importance. From the 1970s on, almost all iron ore mined in Michigan and Minnesota was taconite.

As of 2003, Oglebay Norton operated the largest fleet among Great Lakes shipping companies. Among its 12 vessels were two 1,000-foot freighters, the *Columbia Star* and *Oglebay Norton*, each of which could carry more than 60,000 tons. The fleet's cargo capacity was about 340,000 tons. The *Oglebay Norton* set a record in 1992 by hauling 59,078 tons of limestone from Cedarville, Michigan, to Ludington, Michigan. In 1986, the same ship, then known as the *Lewis Wilson Foy*, carried a record 72,351 tons of iron ore. In January 2002, Oglebay Norton and American Steamship entered into a multiyear agreement to pool the assets of their respective fleets, in order to improve levels of efficiency and service for customers.

SIC 4449

WATER TRANSPORTATION OF FREIGHT, NOT ELSEWHERE CLASSIFIED

This category includes establishments primarily engaged in transportation of freight on all inland waterways, including the intracoastal waterways on the Atlantic and Gulf Coasts. Transportation of freight on the Great Lakes and the St. Lawrence Seaway is classified in **SIC 4432: Freight Transportation on the Great Lakes—St. Lawrence Seaway**. Establishments primarily engaged in providing lightering and towing or tugboat services are classified in Industry Group No. 449: Services Incidental to Water Transportation.

NAICS CODE(S)

483211 (Inland Water Freight Transportation)

INDUSTRY SNAPSHOT

There are approximately 12,000 miles of navigable inland waterways used by the domestic shipping trades in the United States. This statistic does not include the Great Lakes merchant marine trade, which if included, would almost double the statistic. In 2002 the industry was served by 3,429 towboats, some 22,438 dry cargo barges, and 3,501 tanker barges. Excluding Great Lakes shipping, the inland trade industry moved 691 million metric tons of freight in 2000, which included one-fourth of the exported petroleum and chemical shipments and three-fifths of the exported grain shipments, as well as one-fifth of the domestic coal shipments.

The inland and intracoastal navigation system is operable in water from 6 to 9 feet in depth, but several thousand miles are considerably deeper. The most important inland waterways for commerce are the Mississippi River System, the Gulf Intracoastal Waterway, the Columbia River System, the McClellan-Kerr Arkansas River Navigation System, the Tennessee-Tombigbee-

Mobile River System, and the Hudson River-New York State Barge Canal System. About one-third of all inland traffic is on the Mississippi River, followed by the Ohio River, the Gulf Intracoastal Waterway, the Illinois Waterway, and the Tennessee River, in that order.

Most freight consists of dry bulk cargo and is carried aboard barges known as hoppers. This includes grain, coal, and chemicals. Petroleum products, which account for about 40 percent of the inland waterways cargo, are carried in tank barges. Ocean-going tank barges used on the Gulf and Atlantic Intracoastal Waterways may carry as much as 225,000 barrels of oil. Tonnage is high during the crop harvest months, but the Upper Mississippi and Missouri Rivers are closed to barge traffic in winter.

Inland waterway transportation of freight is considered the safest, least polluting, and most cost efficient of all freight transportation in the United States. Waterway transportation of freight is more than twice as energy efficient as rail transportation, and eight times as efficient as truck transportation. The U.S. Coast Guard enforces regulations regarding design, construction, and operation of towboats and river barges. In addition, the Coast Guard is responsible for licensing crews aboard the vessels. Cabotage laws require that vessels involved in inland water transportation of freight be built, owned, and crewed by American citizens or U.S. owned companies.

BACKGROUND AND DEVELOPMENT

Mississippi River System. The Mississippi River system consists of the Mississippi and Ohio Rivers and their tributaries. It was the busiest and most important inland waterway in the United States in the early 1990s, accounting for about 40 percent of all freight shipped on the nation’s inland and intracoastal waterways. By 2003, more than 150 million tons of petroleum, coal, chemicals, and grain worth more than \$24 billion were transported in the Upper Mississippi River Basin each year. More than 700 million tons of both international and domestic freight were carried annually on the Mississippi River in the 1990s, with an additional 480 million tons each year via internal traffic. Of the international and domestic freight, nearly 70 percent was internal Mississippi River freight.

More than 50,000 barges and 4,000 ocean-going vessels traveling the Mississippi call at the Port of South Louisiana at the mouth of the river. The port, extending 54 miles along the Mississippi, was the largest tonnage port in the United States, and the third biggest in the world, handling more than 245 million tons of cargo in 2000. Some 15 percent of all U.S. exports went through this port.

The Mississippi River is the longest river in the United States, flowing more than 2,300 miles from northwestern Minnesota to the Gulf of Mexico. More than

1,800 miles are considered navigable. A series of 29 dams and locks constructed by the Army Corps of Engineers after World War I ensured a minimum depth of nine feet on the upper Mississippi as far north as Minneapolis. Below St. Louis, the Mississippi reaches depths of 100 feet or more. The Mississippi River-Gulf Outlet, a 76-mile canal between New Orleans and the Gulf of Mexico, was completed in 1963. It opened the port of New Orleans to ocean-going vessels and cut more than 40 miles off the river's winding course through the treacherous Mississippi Delta.

The Ohio River is more than 980 miles long, beginning at Pittsburgh, where it is formed by the confluence of the Allegheny and Monongahela Rivers, and flowing to Cairo, Illinois, where it joins the Mississippi. It is the second largest barge line in the inland waterways system. The only serious impediment to navigation on the Ohio was removed in 1830 with the construction of the Louisville and Portland Canal around the Falls of the Ohio at Louisville, Kentucky. A system of 41 moveable dams completed in 1929 eliminated the problem of low water and permitted year-round navigation. Major tributaries to the Mississippi and Ohio Rivers include the Tennessee, Arkansas, Cumberland, Missouri, and Illinois Rivers.

The Mississippi and Ohio Rivers were opened to exploration by the French in the 1600s, but did not become important rivers of commerce until the beginning of the nineteenth century. Settlers began moving into the Ohio Valley about the time of the American Revolution, and records indicate shipments of flour from Louisville to New Orleans as early as 1782. In 1783 a Louisville merchant advertised goods from Philadelphia that had been shipped up the Mississippi. Commerce was occasionally interrupted as Spain, which had obtained the Louisiana Territory from France in 1762, strictly controlled trade on the Mississippi and periodically closed the river to foreign navigation. In 1801, Spain ceded the territory back to France, which sold it to the United States in 1803 in the Louisiana Purchase.

With access to the Gulf of Mexico guaranteed by the Louisiana Purchase, south bound commerce on the Mississippi grew rapidly with pork, corn, whisky, hides, and other agricultural products from the Ohio Valley shipped aboard flatboats or the more colorful keel boats, which could haul up to 10 tons. Strong river currents kept trade moving in one direction until the introduction of the steamboat in about 1817. Within just a few years, 60 steamboats plied the waters of the Mississippi and Ohio Rivers. By the mid-1830s, there were more than 230 such boats. By the 1840s, steamboats regularly carried grain and lead from the upper Mississippi; coal from the Ohio Valley; and cotton, sugar, and molasses from the South. Stern-wheelers, introduced in the late 1850s, could carry up to 350 tons of cargo while still maintaining less than

three feet of draft. Rates for freight shipped from New Orleans to Louisville fell from \$5 per hundredweight in 1815 to only 25 cents in 1860. Rates for the return trip fell from \$1 to 32 cents.

The commercial importance of the Mississippi River System, especially for east-west trade, began to decline in the 1850s with the construction of railroads, which could deliver goods faster and more directly. This became especially apparent during the Civil War, when the Confederacy mistakenly believed it could cripple the Union by controlling the Mississippi. After the war, shipments of coal increased dramatically, but railroads captured most of the grain and cotton trade. Between 1870 and 1891, the number of steamboats on the Mississippi and Ohio Rivers dropped from almost 500 to about 150. Barges, pushed ahead by steamboats, began to carry much of the remaining river trade. In 1904, the steamboat *Sprague* set a record by guiding a "tow" of 56 barges loaded with 53,000 tons of coal from Cairo to New Orleans. Steamboats continued to operate on the Mississippi and Ohio Rivers until the early 1900s, when they were replaced by diesel powered towboats. Although called towboats, the vessels actually pushed their "tows."

The United States recognized the importance of river freight during World War I, when the railroads were unable to meet the increased demands for shipping, and the government was forced to build an emergency fleet of barges and towboats. This led to a revival of trade on the Mississippi River System in the 1920s, when the upper Mississippi channel was dredged to a depth of nine feet and a series of moveable dams made it possible to navigate the Ohio during low-water months. Shipments on the Ohio increased from 7 million tons in 1915 to 22 million tons in 1929. The Inland Waterways Corporation, created by Congress in 1924 to regulate freight transport on the rivers, also developed a radically new towboat design with increased power that further revitalized the industry. In 1938, Congress authorized the construction of floodwalls along the Ohio and reservoirs on its tributaries to control flooding. In 1944, Congress also passed the Flood Control Act, which included provisions for a 12-foot channel and a series of dams on the upper Mississippi, and modernization of locks and dams on the Ohio. Work on the improvements did not begin until 1954.

Nearly 35 percent of the freight carried on the Mississippi River System in the early 1990s was petroleum products. Coal accounted for about 25 percent. Tows on the lower Mississippi often included as many as 40 barges—the equivalent of 600 railroad cars of freight—and were the size of four football fields.

Overall demand for inland waterway shipping grew only slightly during the 1998-1999 trade season. With an aging barge fleet, capacity was expected to decrease, to keep rates up, while volume was expected to expand less

than 0.5 percent through 2010. One exception was the Mississippi River, which had a good season in 1999. Its rates were generally higher than the 6.1 percent average rate increase appreciated by the water transportation industry overall.

Intracoastal Waterways. The Gulf Intracoastal Waterway is a natural, sheltered waterway completed in 1949 that follows the coastline of the Gulf of Mexico for 1,065 miles from Brownsville, Texas, to Carrabelle, Florida. The Atlantic Intracoastal Waterway also is a system of rivers, bays, estuaries, and inlets that stretches 1,200 miles from Miami, Florida, to Trenton, New Jersey. There are three major canals along the Atlantic Intracoastal Waterway: the Chesapeake and Delaware Canal across northern Delaware, which connects Chesapeake Bay with the Delaware River just south of Philadelphia; the Dismal Swamp Canal, south of Norfolk, Virginia; and the Caloosahatchee River-St. Lucie Canal across southern Florida. Vessels traveling the Atlantic Intracoastal Waterway are exposed to the ocean for less than 100 miles during the entire route.

Columbia Snake River System. The Columbia Snake River System is the longest river in the United States to flow into the Pacific Ocean. It is the nation's second largest waterway. From its headwaters in the Canadian province of British Columbia, the Columbia flows southwest through Washington state before turning westward to form much of the northern border of Oregon and joining the Snake River at Lewiston, Idaho. Along its course are 465 miles of navigable waterways and 36 large and small ports. Eleven dams on the American portion of the Columbia, including the Grand Coulee Dam, account for nearly one-third of the hydroelectric power produced in the United States. Ocean-going vessels can travel inland on the Columbia as far east as Pasco, Washington, while barges can navigate further up the Columbia and onto the Snake River as far as Lewiston, Idaho. Freight hauled on the Columbia consists primarily of grain and other agricultural products. One-third of all U.S. wheat exports move out of the Columbia River to world markets. Potatoes are another major export commodity moving downriver from Lewiston, Idaho; Pasco, Washington; and Umatilla, Oregon.

Steamboats first appeared on the Columbia in 1851, running between Astoria, Oregon, on the Pacific Coast and Portland, Oregon, 113 miles inland, and on to the Cascade mountain range. Amule-powered portage railroad, built in 1853, allowed steamboats to go as far as The Dalles, Oregon. The Oregon Steam Navigation Company, a monopoly controlling steam transportation on the Columbia and Willamette Rivers, was formed in 1861. During the 1860s, the Columbia and Snake Rivers were important routes for miners flocking to Idaho and Montana, and some steamboats managed to traverse the rivers nearly to the

gold fields. However, the commercial importance of the Columbia and its tributaries did not begin to grow until after 1873, when construction of the Oregon City locks on the Willamette allowed grain from the fertile upper Willamette Valley to be shipped directly to Portland.

Other improvements followed. Locks were built on the Columbia at the Cascades between 1878 and 1898, and the Celilo Canal at The Dalles opened in 1915. The Bonneville Dam, just west of The Dalles, was completed in 1937. A towboat demonstrated the feasibility of shipping grain by barge all the way from Lewiston in 1945, but large shipments did not begin until the Lower Granite Dam was opened in 1975.

McClellan-Kerr Arkansas River Navigation System. The Arkansas River is the longest tributary of the Mississippi, flowing more than 1,450 miles from central Colorado to the eastern edge of Arkansas, where it enters the Mississippi. The first steamboat reached Little Rock, Arkansas in 1822, and Fort Gibson, Oklahoma, in 1827. The 436-mile-long McClellan-Kerr Navigation System was completed in 1971, and opened the Arkansas to barge traffic as far west as Tulsa, Oklahoma. The four largest cities in Arkansas, including Little Rock, are all located along the river.

Tennessee-Tombigbee Waterway. The Tennessee River is the largest tributary of the Ohio River and is part of the Mississippi River System. From its headwaters in Knoxville, Kentucky, the river flows southwest through Tennessee and into Alabama before turning north and eventually emptying into the Ohio at Paducah, Kentucky. The Tennessee-Tombigbee Waterway, a \$2 billion inland waterway, opened in 1985 by connecting the Tennessee with the Black Warrior and Tombigbee Rivers in Alabama. Nicknamed the Tenn-Tom, the 234-mile long waterway connects 16,000 miles of 14 major navigable inland waterway systems in Middle America with deepwater ports on the Gulf of Mexico. The Tombigbee flowed into the Mobile River, providing shorter access to the Gulf of Mexico. While estimates projected 20 million tons would be shipped on the Tenn-Tom per year, that figure had only reached 8 million tons by 1995. With the construction of the Trico Steel and British Steel mini mills in Decatur and Mobile, Alabama, in 1996, tonnage from these two mills alone was projected to represent an additional 2.5 million tons of cargo annually. Companies shipping via the waterway claimed large savings over conventional modes of transportation.

On the Tennessee-Tombigbee Waterway, 1998 steel hauling traffic increased by 140,000 tons from 1997, and as of June 1999 was up an additional 50,000 tons from 1998. Overall tonnage in all categories on the Tenn-Tom during 1998 was up about 2 percent, with a total 1998 tonnage trade of 9.3 million tons. Traffic on the Tenn-

Tom was expected to increase again in 2000, due to the new Boeing plant in Decatur, Alabama, which would begin building Delta Five Rockets.

Hudson River-New York State Barge Canal System.

At one time, the New York State Barge Canal System was the most important inland waterway in the United States. The famed Erie Canal from Lake Erie to the Hudson River was completed in 1825, and provided the United States with a navigable waterway from the Atlantic Ocean to the upper Great Lakes. The canal, enlarged several times between 1825 and 1862, was one reason that New York City developed into the nation's financial center.

Like the Mississippi River System, however, the Erie Canal declined in importance after the Civil War because of competition with the railroads. In 1903, New York State passed a \$100 million bond issue to upgrade the Erie Canal and to connect it with three smaller canals to create the toll-free New York State Barge Canal System, which opened in 1918. The smaller canals linked the Erie Canal with Lake Ontario, Lake Champlain, Seneca Lake, and Cayuga Lake. More than 90 percent of the state's population now lives within 20 miles of the Hudson River or the canal system.

In 1993 and several years following, unusually heavy rains in the upper Midwest caused the Mississippi and its tributaries above St. Louis to swell to record flood levels, inundating towns along the rivers and destroying billions of dollars worth of farm crops and personal property. The Great Flood of 1993 and floods that followed also had a devastating effect on the inland waterways shipping industry. In 1997, the U.S. Army Corps of Engineers informed the port of New Orleans that it would take all summer to restore a 45-foot draft in the Southwest Pass, the channel used by ocean-going vessels to enter Louisiana's five deepwater ports, because of the millions of tons of sand and silt from devastating Ohio River Valley floodwaters.

Ironically, in 1993 the inland waterways shipping industry was only beginning to recover from a drought in 1988, when water levels on the Mississippi and Ohio Rivers fell to their lowest point since 1871. More than 100 towboats ran aground on the upper Mississippi during the summer, periodically closing the river to traffic. Those towboats that did manage to navigate the low water were forced to reduce the load and number of barges in their "tows" by two-thirds, from an average of 50 to 16 barges, which reduced profitability and forced companies to increase rates.

CURRENT CONDITIONS

In the early 2000s, the industry was scrambling to upgrade or replace equipment on projects involving locks and dams. By 2003, more than 50 percent of the 194

locks in the United States were more than 50 years old. In the Upper Mississippi, only one of the locks was built after the 1930s. The locks were half the length of the barges in some cases, causing the traffic equivalent of an interstate highway with one lane. The total replacement cost was expected to be \$125 billion. A lack of timely action on aging and degraded equipment was estimated to cost the industry \$2.6 billion annually, \$155 million of which is due to congestion and delays. And of course, the longer repairs are delayed, the more expensive the repairs will be.

The question was whether inland waterways were a freight industry bargain or a dinosaur, whether a true need or government pork. Nonetheless, in 2004 barge transportation remained the cheapest form of freight transportation. According to the Waterways Council, freight moved by water costs less than 5 percent of the cost of other modes of transportation. The freight moved by water would require more than 40 million trucks or more than 10 million railroad cars. While there were hundreds of millions of dollars in the government trust fund for upkeep of the waterways, disbursement and appropriation was at issue, as was the question of how much more the public transportation system should be subsidized and how much more those in the industry should contribute. The budget allocated to the U.S. Army Corps of Engineers Civil Works program was \$1.3 billion shy of the amount the Corps claimed it needed in 2003.

In late 2003, amidst a storm of criticism from both the state government of Kansas and conservationists, the U.S. Army Corps of Engineers planned to tap into reservoirs in Kansas for the ninth time in order to release water into the Mississippi as a support to inland waterway barge traffic. In addition to questions of water conservation, the debate focused on the relative importance of barge traffic, as well as the Corps' federal duty to support such traffic.

INDUSTRY LEADERS

In 2001, there were 362 firms operating 395 establishments in this industry, down from 368 firms in 2000. Nearly all were small or medium-sized firms employing fewer than 100 workers. Collectively, there were nearly 16,000 employees earning a payroll of \$730 million.

The 2001 industry leader was Ingram Barge Co. of Nashville, Tennessee, with more than \$2.0 billion in revenue and 2,800 employees, followed by Ingram Industries Inc. with \$1.9 billion in revenue and 6,100 employees. In 2002, Ingram Industries acquired competitor Midland Enterprises. Houston-based Kirby Corp. posted \$535 million in revenue in 2001, with 2,200 employees. Other industry leaders that year were Tampa-based Gulf Coast Transit Co. with \$237 million in revenue and 400 employees, and New York-based General Maritime Corp. Industry analysts expected more companies to

pursue mergers and consolidations in the mid-2000s as a way to remain viable.

As of January 1, 1999, all members of the American Waterways Operators (AWO) were required to participate in its Responsible Carrier Program (RCP) as a condition of membership. The requirement was precipitated by the 1994 accident involving a barge which struck an unlit railroad bridge in fog, causing the railroad track alarm to malfunction. As a result, Amtrak's Sunset Limited derailment killed 42 people. The RCP requirements exceed federal safety standards and regulations, incorporating only the best industry practices available, in an effort to increase industry safety.

RESEARCH AND TECHNOLOGY

A significant development in the inland waterways trade fleet has been the conversion of digitized Army Corps of Engineer maps of the entire inland river system, hooking them to Global Positioning Systems (GPS) installed on each boat. Such information, as applied to this industry, assists captains in pinpointing their exact locations on the river, their relative positions as to oncoming traffic, and their expected itineraries based upon speed and direction.

Another key issue carrying over into 2000 was the general upgrading and replacement of an aging fleet. By 2003, an estimated 35 percent of the dry cargo barges were 25 years old or more. Barge construction had been accelerated to meet the expected demands of the first decade, with construction of state-of-the-art jumbo open- and covered-hopper barges costing approximately \$235,000-\$275,000 each. By 2005, \$1.4 billion dollars of capital would be required by the industry.

SIC 4481

DEEP SEA TRANSPORTATION OF PASSENGERS

This category includes establishments primarily engaged in operating vessels for the transportation of passengers on the deep seas.

NAICS CODE(S)

483112 (Deep Sea Passenger Transportation)

483114 (Coastal and Great Lakes Passenger Transportation)

INDUSTRY SNAPSHOT

The passenger cruise industry, as we know it today, was formed around 1970 when approximately 500,000 people took overnight cruises. Since that time, the number of passengers has increased dramatically, reaching an estimated 7.4 million people in 2002. According to Cruise Lines International Association (CLIA), this number was expected to reach nearly eight million in 2003. To encourage this activity, cruise line companies have worked with airlines to offer built-in fares and so-called "drive-cruise vacations," whereby airline-leery travelers embark from nontraditional ports closer to their homes. According to CLIA, the cumulative market potential for

the cruise industry was projected to reach \$85 billion between 2000 and 2005.

The North American cruise industry, which includes the United States and Canada, has represented approximately 90 percent of the worldwide cruise market in recent years. In 2001 alone, the industry's benefit to the U.S. economy totaled \$20 billion, according to CLIA. This included some \$11 billion of direct spending on U.S. goods and services. By 2002, approximately 167 ships were serving the North American market, with an aggregate capacity of 173,846 berths.

By capacity, almost half of all cruises leaving from North American ports traveled to the Caribbean in the early 2000s. Other leading destinations included Europe, the Mediterranean, Alaska, and Mexico. Historically, the most popular U.S. ports for embarkation have included Miami, San Juan, Port Canaveral, Port Everglades, and Los Angeles. By 2002, CLIA reported that Florida, California, Texas, Massachusetts, New York, Pennsylvania, New Jersey, Illinois, Ohio, and Georgia contributed the most to the cruising business.

Since the mid-1980s, the cruise industry has conducted extensive market and consumer research. As a result, the industry has added new destinations, new ship design concepts, new on-board/on-shore activities, new themes, and new cruise lengths to reflect the changing vacation patterns of the public.

The cruise industry continues to have a very close working relationship with the travel agency community. More than 90 percent of all passengers were projected by the CLIA to have been booked through travel agents. Travel agencies found that cruises were profitable to sell and that many people who take a cruise want to repeat the experience.

ORGANIZATION AND STRUCTURE

Cruise lines generally offered either luxury, mass market, or specialty cruises, although some analysts believed two more distinct categories have emerged: super-luxury cruises, catering to the very rich, and shorter budget-priced cruises, targeting middle-income vacationers.

Luxury cruise lines emphasize personal service aboard relatively small cruise ships. The mass-market category includes such highly advertised companies as Carnival Cruise Lines, Princess Cruise Lines, and Royal Caribbean Cruise Lines. These companies offer resort-style cruises aboard mammoth ships. The specialty cruise segment includes companies like Windstar Cruises, which offers adventure cruises to exotic ports of call aboard small ships that often carry as few as 100 passengers. Destinations include Africa, the Amazon, Antarctica, and seldom-visited islands in the Caribbean and

South Pacific. Specialty companies also offer theme cruises with lecturers or celebrity hosts from the world of science, entertainment, or sports. For example, the Cunard Steamship Co. once offered murder mysteries aboard the famous *Queen Elizabeth 2 (QE2)* and opera and classical music experiences in which amateurs were invited to study and play alongside professionals aboard the *Sagafjord*.

Registry. U.S. cruise industry vessels are primarily of Panamanian, Liberian, or Bahamian registry, which provides cruise line operators with significant tax breaks over U.S. registration. Foreign registration, known as "flags of convenience," also allows U.S. ships to hire foreign crews and escape strict U.S. safety inspections. The only U.S. flagged ships in the North American deep-water cruise industry are those operated by American Hawaii Cruises and Clipper Cruise Lines.

Likewise, major cruise companies, although they operate from U.S. ports and their headquarters are in the United States, are often incorporated elsewhere to avoid U.S. taxes. For example, the corporate headquarters for Carnival Corporation, the largest North American cruise operator, are in Miami, but the company and its cruise subsidiaries are incorporated in Panama, the Netherlands Antilles, the British Virgin Islands, the Bahamas, and Liberia.

National Organizations. Cruise Lines International Association (CLIA), headquartered in New York, was formed in 1975 to promote the cruise industry and provide training to affiliated travel agencies. In 2003, 25 cruise lines belonged to CLIA, as did 17,000 affiliated travel agencies. Travel agents began actively suggesting cruises as a vacation alternative in the 1980s. Cruise-only travel agencies have since been formed, and large agencies have created cruise divisions. CLIA also sponsors National Cruise Vacation Month in February. The International Council of Cruise Lines, headquartered in Washington, D.C., lobbied on behalf of foreign-flag cruise ships operating out of U.S. ports.

BACKGROUND AND DEVELOPMENT

Until the early 1800s, most ocean-going vessels sailed only when they had a full load of cargo and the weather was favorable. Passengers were secondary. However, in January of 1818, the Black Ball Line in New York began regularly scheduled service between the United States and England. The first ship, the *James Monroe*, left New York Harbor on time, despite a blizzard, and arrived in Liverpool three weeks later. The Black Ball Line proved so successful that other ships began regular service. "Packet ships," as they were known, were the first ships to concern themselves with the comfort of their passengers.

In the 1830s, steamships began to replace packet ships for carrying mail and passengers. The Pacific Mail Steamship Company, an American line founded in 1848, eventually came to dominate passenger service across the Pacific, but English companies dominated transatlantic service. One of these companies was the Cunard Steamship Co., Ltd., founded in 1840 by Samuel Cunard. Cunard was a Canadian who won the contract to deliver mail between England and Halifax, Nova Scotia. He and English partners formed the British and North American Royal Mail Steam Packet Co., which was renamed the Cunard Line in 1878. The first Cunard ship was the *Britannia*, which set sail from Liverpool on July 4, 1840. The ship carried a cow on board to provide passengers with fresh milk during the 14-day crossing. By 1880, the Cunard Line operated 19 ships that provided regular transatlantic passenger service.

Notable Firsts. In 1852, the *City of Glasgow*, owned by the British Inman Line, became the first ship to provide regular transatlantic passenger service without also having a contract to deliver mail. The *Glasgow* was also the first ship to be fitted with a spar deck covering part of the main deck. The spar deck provided passengers with a sunny recreation area in good weather and protection on the main deck during bad weather.

In 1879 another Inman ship, the *City of Berlin*, became the first passenger ship outfitted with electric lights. The Inman Line was also the first to carry immigrants to the United States on a regular basis in “steerage class.” Throughout most of the nineteenth century, passengers traveling in steerage slept wherever there was space in the hold and provided their own food or ate out of communal kettles. Signs aboard Cunard Line ships cautioned that “passengers of the First and Second Class are requested not to throw money or eatables to the steerage passengers, thereby creating disturbance and annoyance.” By the end of the nineteenth century, carrying immigrants was profitable for most passenger ships. The International Navigation Company of Philadelphia, later known as the American Line, purchased the Inman Line in the late 1890s.

The first organized recreational activities aboard an oceangoing passenger ship may have been aboard the *Great Eastern* in 1858. A commercial failure, the *Great Eastern*, owned by the Eastern Navigation Company, was the largest ship of its day. It was also the first ship with enough space for passengers to congregate on deck. On its maiden voyage, passengers organized a marathon and played ninepins. Most on-board recreation would be organized by passengers until after World War I, when deck tennis, shuffleboard, quoits, dancing, and bingo became popular ship-sponsored activities.

In 1870 the *Oceanic*, owned by the Oceanic Steam Navigation Company, became the first ship with multiple

passenger decks. The *Oceanic* also offered passengers an on-board saloon and oversized cabins equipped with electric bells to summon stewards. In the 1880s, the *Umbria* and the *Etruria*, owned by the Cunard Line, became the first ships with refrigeration for food storage.

Superliners. By the early 1900s, Germany had begun to dominate transatlantic passenger service with luxury liners that rivaled the most posh European hotels. The *Amerika*, owned by the Hamburg-Amerika Line, was the first ship equipped with an elevator. It also boasted an on-board restaurant operated by the Ritz-Carlton Hotel in London. Even the famed Cunard Line was losing money to the German competition, and American financier J. P. Morgan, who had purchased the White Star Line, was ready to buy the Cunard Line. However, the English government saved Cunard by subsidizing the construction of two new ships, the *RMS Mauretania* and the *Lusitania*.

The *Mauretania* and the *Lusitania*, launched in 1907, were the first “superliners,” the largest and most luxurious passenger ships yet built. Aboard these English superliners two cruise traditions arose: dressing for dinner and the shipboard romance. Cunard’s advertising promised, “Passengers will remember how romantically the glowing phosphorescent waves curled back in the ship’s wake falling forever in flakes of diamond and pearl. They will remember how readily the damsel of their choice could be persuaded to a secluded spot in order to observe this poetic phenomenon.”

In 1911 the White Star Line surpassed even Cunard for luxury when it launched the *Olympic*. In addition to the amenities that had become standard, the *Olympic* was outfitted with a swimming pool, Turkish baths, and a tennis court. The ill-fated *Titanic*, which sank on its maiden voyage in 1912, was a sister ship to the *Olympic*. White Star never fully recovered financially from the sinking of the *Titanic*. In 1934, the Cunard Line purchased White Star and became Cunard White Star Ltd.

The *Lusitania* also earned a place in history when it was sunk by a German U-boat in 1915. Although kept secret by the U.S. and British governments for nearly 50 years after the sinking, the *Lusitania* was carrying tons of munitions for the English war effort, in violation of U.S. neutrality laws. Considered unsinkable by many, the *Lusitania* sank in only 21 minutes after being hit by a single torpedo, which detonated the contraband cargo. Nearly 1,200 people were killed, including 128 Americans, hastening U.S. entry into World War I.

After World War I, the largest of the German ocean liners were divided among the Allies. The United States Line got the *Vaterland*, which it renamed the *Leviathan*. The *Leviathan* became the first ship to launch a mail plane from its decks in 1927. Cunard, which lost 22 ships

during the war, was given the *Imperator*. It was rechristened the *Berengaria* and became the line's flagship. White Star received the *Bismarck*, which it renamed the *Majestic*. The *Majestic* was the largest ocean liner afloat until 1935, when the French launched the 80,000-ton *Normandie*. The *Normandie*, described as a floating luxury hotel, included 28 six-room suites, 30 two-room suites, and 24 verandah suites along with the usual array of staterooms, each of which had a private bath. The ship also had an air-conditioned dining saloon, a movie theater, and a glass-enclosed garden complete with fountains and caged song birds.

The years between 1920 and 1940 were considered the glamour days for transatlantic passenger ships. The rich and famous from Europe and the United States often took long, slow, luxurious, pampered trips at sea, which were captured by the newsreels to be shown to common folks in movie theaters. However, the Depression of the 1930s almost destroyed the Cunard Line. Again the British government came to the rescue by subsidizing the construction of two more ships, the *Queen Mary* and the *Queen Elizabeth*. The *Queen Mary*, launched in 1936, became the new symbol of luxury, surpassing even the *Normandie*, which was destroyed by fire in New York Harbor in 1942. Only 350 of the *Queen Mary*'s 1,100 crew members were needed to operate the ship; the other 750 catered to the needs of 2,100 passengers. The *Queen Elizabeth* was launched in 1940 but was soon converted into a troop carrier during World War II.

After World War II, the glamour of cruises faded. Jet planes replaced ships for those who could afford to fly, crossing the Atlantic in hours instead of days. By the 1960s, most passenger ships had become drab and dingy. In 1952, the American Line launched the *United States*, which was the largest passenger ship ever built in the United States and the fastest oceangoing passenger ship in service. However, a lack of passengers forced the ship to be mothballed in 1969. Cunard also sold the *Queen Mary* in 1967, symbolizing the end of an era. The ship became a tourist attraction in Long Beach, California. The *Queen Elizabeth* was sold in 1968, leaving Cunard with only one ship, the *Queen Elizabeth 2*. The original *Queen Elizabeth* caught fire and sank in Hong Kong Harbor before it could be turned into what was planned to be a floating university. Cunard repositioned itself as a cruise line in the 1970s.

The modern cruise industry began to take shape in the late 1960s. Faced with declining demand for transatlantic passenger service, especially during the winter when the North Atlantic was stormy and cold, passenger lines began offering vacation cruises to warm-weather locations. Instead of the transportation business, they were becoming part of the tourist and vacation industry. Princess Cruise Lines, founded in 1965, was one of the

pioneers in this emerging industry, leasing a converted ferry from the Canadian Pacific Railway during the winter months to offer cruises from Los Angeles to Mexico. However, several business historians considered Carnival Cruise Lines and its co-founder Ted Arison to have actually invented the modern cruise industry in the mid-1970s.

Miami-based Carnival Cruise Lines was founded in 1972 as a subsidiary of the American International Travel Service. The company purchased the former *Empress of Canada* passenger liner, renamed it the *Mardi Gras*, and invited 300 travel agents to sail on its maiden voyage, which almost proved disastrous. The *Mardi Gras* ran aground before it cleared the Port of Miami. By 1974, Carnival was near bankruptcy. Arison assumed more than 5 million dollars in debt and bought American International Travel's interest in the cruise line for one dollar.

What followed was a remarkable, serendipitous turnaround. Even with a complete remodeling, the *Mardi Gras* remained an aging, inefficient passenger ship. During the energy crisis of the 1970s, it was forced to sail slowly to save on fuel. To fill the additional time at sea between ports of call, Arison added a disco, comedians, singers, and other live entertainment. He also encouraged less formality, more casual dress, and a festive atmosphere. The crew began to call the *Mardi Gras* the "fun ship," and Carnival began advertising that time aboard ship was as fun and exciting for the passengers as the exotic destinations they were sailing to.

The "Fun Ship" marketing strategy, adopted as a registered trademark of the Carnival Cruise Lines, was an enormous success. Based on two people per cabin, the *Mardi Gras* sailed at more than 95 percent capacity in 1974 and 100 percent capacity in 1975. At the end of the year, Carnival purchased a second ship, the former *Queen Anna Maria*, which it renamed the *Carnivale*. A third refurbished ship, renamed the *Festivale*, was added in 1978. It was then the largest and fastest cruise ship sailing between Miami and the Caribbean. Over the next four years, Carnival built four new superliners and quickly became the largest cruise line in the world, capturing a quarter of the North American market and carrying twice as many passengers as its nearest competitor.

The cruise industry also received an invaluable boost from "The Love Boat," a popular TV series that aired on network television for nine seasons beginning in 1977. "The Love Boat," which featured a ship owned by Los Angeles-based Princess Cruise Lines, revived the Golden Era link between ocean liners and romance and made the point that cruises were not only for the rich. "The Love Boat" was a staple among syndicated reruns into the 1990s.

A 1997 Cruise Lines International Association (CLIA) study identified some interesting—and favorable—trends in the passenger cruise industry. The study reported that by 1997, approximately 11 percent of the U.S. population had taken a cruise, compared to just 4 percent a decade earlier. The fastest growing segment of those taking cruises was passengers between the ages of 25 and 39 years old, and the average household income was about \$50,000 per year.

An issue brought to the forefront by the International Council of Cruise Lines was the need for industry-wide international and national regulations governing the care of sick or injured passengers on cruise ships. For example, Holland America Lines, a passenger line with an excellent reputation for safety and sanitation, reported 325 to 375 emergency disembarkments in an average year. Council statistics indicated that if Holland America's figures were the industry norm, annual evacuations from ships would total roughly 3,760 to 4,350.

Only Norway, Britain, and Italy had any rules regarding cruise line medical care. The majority of deep-water vessels calling on U.S. ports, however, were registered in the Bahamas, Liberia, Panama, Norway, and Italy. The U.S. Coast Guard does conduct sanitation inspections of these foreign ships.

Attendees of an International Council of Cruise Lines meeting on the topic in early 1996 recommended guidelines that outlined the basic, advanced life support and cardiac life support that should be available on board by medical staff and stated that medical staff should be certified in competencies, including emergency medicine, family practice and internal medicine, emergency and critical care, advanced care for injured patients, and minor surgical skills. Approval of such recommendations, however, was expected to be a long process.

A sign of the times in the 1998-99 booming economy was the proliferation of mergers and acquisitions in corporate America, and the cruise industry was no exception. American Classic Voyages Company (AMCV, NASDAQ) announced an agreement to purchase the *New Amsterdam* from Holland America Lines for \$114.5 million, with contingencies. The 1,200-passenger ship was expected to cruise the Hawaiian Islands beginning in the fall of 2000. AMCV reported a \$2.2 million earnings loss for the first six months of 1999; however, its second-quarter 1999 earnings were \$2.3 million.

Carnival Cruise Line had attempted to buy out Norwegian Cruise Lines but in December 1999 dropped its bid when Norwegian sold two of its ships in order to meet loan payments. Norwegian officials projected a \$92 million profit for 2000. Its 1999 earnings were approximately \$40 million.

Royal Caribbean Cruise Lines received negative press in 1999 for its plea-bargained agreement to pay \$18 million in fines for illegal dumping of waste oil and sewage in Alaskan waters. It had previously conceded similar dumping near Puerto Rico, only after being caught falsifying log records and proffering false testimony during Congressional inquiry. Notwithstanding, the company's annual revenues were more than \$1.9 billion by September 1999, with gross profits of \$686 million.

A 1998 newcomer to the cruise industry was Disney, spending \$130 million to launch its *Disney Magic*, followed by the launch of a sister ship, *Disney Wonder*, in August 1999. Both ships boasted 2,400 berths and three onboard restaurants.

CURRENT CONDITIONS

Despite weak economic conditions, rising unemployment levels, and concerns about terrorist attacks, CLIA reported that the North American cruise industry achieved record years in both 2001 and 2002, helping to sustain an annual growth rate that averaged more than 8 percent from 1980 to 2001. Some 7.6 million passengers went on cruises in 2002, the majority of which (7.5 million) cruised on CLIA member vessels. That year, North American passengers accounted for more than 86 percent of the passengers CLIA members served worldwide.

By the early 2000s, cruises lasting between two and five days continued to grow in popularity. This category, which included some 2.6 million passengers in 2001, increased almost 640 percent over 1980. Cruises lasting six to eight days saw 3.5 million passengers in 2001, an increase of almost 320 percent from 1980 levels.

In addition to marketing and public relations efforts aimed at assuring would-be travelers that it was safe to go on cruises, the industry offered attractive pricing to increase volume in 2002. Another innovative industry growth initiative involved so-called "drive-cruise vacations," whereby leading cruise lines introduced itineraries that originated in ports located near major North American cities. This helped to address concerns of travelers in the wake of the terrorist attacks made against the United States on September 11, 2001, and also opened up the cruise market to those who always have been reluctant to fly on airplanes.

The industry also was forced to address concerns about gastrointestinal illnesses on cruise ships after passengers and crew aboard a number of cruise lines fell ill. According to the Centers for Disease Control and Prevention (CDC), between January 1 and December 2, 2002, the agency investigated more than 20 reports of illnesses involving 17 ships. Among the ships affected during this timeframe were Princess Cruise Lines' *Sun Princess* ,

Royal Olympic Cruises' *Olympia Voyager*, and Carnival's *Carnival Spirit*. Following these outbreaks, cruise lines were forced to transport passengers back home via airplane and clean and disinfect their ships. In some cases, assistance also was provided by CDC's Vessel Sanitation Program.

According to the CDC, "Of the 21 outbreaks, 9 were confirmed to be associated with noroviruses, 3 were attributable to bacterial agents and 9 were unknown etiology." In 2002, CDC confirmed 26 land-based outbreaks of gastroenteritis attributable to norovirus. Noroviruses (i.e., Norwalk-like viruses or NLV) are nonbacterial agents that can cause gastroenteritis. Symptoms include sudden onset of nausea, vomiting, and watery diarrhea that can last from 12 to 60 hours."

INDUSTRY LEADERS

Founded in 1972 as Carnival Cruise Lines, Inc., and renamed in 1993, the Carnival Corporation is the largest cruise operator in the world, with 45 vessels and six cruise lines in 2003. In addition to Carnival Cruise Lines, which remains an operating division, the company owns and operates the Holland America Line, Windstar Cruises, Cunard Cruise Line, Seabourn Cruise Line, and Costa Crociere S.p.A. The company employed approximately 37,200 employees in 2002 and reported earnings of \$4.4 billion.

The Carnival Cruise Lines division of Carnival operates 16 ships offering mass-market cruises, including the *Sensation*, a 2,600-passenger superliner launched in 1993. That same year, Carnival signed a contract to build the largest cruise ship in the world capable of accommodating 3,000 passengers. Called the *Destiny*, it became the world's first 100,000-ton cruise ship upon its delivery in late 1996. In 1995, two other superliners, the *Fascination* and *Imagination*, were launched into service. The *Carnival Glory* was scheduled for service in 2003, followed by the *Carnival Miracle* and *Carnival Valor* in 2004, and another unnamed ship sometime in 2005.

Royal Caribbean Cruise Lines, founded in 1969, became one of the world's largest cruise lines by passenger capacity in the mid-1990s, offering more than 50 different itineraries ranging in length from 3- to 15-night cruises. In 2003, its 25-ship fleet, which had a combined capacity of about 59,000, called at more than 200 destinations. Among its fleet were the 3,100-passenger *Navigator of the Seas*; 2,100-passenger *Brilliance of the Seas*; 2,354-passenger *Majesty of the Seas*; 2,354-passenger *Monarch of the Seas*; 2,276-passenger *Sovereign of the Seas*; 1,804-passenger *Legend of the Seas*; 1,600-passenger *Nordic Empress*; 1,512-passenger *Viking Serenade*; 1,402-passenger *Song of America*; 1,004-passenger *Song of Norway*; 714-passenger *Sun Viking*. Between 1996 and 1998, five additional megaships were planned to be

launched for Royal Caribbean: *Splendor of the Seas*, *Grandeur of the Seas*, *Rhapsody of the Seas*, *Enchantment of the Seas*, and *Vision of the Seas*.

The Holland America Line, which Carnival purchased in 1988, is one of the oldest names in passenger ship history, dating back to 1873 and the Netherlands America Steamship Company. More than one million immigrants came to the United States aboard Holland America ships between 1873 and World War I. Holland America provided regular transatlantic passenger service until the late 1960s, when it retired the *Nieuw Amsterdam* and devoted attention to the cruise industry. Under Carnival's ownership, the Holland America Line added two new ships in 1993 and in 1994. Holland America offers premium-priced cruises to Alaska, Europe, and the Caribbean. In 1993 Holland America also resumed around-the-world cruising. The company planned to introduce a number of new ships in the early 2000s, including the *Oosterdam* in 2003 and two other ships in 2005 and 2006.

Windstar Cruises, founded by Circle Line Cruises in 1986, offers luxury adventure cruises aboard four-masted schooners with computer-controlled sails. Each of Windstar's 440-foot windjammers, the largest sailing ships ever built, carry about 150 passengers in a yacht-like environment. Windstar's North American cruises are primarily to small warm-weather ports in the Caribbean and focus on water sports such as scuba diving and windsurfing. The line also offers cruises in the Mediterranean, South Pacific, and Southeast Asia. Circle Line sold Windstar to Holland America in 1988. Carnival acquired Windstar when it purchased Holland America.

Seabourn Cruise Lines, founded in 1987 by Atle Brynstad, a Norwegian entrepreneur, offers luxury cruises aboard two 200-passenger, all-suite ships, the *Seabourn Pride* and the *Seabourn Spirit*. Along with luxury accommodations, the Seabourn ships offer underwater observation rooms and sea-level platforms for water activities. Seabourn is part of Carnival Corp., which first purchased a 25 percent interest in Seabourn in 1992.

The Cunard Line, one of the oldest passenger ship companies in the world, formerly was a wholly owned subsidiary of the multinational Trafalgar House Plc, based in London. By the early 2000s, the company was one of six cruise lines owned by industry giant Carnival Corp. Founded in 1840 by Samuel Cunard to deliver mail between England and Halifax, Nova Scotia, the Cunard Line included such famous ships as the *Lusitania*, sunk by a German U-Boat at the beginning of World War I, and the *Queen Mary*. Cunard headquarters were moved to New York in 1977. In the 1990s, Cunard offered cruises to more than 300 ports of call. It also was the only ship line providing scheduled passenger service between the United States and Europe.

P&O Princess Cruises Plc was the third largest cruise line in the North American market, with a fleet of 20 ships. Princess was founded in 1965 by Seattle entrepreneur Stanley MacDonald, who leased the 318-passenger *Princess Patricia*, a converted ferryboat, from the Canadian Pacific Railway during the winter months and offered cruises between Los Angeles and Mexico. Princess continued to operate ships under charter until 1971, when it purchased the *Island Venture*, which was renamed the *Island Princess*. In 1974, Princess was purchased by the P&O Lines, a venerable British firm that added the *Sun Princess* to the Princess fleet. In 1977 Princess became the model for the hit television show "The Love Boat," which provided market exposure to Princess and the cruise industry. During the late 1990s, Princess added the *Dawn Princess*, the sister ship to *Sun Princess*, and the 104,000-ton *Grand Princess*, reportedly the largest cruise ship ever built. P&O spun off its Princess line in 2000. A failed acquisition attempt by Royal Caribbean followed in 2002. By 2004, the company plans to increase its fleet with seven new vessels.

Celebrity Cruises, founded in 1972, is one of the largest companies in the luxury segment of the cruise industry. In 1997, the company merged with Royal Caribbean. Celebrity Cruises introduced Royal Celebrity Tours in 2001, which provided travelers with "land-and-sea" packages. According to the company, by 2003 it remained committed to "high quality, superior design, spacious accommodations, grand style, attentive service and exceptional cuisine."

WORKFORCE

The majority of jobs aboard cruise ships generally fall into three categories: crew, food service, and accommodations. Crew is comprised of deck hands, engineers, and maintenance. Food service is comprised of all the jobs associated with running restaurants, including managers, waiters, cooks, and kitchen staff. Accommodations is comprised of all the jobs associated with running a hotel, including reservations, laundry service, and house-keeping. The ships also employ numerous clerical personnel, activities directors, and managers of the on-board retail shops and passenger services. Cruise ships are also among the largest employers of entertainment, including singers, comedians, dancers, and stage actors for musicals produced at sea.

Although many onboard cruise line employees are not from the United States, CLIA estimated that the North American cruise industry generated 267,762 jobs for U.S. workers in 2001. Direct industry employment within the United States was 27,379 that year. In addition to wages and tips, employees also received room and board.

SIC 4482

FERRIES

This category includes establishments primarily engaged in operating ferries for the transportation of passengers or vehicles. Establishments primarily engaged in providing lighterage services are classified in **SIC 4499: Water Transportation Services, Not Elsewhere Classified**.

NAICS CODE(S)

483114 (Coastal and Great Lakes Passenger Transportation)

483212 (Inland Water Passenger Transportation)

INDUSTRY SNAPSHOT

In 2000, there were 224 ferry operators in the United States. Operators provided ferry service on 487 nonstop ferry route segments, comprising 352 ferry routes and serving 578 ferry terminal locations. The 677 ferries in operation carried 113 million passengers and more than 32 million vehicles. Some 10 percent of ferries were high speed vessels, capable of going 25 knots or faster. After falling to historic lows in the 1970s, U.S. ferry services began enjoying a revival in popularity as commuters sought alternatives to overcrowded highways.

ORGANIZATION AND STRUCTURE

Ferries in the United States run the gamut from small floating parking lots capable of carrying a few dozen cars a short distance to huge ferryliners, such as those servicing the Alaska Marine Highway, that are capable of carrying hundreds of automobiles. Some even provide passengers with conveniences ranging from lounges and cafeterias to overnight accommodations on trips that could last up to a week. Some old-fashioned rope or steam-operated paddle-wheel ferries still run as tourist attractions and as a living monument to the long history of ferries in the United States.

Multi-route ferry systems, such as the Alaskan system or the Washington State Ferry System, are often operated by state departments of transportation. However, many commuter routes in urban areas such as New York and San Francisco are privately operated. Highway river crossings are characterized by a mix of government and privately run services. Federal law requires that all passenger ferries be inspected by the U.S. Coast Guard. There was no national organization of ferry operators, although many of them belonged to the American Waterways Operators.

BACKGROUND AND DEVELOPMENT

Ferries are commonly defined as boats that carry passengers or vehicles across narrow bodies of water in return for payment. They have a long history. Even Charon, ferryman for the dead in ancient Greek mythology, demanded payment before transporting souls across the river Styx into Hades, prompting Greeks to place coins in the mouths of the dead before burying them.

The earliest accounts of European exploration in North America record instances of Native Americans charging to carry passengers across rivers in birch bark canoes. There are, in fact, written accounts of wagons being loaded into two canoes paddled side-by-side. Many early government treaties conferred the right of ferriage to the Indians, but the Indians were shunted aside as soon as a ferry route became profitable, as John Perry points out in *American Ferryboats*.

As late as 1828, 10 years after Illinois became a state, the Winnebago Indians controlled the important commercial ferry route across the Rock River at modern day Dixon. When the Winnebago monopoly was challenged in 1827, the Indians destroyed both the offending ferryboat and ferry house. Eventually, ferriage rights were negotiated as part of the Treaty of Green Bay. French trapper Joe Ogee established the first non-Indian ferry in 1829. In 1832, Ogee sold the ferry to John Dixon, and the community became known as Dixon's Ferry.

Piecing together a history of the early American ferryboat industry is difficult because few official records were kept. What is known was usually gleaned from the diaries of travelers, or as was often the case, when squabbles over who had the legal right to provide ferriage ended up in court. However, by the 1640s, there were several established ferry routes in the American colonies. In 1630, the Massachusetts Bay Colony issued a request for someone to begin ferry service between Boston and Charlestown. The first regular ferry service between New Amsterdam on Manhattan Island and Brooklyn on Long Island is known to have been in operation by 1643, and probably for several years before that.

In 1654, New Amsterdam also passed what may have been the first ferry ordinance in the New World. The ordinance declared that no one could provide ferriage without a license, that ferry service must adhere to a regular schedule, and that ferry operators must provide shelters for passengers on both shores. Despite the ordinance, however, ferry service between Manhattan and Brooklyn was a contentious free-for-all for more than 100 years as the two communities argued over which had the right to carry passengers across the East River. The dispute often turned ugly, as when Brooklyn radicals burned the ferry house belonging to the officially chartered and licensed New York Corporation. Brooklyn finally won the legal right to provide its own ferry service in 1775. Although the colony of New York appealed to the Court of King George III, the appeal was never heard because the American colonies declared their independence in 1776.

Current-Driven Ferries. Initially, Indian canoes were replaced on ferry routes by flat-bottomed boats that were either rowed, poled, or paddled across the stream or river. On open water, ferryboats were often fitted with sails. The first technological improvement was simply to string a rope across the river. The rope allowed the ferry to be pulled across. But more importantly, it acted as a restraint so that the ferry would end up at the right point on the opposite shore instead of being pushed downstream by the current. This made it feasible to build permanent docks, rather than allowing the ferries to run aground along the riverbank somewhere close to their destination. In some places, horses or windlasses were used to pull the ferries.

The use of ropes led to the development of “current ferries.” Ferry operators discovered they could use water power to drive the boats by turning them at a slight angle to the river current, much like tacking in a sailboat, except the rope also kept the ferry from moving downstream. The return trip could be made by reversing the angle of the ferry. The current ferry established the pattern of double-ended ferryboats, which removed the need to turn the boat around. Eventually, wire cables replaced ropes, but current ferries remained the most common short-haul ferries in the United States into the nineteenth century. Another innovation was the pendulum ferry. Fairly popular in Europe, although rare in the United States, pendulum ferries took advantage of a mid-river island to anchor a rope or cable strung along a line of floating platforms. Such ferries would then swing across the river at the end of the rope pendulums.

Team Boats. Current ferries were fine for narrow rivers that could be spanned by ropes or cables, but broad rivers or coastal bays required a different source of power. The “team boat,” which appeared in America in the early nineteenth century, used mules or horses carried aboard the ferry to power a capstan or treadmill that drove a paddle wheel. The Romans apparently used oxen in a similar manner to propel war boats, but team boats were considered an ingenious new invention by early Americans. The first team boat in the United States is believed to have been put in service in 1814 on a run between Brooklyn and Manhattan. The *Long Island Star* reported that the boat took 8 to 18 minutes to cross the East River and carried an average of 200 passengers, plus horses and vehicles. The team boat was the principal type of ferry for open water for almost two decades, until the steamboat replaced it. However, many team boats operated well into the twentieth century.

Steam Ferries. Steamboats, including ferries, were operating in the United States as early as 1786. However, credit for creating the first practical, commercial steamboat is usually given to Robert Fulton in 1807. Fulton was a successful jeweler and painter of miniatures before he turned his attention to science and engineering in the late eighteenth century. He invented a number of labor saving machines and designed several experimental submarines between 1797 and 1806. The following year, Fulton directed the construction of a steamboat originally known as the *North River Steamboat* and later renamed it the *Clermont*. For many years, the *Clermont* carried passengers and cargo up and down the Hudson River, but it was never used as a ferry.

In 1808, Fulton formed New York and Brooklyn Ferry Associates and established a watershed business relationship with Robert R. Livingston, former United States Ambassador to France who had signed the Declaration of Independence and negotiated the Louisiana Pur-

chase. Several years before, around 1790, the governments of Pennsylvania, New Jersey, and New York each granted exclusive license to American inventor John Fitch to operate steam-driven vessels on the waters bordering their states. Fitch later transferred the license to operate in New York waters to Livingston, a former business partner who was also presiding judge of the New York court of chancery when the monopoly was granted. Since obtaining the franchise, Livingston had also received permission to double ferry tolls once steam ferries were put in operation.

When Livingston joined up with Fulton, team-boat ferry operators were told they should be prepared to go out of business. The New York Legislature even agreed to extend Livingston’s monopoly an additional five years for every steamboat that he and Fulton put in service. However, before they were able to launch their first steam ferry, another entrepreneur beat them to it.

John Stevens, a former business associate of both Fitch and Livingston, had launched his first steam ferry in 1809. He wanted to run between Hoboken, New Jersey, and New York, but because of Livingston’s monopoly, he decided to operate between Philadelphia and Trenton, New Jersey, across the Delaware River. In 1810, Stevens obtained a ferry license from New York City, in conflict with the state license. Stevens tried to reach an amicable agreement with Fulton and Livingston, but when negotiations failed, Stevens went ahead and launched the *Juliana*, the first steam ferry in New York waters, in 1811. The *Juliana*, however, challenged the Fulton-Livingston monopoly for only one season. Soon after the ferry was launched, the New York Legislature enacted a law that allowed the seizure of any steamboat not authorized under the state monopoly. The next summer, the *Juliana* was literally chased out of New York waters. Stevens returned to using team boats on his Hoboken to New York run.

Fulton and Livingston launched their first steam ferry, the *Nassau*, in 1814. It ran between Manhattan and Brooklyn. The *Long Island Star* reported of the *Nassau*, “The captain, lordly as old Neptune, drives his splendid car regardless of wind or tide, and is able to tell with certainty the hour of his return.”

Gibbons v. Ogden. The New York seizure law, and a similar law passed by New Jersey in retaliation, seriously retarded development of the ferry industry and perpetuated the use of team boats. The laws also led to the first case ever decided by the U.S. Supreme Court under Article I, Section Eight of the U.S. Constitution, known as the commerce clause.

In 1824, the Court agreed to hear the now-famous case of *Thomas Gibbons v. Aaron Ogden*. The ferry, heavily loaded with 27 boxcars, sank in Lake Michigan,

about seven miles from Milwaukee, during a fierce storm in 1929. Fifty-nine crew and passengers died.

Between 1920 and the early 1960s, ferries on Lake Michigan were also an important conveyance for passengers heading to vacation resorts in Michigan and Wisconsin. However, interstate highways built in the 1960s cut into this passenger service. When the railroads were deregulated in the late 1970s, many of the ferry routes were abandoned. The last railroad to operate ferry service on the Great Lakes was the Chesapeake and Ohio, then known as the Chessie System. In 1983, the railroad's ferry service between Ludington, Michigan and Kewaunee, Wisconsin was purchased by the private Michigan-Wisconsin Transportation Company.

The Michigan-Wisconsin Transportation Company went out of business in 1990, temporarily ending more than 140 years of continuous ferry service on the Great Lakes. In 1991, the *Badger*, the last Great Lakes car ferry, was purchased by a former chief engineer for the Pere Marquette Railway. Lake Michigan Carferry Services, Inc. began operation in 1992, between Manitowoc, Wisconsin, and Ludington. The four-hour trip was at least six hours faster than driving by car around the southern end of the Lake and through Chicago.

Puget Sound Navigation Company. Small steamboats, known as the Mosquito Fleet, were operating on Puget Sound, in what is now the state of Washington, as early as 1836. The first ferryboat was the *City of Seattle*, launched on New Year's Eve in 1888. It operated between Seattle and West Seattle for more than 25 years. By the early 1900s, there were at least 70 ferryboats crisscrossing Puget Sound on 70 different routes.

Puget Sound Navigation Company, a subsidiary of the Alaskan Steam Ship Company, began operating ferryboats in 1898. Also known as the Black Ball Line because of its flag, Puget Sound Navigation became the largest licensed ferry operator in the United States in the 1930s with a fleet of more than 30 boats, many of them purchased from San Francisco ferry operators after the Golden Gate Bridge opened in 1937. Puget Sound Navigation controlled most major ferry routes on Puget Sound as a state-regulated monopoly from 1935 until 1951 when it became part of the Washington State Ferry System. It was also responsible for all passenger vessels operating on Puget Sound being called ferryboats. In the early 1900s, only steamboats operating on the shortest routes were commonly called ferries. But in 1909, Canada passed a law limiting the number of passengers that ocean steamships could carry based on gross tonnage. The law was to benefit the Canadian Pacific Railway, which operated steamships between Seattle and Vancouver, in the province of British Columbia. Canadian Pacific's luxury steamships were larger but carried fewer passengers than

the vessels operated by Puget Sound Navigation. But Charles Peabody, chairman of Puget Sound Navigation, declared publicly that his vessels were ferryboats, not ocean steamships. Puget Sound Navigation continued carrying boatloads of passengers between Seattle and Vancouver, and the Canadian government never challenged the definition. Passenger boats on Puget Sound have been considered ferryboats ever since.

Puget Sound Navigation is also known for operating the *Kalakala*. Originally built as a passenger ship in San Francisco and converted to carry automobiles on Puget Sound in 1935, the futuristic-looking *Kalakala* was the world's first streamlined ship. It could carry 110 cars and 2,000 passengers, and was probably the most photographed ferry in the world. More than six million passengers rode the *Kalakala* between 1935 and 1941 alone. It was in service on Puget Sound for 32 years.

In the late 1940s, a series of labor strikes and declining ridership forced Puget Sound Navigation to seek a 30-percent rate increase from the State of Washington. The state refused, and Alex Peabody, who had succeeded his father as president, threatened to suspend service, which he did on February 29, 1948. Peabody and Washington State reached an agreement and service was restored a few weeks later. However, Washington state also began to explore the possibility of buying Puget Sound Navigation and operating the ferry service as a public transportation system. Peabody resisted at first, but in 1951 his financial backers forced him to sell, leading to the creation of the Washington State Ferry System.

Ferries began making a comeback in the 1980s as traffic congestion, air pollution, and urban stress became critical problems. In New York, five private ferry operators began service on nine routes between 1986 and 1992. In 1992, New York City offered free use of terminal facilities for ferry operators who agreed to undertake routes specified by the city. Other cities to experience a renaissance in ferry service included Boston, Detroit, and Fort Lauderdale, Florida. Ferry service across San Francisco Bay resumed in 1989 when an earthquake damaged the Bay Bridge. The ferry was so popular that a rival ferry began service in 1990. Both ferry systems planned to add routes, and city transit officials expected 6 to 8 percent of all San Francisco Bay area commuters to be riding ferries by 2000. Many of these new ferries were high-speed, high technology catamarans.

In early 1999, *Fast Ferry* magazine reported that there were approximately 1,250 fast ferries operating in the world. Traveling 25 to 35 knots, they are capable of carrying at least 50 passengers, or a combination of freight and passengers, making them ideal, alternative transportation in congested areas near waterways. Some of the new market areas include service from Boston to Martha's Vineyard and Nantucket, and a \$1 billion Water

Transit System planned for San Francisco's Bay Area. Smog-sensitive Californians were pleased to learn that the proposed system, covering 440 miles of water routes, would produce only a fraction of the amount of non-methane hydrocarbons as would vehicular traffic moving the same number of persons.

The Great Lakes ferry system had 20 ferry services going into the 1998 season, serving both upper and lower Michigan. For fiscal year 1997, Great Lakes ferries carried 722,420 passengers, 448,221 vehicles, and completed 64,860 ferry crossings.

One of the most successful ferry shuttle services in the country was operated by the Massachusetts Bay Transportation Authority (MBTA). Ridership doubled between 1997 and 1999. Its biggest passenger commuter ferry service carried 380,000 passengers a year in the Boston Harbor area. Another service from Lovejoy Wharf to the World Trade Center, with a stop at the new Federal Courthouse, was carrying 2,240 one-way passengers per month by mid-1999.

CURRENT CONDITIONS

The National Ferry Database reported that there were 224 ferry operators operating 677 ferry vessels in the United States as of 2000. They provided 487 nonstop ferry route segments, comprising 352 ferry routes with service at 578 ferry terminal locations.

Security in most sectors of the travel and recreation industry tightened as a result of the attacks of September 11, 2001, and ferries proved no different. The Coast Guard announced in late 2002 that it planned to increase safety measures on high-capacity passenger ferries. Passengers would be screened and vehicles inspected periodically based on threat level. Under normal conditions, up to 5 percent of passengers would be searched, whereas during extreme conditions all passengers and vehicles could be searched. Costs for the new security measured was estimated at \$20 million.

Another result of the attacks of the September 11 attacks, New York City lost its Port Authority Trans-Hudson train service. To offset this loss, U.S. Secretary of Transportation Norman Mineta provided \$55 million to Metropolitan New York City for ferry-related projects in 2003. The funding would expand interstate ferry services. The same year, Perth Amboy, New Jersey began ferry service to New York Harbor. The privately-owned ferry would operate out of a location near the New Jersey Transit commuter rail service. The New Jersey Transit had agreed to spend \$30 million in federal and state funds to build a three-story ferry terminal in Weehawken leased to waterfront entrepreneur Arthur Imperatore. Imperatore owns NY Waterway ferries, which transport some 16,000 people across the Hudson River from docks located in Jersey City, Weehawken, and Hoboken. The new termi-

nal would double the current 5,500 passengers out of Weehawken each day and represents the largest investment in ferries by the state.

Other new services included the Fred Olsen Express, which launched daily ferry service between the Port of Miami and Freeport, Grand Bahama in 2001. The 100-mile, three-hour route can carry 650 passengers. Fred Olsen Express is owned by two Norwegian corporations of shipping mogul Fred Olsen. The ferry would carry tourists as well as cargo. Round-trip fares run approximately \$115, compared to about \$182 for the lowest air fare available. Some in the industry are skeptical, noting that several others who have attempted this route in the past have not been successful. However, fast ferries have become more popular in recent years as an alternative to flying and crowded highways.

INDUSTRY LEADERS

Washington State Ferries. As of 2002, the state of Washington operated 29 ferries and oversaw 1,600 employees with a \$330 million operating budget, making it the largest ferry operator in the United States. In 1992, more than 23 million passengers rode Washington State ferries, more than the number of passengers who rode Amtrak trains or used the Seattle-Tacoma International Airport. In 1992, Washington State ferries also carried nearly 10 million cars and other vehicles on routes crossing Puget Sound. The year 1992 marked the tenth straight annual increase in passengers and vehicles for the ferry system.

The largest of the Washington State ferries were the *Spokane* and the *Walla Walla*, jumbo ferries that could each carry more than 2,000 passengers and 200 automobiles. When they were built in 1972, the *Spokane* and the *Walla Walla* were the largest ferryboats in the world. The smallest of the Washington State fleet was the 86-foot *Tyee*, a passenger-only ferry that could carry 200. The longest of the ferry system's routes is the 40-mile international trip between Anacortes, Washington, and Sidney on Vancouver Island in British Columbia, Canada. The route winds its way through the San Juan Islands and takes approximately three hours. The shortest route is less than two miles between Tacoma and Vashon Island. Fares ranged from \$5.50 for a driver and automobile on most routes to \$26 on the Anacortes-to-Sidney route.

Ferry operators in Washington advertised the scenic beauty of the Puget Sound as early as 1890, and nearly 60 percent of the passengers in 1992 were recreational riders, making the ferry system one of the state's biggest tourist attractions. The Washington State Ferry System officially began operation in 1951, when the state purchased the Puget Sound Navigation Company, which had operated as a regulated monopoly since 1935. In addition

to the state system, there were 13 other ferries in Washington operated by county or private enterprises.

The Washington ferry system ran into trouble in the early 2000s, and set about aggressively cutting costs to stabilize the agency's budget in attempts to produce a surplus by 2009. The agency proposed fare increases, cuts in spending, and other measures, including situating shops and restaurants in downtown Seattle's Colman Dock. A fare hike of 10 percent for 2003 was proposed, on top of the 12.5 percent increase in 2002.

Alaska Marine Highway. The Alaska Marine Highway was created in 1960, a year after Alaska became the forty-ninth state. In 1992, the system operated eight ferryliners that served three different regions of Alaska. More than 415,000 passengers rode the ferries, which also transported more than 110,000 automobiles. The state Department of Transportation and Public Facilities operates the Alaska Marine Highway.

The Alaska Marine Highway was designed to serve the communities of southeast Alaska, most of which could not be reached by highways. The ferries travel the Inside Passage, a natural seaway protected from the open ocean by the Alexander Archipelago. The first ferries ran between Haines and Juneau. Service was extended north to Skagway and south to Prince Rupert in 1961, and further south to Seattle in 1967. In 1989, Bellingham, Washington, replaced Seattle as the southern terminus of the line.

The trip between Bellingham and Skagway takes three-and-a-half days and covers more than 1,100 miles. Most of the Alaska ferryliners provide staterooms, showers, and food service. Passengers are also allowed to spread sleeping bags on the floor of the passenger lounges at night. Many passengers pitched tents on the open rear deck of the ferryliner.

In 1964, the Alaska Marine Highway created a second ferry system to serve communities in south-central and southwest Alaska, eventually extending from Whittier on Prince William Sound as far west as Dutch Harbor in the Aleutian Islands. All of the routes combined served 32 ports in Alaska, British Columbia, and Washington state, and covered more than 3,500 miles.

In addition to providing transportation for residents of Alaska, the state ferry system also carried thousands of tourists annually. In 1992, the state Department of Transportation estimated that 1 of every 12 tourists reached Alaska via the Alaska Marine Highway. Tourists riding the ferryliners spent an estimated \$26 million annually.

In 1991, the Alaska Marine Highway began a six-year program to refurbish its ferryliners, which ranged in age from the *Taku*, built in 1963, to the *Aurora*, built in 1977. The program also included replacing the

Malaspina, also built in 1963, with a new ferryliner launched in 1996. Like the *Malaspina*, the new ferryliner carries 500 passengers and took over the Bellingham to Skagway route. The system's largest ferryliner was the 418-foot *Columbia*, built in 1974, which can carry 625 passengers and 158 automobiles.

Between 1992 and 2001, the Alaska Marine Highway System carried 3.7 million passengers and a million vehicles, or an average of 370,000 passengers and 100,000 vehicles per year. The system's first fast vehicle ferry was expected to begin service in 2004.

New York City Area Ferries. Among the best-known ferries in the United States are the blue and orange Staten Island Ferries. The ferries provide the only direct link between the New York City boroughs of Manhattan and Staten Island. More than 370,000 people lived on Staten Island in the early 1990s. The ferries also provide tourists with a waterborne view of the Statue of Liberty in New York Bay. In recent years, the ferries averaged more than 20 million passengers annually, or 70,000 per day.

The first official ferry service between Manhattan and Staten Island was chartered in 1712. Cornelius Vanderbilt operated one of three Staten Island ferry companies during the early 1800s. In 1853, Vanderbilt merged his service with the rival services. The Staten Island Railroad operated the ferry service from the late 1850s until 1905, when New York City purchased the route, making the Staten Island Ferries the first publicly owned mass-transit system in the United States. The cost of riding the Staten Island ferry remained five cents from 1897 until 1975.

As highways in the New York City area became increasingly more congested with commuters bound to and from work, a number of other ferry services were established. These new ferry routes link points wholly within the city, as well as points in New Jersey, Long Island, and Connecticut with the city. Unlike the publicly operated Staten Island Ferries, these newcomers to ferry service in the city are mostly privately run.

North Carolina Ferry Division. The North Carolina Department of Transportation operated the second largest ferry operation with 21 vessels on seven routes in 2002. The ferries carried about 900,000 cars a year and more than 2.5 million passengers. North Carolina, with its many inlets and offshore islands, entered the ferry business in 1934 when it began subsidizing a private ferry at Oregon Inlet. The state took over the Oregon Inlet ferry in 1950. The first state-owned ferry service, however, was on Croatan Sound. The state purchased the ferry operation in 1947 from the widow of a private operator.

Between 1947 and the early 1960s, the state inaugurated or acquired several more ferry routes using surplus World War II-type Landing Craft Tank (LCT) and Land-

ing Craft Utility (LCU) vessels purchased from the U.S. government. Many of those ferry crossings were later eliminated by bridge construction. The first modern doubled-ended ferries were put in service in 1957. All of North Carolina's ferries were operated toll free until 1961, when the state assumed operation of the Pamlico Sound ferry between Atlantic and Ocracoke Island. In 1962, the state began ferry service between Knotts Island and Currituck to cut in half a 90-minute school bus ride for children living on the island.

The North Carolina Department of Transportation Ferry Division was created in 1977, combining an early ferry operations department and a maintenance facility at Manns Harbor. In 1993, the newest ferry route was another Pamlico Sound crossing between Ocracoke and Swan Quarter on the mainland. It was also the longest route at 26 miles. The newest ferry in operation was the *Governor Russell*, completed in 1992, which could carry 34 vehicles and 225 passengers. The oldest ferry in operation was the *Hattaras*, an LCU built in 1953.

Of the private ferry service operations around the country, one of largest was run by Catalina Channel Express, Inc., based in San Pedro, California. Catalina Channel Express, which marked 20 years of service in 2001, operates a fleet of eight passenger-auto ferries from the greater Los Angeles area to Catalina Island and carries more than 1 million passengers annually. The Cross Sound Ferry Services, Inc. runs boats across Long Island Sound between Connecticut and the north shore of New York's Long Island. It is based in New London, Connecticut. Based in Alameda, California, Harbor Bay Maritime is another leading private ferry operation in the United States. It operates ferry routes in the San Francisco Bay Area. Other large private ferries included the Boston-based Bay State Cruise Co., Inc., and Harbor Boating, Inc., in Baltimore.

SIC 4489

WATER TRANSPORTATION OF PASSENGERS, NOT ELSEWHERE CLASSIFIED

This category covers establishments primarily engaged in furnishing water transportation of passengers, not elsewhere classified.

NAICS CODE(S)

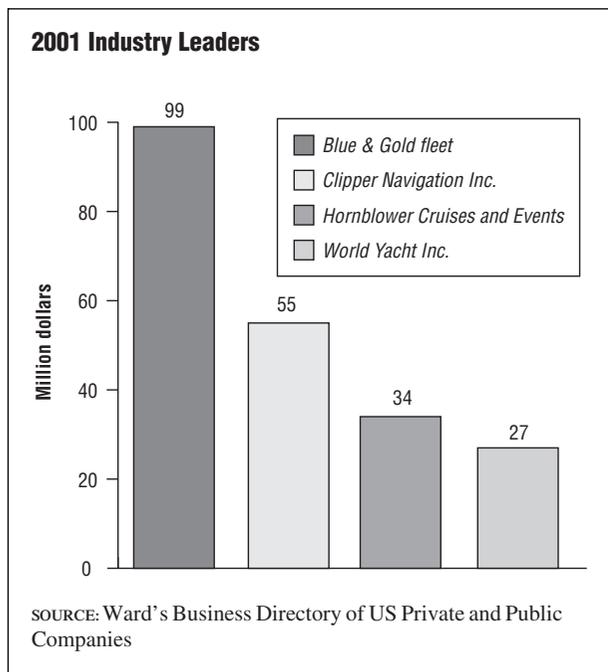

483212 (Inland Water Passenger Transportation)

487210 (Scenic and Sightseeing Transportation, Water)

This industry is comprised of a number of different operations. Airboats, or swamp buggies, provide transportation primarily for sightseers in swamps and marshy areas; excursion and sightseeing boats offer passenger tours and non-deep water cruises; canal boats give passengers the opportunity to explore historic canals. In 2001, 249 establishments offered services in the inland water passenger transportation industry, employing 3,751 yearly, with an annual payroll of \$121.64 million. More than half of these establishments employed fewer than five individuals, and only five employed more than 100.

Not only because of their unspoiled beauty and diversity of wildlife, but also because of their inaccessibility without the aid of a knowledgeable guide, swamps represented an ideal setting for services offering sightseeing tours on such watercraft as airboats (swamp buggies). The airboat tour industry experienced two events that have had, and will continue to have, polar impacts on the viability of the industry. First, since the vast majority of the airboat tour business in the United States is centered in Florida, the crash of ValuJet Flight 592 on May 15, 1996 brought to the nation's attention the potential importance of airboats in search-and-rescue scenarios. This is because areas such as a swamp are virtually inaccessible by other, more traditional means. Commercial airboats were among the first vehicles used to access the crash site for the rescue and evacuation of potential survivors, and eventually were used to transport various personnel to and from the site, including relatives of victims.

Conversely, the battle between environmentalists and airboat operators in Florida has been heating up.

According to the environmentalists, airboats have contributed greatly to increased ecological pressure placed on swamps—most notably, the Everglades. The intrusion of these vehicles and the sightseers they bring is causing a loss of habitat for endangered and threatened species. Environmental groups were looking to enact legislation to curtail airboat use.

By 2001, concerns over the safety of airboats was rising, as the boats were not required to carry communication radios or other tracking devices, and there were no speed limits or consistent traffic patterns. Due to the height of the native grasses in the natural area and the noise generated by the boats, it can be difficult for boats to be aware of another's presence until the boats are right next to each other. While Everglades tour boats were not supposed to detour from established routes for any reason, so that they may be found in case of trouble, there was nothing to keep a boat in trouble from unplanned drifting.

Other such businesses, however, based their tourist appeal not on remoteness from civilization, but rather on the historical connections between industry and natural or man-made waterways. Disused canals held great natural beauty, but also served as a reminder of a key moment in the nation's past (the brief and yet crucial role of canals in opening up the West and fostering the growth of the U.S. economy) and of a time when the forces of industrialization and the natural world co-existed on a more equal footing. One example was the Chesapeake and Ohio canal, connecting Cumberland, Maryland, and Washington, D.C. The canal became a historic park, thanks in part to the efforts of Supreme Court Justice William O.

Douglas, who successfully opposed plans to turn the route into a scenic autoway.

The nation's excursion boat business continued to expand, offering the public activities ranging from dinner yacht cruises and steamboat rides to canal cruises, charter canal boats, and even rides on official U.S. Mail boats. Riverboat rides continued to be popular on river ports, especially throughout the Mississippi/Missouri/Ohio River systems and in the Tennessee River Valley.

Additionally, many individuals were seeking to explore shipwrecks, initially protected on account of their historical significance. These wreck sites have become "bottomland preserves," providing additional sources of tourist revenue for local businesses offering water transportation services shuttling tourist, marine biologists, and scuba enthusiasts to and from sites.

According to the U.S. Transportation Institute's *Industry Profile*, as of July 2002, riverboat gambling operations were state-authorized in Indiana and Iowa, cumulatively operating approximately 20 self-propelled vehicles. There were an additional 26 U.S. flag "cruise-to-nowhere" gaming vessels, which were primarily located in Florida. There also were traditional steamboats offering cruises on the Mississippi and Ohio Rivers. The Delta Queen Steamship Company, for instance, was operating three paddlewheel steamboats.

As of 2001, the industry leader was San Francisco-based Blue & Gold Fleet, with \$99 million in revenue and 400 employees. The company operated passenger service to tourists in the Bay Area, particularly to Alcatraz Island. In second place was Clipper Navigation of Seattle, with \$55 million in revenue and 200 employees. Like Blue & Gold, Clipper Navigation catered to the tourist industry, but its market was the Pacific Northwest, including Vancouver. Other industry leaders were San Diego-based Hornblower Cruises and Events, with \$34 million in revenue, and New York-based World Yacht Inc. with \$27 million in revenue.

SIC 4491**MARINE CARGO HANDLING**

This category covers establishments primarily engaged in activities directly related to marine cargo handling from the time cargo, for or from a vessel, arrives at shipside, dock, pier, terminal, staging area, or in-transit area until cargo loading or unloading operations are completed. Included in this industry are establishments primarily engaged in the transfer of cargo between ships and barges, trucks, trains, pipelines, and wharfs. Cargo-handling operations carried on by transportation companies and separately reported are classified here. This industry includes the operation and maintenance of piers, docks, and associated buildings and facilities, but lessors of such facilities are classified in **SIC 6512: Operators of Nonresidential Buildings**.

NAICS CODE(S)

488310 (Port and Harbor Operations)

488320 (Marine Cargo Handling)

INDUSTRY SNAPSHOT

More than two billion tons of foreign and domestic commerce move through U.S. ports each year. Port and harbor facilities provide employment for companies that load and unload ships, transfer cargo from one mode of transport to another, or provide storage facilities. In recent years, some 800 U.S. firms employing more than 21,000 workers participated in marine cargo-handling operations.

Ports on the U.S. West, East, and Gulf Coasts include both public facilities governed by port authorities and privately held terminals. Companies employ stevedores or longshoremen to load and unload break-bulk, bulk, or container ships. Most of these workers belong to a longshoremen's union. The goals of these unions are to preserve longshore employment and to raise the wages of members. The West Coast trade has represented about 50 percent of the total containerized waterborne trade in the United States, supported by high-growth markets in the Asia-Pacific region.

Containerization, or the use of standardized containers to ship bulk cargo, was one of the most important innovations in the marine cargo handling industry. This standardization of cargo handling produced both increased productivity and reduced labor needs. Another fundamental change in the industry was the growing usage of computerization in nearly every aspect of work, both in the office and on the wharf. The development of automation and containerization, including the growing use of robotics, could eventually make marine cargo handling completely automated.

ORGANIZATION AND STRUCTURE

America's busiest ports, by tons of cargo, were the ports in South Louisiana, Houston, New York, New Orleans, Baton Rouge, Corpus Christi, and Valdez, Arkansas. Port authorities were created from the 1920s to the 1950s, when port cities realized the economic impact shipping had on not only their city but also the general public. During that 30-year period, large amounts of public funds were spent to repair and replace cargo and port facilities. But by the start of the 1990s, many were found to be in poor financial shape. Only 33 percent of the ports on the North Atlantic coastline showed a profit before tax support, and only the Pacific ports—especially those in Southern California—consistently reported profits prior to subsidy. Privatization of the industry has been contemplated by several port authorities, particularly in Washington, but most of the industry remained in the hands of private sector interests.

Companies that handle cargo at the ports, generally referred to as terminal operators, provide a variety of services to incoming and outgoing shippers. Usually these include loading and unloading ships, transferring cargo from one mode of transport to another, and storing cargo. Employees of marine cargo handling companies that actually perform the loading and unloading are called stevedores or longshoremen. Many employees belong to one of two unions, the International Longshoremen's Association (ILA) or the International Longshore and Warehouse Union (ILWU).

On the shipping end of the industry, as of 2003, the Pacific Maritime Association represented more than 70 stevedore companies, terminal operators, and shipping lines on the West Coast. The American Shippers Association reported roughly 700 members in recent years. These associations provide a unified front for negotiating favorable rates and services, promoting fair competition, and bargaining with the longshoremen's unions.

BACKGROUND AND DEVELOPMENT

Since the 1960s, the cargo-handling industry experienced tremendous changes. As early as the 1940s, mechanized cargo handling began in North America. However, its growth during the 1960s and the containerization movement during the 1970s resulted in great changes in worker activities, costs, and productivity levels.

The three kinds of cargo handled by stevedores included break-bulk, bulk, and containerized. Break-bulk general cargo vessels totaled 21 percent of the world's shipping by gross registered tonnage (GRT). Break-bulk general cargo ships were self-sustaining in cargo handling, meaning that they did not need on-shore handling equipment. Many ships even carried their own containers in order to operate at ports lacking adequate handling facilities. These kinds of ships included coasters, tramps

(cargo vessels lacking a regular schedule), and cargo liners.

Handling break-bulk cargo was normally labor intensive and time consuming, requiring the movement of sheds close to the berth and the availability of equipment for lifting and moving cargo. On the ship, moving cargo usually involved making slings or trays and carrying or hauling heavy cargo into the center of the hatch to remove it from the ship. Movement of break-bulk cargo required extra caution when pipes, plates, and other awkward loads or dangerous materials had to be transported. Work on the wharf included making up slings and landing loads onto vehicles. Use of forklift trucks and mobile cranes, both introduced to most ports during the 1960s, was fundamental in removing much of the hard labor from onshore cargo handling.

Bulk cargo vessels ranged from 50,000 to 150,000 deadweight tons (DWT), and most of the larger modern vessels were without cargo-lifting equipment. These kinds of vessels included bulk carriers, ore carriers, timber carriers, and combination carriers for ore and oil, and for ore, dry bulk, or oil. Bulk cargoes such as ore, coal, coke, bauxite, sand, and salt once were handled using buckets, scoops, and baskets. However, the loading and unloading of bulk cargo was mechanized long ago. Bulk terminals handled a combination of commodities such as grain, wood chips, and scrap metal, while others housed a single commodity such as iron ore, copper ore, or minerals. Liquid bulk cargo such as crude oil and petroleum products accounted for more than 40 percent of the cargo engaged in seaborne trade. Handling of liquid bulk was almost entirely automated, thus requiring limited manpower.

The development of standardized modular containers for transporting bulk goods became known as containerized cargo. Standardization included the maximum weight of individual containers, specific lifting points, and uniform shapes. Due to containerization, much of the handling equipment in ports around the world also became highly standardized. Most manufactured goods and primary products were carried by containers. Only very large items were excluded, but even logs and timber could be carried in specially designed containers. Although standard in size, containers were built using a variety of materials and could be refrigerated, heated, ventilated, or specially equipped to handle virtually any kind of cargo. The use of standardized containers reduced the time it took to load or unload a vessel, thereby increasing productivity and reducing port labor needs. The speed and volume of cargo handling continued to increase during the 1990s, as container systems become more widely accepted.

Due to these technological advancements in cargo movement, the job of stevedoring has changed over the past 70 years. What used to be laborious, physically

demanding manual labor was replaced with handling diverse materials and operating highly technological equipment. The expansion of containerization also modified cargo-handling operations, as ports had to be equipped with special cranes capable of lifting these containers.

Having the most profound impact on containerization and cargo-handling operations were the number of huge containerships that came on line in the mid-1990s. To replace inefficient ships, meet shippers' demands, and maximize loads, larger, faster, and more efficient containerships began to be introduced on certain trade lanes. The largest, dubbed supercontainers or post-Panamax vessels, were engineered to carry 4,000 to 5,000 20-foot equivalent units (TEUs), rather than the most prevalent generation capacity of 3,000 to 3,400 TEUs. Such huge vessels impact land operations such as on-dock rail facilities and intermodal connections. In addition, cranes must have a broad enough reach to stretch across six containers.

Ports, such as the major U.S. West Coast gateways of Los Angeles and Long Beach, California, positioned their operations to accommodate these huge supercontainer ships. In 1995, the Port of Los Angeles embarked on a \$600 million expansion plan. At the close of 1996, the Port of Long Beach and Chinese steamship line China Ocean Shipping Co. (COSCO) finalized plans for a \$200 million marine terminal to accommodate post-Panamax ships. Six cranes with the capability to reach across 18 to 20 rows of containers were ordered for the terminal. Since 1994, the port had undergone more than \$1.35 billion in property purchases and capital projects to expand and upgrade its cargo-handling capabilities. It would become the largest container terminal in the United States.

Other port volumes reflected not the importance of containerized cargo but the difficulty they had in sustaining its business. On the West Coast, the Port of Long Beach accounted for 31.4 percent of all West Coast containerized volumes. On the East Coast, the Port of New York and New Jersey remained the busiest container port with some 40 percent of the North Atlantic business.

A more current problem facing all U.S. ports is the ongoing controversy about how to dispose of the muddy silt dredged to keep the harbors navigable. Much of the silt contains environmentally hazardous pollutants, which creates dredging permitting delays. Through the lobbying efforts of the American Association of Port Authorities, amendments to the Water Resources Development Act (WRDA) were proposed to Congress. They called for a national dredging policy that would enable the U.S. Army Corps of Engineers to dredge more efficiently. Provisions in the act called for authorizing equitable federal cost sharing and dredged material disposal facilities, the prompt removal of obstruction to navigation, and capping of local cost sharing during the feasibility stage of project development. Until a solution could

be agreed upon by all concerned parties, the heightened environmental issues about pollution in dredged materials was expected to create additional delays, increased costs, and lost business for American ports. The ports began looking for ways to share the costs of dredging, claiming they were the cause of the problem, but a solution had yet to be finalized.

Facing their own financial constraints, terminal operators explored the idea of forming partnerships among themselves, a process dubbed by the shipping industry as "rationalization." By forming regional port authorities, terminal operators working with a shipping line in one port could form a partnership with operators in other ports that served the same shipper. The operators would divide the revenue generated for the work done in all the ports under an agreed-upon formula. Using this arrangement, the shipping line would benefit by receiving a volume discount, while the terminal operators would gain additional business without investing in equipment, office space, and labor. Several examples of regional port authority alliances included the Virginia Port Authority, the Port Authority of New York and New Jersey, and the Delaware River Port Authority. Prior to forming the Virginia Port Authority, competition between Norfolk, Portsmouth, and Newport News was so intense, steamship lines decided to call on other East Coast ports.

Many of the major container shipping lines began taking their stevedoring and terminal work in-house, virtually squeezing independent stevedoring operations out of the market. Edward DeNike, senior vice president of Stevedoring Services of America in Seattle, Washington, suggested in the *Journal of Commerce and Commercial* that independent operators should expand their services and embrace intermodal operations—the combination of different modes of transport. Working with 25 steamship operators, Stevedoring Services has become an intermodal operator with its 22 rail ramps, nine chassis pools, and a computer services division. Direct Container Line, Inc. also launched an intermodal container service between Japan and Mexico. The company offered Japanese shippers and Mexican importers door-to-door service that took 14 to 16 days, nearly 20 days faster than all-water cargo transportation.

Often companies that offered intermodal services were classified as non-vessel operators (NVOs). These companies did not own any vessels; instead, they either coordinated the transportation of several shipments in one container and were called "consolidators," or they handled the complete transportation of full box loads and were called "multimodal operators." Combined transport, such as the marriage of rail and trucking, generally was most developed within the North American market, followed by the European community. Intermodalism had yet to pick up in Asia.

On May 1, 1999, the ocean and inland container transportation industry became deregulated under provisions of the Ocean Shipping Reform Act of 1998 (OSRA). The Act's provisions intended to open competition in the industry. One of the key changes under the new law was the elimination of filing requirements with the Federal Maritime Commission of all contracts between container ship operators, importers, and exporters. Under OSRA, such contracts may remain confidential and unavailable to competitors' inquiries. Although intended to challenge price-fixing and favoritism, smaller shippers feared that it would promote unequal bargaining power among shippers. Small to medium-sized companies began to form alliances in order to leverage their negotiating power and keep them competitive in the market. In September of 1998, three California consolidators—Direct Container Line, Brennan International, and Conterm Consolidation Services—formed the New American Consolidators Association (NACA) to combine their buying and negotiating power. In early 1999, the National Customs Brokers & Forwarders Association of American Shippers Association (NCBFAASA) was formed and was already up to 90 members by July of 1999.

Contract negotiations between the Pacific Maritime Association and the International Longshoremen and Warehousemen's Union during the summer of 1999 caused slowdowns and backups at the Ports of Long Beach and Los Angeles, creating a ripple effect along the entire coast. At one point, crane drivers shut down the Port of Oakland, California, on July 7, further exacerbating the tense bargaining. A three-year contract was finally agreed upon in November of 1999, with voting approval by more than 80 percent of the union's members (only 60 percent was required). In 1998, average earnings for West Coast union workers were between \$99,000 and \$125,000 annually, including overtime and shift differential. Average hours worked per week were 54 hours.

In other industry news, the Port of Galveston (Texas) reported a 172 percent increase in net income for the first half of 1999, compared to the same period in 1998. The Port of Tacoma (Washington) and Hyundai Merchant Marine announced the opening of Hyundai's 60-acre container terminal, which features on-dock ship-to-rail transfer capability for auto shipments.

In December of 1999, workers at the Long Beach port rejected a proposed automated computer system intended to facilitate job dispatching to allow longshoremen to start work on time. The union has generally been wary of automation, fearing job elimination and general cutbacks. However, the Port of Savannah (Georgia) announced in 1999 that it would install integrated computer software for its container-management operations, ranging from gate operations to bookings, billings, and work-order tracking.

CURRENT CONDITIONS

Labor issues have always impacted the marine cargo handling industry. However, during the early 2000s their effects were felt across America and throughout the world. When the International Longshore and Warehouse Union (ILWU) failed to come to terms with the Pacific Maritime Association (PMA) in the fall of 2002, more than 10,000 dockworkers at 29 coastal ports staged a lockout that lasted 11 days. The lockout created a number of significant problems. Hundreds of ships were stranded, leading to congestion at area seaports. In addition, some industry observers estimated that losses would cost shipping companies anywhere from \$400 million to \$600 million.

The lockout arguably had its most significant impact on the larger U.S. economy. For example, while the lockout was underway *JoC Online* reported that industry analysts were anticipating “a noticeable increase in plant closings, job losses, and financial market turmoil.” The publication reported that “storage facilities at beef, pork and poultry processing facilities across the country are crammed with produce that can’t be exported.” Several weeks after the lockout ended, *Fortune* revealed some of its effects, including a loss of 181 million work hours and an estimated loss of \$693 million in tax revenues.

Because of the havoc it was wreaking on the nation’s economy, President Bush ended the lockout on October 9, 2002, by invoking the Taft-Hartley Act of 1947. After a federal judge ordered a brief “cooling off period” so that a federal mediator could help to resolve the matter, the two parties finally came to terms on a new contract in late November. The agreement was subsequently ratified by both organizations and finally approved on February 1, 2003. According to the PMA, “The agreement provides ILWU members with substantial wage and benefits increases. This includes fully employer-paid health care, a 58 percent hike in pension benefits, and job protection guarantees to ensure that no currently registered worker will lose a job as a result of technology.” Disagreements over the use of technology were at the forefront of discussions. While workers feared technological improvements could lead to workforce reductions, employers wanted to modernize their operations via the introduction of technologies like bar code scanners, global positioning satellite (GPS), and electronic messaging.

INDUSTRY LEADERS

In the early 2000s, the nation’s leading marine terminal operator was Seattle, Washington-based Stevedoring Services of America (SSA). With roots stretching all the way back to the late 1800s, the company’s present owners became involved with the company in 1949, when the Bellingham Stevedoring Company was founded. Since that time, SSA has grown by acquiring other terminal

operators, including Ryan-Walsh, Inc. Ryan-Walsh became well known throughout the maritime industry as a bulk cargo and container handling company. It was a subsidiary of Pittsburgh-based Vectura Group, Inc., a holding company that also owned National Marine, Inc., a barge transportation company based in New Orleans. In 2002, SSA had estimated annual sales of more than \$1 billion and some 10,000 employees. In addition to having a presence in all of the United States’ major coastal shipping zones, SSA was involved in river operations and rail management. In addition, it operated abroad via some 150 international operations.

Direct Container Line (DCL), based in Carson, California, became the leading U.S. export non-vessel operating common carrier (NVOCC), specializing in the movement of less-than-container load (LCL) freight. Although focused on service to the Pacific Rim, DCL worked with export shippers and freight forwarders to ship and consolidate freight from virtually any U.S. port to most major markets. Company chairman Owen G. Glenn founded Pacific Forwarding Group in Australia in 1975 and formed DCL in 1978. In 2003, DCL employed 500 workers and operated 13 offices and 25 receiving terminals in the United States. In addition to its domestic operations, the company had a presence in 86 countries.

International Terminal Operating Company, Inc. (ITO) was founded in 1921 by Captain Franz Jarka. Originally called The Jarka Corporation, the company specialized in handling freight and passengers in the Port of New York. Soon, The Jarka Corporation expanded its services to encompass the ports of Boston, Philadelphia, Baltimore, and Hampton Roads, Virginia. In 1962, ITO was acquired by Ogden Corporation. In 1983, the company merged with John W. McGrath Corporation, which included Atlantic and Gulf Stevedores, Inc. and integrated their North Atlantic and Gulf Coast operations. Ogden and McGrath continued to share ownership of ITO.

ITO opened its first public container handling facility in 1967, and it was among the first to utilize computers in its terminal operations. The company used the latest technology to coordinate all its port activities, including receiving and delivery functions, cargo documentation, and terminal security. ITO worked with many of the largest container, break-bulk, and specialized cargo carriers in the world and became one of the largest stevedores and marine terminal operators in the United States. In 1999 the United Kingdom-based Peninsular and Oriental Steam Navigation Co. (P&O) acquired ITO. The company then became part of P&O Ports, one of P&O’s many subsidiaries. P&O Port’s operations spanned 17 countries around the globe. In all, P&O Ports ran 24 container terminals in 84 ports.

WORKFORCE

Crews of stevedores or longshoremen typically loaded and unloaded ships and moved cargo in and out of warehouses. Longshoremen employment began to decline in the 1950s, and most workers depended on the International Longshoremen's Association (ILA) or the International Longshore and Warehouse Union (ILWU) to preserve existing longshore jobs. The ILWU represented more than 42,000 longshoremen working in California, Oregon, Washington, Alaska, and Hawaii. The ILA had about 65,000 members, although the number working at any given time was much smaller.

Longshoremen labor disputes dominated the maritime industry. In the past, tremendous pressure was placed on shippers by the unions due to their competitive rivalry. Faced with declining memberships, each tried to obtain higher settlements, an accomplishment that could be used to attract new union members. These continual attempts to raise wages and protect a declining number of jobs resulted in several major strikes during the 1960s, 1970s, 1990s, and early 2000s.

Earnings for longshoremen remained relatively high compared to the average earnings in American industry. For example, full-time workers of the International Longshore and Warehouse Union at the ports of Long Beach and Los Angeles recently earned an annual salary of \$99,000, including shift differential and overtime. Wages also varied according to the kind of cargo handled. Moving distress cargo and explosives brought in double the hourly rate of general cargo. Workers handling cargo that was 32 degrees Fahrenheit or below also received a slightly higher hourly rate than those dealing with general cargo.

AMERICA AND THE WORLD

Many ports throughout the world have prepared for the anticipated growth in container traffic, which is projected to increase for all of the world's major trades. Trade with Asia and Latin America has been projected to grow the fastest. Container traffic between Europe and Asia should expand at a faster rate than the U.S./Asian route. A more uncertain region was South America. Many ports located there lack planning, financing, or room for expansion. These factors, coupled with a recent trade boom, caused a shipping "bottleneck." However, North American/South American volumes were expected to continue to grow at a respectable rate. In particular, American shippers saw an end to the double-digit growth in cargo traffic to South America, due to the anticipated entry of global carriers, accompanied by fears of overcapacity and falling freight rates. Unlike the South American ports, those in the United States and Europe are well equipped to handle increased container traffic and should not require large investments. However, some observers foresee increased competition among the European ports.

In the meantime, the labor unions geared up for the "internationalization" of shipping lines and increased containerized cargo traffic. Since both of these factors posed a formidable threat to future longshoremen employment, ILWU officials met with labor delegates from 15 Pacific Rim nations in San Francisco in April 1993 to explore the possibility of international solidarity among shipping employees. One suggested way of showing international labor support was that when one union came under attack by a particular company, other unions—through their operations with that company—would send a message of protest. "Sympathy strikes" and boycotts are generally prohibited in the United States, but other forms of protest are permitted.

RESEARCH AND TECHNOLOGY

Widespread introduction of computers affected all forms of port activities and extended into every sector of cargo handling. A number of ports in North America and Europe introduced computers for office administration tasks, such as payroll and accounting. Several ports applied computers to the actual work of container control and cargo clearance, and they also developed their own information retrieval systems. Computers eventually were used for all aspects of port operation, and in the not-too-distant future, containerized cargo might be electronically inspected for damage, logged in by some type of electronic or laser-sensing device, coded, and recorded by computer.

One example of advanced computer technology is the development of Automated Guided Vehicles (AGVs). These unmanned, computer-guided, chassis-like carriers were introduced by Europe Combined Terminals BV and Sea-Land Service, Inc. in the Port of Rotterdam in 1993. An AGV is capable of performing much of the work commonly done by a driver pulling a chassis by positioning itself under the quayside gantry crane while being loaded or unloaded. When fully loaded, it proceeds to the stacking crane where the box is removed. The AGV receives directions from the terminal's Process Control System (PCS), which controls all the computerized operations at Delta/Sea-Land. The ECT-Delta/Sea-Land facility in the Port of Rotterdam cost \$275 million and took 10 years to complete. However, the system would be able to accommodate an increase in the terminal's capacity over the next 10 to 15 years.

An even more recent invention is the Robotic Machine, created by Paul Dunstan, president of Robotic Container Handling Co., of Bellevue, Washington. This dockside machine consists of a rack system with a computer-controlled container handler similar to a straddle carrier that stores and unloads containers. Its biggest advantage is its design to load and unload 1 million cargo containers a year in a terminal area covering only 50

acres. Each custom-built machine is 2,000 feet in length and capable of processing more than 50,000 cargo containers a month; it can reduce ship time in port by more than 50 percent. North American ports had often been criticized for lagging far behind international ports for container utilization per terminal acre. Singapore, for example, averages some 20,000 container moves an acre each year. (In the United States, that figure is 5,000 moves.)

In the face of continued automation and computerization throughout the marine cargo handling industry, labor unions began trying to prevent the elimination of jobs. Now the unions faced "a new, more sophisticated menace" with the industry's push toward further computerization and the introduction of robotics. Yet, employers claimed that to match their competitors, they must invest in the new equipment and advanced technology. Recognizing that reality, the ILA took the position of not blocking progress in its entirety, but instead claiming jurisdiction over the automated jobs.

SIC 4492

TOWING AND TUGBOAT SERVICES

This classification covers establishments primarily engaged in furnishing marine towing and tugboat services in the performance of auxiliary or terminal services in harbor areas. The vessels used in performing these services do not carry cargo or passengers.

NAICS CODE(S)

483113 (Coastal and Great Lakes Freight Transportation)

483211 (Inland Water Freight Transportation)

488330 (Navigational Services to Shipping)

INDUSTRY SNAPSHOT

Approximately 15 percent of the total amount of transportation in the United States travels through inland waters, while 4 percent of this traffic takes place on the Great Lakes, and 5 percent along coastal ocean routes. Operators of tows and tugboats work these inland waterways, providing services such as docking ocean vessels, shifting floating equipment with harbors, marine towing services, tugboat services, and undocking ocean vessels. As of July, 2002, there were 5,445 towboats in the entire U.S. fleet, some 3,429 of which operated in the inland waterway trade, according to The Transportation Institute.

Cargo transported along the U.S. inland waterways can be moved by barge or towboat. Barges range from 100 to 300 feet in length, carry a wide variety of cargo, and serve as a floating work station for offshore construction. Some barges certified for coastal and ocean service are capable of transporting liquid cargoes, such as oil. Companies that operate tugs and towboats usually have barges in their fleets. However, barge operations have

been classified separately under **SIC 4449: Water Transportation of Freight, Not Elsewhere Classified.**

Many different types of tugs and towboats work the various inland waterways. Towing-supply vessels are from 150 to 222 feet in length and are used for towing drilling rigs, service and supply rigs, and offshore structures from shore. Supply vessels are 160 to 252 feet in length and handle supplies, equipment, and materials. They usually are outfitted with special pneumatic tanks for bulk cargoes and can be adapted to perform research. Utility, production, and line handling vessels are much smaller than the other two types, ranging in length from 65 to 130 feet. They can transport crews and light equipment, carry supplies, and are often utilized as a general utility vessel. Offshore tugs are for any kind of ocean towing. They tow mobile drilling rigs and service the construction and pipe laying industry. They also are used for commercial ocean towing. Inland towing vessels range from 400 to 2,000 horsepower and are used for any kind of coastal and river towing. They can tow drilling rigs and barges within various coastal area inland waterway systems, such as lakes and bays. They also are commercial tows, providing service to industrial clients. Crew boats are much smaller than the other types of vessels, ranging in length from 76 to 125 feet; they can transport light cargo and passengers at high speeds.

BACKGROUND AND DEVELOPMENT

Establishments that provide marine towing and tugboat services primarily work the inland waterways of the Atlantic, Gulf, and Pacific coasts; the Mississippi River; the Great Lakes; and the domestic ocean. These North American waterways comprise more than 26,000 miles of navigable rivers, canals, lakes, and coastal regions. The largest is the Mississippi River system, which runs more than 8,950 miles through the middle of the United States and intersects with the Missouri and Ohio rivers.

One of the earliest functions of the tugboat was to tow sailing ships into and out of the harbor and to assist in berthing (docking and undocking). The tug also was used to assist steamships. Although these vessels were able to enter and leave the harbor on their own, they were unmanageable to dock. Even though ships continue to be built with increased power and maneuverability, the tug remained necessary due to the ships' corresponding increase in size and tonnage.

Currently, the auxiliary propulsion force of tugs and towboats can serve many purposes. Large ships need tugs to assist in docking operations, to maneuver in confined waters and narrow channels, and to escort to clear waters. Items such as barges, cranes, "A" frames, derricks, lighters, tank barges, and railroad floats are towed by tugs. Towing also may be necessary to move a non-self-propelled piece of floating equipment. Such items might

include mining equipment, drill rigs, dredges, barges, floating towers, "dead" ships, scrap hulls, and damaged marine equipment.

Tows have been ideal for river trade due to their shallow draft and ability to navigate the upper reaches of the Mississippi, Missouri, Ohio, and Columbia Rivers. Unlike ships, tugs are adaptable to changing needs with a minimum of delay because they do not have to wait until cargo is discharged before moving on to another job. The use of tows and barges historically has been one of the least expensive ways to transport coal, lumber, ore, oil, and bulk cargoes in the river and coastal trades.

Canal tugs operate on the canals of inland waterway and intracoastal systems and are designed to pass under low bridges covering most waterways. Railroad tugs haul car floats that transport railroad freight cars. The railroad tug must maintain a tight schedule and therefore has been specially designed for maneuverability, power, and visibility.

Coastal tugs are heavier than harbor tugs, and consequently have greater horsepower, larger all-around dimensions, and increased fuel capacity. American ocean tugs have been among the largest towing vessels utilized worldwide, second only to the enormous river towboats. Actually, the ocean tug is similar to a small ship. It has a large fuel capacity, quarters for a crew, and stores provisions for extended operations. Rescue and salvage tugs are at least as large as ocean tugs and contain extensive equipment for diving and salvage work. These vessels usually operate on short notice.

In the 1980s, inland waterway commerce rose slowly. However, the towing and tugboat services industry, especially the inland towing sector, was slowed by "the effects of overcapacity and slower-than-expected growth in markets for grain and other bulk materials," according to *American Shipper*. The Midwest flooding of 1993 further hindered the industry; tugboat and towing operations came to a complete halt on the Mississippi River at the height of the shipping season. Widespread economic growth in 1993, however, gave industry operators reason to believe that tugboat and towing services would be in high demand for the next several years.

Environmental concerns, especially relating to the prevention of oil spills, led to increased competition among tug service operators on the West Coast. As the state laws regarding tanker movement in the San Francisco bay have tightened, some tug operators already have begun to purchase specially equipped vessels to use as escorts in the area. More specifically, California's Office of Oil Spill Prevention and Response established new rules that require tankers to have a tug escort when moving in and out of the San Francisco bay. The ruling mandated that tankers carrying a minimum of 5,000 tons

of oil must have enough tugs on hand to provide one horsepower of pulling power for every deadweight ton. The bay area has been home to several major oil terminals and bulk ports, and has at least 1,000 tankers travel into the area annually.

Tanker operators were hoping that double-hulled vessels would be exempt from the escort requirements; that has yet to occur. The average tug escort costs between \$8,000 and \$10,000, depending upon the size of the vessel and the distance traveled. Tanker operators estimated that using tug escorts could add more than \$1 million a year to the cost of their shipping operations. The California ruling also mandates that the "best achievable technology" must be used to avoid accidents. Tug operators are hopeful that the use of tractor tugs will become mandatory.

Hoping to take advantage of the new oil-spill prevention laws, Crowley Maritime Corp. had planned to spend nearly \$100 million on a fleet of these specialized tugs. "This is the Swiss Army knife of tug boats," Crowley's engineering manager, Ed Schluter, told interviewers in *Popular Science*. The article featured the two 153-foot, 10,200 horsepower tractor tugs built by Crowley and delivered to Alaska's Alyeska Pipeline Company in early 1999.

The U.S. inland towing industry spent the 1980s recovering from the boom in shipbuilding during the 1960s and 1970s. However, many vessels in the tug and towing industry have reached the end of their economic life span—approximately 20 years—and some operators began to update their fleets. National Marine, for instance, spent more than \$10 million annually from 1988 to 1992 on new vessels. National's efforts to improve its fleet included a purchase of three 6,800-horsepower line haul towboats. Such new models incorporate the latest technology and have been built to operate in an increasingly restrictive regulatory environment.

The National Transportation Safety Board (NTSB), the Coast Guard, and the tugboat industry have been exploring increased requirements for towboat pilot licensing, mainly resulting from major incidents occurring in the past few years. A 47-death accident occurred in 1993 when barges being pushed by a tug in heavy fog conditions hit and damaged a bridge. The result was an Amtrak train plunged into an Alabama river. The NTSB's recommendations were drafted into new rules by the U.S. Department of Transportation, and included increased proficiency requirements for towboat pilots, as well as regular performance evaluations, plus mandates that towboats be equipped with current radar systems and appropriate charts and compasses. In January 1996 near Rhode Island, a Scandia tugboat was pulling a barge carrying 4 million gallons of fuel oil. The Scandia became disabled by fire resulting in the barge leaking

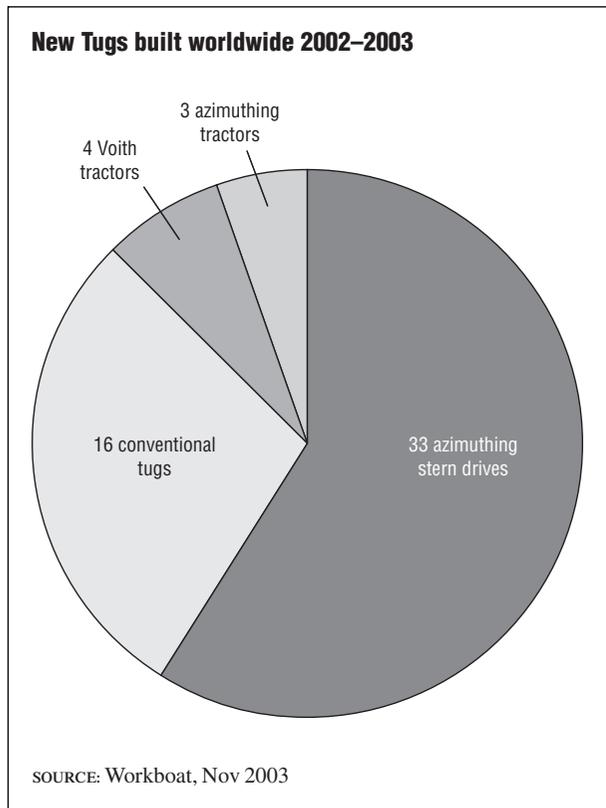

800,000 gallons of oil. A representative of Soundwaters Environmental Group, Stephen Tarrant, said: "This incident is just a reminder that something like that can happen at any point." In fact, between 1986 and 1994 tugboats and barges were accountable for 23 percent of all oil spills, compared with tankers, which comprised 60 percent, and 8 percent were attributable to oil drilling rigs, according to Coast Guard statistics.

The American Bureau of Shipping is an industry regulatory organization that conducts annual inspections of larger tugs, such as the Scandia. However, coastal tugs usually are small enough to be prohibited from requiring inspection by the Coast Guard. Oil companies, which charter tugs, frequently have their own inspections. Jack Morgan of American Waterways Operators claims Coast Guard and industry studies indicate that "two-thirds of the accidents are human error rather than equipment failure." Fires and electrical failures account for 1.7 percent of towing vessel accidents, according to Coast Guard statistics. After the Amtrak derailment, the Coast Guard increased requirements for licensure of tugboat skippers, including formal training in the use of radar. Federal regulations already mandate that the captain and pilot have firefighting training and equipment. In addition, towing firms and the industry association agreed to improve training and equipment by the late 1990s.

A few maritime events during 1998 and 1999 were illustrative of the versatile applications of tow boat and tug boat services. When two Carnival cruise ships caught fire in two separate incidents (July of 1998 and September of 1999), tow boats pulled the damaged ships safely back into harbor. Elsewhere, on an historic December 31, 1999, the government of Panama assumed control of the massive Panama Canal. In the late 1990s, tug boats were often called upon to assist super-sized Panamax vessels into the lock chambers by maneuvering the vessels into position and pushing on the stem of the vessels. Even though this assistance facilitated the passage of such wide-berthed ships (with less than 12 inches separating the ships' sides and the Canal walls) through the Canal, the vibratory damage to the concrete lock walls has become increasingly alarming to the U.S. government. The ability of the Panamanian government to assume maintenance and upkeep on the Canal was of heightened international significance for the twenty-first century.

CURRENT CONDITIONS

As of July 2002, there were 5,445 towboats in the entire U.S. fleet, some 3,429 of which operated in the inland waterway trade, according to the Transportation Institute. From the middle of 2002 to the middle of 2003, there were 56 new tugs built worldwide. Of these, 33 were azimuthing stern drives, 16 were conventional tugs,

four were Voith tractors, and three were azimuthing tractors.

A boon to private industry came in the late 1990s when the U.S. Navy began chartering tugs instead of replacing its fleet. Not only had this move buoyed the industry, it saved an estimated \$18 million annually in taxpayer money. By 2003, companies such as Moran Towing and Transportation that provided tugs to the Navy had upgraded to required technologies through the latest tractor-tugs. These state-of-the-art tugs replaced the standard Navy yard tugs, which were low-horsepower, single-screw tugs.

As a consequence of the Navy contracts, demand for the latest and greatest tugs has been going up in other markets. From 1997 to 2003, 89 cycloidal-drive and ASD tugs were built in the United States, 10 more than had been built in the preceding three decades. The move industry-wide was toward tractor tugs, a trend that was expected to continue.

INDUSTRY LEADERS

Crowley Maritime Corp. Crowley Maritime was not only the domestic industry leader, but was one of the largest companies in this industry worldwide as of 2003. Headquartered in Oakland, California, Crowley had approximately 100 offices in major ports and cities, and a fleet of 300. A family-owned operation, the company had

about 5,000 employees and generated an estimated \$1 billion in revenue in 2001. Crowley Maritime Corp. was founded in 1892 when Thomas Crowley, Sr., began a ferry service with an 18-foot Whitehall rowboat. Working in the San Francisco bay, Crowley hauled transport crews, merchants, supplies, and equipment from the docks to cargo ships anchored in the bay. In latter 1999, the company decided to divest its interest in South American operations, which produced two-thirds of its revenues.

Crowley Maritime has been an industry leader in instituting computer technologies. Crowley utilizes automated tariff retrieval systems, electronic data exchange, data communications, and electronic imaging. More than 150 users work with Crowley's automated tariff retrieval system to produce rate quotations, billings, audits, and other tariff-related functions. Customers can access the data through a mainframe computer located at company headquarters in Oakland, California. Crowley also joined in the Information System Agreement (ISA), a group created in 1991 by American President Line Ltd., Maersk Inc., P&O Containers, and Sea-Land Service to exchange information in the maritime industry. The group has been working with ports and government agencies to "streamline" electronic data exchange (EDI) standards on a global basis, and published a 600-page EDI implementation guide. In early 1999, Dakota Creek Shipyard signed a \$26 million contract to build three new tugboats for Crowley in Valdez Harbor and Prince William Sound.

Tidewater, Inc. A New Orleans-based public company, Tidewater owns and operates marine vessels used by the international offshore energy market, particularly oil. Founded in 1956, the company had 6,800 employees and generated \$729 million in annual revenue in 2001. By 2003, Tidewater boasted a fleet of 570 vessels. In 1992, the company merged with Zapata Gulf Marine Corp., its marine service joint venture. Tidewater's Marine Division provides a full range of marine services including the transportation of supplies, materials, and personnel; towing of mobile drilling rigs and construction barges; positioning and anchor handling of drilling rigs and construction and pipe-laying barges; standby services; and diving and marine maintenance support.

Other notable companies in the industry include Seabulk International Inc. of Fort Lauderdale, Florida, with \$347 million in 2001 revenue and 2,600 employees, and Moran Towing and Transportation Company Inc. of Greenwich, Connecticut, with \$214 million in 2001 revenue and 900 employees.

RESEARCH AND TECHNOLOGY

In the late 1990s, Halter Marine Co. of Gulfport, Texas, announced the development of a new class of harbor tug boats, called ship docking modules (SDMs).

These 90-by-50-foot tugs were especially designed to assist in maneuvering ships into tight dock spaces. They were equipped with 4000 horsepower, twin Caterpillar diesel engines and could provide 100 percent power in any direction.

Other new designs in the 2000s were incorporating the best parts of stern-driven ASD and forward-mounted Z-drive tractor tugs into one tug for maximum handling. As of 2003, the West Coast was seeing the addition of many technologically advanced tugs and tug equipment.

SIC 4493

MARINAS

This category covers establishments primarily engaged in operating marinas. These establishments rent boat slips and store boats, and generally perform a range of other services including cleaning and incidental boat repair. They frequently sell food, fuel, and fishing supplies, and may sell boats. Establishments primarily engaged in building or repairing boats and ships are classified in **SIC 3731: Ship Building and Repairing** or **SIC 3732: Boat Building and Repairing**. Establishments primarily engaged in the operation of charter or party fishing boats or rental of small recreational boats are classified in **SIC 7999: Amusement and Recreation Services, Not Elsewhere Classified**.

NAICS CODE(S)

713930 (Marinas)

INDUSTRY SNAPSHOT

According to the U.S. Census Bureau, in 1999 there were 8,200 U.S. marinas. Marinas are usually very small operations, with about half of marinas employing between five and nine workers, most of whom are seasonal. The National Marine Manufacturers Association (NMMA) estimated that in 2002 there were 12,000 marinas, boatyards, yacht clubs, dockominiums, parks, and related facilities. That number has remained unchanged since 2000. Marinas enjoyed an expansive period between 1992 and 1997, when the number of marinas increased 26 percent; there was a 53 percent increase in revenues; employees increased by 27 percent; and there was a 49 percent increase in annual payroll. According to the U.S. Coast Guard (USCG), the number of registered boats increased 14 percent between 1990 and 1999. Despite slighter a lower number of participants in boating in 2002, that year also saw an increase in the number of boats in use, as well as retail and pre-owned boat sales.

The marine industry faced some challenges at it moved into the new millennium, including the shaky economic climate. Recreation and travel in general faced numerous problems due to the events of September 11, 2001, which had people traveling and spending less. The war with Iraq in 2003 and escalating fuel prices also had a negative affect on this sector. Marine industry leaders, however, were mildly optimistic about recovery for the sector during 2003.

ORGANIZATION AND STRUCTURE

Marinas, always on or adjacent to the water, have varied physical shapes and sizes, offer a diverse range of services, and lend themselves to different ownership arrangements. Each marina has limitations and options to serve the boating public.

A marina rents, leases, or sells slips, usually in a boat basin with piers and stationary or floating docks. More than 8,000 marinas, with about 400,000 slips, sell marine services. There are moorings and anchorages for about 33,000 boats. More than 200 dry slip or land-based, often stacked, boat facilities store up to 150,000 boats on racks in buildings or on open land. Approximately 1,100 boat yards provide wet slips. More than 100 dockominiums berth boats in clusters of individually owned docks. More than 80 percent of the marinas provide yard services to maintain, repair, or build boats.

Financial Structure. Marinas are located on gravel pits, reservoirs, lakes, rivers, coastal waterways, and oceans. All marina ownership is held by the owner of the associated upland. Water rights are leased from the gov-

ernment. In many states, a government body holds coastal water rights for the public interest.

About 70 percent of marinas are privately owned, profit-making businesses that sell services to the public. About 1 to 2 percent of the marinas are cooperative, condominium, housing development, and yacht club marinas, which serve their members and offer reciprocity privileges to other associations. The remaining 30 percent are municipal, state, and federal government marinas, which are open to the public at minimal or no cost, although some federally owned marinas are exclusively used by the military.

More than 70 percent of the marinas are owner-operated, stand-alone facilities. Corporations, families, and retired business owners provide slips and sell fuel and minimal ship stores. Investment sources are often friends, family, local banks, and savings and loans establishments. Larger marinas are often expanded owner-operated facilities.

The full-service marinas are owned by private or publicly traded real estate corporations. Some offer extensive boat yard services. Others are development complexes. They showcase marinas in two architecturally consistent mixed-use categories that maximize land-bound sales. Urban revitalization complexes integrate commercial space with residences. Resorts emphasize water- and land-based recreation and sports. Investment sources are banks, savings and loans establishments, venture capitalists, private and public industrial and recreational development bonds, investment banking, pension funds, and life insurance companies.

Full-service marinas have broad profit centers. Product sales are derived from slip and building fees, diesel, gasoline, propane and alcohol fuels, engine oil, vending machine products, marine and grocery goods, electronics, custom-built equipment, and boats. Services available include boat washing and cleaning; wood, fiberglass, rigging, engine, and propeller painting, maintenance, and repair; haul outs; and diving.

Marinas rent or lease wet or dry storage by the boat's or slip's length or slip's square footage. Marinas charge transient boats a daily or weekly rate. Permanent customers pay a monthly, seasonal, off-season, or annual rate based on competitive, comparable local prices. Therefore, other sales usually account for a significant amount of marina profits.

The full-service marina draws the demanding boating public with amenities including, but not limited to, deep water for boating; safe tie-ups; launching ramps; dock hand and concierge service; water, electricity, television, and telephone service to the boat; sewage pumping; storage facilities; and various other benefits.

BACKGROUND AND DEVELOPMENT

The early concept of the marina, including public access and common ownership of waterfront property for commerce and transportation, dates to Roman Law of 2,000 years ago. The concept was lost during the Dark Ages. The Magna Carta restored public rights to coastal tidelands in 1215 A.D.

In the United States, marinas developed slowly. The U.S. Congress passed The River and Harbor Act of 1899, which authorized the Secretary of the Army, through the Army Corps of Engineers, to approve the building of any structure on or over navigable waters. Recreational boating increased. The wealthy built private harbors in the early 1900s. By the 1930s, the term marina (Italian for small craft harbor) described the recreational boat facility.

After World War II, the middle class bought recreational boats with discretionary income. The marine industry used lighter-weight aluminum and fiberglass developed during World War II to mass-produce durable, low-maintenance marina docks and other products. Simpler welding techniques refined steel construction for hoists. Inexpensive concrete was also available for piers, docks, and pilings.

Until the 1960s, most marinas were owner-operated. Then, developers showcased the marina as the first stage in long-term, mixed-use plans for urban revitalization and resort complexes. As a result of the increased recreational boating across the country, Congress broadened The River and Harbor Act in 1968 to require approval for building recreational structures, further protecting U.S. waterways.

In the 1970s, a series of devastating events rocked the marine industry. Double-digit inflation, 20 percent interest rates, fuel pump lines, the Arab oil embargo, a federally proposed weekend energy conservation motor boating ban, and environmental regulations all adversely affected the marina economy.

Legislation. The federal Water Pollution Control Act amendments of 1972 required permits to regularly discharge waste water. The Coastal Management Act controlled development to protect water quality and coastal and inland wetlands. The Clean Water Act of 1977 further protected natural resources. The Environmental Protection Agency and the National Oceanic and Atmospheric Administration released guideline documents to control non-point source pollution.

The early 1980s provided the marina industry with a friendlier business environment. Increased discretionary spending, tax changes, declining interest rates, and laxly enforced regulations all spirited growth. Amendments to The Federal Tax Reform Act of 1986 allowed private marinas on port district property to continue tax exempt

financing for equipment, docks, and marina-related buildings.

The marina industry has remained non-standardized. According to Neil Ross, past president and co-director of the International Marina Institute, the marina industry, in its evolution, is like the roadside service industry when motels were replacing family-owned cabins. However, it is changing rapidly in response to management, environmental, and real estate demands and opportunities.

Approximately 80 percent of tidal flow and inland coastline is private commercial and residential space. Marinas only allow their customers and service workers access due to security and insurance regulations. Actual public access to waterfront is limited to the 20 percent of municipal, state, and federal marinas. With an increase in use, this limited shoreline began proving insufficient to meet the needs of the expanding boating public.

The marina industry began coordinating with government, banks, and insurance companies to maximize cost-effective, creative business procedures. Financiers consolidated foreclosed marinas into \$100 to \$150 million portfolios for publicly traded real estate investment trusts, freeing banks from the responsibility of disposal. Developers submitted long-term plans to accelerate the three- to five-year complicated government permitting process for dredging and filling. Brokers began selling dockominiums and other large facilities so developers immediately recoup some investment costs. Investors replaced owner-operated businesses with retail chains and franchises to cut costs. In addition, cash-strapped municipalities increasingly investigated the sale of public marinas to private owners. Dry stack marinas, which require less waterfront volume, were an increasing presence as well.

According to 1998 statistics, 13 million families owned boats in the United States, and 570,000 new boats (all types) were sold that year. The NMMA reported that another eight million persons were interested in buying a boat some time in the future. In 1997, some 9,967 marina facilities provided storage space and sold marine-related services and products to recreational power and sail and commercial watercraft owners. No standardized format for determining marina industry assets existed, because a "marina" may refer to a facility with only four docks or one with thousands of slips as part of a larger facility.

The marina industry experienced rapid growth and increased annual sales in all climate zones from 1982 through 1987, the year retail sales topped \$8 billion. This was the longest period of uninterrupted growth in the industry's history. From the late 1980s through the early 1990s, the industry suffered increasing financial difficulties. In 1992, boat slip vacancies averaged from 20 to 30 percent, although this figure was less in the Sunbelt

states. By 1996, even marinas in southern California were experiencing increasing vacancy rates, some exceeding 40 percent—and generally, vacancies signify additional marina retail losses. A slip customer purchases more products and equipment from the marina than the boating public based elsewhere. Marina expansion and development slowed in the early 1990s, a reflection of a stagnant national economy and poor weather conditions. By the latter 1990s, the number of marinas in operation had stabilized, with a prediction for increased growth due to the positive economic outlook.

Boating Industry's 1998 random survey of marinas around the country indicated stable occupancy rates, with a slight increase, and a 90-plus percent occupancy rate during peak seasons. In the 1990s, marina owners and operators began to address several challenges to the industry, including periods of economic instability, increased marina insolvencies, stringently enforced environmental regulations, a lack of natural waterfront with adjacent land, and the loss of traditional lending sources. Conversely, market forces created more demand for marina facilities, especially in the Southeast and the West.

CURRENT CONDITIONS

Despite a tough economic climate and the cocooning effect on Americans in a post-September 11, 2001 environment, boating was still enjoying relatively clear sailing in 2002. Estimates from the NMMA showed that in 2002, there were 68.8 million boating participants in the United States, down slightly from 69.4 million in 2001. However, the number of boats in use rose during 2002, from nearly 17.2 million in 2001 to 17.4 million the following year. Retail boat sales were also up for the year, from \$28.5 billion in 2001 to \$29.2 billion in 2002, as were pre-owned boat and motor sales which rose about \$130 million during the same time period.

According to the U.S. Census Bureau, estimated revenues for marinas were \$3.26 billion in 2001, up a fraction from \$3.25 billion the previous year. Despite showing a gain in a challenging economic climate, in previous years marinas had shown more dramatic increases in revenue, rising 7.2 percent from 1999-2000 and also gaining 7.2 percent from 1998 to 1999.

According to the U.S. Coast Guard, there were 12.9 million recreational boats registered in the United States. In 2001, an increase of 94,000 or 0.7 percent from 2000. The NMMA estimated that in 2001 there were more than 17.3 million boats owned in the United States and that 541,000 new boats were sold at retail. Recreational boating was down slightly in 2000, about 1 percent for the year, with 72.3 million Americans participating in boating. However, spending on boating rose 15 percent in the same time period, to \$25.6 billion in 2000, up from \$22.2 billion in 1999.

To address ongoing environmental issues and limit future contamination, many states have formed incentive-based marina pollution prevention outreach programs. One such program is the Clean Marina Program, which involves states and organizations including California, Connecticut, Florida, Massachusetts, Maryland, North Carolina, South Carolina, Texas, Virginia, and the Tennessee Valley Authority. The program includes an advisory committee, a coastal nonpoint source management program, guidebooks, educational outreach, grant funds, and coordinates with other programs. Similar partnerships include Boat US, Ocean Conservancy, Marina Environmental Education Foundation, States Organization for Boating Access, and the National Clean Boating Campaign.

INDUSTRY LEADERS

Marinas vary widely in terms of size, services, and dockage capacity. However, the largest marina businesses provide full services. In the late 1990s, four top industry leaders were American Commercial Lines, Inc., of Jeffersonville, Indiana (In 1998 American merged with the Vectura Group's National Marine); ATC Leasing of Kenosha, Wisconsin, a subsidiary of Jupiter Industries, Inc.; Richard Betram & Co., Inc., of Miami, Florida; and Skipper Marine Corp. of Milwaukee, Wisconsin. Skipper bought four boat dealerships in Michigan during 1999, bringing its total sales outlets to 11. In addition, it operated 20 marinas in four states.

These corporations own and operate marinas as part of larger hotel resort complexes that include other sports and recreational facilities. The largest marina in the United States is Marina del Rey (California), which boasts more than 8,000 slips—the majority occupied by large yachts. Westrec, a management company, controls chains that include over three dozen marinas.

In 2001, the top 20 states for registered boats made up nearly 75 percent of the total amount in the country, with 9.6 million boats. The top 10 states for boat registrations accounted for some 51 percent of registered boats at 6.6 million. Michigan, with more than one million boats, remains the leading boating state in the United States. California followed with 957,463; Florida was third, with 902,964; Minnesota fourth, with 826,048; Texas fifth, with 621,244; Wisconsin sixth, with 575,920; New York seventh, with 526,190; Ohio eighth, with 414,658; South Carolina ninth, with 382,072; and Illinois tenth, with 369,626 registered boats.

WORKFORCE

The marina industry's lack of standardization is reflected in its employment practices. Marinas generally employ staff and bring in independent contractors or con-

cessionaires to whom the marina may lease space or charge to work in the facility.

The stand-alone marina labor force includes the self-employed owner-operators and additional staff as needed, who serve as dock masters, retailers, maintenance managers, and bookkeepers. For 1996, the average number of employees for each marina was between 2.5 and 4 per 100 berths; these were often part-time employees. During slow times of the year, the staff repaired facilities or worked at other marinas, often in a warmer climate zone. Full-service marinas often employed highly specialized employees as well. Various general managers, service managers, operations managers, and controllers were often part of the payroll of larger establishments.

The industry as a whole was standardizing employment and training. The International Marina Institute began a certified marina manager program in 1992, which emphasized standardizing accounting and other financial procedures, environmental processes, and education of customers. The Marina Operators Association of America had more than 300 members, primarily owners and managers representing large marinas, who participated in ongoing information programs. The International Marina Institute had 350 dues-paying members in the mid-1990s, and promoted growth and professional development among members and their staffs.

RESEARCH AND TECHNOLOGY

New technologies boost marina profits and management efficiency, provide weather protection, meet environmental regulations, and expand space. Marina franchises and management companies are fledgling innovations. Management retraining and computer software lead in office and on-the-dock changes.

In the realm of structural changes, docks and other structures are increasingly made of refined composite structures designed to withstand the elements more effectively than wood. Marinas have increasingly turned to new products with environmental and fire-resistant attributes. Engineers in the 1990s have also redesigned boat yard and dockside disposal systems to meet environmental regulations. Space limitations are resolved with offshore islands for docking, refueling, and mixed-use facilities such as floating hotels. Another area of enhanced development in the latter 1990s was the increased space for dry-dock storage created by new technology and equipment facilitating dry-stack storage. Older marinas continued to utilize large vacant parcels of real property to store boats off-season. However, new technology, including the development of powerful forklift-type vehicles, permits the lifting and stacking of boats into shelf-like racks for off-season storage.

SIC 4499

WATER TRANSPORTATION SERVICES, NOT ELSEWHERE CLASSIFIED

This classification covers establishments primarily engaged in furnishing miscellaneous services incidental to water transportation, not elsewhere classified, such as lighterage; boathiring, except for pleasure; chartering of vessels; canal operation; ship cleaning, except hold cleaning; and steamship leasing. Establishments primarily engaged in ship hold cleaning are classified in **SIC 4491: Marine Cargo Handling**; and those primarily engaged in the operation of charter or party fishing boats or rental of small recreational boats are classified in **SIC 7999: Amusement and Recreation Services, Not Elsewhere Classified**.

NAICS CODE(S)

532411 (Commercial Air, Rail, and Water Transportation Equipment Rental and Leasing)

488310 (Port and Harbor Operations)

488330 (Navigational Services to Shipping)

488390 (Other Support Activities for Water Transportation)

The miscellaneous water transportation services industry covers a variety of services related to water transportation. These include boat livery, except pleasure; commercial boat rental; canal operation; cargo salvaging from distressed vessels; chartering of commercial boats; dismantling ships; lighterage; operation of marine railways for dry-docking; marine salvaging; marine surveying, except cargo; marine wrecking; piloting vessels

in and out of harbors; ship cleaning, except hold cleaning; ship registering, including surveying and classifying ships and marine equipment; and steamship leasing. These duties usually are performed dockside and include loading and unloading of railroad cars, trucks, barges and containers; building grain feeders; lashing and strapping cargo; and repairing shipping pallets. Cleaning crews wash and paint surfaces, clean oil tanks, take inventory, clean and wash decks, clean and check lifeboats, clean the quarters, and sort and check laundry. Additional services can be provided by towing and barge operators. Such work includes lighterage or the transfer of goods from ship to barge.

This industry also includes companies that repair, salvage, or scrap ships, and organizations that conduct safety inspections, called classification societies. The leading societies are Lloyd's Register of Shipping (U.K.), Nippon Kaiji Kyokai (Japan), and the American Bureau of Shipping (U.S.). By the end of the 1980s, members of the maritime industry had become highly critical of classification societies for their reduction in standards, charging that the changes had led to increased passenger and vessel loss and the decline of maintenance standards throughout the world. In an attempt to prevent additional losses, the International Association of Classification Societies has begun to implement “enhanced surveys” for tankers and bulk carriers, vessels with the greatest potential for loss.

In recent years, many ship repair companies have been hesitant to work on some vessels, fearing they will be held liable for any subsequent malfunction. Moreover, underwriting agencies have become more cautious of paying claims that have been the result of poor maintenance rather than damage caused by an accident. This wariness has created an environment wherein ships needing repairs are more likely to be relegated to the scrapheap.

The uncertainty of the ship-repairing sector kept many companies from expanding. San Diego, California's private ship-repair industry received \$238 million from the U.S. Navy in 1998. Although the 1999 budget was \$260 million, the locals are still recouping from the slag following 1997's \$282 million. The private ship-repair industry takes in about 40 percent of U.S. Department of Defense work, the other 60 percent going to public shipyards. In 1998, it was 34 and 66 percent. The same was not true in the Norfolk, Virginia area, where the Navy paid private companies \$942 million for ship maintenance work in fiscal year 1998, as opposed to only \$417 million going to the Navy shipyard. At Puget Sound, Todd Pacific Shipyards of Seattle entered a \$100 million multi-year contract with the Navy in 1999 for alteration and repairs on aircraft carriers, representing the first such contract award to private industry.

Another area of this industry was salvage, both of cargo and vessels, a sector served by the American Salvage Association. Traditional salvage jobs were becoming fewer and farther between in the 2000s. Due to changes in regulatory laws after the Exxon Valdez oil spill and the Oil Pollution Act of 1990, the salvors in the 2000s had a responsibility to the environment first. The focus was on keeping the contaminants on the vessel and out of the environment. In addition, many in this sector were expanding to offer diversified services such as diving, heavy lift, or surveying.

After the terrorist attacks of September 11, 2001, most of the money and attention in the water transportation industry in general and the Coast Guard specifically was directed toward security. But as of late 2003, salvors were awaiting regulations that would standardize the industry. Among such regulations would be a stipulation that ship owners must contract with a U.S. salvage company in order to do business in the United States.

The clear industry-wide leader in the early 2000s was Edison Chouest Offshore Inc. of Galliano, Louisiana. The company was founded in 1960 and doubled in size from 1993 to 2003. It posted 2001 revenues of \$392 million and 2,000 employees, far outpacing any of its competitors.

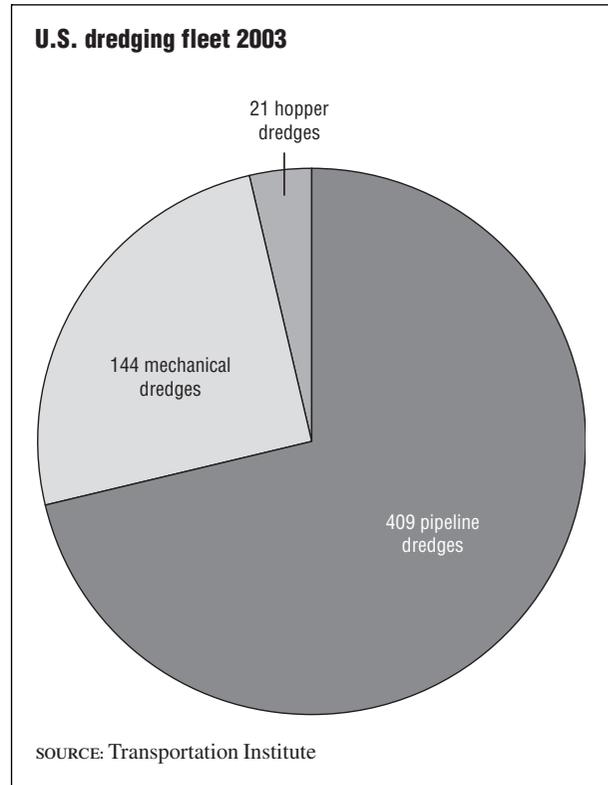

In second place was Houston-based Sonsub Inc. with \$75 million in 2001 revenue and 500 employees. Next was Fleet Yacht Charters of Boston, with \$41 million in revenue and 100 employees. Other notable companies in the industry were Houston-based Biehl International Corp. with \$29 million in revenue, and Tampa-based A.R. Savage and Sons Inc., with \$21 million in revenue.

A collateral but important component of the water transportation industry is the servicing and dredging of ports, channels, and marina ingress/egress waterways throughout the United States. According to the Transportation Institute, the U.S. flag dredging fleet in 2003 was comprised of approximately 409 pipeline dredges, 144 mechanical dredges, and 21 hopper dredges. The largest purchaser of marine dredging services was the federal government, through the Army Corps of Engineers. The maintenance-dredging budget runs from \$220 to \$260 million annually. New dredging work each year will add another \$50 to \$180 million. Shore protection services, environmental clean-up, and wetlands restoration are slow-growing corollary dredging trades, with the exception of shore protection, which jumped from \$25 million to about \$90 million in 2003.

SIC 4512

AIR TRANSPORTATION, SCHEDULED

The scheduled air transportation industry primarily has been engaged in furnishing passenger air transportation over regular routes and on regular schedules. This industry includes Alaskan carriers operating over regular or irregular routes.

NAICS CODE(S)

481111 (Scheduled Passenger Air Transportation)

481112 (Scheduled Freight Air Transportation)

INDUSTRY SNAPSHOT

The passenger air transportation industry provides air travel to both domestic and international destinations. What once began as a mode of transport for the U.S. mail has become a multibillion dollar industry. For 2001, the

industry had estimated revenues of \$80.9 billion. Air travel has become so commonplace that, according to an Air Transport Association (ATA) Gallup poll, nearly 75 percent of all Americans have flown on a commercial airliner at least once.

The airline industry experienced uninterrupted growth in revenues throughout the 1990s. However, a weakening global economy, coupled with the September 11, 2001, terrorist attacks, had drastically reduced airline traffic by the end of 2001. As a result, the industry posted unprecedented losses of \$7.7 billion for the year, as revenues dropped 13.5 percent from a record high of \$93.6 billion in 2000. The slowdown continued into 2002 and 2003, as major airlines, faced with reduced sales, continued to reduce their capacity and trim their ranks. United Airlines, the second largest airline in the world, filed for bankruptcy at the end of 2002.

The leading airport early in the twenty-first century in terms of volume was Atlanta Hartsfield International, with nearly 76 million passengers transported in 2001. Chicago O'Hare Airport transported more than 66 million passengers. Los Angeles International Airport ranked third with roughly 61,000 passengers, and Dallas/Fort Worth International held fourth place with over 55,000 passengers transported that year.

Three carriers have historically dominated the industry. American Airlines, United Airlines, and Delta Air Lines have become the best-known domestic carriers, leading the industry in terms of revenue passenger miles. In the early 2000s, all three industry leaders continued to struggle with difficult economic conditions, as well as the fallout from the September 11 terrorist attacks. In 2002, the largest airline in the world, American Airlines, announced the layoff of 7,000 employees, following a 20 percent workforce reduction in 2001. United Airlines, as part of its bankruptcy restructuring, planned to lay off roughly 9,000 workers in 2003. Delta also underwent significant downsizing in both 2002 and 2003, eliminating 13,000 and 8,000 jobs, respectively.

ORGANIZATION AND STRUCTURE

The U.S. Department of Transportation (DOT) has categorized airlines based on their annual revenues into three groups: major, national, and regional/commuter.

Major airlines are carriers with more than \$1 billion in annual revenues. This category once included Eastern, Pan Am, Northwest Airlines, Continental, Republic, America West, and Trans World Airlines (TWA). By the early 1990s, many of these companies were in some form of bankruptcy or had shut down operations completely. The result of these and other closings was the consolidation of assets among the three strongest majors: American Airlines, Delta, and United. Also new to this category was Southwest Airlines, formerly a national airline,

which offers short-haul, point-to-point service with few amenities.

Airlines with annual revenues of \$100 million to \$1 billion are generally categorized as national airlines. Although this category has been called "national," the name is not based on geographic boundaries, as only a small number of carriers actually have nationwide routes.

A carrier with less than \$100 million in annual revenue has been classified as a regional/commuter airline, according to the DOT. By the start of the 1990s, approximately 140 carriers were in operation, but the top 50 regional/commuter carriers accounted for approximately 97 percent of the group's revenue passenger miles.

Hub-and-Spoke System. The major airlines operate under the hub-and-spoke system set up after passage of the Airline Deregulation Act of 1978. This system created central hubs across the United States, where feeder flights were directed. Passengers from the feeder flights transferred to numerous other flights provided at the hub to their final destinations. The hub-and-spoke system has been advantageous to the major airlines in creating additional service to more destinations and allowing more efficient use of planes, terminals, ground equipment, and employees.

Unlike governments in many other countries, the U.S. government has not owned or operated an airline in any form. Instead, all U.S. airlines have been either public or privately held companies. Government involvement in the industry has been in the form of regulatory agencies, congressional acts, and appointed commissions.

BACKGROUND AND DEVELOPMENT

The creation of the passenger airline industry was contingent on the development of the aviation industry. With the first successful flight by the Wright brothers in Kitty Hawk, North Carolina, in 1903 the aviation industry began. However, the general public did not eagerly embrace air travel, thinking that it was a dangerous mode of transportation. Thus, the development for passengers of an aircraft, which in those days was called a "heavier-than-aircraft," moved slowly.

The country's preparation and eventual entry into World War I provided the necessary stimulus for developing the aircraft industry, if only for wartime usage. But as quickly as the U.S. government supported aviation during the war, it pulled all support and funding after the war, which virtually halted the industry.

The popularity of air travel exploded, though, with the successful overseas flight of Charles Lindbergh in 1927. Various air transport holding companies were created, such as Aviation Corporation, launched by financiers W. Averill Harriman and Robert Lehman. The air transport division of this company was called American

Airways. In 1928, Boeing and its air transport division created another holding company—United Aircraft and Transportation Corporation. By 1931 United Air Lines was created as the management company for United Aircraft's four transport companies.

Mail Service Spurred Industry Development. The airline industry developed in large measure because of efforts to improve the U.S. mail service. Congress appropriated monies for a trial mail run, and flights were originally made by Army planes and pilots. Soon after, the U.S. Post Office put together its own fleet of planes for mail delivery service. By 1920 flights were being made from New York to San Francisco during daytime hours.

Since the post office planes were allowed to carry only mail, political pressure mounted to turn this service over to private airline operators that could expand their cargo. In 1925, the Kelly Airmail Act gave private airlines, via a system of competitive bidding and subsidies, the opportunity to serve as mail carriers. The first national aviation policy, the Air Commerce Act of 1926, established provisions for the regulation of air traffic, the registration of aircraft, and the production of pilot licenses. Passenger volume per year grew from 6,000 to 400,000, and carriers proliferated. Air traffic across the nation grew increasingly disorganized, however. The McNary-Waters Act of 1930 gave the nation's postmaster general the authority to manage the industry. While the bidding system nominally remained in place, Postmaster General Walter Brown, who had lobbied for his expanded powers, arranged a meeting wherein the airlines negotiated territories among themselves. As a result, three primary routes were established—north, middle, and south—across the United States, with United, American, and TWA controlling one route each.

Brown's dictatorial power over the airline industry, however, came under increasing criticism. With the entrance of the Roosevelt administration in 1933, congressional hearings were held that included the investigation into the awarding of mail contracts. Under pressure from Senator Hugo Black, President Roosevelt cancelled all of the mail contracts, deeming them illegal, and turned over the mail delivery service to the Army Air Corps. This decision turned out to be a disastrous mistake because the Corps pilots were unfamiliar with the territory and had to fight treacherous winter weather. By the third week, five pilots had been killed in various crashes, and public outcry persuaded President Roosevelt to return the mail service to contractors.

Under the 1934 Air Mail Act, the postmaster general's power over the industry was diluted, and measures to ensure truly competitive bidding were established.

New airlines as well as established ones made low bids in an effort to snare market share, and as a result of the fierce competition, no carrier was able to make a profit.

Civil Aeronautics Act. The desperately competitive industry seemed in danger of destroying itself. The government reacted by passing the Civil Aeronautics Act in 1938. The legislation created the Civil Aeronautics Authority (CAA), an independent regulatory bureau. This organization later was named the Civil Aeronautics Board (CAB). The CAB regulated passenger fares and airmail routes, monitored acquisitions and mergers, and distributed routes to airlines. The policies implemented by the Board in the 1930s remained intact for nearly 40 years, resulting in a sort of stagnation in the industry. No new major carriers established themselves during that time, a period in which the number of major airlines dwindled to nine.

The U.S. entry into World War II required the country's commercial fleet of planes to be sent overseas, along with flight personnel. The war increased the development of aircraft, not only for wartime use, but also for postwar commercial aviation. The 1950s brought both the introduction of the electronic reservations system and cross-country jet service. Advances in passenger comfort and plane capacity further aided the industry. During the 1950s and 1960s, companies continued to buy modernized planes and expanded service to both domestic and international destinations.

The Federal Aviation Act was passed in 1958 after two airplanes collided over the Grand Canyon. The Act created the Federal Aviation Agency, which was responsible for developing an air traffic control system. In 1967 the Agency was renamed the Federal Aviation Administration (FAA) and was put under the control of the U.S. Department of Transportation (DOT), which was also created that year.

Industry Deregulation. In the 1970s the industry underwent a tremendous transformation. Industry players were rocked by expensive new aircraft purchases and fuel costs that, because of oil supply concerns, amounted to as much as 30 percent of operating expenses. Labor costs soared as well, while service demand remained tepid. The airline industry was in serious trouble.

During this same period, cries calling for repeal of the 1938 legislation that froze the industry for so long grew louder. Critics contended that the airline industry had become a sluggish, ineffective entity in the regulatory environment in which it functioned. Events of the mid-1970s seemed to support this viewpoint. Thus, the Airline Deregulation Act of 1978, which removed governmental control of routes and fare pricing, was passed and signed by President Carter.

The airline industry felt the effects of deregulation almost immediately. New players in the industry proliferated, both at the national and regional level. Established regional airlines, meanwhile, viewed deregulation as an opening to expand their influence. Competition quickly grew fierce across the industry, and established giants scrambled to keep pace with new, more nimble companies armed with modern aircraft that fit their needs, and strategies that jelled with the hub network concept.

In the mid-1980s, the industry was swept by a wave of mergers, acquisitions, and bankruptcies. These mergers were approved by the Department of Transportation rather than the Justice Department (the Justice Department assumed power over airline mergers in 1988). This consolidation of the industry left eight airlines controlling more than 90 percent of U.S. air traffic. The industry boomed with increased traffic and first-time air travelers because of drastic reductions in fares and the addition of cities served by air transportation. The industry encountered significant problems as well, however. Demand for new aircraft exceeded manufacturers' supplies, creating a situation wherein, by the late 1980s, 20 percent of U.S. planes in operation were older than the 20-year standard life. Safety concerns mounted as well, after several major airplane crash disasters resulted in the loss of hundreds of lives. Critics contended that the airlines were not paying sufficient attention to maintenance needs because of cost concerns.

Perhaps the biggest threat to the domestic airline industry, however, was the most basic one: the inability to make a profit. Operating costs, especially in the realm of labor, coupled with incessant fare wars in which ticket prices were often slashed as much as 50 percent, battered the industry's major companies.

Customers have obviously benefited from deregulation. Since 1979, passenger enplanements had increased by more than 70 percent, revenue had tripled from \$27 billion to more than \$77 billion, and nearly 90 percent of all passengers during the 1980s traveled on discounted fares.

Daunting financial difficulties for the carriers persisted into the early 1990s. In 1993, due to financial problems that challenged the airline industry, the Clinton administration created the National Commission to Ensure Strong Competitive Airline Industry. This group produced a 90-day study of public-policy changes to be enacted in order to maintain profitability.

Staged Strong Recovery After 1992. The passenger air transportation industry made an unprecedented turnaround in profitability, traffic, and price stability in the 1990s. The industry had flourished from the late 1950s through the early 1970s, as U.S. airline passenger traffic grew at 13 percent a year. By the early 1990s, however,

the industry had been hit hard by the Gulf War, rising fuel prices and other operating costs, fare wars, rising debt service costs, and the slowdown of the American economy. On average, the industry's annual growth in traffic was less than 1 percent from 1987 through 1992, and even this dismal rate was achieved by selling seats below cost.

Consolidation in the industry was forecast to pick up, as the major airlines became profitable once again. In late 1996 American and British Airways, Continental and Delta, and USAir and United toyed with the idea of joining forces. However, none of these happened in 1996, and pilots, unions, and government antitrust sentiments tended to hamper merger prospects.

Successful nationals provided service to a niche market, did not interfere with the majors, and operated from airports with minimal competition. Examples included Southwest Airlines at Dallas Love Field, Midway Airlines at Midway Airport in Chicago, and America West in Phoenix. Alaska Airlines has remained the only large, successful national airline in operation, with more than 50 percent market share of the Pacific Northwest/Alaska market.

Regional airlines have continued to flourish for two reasons. First, in an effort to cut costs, the majors have "handed over" to affiliated regional airline routes that were not profitable for them. Customers were attracted to fly on the regional line with the enticement of gaining frequent flyer miles. With this arrangement, the major airline maintained its name recognition without having to run an unprofitable route.

The majors' withdrawal of jet service to certain markets also presented opportunities for nonaffiliated regional airlines. Defying negative trends, several small airlines, such as Reno Air Inc., Skybus Corp., and Kiwi International Air Lines Inc., started operations during the early 1990s. Tapping into the glut of planes and unemployed workers created by the industry shakeout of the late 1980s, 17 airlines had applied to become certified for chartered service by the end of 1991.

During the early 1990s, carriers put forth a serious effort to control operating costs by cutting personnel, reducing salaries, trimming flight schedules, and retiring older aircraft. The industry benefited from 1994 through 1996, as the capacity glut diminished.

At the beginning of 1996, profits and traffic in the airline industry were affected by the expiration and reinstatement of a 10 percent federal excise tax on domestic airline tickets. Congress let the tax expire at the end of 1995 but reinstated it on August 17, 1996. The airlines lowered prices during this time and traffic increased—as did profits. However, the tax expired again at the end of 1996 and was reinstated in March 1997. This time, most

airlines (except Southwest) raised prices after the reinstatement. Wall Street analysts predicted that strong airline traffic and lower fuel costs would have a more positive effect on the industry, despite the reinstatement of the federal excise tax and any threat of future price wars.

Fuel prices were at 30-year lows by the end of 1998, helping to support profits in the airline industry, even as the industry was hit by several one-time events that served to drive down profits compared to 1997. For example, a lengthy pilot strike against Northwest Airlines drove the company into the red for 1998. While the industry reported an increase in overall revenues from \$88 billion in 1997 to \$90.5 billion in 1998, the top nine airlines reported a 15 percent decline in earnings for the year. Cost-cutting measures, including lowering commissions paid to travel agents, helped improve profits in some cases.

While America West, the ninth-ranked airline in terms of passengers and revenue passenger miles in 1997, was courted by United Airlines and Delta Air Lines in early 1999, nothing came of it by the end of the year. In fact, following about a dozen airline mergers in 1986 and 1987, there was no major airline merger during the 1990s, although Northwest took a majority stake in Continental Airlines in 1998.

Rather, airlines have joined forces through alliances with other domestic and international carriers. Code sharing, whereby one carrier's flight schedules are coded under an affiliated carrier's symbol on airline reservation systems, has become a popular way of forming alliances. The top five airlines have formed clusters of code-sharing alliances with international carriers, making it easier for customers to book connecting flights. United Airlines leads the Star Alliance with Lufthansa, Scandinavian Air System, All Nippon Airways, and Air Canada. American's One World Alliance includes British Airways, Qantas, TACT, and other Latin American carriers. Delta is seeking to join Air France's Atlantic Excellence partners, which includes Swissair and Sabena.

CURRENT CONDITIONS

Merger negotiations heated up among the major airlines in the late 1990s. American Airlines courted US Airways in 1999, a combination that would have resulted in the nation's largest airline. However, those negotiations eventually stalled. In 2000, United Airlines announced its intent to acquire US Airways for \$4.3 billion in cash, as well as the assumption of \$7.3 billion in debt. The following year, however, the U.S. Justice Department raised antitrust concerns that eventually undermined the deal. One major consolidation effort did come to fruition in 2001, when American Airlines paid \$740 million for the assets of TWA.

The airline industry experienced a devastating blow in 2001, when terrorists used hijacked planes to destroy the World Trade Center towers in New York City and severely damage the Pentagon in Washington, D.C. Air traffic ground to a halt for several days. Revenue passenger miles dropped 5.9 percent, the largest decline in industry history, to 652 billion in 2001, while passenger enplanements fell 6.6 percent to 622 million. When air traffic did resume, it was at a severely reduced pace, and most major airlines announced stringent cutbacks that included substantial layoffs and reduced capacity, in terms of both fleet size and route offerings. Scheduled flights fell from 9 million to 8.8 million between 2000 and 2001, reflecting a reduction in the number of daily flights by about 600. Despite the prompt passage of legislation that awarded governmental assistance to airlines, the industry experienced a loss of \$7.7 billion in 2001, its largest loss ever.

Undermining the industry's efforts to recover from the terrorist attacks in 2002 was the economic downturn affecting both the United States and the rest of the world as well. Consumer fears regarding the safety of flying and recessionary economic conditions continued to take their toll on airline revenues in 2003.

INDUSTRY LEADERS

The U.S. air transportation industry has been dominated by the strength and size of three domestic carriers: American, United, and Delta. The industry also has been greatly affected by the emergence of national airlines that provide service to niche markets. One company that has served as a model for this type of operation has been Southwest Airlines.

American Airlines. American Airlines has long been the main subsidiary of AMR Corporation, with headquarters in Fort Worth, Texas. American Airlines is the largest carrier in the world, serving more than 160 cities worldwide. With more than 128,000 employees, American operates from hubs in Chicago, Dallas/Fort Worth, Miami, and San Juan, Puerto Rico. In 2001 revenue passenger miles totaled nearly 127 billion, and operating revenues reached \$18.9 billion.

In 1999 American's parent company spun off its 83 percent interest in Sabre Holdings by distributing its Sabre shares to AMR shareholders, subject to a favorable ruling from the U.S. Internal Revenue Service. Once a part of American Airlines, Sabre had been reorganized in 1996 as a separate subsidiary through an initial public offering. Sabre provides American with essentially all of its information technology, including reservations, flight operations, and other real-time services.

American Airlines, previously named American Airways, started as the air transport division of the holding

company Aviation Corporation. In 1934, the company was renamed, and C.R. Smith was appointed president. Smith continued to serve in this position until 1968, when he was named secretary of commerce by President Lyndon B. Johnson.

United Airlines. With corporate headquarters near Chicago O'Hare International Airport, United Airlines claims to be the second-largest air carrier in the world and the largest majority employee-owned company. It offers service to 130 destinations in 28 countries and one U.S. territory. In addition to its main Chicago hub, the airline has four other U.S. hubs: Denver, Los Angeles, San Francisco, and Washington, D.C. In 2001 revenue passenger miles totaled roughly 116 billion, while operating revenues reached \$16 billion.

The company began with Varney Airlines, which later became a part of Pacific Air Transport and National Air Transport. This company merged into Boeing Air Transport, part of Boeing Airplane Company and Pratt & Whitney. In 1931, United Airlines was organized as a management company for the airline division and became a separate business entity three years later. In 1961 United Airlines acquired Capital Airlines, added 7,000 employees, and increased the route system; thus, it established its claim to the title of the world's largest privately owned airline.

Following tough negotiations with its unions in the mid-1990s, the pilot and machinist unions and the non-union ground support groups along with management agreed to an employee stock ownership plan (ESOP) that placed 55 percent of the company stock in employee hands. United became the largest employee-owned company in the United States. All parties participated in the employee stock ownership plan except United's flight attendants. By 2000, settlements with its pilots and mechanics had been signed to restore the wage levels that preceded the buyout. To reach this agreement, some profit-sharing rights were given up by the workers.

Delta Air Lines. Delta Air Lines, with headquarters at the Hartsfield Atlanta International Airport in Atlanta, Georgia, once offered the most extensive transatlantic service of any carrier in the world. The company operates 2,800 flights daily to more than 220 cities in 34 countries. Delta has more than 60,000 employees and a fleet of 815 jet aircraft. In 2001 Delta ranked third in the industry in terms of revenue passenger miles, which exceeded 97 billion, and operating revenues of \$13.2 billion.

Delta was founded in 1925 in Monroe, Louisiana, as Delta Air Service, a crop dusting company. Passenger service began in 1925 with flights to Dallas, Texas, and Jackson, Mississippi. The company merged with Northeast Airlines in 1972. Delta announced 1992 revenues of \$10.84 billion but was unable to post a profit for the year.

Instead, the company lost more than \$500 million. However, revenues and profits increased substantially during the 1995 and 1996 time period. Revenues reached \$12.5 billion, and profits reached \$156 million in 1996.

Southwest Airlines. Once a regional airline, Southwest Airlines is a short-haul, low-fare, high frequency, point-to-point carrier. By avoiding hub-and-spoke service, it is able to provide more direct nonstop routings, thus minimizing connections, delays, and flight times. Based in Dallas, Southwest Airlines initiated service in 1971 with flights to Houston, Dallas, and San Antonio. In 1991, the company moved into the major category due to its increased revenue. By 1999, the company was serving 52 cities in 26 states. The airline has been noted for its consistent profitability, and it was the only major carrier from 1990 through 1997 to make a profit. In 2001, it reported net income of \$511 million. That year it ranked seventh in revenue passenger miles, with approximately 44 billion, and eighth in operating revenues, with \$5.5 billion.

Other top ten airlines included Northwest Airlines, US Airways, Continental Airlines, Trans World Airlines, and America West. Of these companies, Continental, Trans World, and America West went through and survived bankruptcy proceedings in the early 1990s.

WORKFORCE

Following deregulation in 1978, employment in the airline industry increased from 340,000 jobs to more than 530,000 jobs in the early 1990s. In 1997, total employment by the 10 major carriers was 450,753 workers. A popular way to reduce wages in 1995 and 1996 was the use of employee stock payments. TWA, United, Northwest, and Southwest all reached agreements with their labor unions to exchange equity for wage increases.

Deregulation, though, also created differences between the airlines and various unions, which at the end of the 1970s filled 90 percent of all industry jobs. New airlines were able to operate with much lower labor costs than established outfits, and the industry giants soon decided that they had to reduce their labor costs in order to compete. While at some airlines, unions and management were able to reach agreements (equity for wage concessions, etc.), other companies resorted to measures that brought turmoil across the industry. Brain Airlines and Continental Airlines both used Chapter 11 bankruptcy regulations in the early 1980s to nullify existing labor contracts. Chapter 11 regulations enabled the companies to return to business without union employees, if they so desired. In Continental's case, the company fired their employees after filing for bankruptcy then rehired them as nonunion employees at wages that were in some cases more than 50 percent lower than prior to Chapter

11. This maneuvering galvanized unions across the industry, spurring them to protect themselves legally.

With the exception of American Airlines, company relationships with labor unions significantly improved in 1995 and 1996 from earlier years. Management of major carriers such as United Airlines and American Airlines demanded concessions from unions to cut costs. While unions dug in their heels, both airlines resolved the issues, United with an employee buyout and American with the flight attendants—but only after a costly strike. Northwest Airlines was able to reach an agreement with labor in July 1993 with wage reductions and other concessions in exchange for 30 percent of the airline's preferred stock and an increased voice in operations. United's successful employee stock ownership plan (ESOP) was touted as a model of employer-employee relationships by the Clinton administration.

Differences between labor unions and the airlines are sometimes exacerbated by the airlines' practice of taking two to three years to negotiate a labor contract. Labor costs as a percentage of the airlines' operating expenses increased steadily during the 1990s, from 31.6 percent in 1990 to 35.5 percent in 1998. As the airlines slowed contract negotiations, groups of employees were often left working without a contract. Short of striking, unions have resorted to tactics such as informational pickets at airports, thus presenting their cases to the general public. Northwest Airlines was hit by a costly airline pilots' strike in 1998, and pilots at American Airlines staged a sickout in early 1999. Although the airlines' profitability in the late 1990s was in part the result of earlier wage and benefits concessions on the part of unionized workers, the airlines appeared reluctant to make suitable offers to unions representing their pilots, flight attendants, and machinists.

Future trends in hiring airline industry employees will always be contingent on the strength and pace of the industry's economic outlook. While airlines are making good money, job security will probably always be tenuous, especially at the less-profitable carriers. The prospect of future airline mergers may also have a negative effect on industry employment. The emergence of new regional airlines has provided some opportunity for employment, but wages have been lower than the industry standard due to the large number of experienced unemployed airline workers. Computer-related jobs, such as systems analysts and reservations and keyboard operators, will continue to be in demand, as companies become increasingly automated.

AMERICA AND THE WORLD

The U.S. Department of Transportation's Office of International Aviation reported that 48.7 million passengers traveled by air between the United States and the rest

of the world during the first half of 1995. This was a 6 percent increase in passenger traffic compared to the first half of 1994. In June 1995 approximately 9.3 million passengers traveled by air in U.S. international markets, which was about 7 percent greater than the same period in 1994. In the first half of 1995, New York, Miami, Los Angeles, Chicago, and Honolulu were the top five U.S. international gateways. Miami recorded an 11 percent increase, with 674,000 passengers. The greatest passenger loss was felt in Boston, where a drop of 6 percent, or 88,000 passengers, occurred in the first half of 1995. The top five country markets for U.S. international travel were Canada, Japan, the United Kingdom, Mexico, and Germany.

More than 1.25 billion passengers per year rely on the world's airlines for business and vacation travel. The world's airline industry transports approximately a quarter of the manufactured exports by value. In the early 1990s, approximately 22 million jobs were in the world airline industry, producing approximately \$1 trillion in annual gross output.

Between 1994 and 2010, passenger and freight traffic were expected to increase at an average annual rate of 5 to 6 percent, which is significantly greater than the growth in global gross domestic product (GDP). Estimates are that by the year 2005, there could be in excess of 2.5 billion air travelers per year. By the year 2010, the world airline industry could exceed \$1.7 trillion, with more than 30 million jobs provided.

Growth in international travel will be contingent on the successful application of Open Skies legislation and other agreements with foreign governments and carriers. Open Skies agreements have offered airlines from foreign countries almost unlimited access to the U.S. market and freedom to set prices. The first-ever Open Skies aviation agreement was signed on September 4, 1992, between the United States and the Netherlands. The agreement allowed the integration of the operations of KLM Royal Dutch Airlines, the Netherlands flag carrier, and Northwest Airlines, in which KLM would own a major interest.

The European Community (EC) has been working on its own version of Open Skies deregulation. The initial resolution, effective January 1993, abolished the web of government-to-government agreements, which allocated routes within the EC and fixed fares. The 12 EC community nations and their seven partners in the European Free Trade Area (EFTA) have been trying to create a common market within Europe and to develop a cohesive group in order to gain access in the U.S. market.

The impact that the EC liberation policy will have on U.S. carriers has yet to be determined. But as *Air Transport World* noted, "Whether they view competi-

tion from U.S. carriers as threat or potential opportunity, all are adamant that Washington open up the U.S. market before Europe makes a move. And none appear to feel particularly hampered by having to continue bilateral negotiations with the United States, for lack of a united position.”

International markets in 1999 appeared to be on the eve of deregulation. The United States continued to push for open international aviation markets. International carriers were preparing for deregulation by building international hub systems and forming strategic alliances. Two leading international alliances involving U.S. carriers were the Star Alliance, led by United Airlines, and including Lufthansa, Scandinavian Air System, All Nippon Airways, and Air Canada. American's One World Alliance included British Airways, Qantas, TACT, and other Latin American carriers. Air France was the lead airline in the European alliance, Atlantic Excellence, which included Swissair and Sabena.

RESEARCH AND TECHNOLOGY

From improved reservations computer systems to high-tech amenities for business travelers to advances in aircraft design, computer software technology is expected to have a tremendous impact on the future of the airline industry. Most airlines have had home pages on the World Wide Web since 1995. Those sites began by simply displaying flight information, but soon the airlines were using the Internet to book flights and offer special discounts. By registering at an airline's Web site, consumers could benefit from unannounced specials and receive weekly briefings on discounts via e-mail. Booking flights via the Internet has the potential of saving airlines a percentage of the \$5.6 billion they paid in commissions to travel agents in 1998, an expense that accounted for nearly 7 percent of total airline costs. Online booking and ticketless travel enable the airlines to realize additional savings in the cost of processing tickets by being able to reduce the number of customer service operators and reservation clerks they employ. It was estimated that Internet purchases of airline tickets amounted to \$2 billion in 1998, up sharply from \$827 million in 1997 but still only 2.5 percent of passenger revenues.

High-tech amenities for the business traveler may be the next battleground for customer service among the major domestic carriers. Satellite-based telephone systems capable of handling calls to and from anywhere in the world have been placed on board planes, and in-flight faxes, computer, and data transmission services are commonplace.

The most significant advances in communications technology continue to be in the design, development, and operation of the airplane itself. Hands-off piloting,

navigation, and landing, and the guidance of satellites in the process of landing have become routine.

Computer technology will continue to refine the cockpit. By 1980 instrumentation and control systems had created the autopilot and “blind flying” instruments, which allowed a plane to fly straight and level even if the pilots removed their hands from the controls. By 1988 aircraft automation took a further step with the introduction of the Airbus A320. The flight-control computers on board actually told the pilot how to fly the plane and could prevent the pilot from exceeding the aircraft's structural limitations.

Modern aircraft have become so automated that some pilots and even some aircraft manufacturers have grown concerned about excessive reliance on the automated systems. New training programs have been established to combat this fear of over-reliance. Although advances in technology will continue to assist in the creation of safer and more fuel-efficient planes, the captain of a plane cannot be eliminated or automated out of the cockpit.

Additionally, according to an Airports Council International survey, “The new generation of large aircraft currently on the drawing boards of aircraft manufacturers could reduce airport capacity and have considerable cost implications for the world's airports.” Approximately \$105 million in infrastructure modifications may be needed to accommodate these new planes. The 600-plus passenger aircraft lower the unit operating costs and increase capacity for the airlines, but the modifications to runways, taxiways, and aprons could cost an average of \$62 million per airport. Changes to passenger terminals and operational facilities could add another \$43 million in costs.

SIC 4513

AIR COURIER SERVICES

The air courier services industry includes establishments primarily engaged in furnishing air delivery of individually addressed letters, parcels, and packages (generally under 100 pounds), except by the U.S. Postal Service. While these establishments deliver letters, parcels, and packages by air, the initial pick-up and the final delivery are often made by other modes of transportation, such as by truck, bicycle, or motorcycle. Also classified in this industry are separate establishments of air courier companies engaged in providing pick-up and delivery only, “drop-off points,” or distribution.

Establishments of the U.S. Postal Service are classified in **SIC 4311: United States Postal Service**; and establishments furnishing delivery of individually addressed letters, parcels, or packages (generally under 100 pounds) other than by air are classified in **SIC 4215: Courier Services, Except by Air**.

Establishments primarily engaged in undertaking the transportation of goods from shippers to receivers for charges covering the entire transportation but making use of other transportation establishments for delivery, are classified in **SIC 4731: Arrangement of Transportation of Freight and Cargo**.

NAICS CODE(S)

492110 (Couriers)

INDUSTRY SNAPSHOT

Definition of Service. The air courier industry is a division of the air cargo industry. As defined by the Air Transport Association (ATA), cargo is the total volume of freight, mail, and express traffic. The air courier divi-

sion includes both freight (generally under 100 pounds) and express mail. As defined by the ATA, freight and express mail are commodities of all kinds, including small packages, counter service, express service, and priority-reserved freight. Air courier service does not include the delivery of U.S. mail.

Major Integrators. In general, two kinds of companies have provided air courier service in the United States. First have been the integrators or all-cargo companies, such as Federal Express and DHL. These companies have a fleet of planes, carry cargo only, usually fly at night, and have ground transportation and personnel for door-to-door pick up and delivery.

Integrators have controlled 90 percent of the domestic market for envelopes, packages, and freight. These companies have been Airborne, Burlington, Air Express, DHL, Emery Worldwide, Federal Express, and United Parcel Service (UPS).

Combination Carriers. Air courier service also has been provided by passenger airlines, such as American Airlines. These companies transport cargo (freight, express, and mail) in the holds of their passenger aircraft. They fly during the day, since passenger traffic is their first priority. Passenger airlines have provided service similar to integrators, except most airlines have to subcontract ground transportation. Airlines also provide airport-to-airport deliveries.

Eleven passenger airlines once included all-cargo aircraft in their fleets. As of 1999 Northwest Airlines, with 10 747-200s, was the only U.S. passenger airline operating all-cargo equipment. The other 10 retired the all-cargo aircraft from their fleets by the end of 1984.

Air Forwarders. Both major integrators and combination carriers have worked with air forwarders to provide shipping services. Air forwarders are companies that arrange the complete shipping process and receive charges for the entire transportation. These companies do not own or operate aircraft and have to purchase space on the planes of airlines or integrators for their packages. Although air forwarders were the precursor to the air courier industry, these companies are not represented in this industry but are classified in **SIC 4731: Arrangement of Transportation of Freight and Cargo**.

Revenue Generated by the Industry. According to the Air Transport Association, cargo services (freight, express, and mail) reached nearly 22 billion revenue ton miles in 2001. A revenue ton mile (RTM) equals one ton of revenue traffic transported one mile. Freight, express, and mail cargo traffic dropped 7.9 percent from 2000 figures, due mainly to the increased security measures initiated after the September 11, 2001, terrorist attacks on the World Trade Center towers and the Pentagon. As a

result, cargo revenue fell 10.4 percent to \$13 billion in 2001.

Most Used Airports. The airport that received the most air cargo (freight, express, and mail) in 2001 was Memphis with 2.6 million tons of cargo enplaned and deplaned. Los Angeles International came in second, with approximately 2.1 million tons that year. Anchorage, Miami International, and New York's John F. Kennedy Airport (JFK) followed with 1.69 million, 1.61 million, and 1.5 million tons, respectively.

Kinds of Service. Companies within the freight/express mail division of the air cargo industry have offered various services related to time-sensitive delivery conditions. Customers can request next-morning or afternoon delivery, same-day service, or second-day delivery. Most international express services require a few days for delivery, depending upon the country's customs procedures and regulations.

BACKGROUND AND DEVELOPMENT

The U.S. airmail system was the forerunner to the air courier industry (or express mail industry). The U.S. airmail system also spurred the growth of the air passenger industry and the creation of the modern airlines. Yet the air courier industry and the time-sensitive delivery of letters and parcels remained dormant until the late 1970s.

Prior to deregulation of the air cargo industry in 1977, air transport of packages was made by the U.S. Postal Service or air forwarders. Time-sensitive shipments were not possible because air forwarders did not operate their own planes and had to depend upon the scheduled service of the airlines.

Deregulation in 1977. Following deregulation, the air cargo industry underwent dramatic changes, as air forwarders and ground transportation operators acquired their own aircraft and became integrators. Some passenger airlines also began to pick up market share, but it was the all-cargo carriers (or integrators) that created the express delivery service that has been most commonly known as air courier service.

Creation of the Hub System. Development of the hub system made possible the large-scale, overnight deliveries and the very existence of the modern air courier industry. Federal Express initiated the hub system, and it has remained the standard operating method in use.

Using this system, all freight is originally shipped to the company's central hub, where it is sorted and rerouted to its final destination. As the air courier industry has grown, some regional hubs have been formed to serve particular areas of the country. Integrators as well as passenger airlines use the hub-and-spoke system.

Air Express Service. The rapid growth of the air courier industry during the 1980s was primarily due to the success of express delivery service. Integrators have dominated this particular service. From 1982 to 1990, the domestic air express market grew at an annual rate of nearly 19 percent. In 1999 the air express industry continued to grow, along with air cargo. Air express deliveries accounted for 60 percent of air shipments in 1998, with overnight letters and envelopes alone accounting for 27 percent of the industry (in both shipments and revenues).

Competition. A flurry of overnight express companies appeared on the scene during the 1980s. By 1992 only seven significant air carriers remained in the express service business. Five companies continued to dominate the category in 1999: the U.S. Postal Service (USPS), the world's largest air-and-ground package delivery company, which offers express mail along with other options; Federal Express, the world leader in the overnight package delivery market; United Parcel Service (UPS), the second largest express courier service; DHL, the world's largest and most experienced international air express network; and Airborne Express, the third largest air express carrier.

Many analysts have considered the status of the air freight industry as a vanguard of the direction of the overall economy. During tight economic times, people cut costs by using the more economical two-day delivery service. As conditions improve, traffic in the more expensive, priority overnight service increases.

A Mature Market. Compared to the growth rates of the 1980s, the cargo industry (freight, express, and mail) slowed by the early 1990s. For example, annual growth in 1990 was 2.2 percent, compared to the 7 percent annual rate during the 1980s. Part of the slower growth rate was not only due to the recession but also to the use of long-range cargo aircraft in the Persian Gulf War.

By 1993 a general upturn in air cargo was reported in both domestic and international markets. Moreover, steady growth in express service (or courier service) has been predicted for the next decade, especially in the international arena. In 1996 air cargo traffic was at a 10-year high; total air cargo was up 30.5 percent from September 1995 to September 1996. All major air express carriers experienced growth in the late 1990s.

Service-Oriented Competition. As the express service industry has continued to mature, integrators have turned to service refinements as a competitive tool. Services such as guaranteed early morning or afternoon deliveries have become commonplace. Second-day service has been expanded, and weight limits have been raised. Extensive tracking processes and communications networks have been established to automate billing and accounting services for customers.

Status of Combination Carriers. The integrators have continued to dominate market share of the express service industry, as most U.S. combination carriers still treat cargo as a secondary service. Although most airlines could compete with integrators in head-to-head competition, they have not yet done so. While airlines have emphasized improved customer service, some have attempted to gain a foothold in the small shipment sector.

According to the Colography Group, an Atlanta-based research firm specializing in the air-freight and air-express industries, there were 2.8 billion domestic air shipments made in 1998. The U.S. Postal Service (USPS) moved 1.3 billion Express and Priority Mail parcels and represented 45 percent of the domestic market. In late 1999 USPS announced an affiliation with DHL Worldwide Inc. for expedited global service to 65 countries.

Overall, the 1998 industry realized a modest 7.6 percent increase from 1997. Federal Express captured 25.6 percent of the public market, followed by UPS at 15.6 percent, and Airborne Express at 11.3 percent, but the lion's share of the market remained with USPS. As of 1999 there were 18 listed companies operating in the air courier industry, only three of which were publicly held.

CURRENT CONDITIONS

Freight and express cargo revenue ton-miles fell from 21.1 billion in 2000 to 20.1 billion in 2001. This 6.2 percent decline in cargo volume caused operating revenues for the freight and express segment of the cargo industry to fall 4.8 percent from \$12.2 billion to \$11.9 billion over the same time period. The mail segment of the cargo industry experienced a steep 22.8 percent decline in volume, with revenue ton-miles falling from 2.1 billion in 2000 to 1.8 billion in 2001. Mail operating revenues plummeted 46.3 percent, from \$1.9 billion to just over \$1 billion. International cargo traffic, which represents nearly 60 percent of total traffic, dropped 6.3 percent, while domestic revenue ton-miles declined 10.1 percent.

The decline in both volume and revenues for the industry reflected heightened security efforts, which were put in place after the September 11, 2001, terrorist attacks in the United States and subsequent reports of mail laced with anthrax. Also causing a slowdown for the industry was the weakened global economy early in the twenty-first century. Mail cargo experienced a sharper revenue decline than freight and express cargo partly because of a 30.5 percent price decrease for mail shipments in 2001, compared to a 1.6 percent jump in freight shipment prices.

INDUSTRY LEADERS

Federal Express. Federal Express had 26 percent of the private market share in 1998 and 45 to 50 percent market share in the air express service division. Each day, Federal Express delivers approximately three million items.

Beginning operations in 1973, the company is known as the creator of the hub system of distribution. By 2002 Federal Express had nearly 185,000 employees worldwide and served 210 countries. It operated 650 aircraft and 50,000 vehicles. Federal Express' headquarters are located in Memphis, Tennessee.

Federal Express has also been the industry leader in various technological advancements. The company was the first to develop a computerized tracking system that could tell where any package was at any time from pick-up to delivery. Federal Express created the customer service system with 32 call centers worldwide that handled 300,000 calls daily. The company also developed the digitally assisted dispatch system (DADS), which communicates to couriers through computers in their vans. In 2002 revenues reached \$20.6 billion, with profits at \$710 million. Federal Express became a publicly held company in 1978 and is listed on the New York Stock Exchange.

United Parcel Service. United Parcel Service (UPS), headquartered in Atlanta, Georgia, is the second largest private express courier in the United States and the world's largest package delivery company, as well as the leader for domestic air shipments.

The company was founded in Seattle, Washington, in 1907, furnishing messengers for errand service. The company merged with a competitor in 1913 and took its name, Merchants Parcel Delivery, reflecting the company's concentration on retail packages. In 1919 the company changed its name to United Parcel Service (UPS) in the process of expanding its business into California and eventually to all of the West Coast.

In 1929 UPS began air delivery along the West Coast, but its airline, called United Air Express, ended operations in 1931 due to the depressed economy. During the 1930s and 1940s, the company concentrated on retail delivery service and opened major urban areas in the Midwest and eastern United States. UPS renewed its air service in 1953, and major cities on the East and West Coasts became connected with two-day service. By 1975 UPS had become the first company to serve every address in the 48 contiguous states.

UPS entered the overnight delivery business in 1982, offering UPS Next Day Air to 24 major metropolitan areas. UPS was already the largest carrier of packages in the United States, but the packages were primarily transported by ground service. On a daily basis, UPS delivers by air more than 1.78 million express mail packages, with UPS Next Day Air and 2nd Day Air Services combined. The company serves more than 200 countries and territories and every address in the United States. With 371,000 employees, UPS operates 146,000 vehicles, including package cars, vans, tractors, and trailers, and 600 aircraft.

Sales in 2001 grew 2.9 percent to \$30.6 billion, although net income fell 18.2 percent to \$2.39 billion.

Airborne Express. Airborne Express is the third largest air express carrier in the United States, second only to Federal Express and UPS. Airborne operates its own airline, ABX Air, Inc., with 120 planes in its fleet and its own ground transportation vehicles. It is the only U.S. air cargo company to own an airport. The Airborne corporate office is in Seattle, Washington.

Airborne Express operated as a freight forwarder until 1980, when it expanded into an overnight air express company. The company, initially Pacific Air Freight, merged with Airborne Freight Corporation of California in 1968, taking the Airborne name. The company first began operations by leasing the services of Midwest Air Charter in Wilmington, Ohio. With deregulation in 1977, Airborne began to purchase its own fleet of aircraft, which reduced the company's dependence on chartered space on other airlines. In 1980 Airborne acquired Midwest Air Charter and the Wilmington Airport, and turned the property into the company's hub airport. In 1995 the company expanded its fleet with the acquisition of Boeing 767-200 aircraft and opened a second runway. It also formed Airborne Alliance Group, a consortium of transportation, logistics, third-party customer service operations, and high-tech companies providing value-added services.

Airborne has been moving freight internationally for more than 40 years. The company has operated overseas with a combination of its own facilities and foreign-service partners. Airborne has entered into joint operating agreements with other large, well-established transportation companies worldwide. The firm posted an overall loss of \$19.5 million in 2001 on revenues of \$3.2 billion.

DHL Worldwide Express. DHL is the carrier with the most worldwide coverage, operating 4,000 offices around the globe. DHL employs 71,500 people and serves nearly 120,000 destinations in 230 countries and territories with its fleet of roughly 250 aircraft. Handling more than 65 million shipments each year, the company works out of 13 hubs, including a Miami-based facility built in 1997. DHL's domestic hub is located at the Greater Cincinnati/Northern Kentucky Airport.

DHL Airways, Inc. was founded in 1969 by Adrian Dalsey, Larry Hillblom, and Robert Lynn (hence DHL) as a shuttling service between Hawaii and San Francisco. In 1971 the company was the first international air express company to provide service to the Pacific Rim, starting with the Philippines. Service was extended to Japan, Hong Kong, Singapore, and Australia in 1972. DHL moved into Europe in 1974, Latin America in 1976, the Middle East in 1977, and Africa in 1978. It was the first company to bring air express service to the Eastern

Bloc countries in 1983 and to the People's Republic of China in 1988. The DHL Worldwide Express network is part of both DHL Airways Inc., based in Redwood City, California, which provides service to the United States and its territories, and DHL International, Ltd. in Brussels, which operates in all other areas of the world. Japan Airlines and the German airline Lufthansa each own 25 percent of DHL International, and the Japanese securities firm, Nissho Iwai, owns an additional 7.5 percent. The estate of the company's late cofounder, Larry Lee Hillblom, owns 60 percent of DHL Airways and 24 percent of DHL International. In 1999 DHL announced a deal with the Boeing Company for the long-term lease of 44 Boeing 757 special freighters to assist with the expanding global express delivery market. DHL also announced plans to sell 23 percent of the company early in the twenty-first century. Sales in 2001 grew 9.1 percent to roughly \$6 billion.

Another carrier is Emery Worldwide, a \$2 million global, multi-modal transportation and logistics company. It operates 580 service agencies in 95 countries, owns 98 aircraft, and uses a ground fleet of 2,000 trucks. In 1997 the U.S. Postal Service awarded Emery a \$1.7 billion, 58-month contract to create and operate a new network for the exclusive handling of priority mail. Cargo ton-miles reached 719 million in 2001.

WORKFORCE

In spite of the recession during the early 1990s, the express service of the air cargo industry continued to grow along with career opportunities. Employment opportunities in the industry have been greatest in major metropolitan areas. In 1997 Federal Express had to advertise nationally for employment in Indianapolis, because there were not enough qualified applicants to fill the job openings locally. At the end of the 1990s, job outlook was favorable because of the expected growth in the global market serviced by the same carriers.

Employees with experience in industry-specific software and knowledge of Electronic Data Interchange (EDI) will be needed, as companies head toward greater interconnectivity with client companies. To provide service to their customers, these companies will need Information Systems (IS) professionals with experience in developing various programming languages, such as C and C++, under the Unix operating system. Computer networking skills also have become critical, because companies have been adding new client sites to their network. With industry trends suggesting that the overnight express service will continue to lead in the growth figures for the industry, employment opportunities for IS professionals, such as computer and information systems managers, are projected to increase faster than other occupations through 2010.

AMERICA AND THE WORLD

By far the most important factor in the global expansion of this industry was the 1999 World Trade Organization (WTO) meeting in Seattle, Washington. At stake was China's anticipated contribution to a global air cargo value, which in 1998 surpassed the \$2 trillion mark (including ground services). In December 1999 Federal Express, UPS, and Polar Air Cargo companies were all filing documents with the U.S. Department of Transportation in an attempt to secure rights to provide service for 10 new authorized round-trip flights to China, the newest member of the WTO.

RESEARCH AND TECHNOLOGY

Advances in computer technology, software development, and the communications industry have provided the air courier industry with the necessary tools for efficient and timely functions related to all aspects of operations. Everything from hand-held computers, to online, real-time data systems has allowed air courier companies to communicate more effectively with ground personnel and their customers. Continued advances will bring additional automation and provide improved accuracy in delivery and billing, and improved service to the customer.

Electronic Data Interchange. Electronic Data Interchange (EDI) is a computer-to-computer exchange of information between businesses. This information, such as inventories and purchase orders, travels over phone lines. Many overnight delivery companies have developed their own personal computer (PC)-based EDI systems to use at their client sites. For example, UPS' MaxiShip system consists of a PC, UPS-developed EDI software, and a printer. The system enables clients to produce all shipping documentation and manage all cost accounting within their own offices.

Federal Express' system, PowerShip, is an internally developed computer system that allows customers to generate their own billing labels and invoices, and track their own packages through the Fed Ex delivery system. The Federal Express EDI system resolved the paperwork problem identified by their salespeople as a burdensome task, by performing four customer functions. First, it generates the shipping label. Second, it prints a manifest of what was shipped at the end of each day. An invoice is automatically generated, and shipping charges are accrued and sent to the home office system for billing procedures. The third function is an array of shipping management and reporting. And finally, PowerShip allows customers to access the Federal Express' computerized package-tracking system. More than 25,000 Federal Express customers began to use this system in the mid-1990s. Customers who do as little as \$75 worth of shipping per day with Federal Express can receive this system. Individuals with access to the Internet can track

their own packages online, using the Federal Express Web site.

Cellular Technology/UPSnet. UPS entered the cellular market with the development of one of the first cellular data networks in the country. The system, called UPSnet, transmits air and ground package delivery information in real-time that can be accessed by any ground transportation vehicle anywhere in the country.

To process delivery data for transmission on UPSnet, a driver first obtains a customer signature on a Delivery Information Acquisition Device (DIAD), a hand-held computer that captures signatures electronically. Next, the driver attaches the DIAD to UPS' DIAD Vehicle Adapter, which is inserted in a cellular telephone modem in the truck. The modem then transmits the information from an external transceiver on board to cellular switches provided by four different cellular carriers and to a UPSnet packet switch. The information is transmitted to a mainframe system at the UPS worldwide data center in Mahwah, New Jersey. UPSnet was expected to be installed in more than 50,000 vehicles in the UPS fleet.

Teller Machines Drop-Off Boxes. Federal Express had been test marketing its own new product, a self-service center based on Automated Teller Machine (ATM) technology. Anyone with a credit card or a prearranged Federal Express account number would be able to drop off an overnight letter or small package at this self-service center at any time. All labeling and billing would be executed on a touch-screen terminal similar to a bank ATM. The system, known as Federal Express Online, has a touch screen video display terminal that offers computer menus for making an address label or choosing either next-day or two-day delivery service. Payment is made by running a credit card through a magnetic slot.

The self-serve center processes the information, sends it over telephone lines to a local or regional database computer that authorizes the credit card transactions, stamps a time on the bar-coded address label, and confirms the delivery address for the customer. These centers were planned to be used around-the-clock and were intended to complement and possibly replace some of the 29,000 Federal Express drop-off boxes. The company hoped that increased automation would reduce costs and improve service.

SIC 4522

AIR TRANSPORTATION, NONSCHEDULED

This category includes establishments primarily engaged in furnishing nonscheduled air transportation. Also included in this industry are establishments primarily engaged in furnishing airplane sightseeing services, air taxi services, and helicopter passenger transportation services to, from, or between local airports, whether or not they are scheduled.

NAICS CODE(S)

621910 (Ambulance Services)

481212 (Nonscheduled Chartered Freight Air Transportation)

481211 (Nonscheduled Chartered Passenger Air Transportation)

487990 (Scenic and Sightseeing Transportation, Other)

INDUSTRY SNAPSHOT

The nonscheduled segment of the air transportation industry includes all companies that provide charter service, airlines carrying passengers and/or cargo, and helicopter services. One major characteristic of the nonscheduled industry is that companies operate on the basis of full-plane sales. Using this procedure, the total aircraft capacity is sold to an organization, such as a ticket wholesaler. In general, these wholesalers are tour operators, military and governmental agencies, specialty char-

ter customers, and sponsors of incentive travel packages. Most charter carriers, either passenger or cargo, are small operations working within a niche market.

Like the scheduled sector of the air transportation industry, the nonscheduled sector faced a major decline in ticket sales after the September 11, 2001, terrorist attacks in the United States. According to the Air Transport Association, charter revenues fell from \$4.91 billion in 2000 to \$4.45 billion in 2001. To encourage consumers to resume flying, many companies began reducing their ticket prices, which eroded profitability for many charter service providers.

ORGANIZATION AND STRUCTURE

According to *The Air Charter Journal*, there were 20,000 aircraft, from jets to turboprops, as well as 3,000 operators available for charter throughout the world at the turn of the twenty-first century. The nonscheduled airline industry included charter passenger airlines and air taxi services. Charter passenger airlines provided service to vacation or leisure destinations and marketed their services through the use of tour operators, travel agencies, or destination resort operators, which included cruise ship operators. With medium- to large-size planes in their fleet, charter carriers also provided service to the U.S. military and other groups. Air taxi services companies provided short-haul, on-demand transportation—in which case they were called “Part 135” operators—and helicopter service. Part 135 operators fly planes with fewer than 30 seats and have relied largely on corporate-oriented clientele. Most carriers also utilized their fleets for sightseeing trips, commutes between airports, emergency medical transportation, and the delivery of workers and equipment to offshore oil well sites. Helicopter services provided similar on-demand corporate transportation.

Scheduled Traffic and Capacity. Charter carriers typically board between 1 and 1.5 million passengers annually and log more than 18 billion revenue passenger miles (RPMs), a measurement based on one fare-paying passenger transported one mile. Charter airlines logged 9.1 billion of their RPMs in domestic service and 8.7 billion RPMs in international service. In comparison, annual enplanements for the scheduled airline sector average 554.2 million per 12-month period, producing 547 billion RPMs. While charter airlines fly fewer people, they tend to fill more seats on their planes. Nonscheduled carriers average 70 to 75 percent load factors (a measure of seats filled), while scheduled airlines typically realize much lower load factors.

Load factors for specific charter airlines usually have been higher than the overall industry average, running anywhere from 80 to 100 percent. Load factor directly affects fare structure. With fares based on a load factor of 80 percent or more, each seat can be sold at a deeper

discount. However, unlike scheduled carriers, if a charter cannot meet these numbers, the flight is canceled. Therefore, charter operators work in high-demand markets and will pull out of the market when demand falls.

Nonscheduled airlines, like charter services, can access approximately 5,000 different airports in the United States. In comparison, scheduled airlines can use only 500 airports around the country. Charter airlines rarely engage in direct competition with scheduled airlines. Instead, charters usually work in markets not directly served by the scheduled carriers. For example, Passport Travel, a Kansas City-based planner of Las Vegas trips, could not secure transportation through a scheduled carrier once the major hub in their market closed. As a result, PTI Tours, the wholesale division of Passport Travel, chartered a 166-seat plane for the summer and was responsible for filling those seats. On the other hand, some charter airlines work directly with cruise lines and operators of other vacation sites, bringing vacationers directly to specific islands from a main hub, say, in Miami.

In the 1990s, depending on aircraft type, country, and personnel, the hourly and overnight waiting charges varied widely. Rates in the United States were around \$50 to \$100 per hour for standby, and \$75 to \$300 for overnight. Rates in Europe for hourly waiting charges were between 3 and 7 percent of hourly flight charges, as reported in *The Air Charter Guide*. Taxes can often be charged as a percentage of the entire cost of the trip. In the United States, an 8 percent levy was typical for aircraft over 6,000 pounds. Prices per hour to charter a plane were generally higher in the Southeast than in the North Central region of the country. The number of planes also varied from four in the Northwest and South Central regions to 27 in the Northeast and Southwest.

Generally, a charter airline will enter into a contract with a tour operator four to six months in advance of the service to be provided. At the time the contract is executed, tour operators are required to pay the charter a deposit. The balance must be paid to the charter carrier at least two weeks prior to the flight date. If the tour operator fails to make the necessary payment, the carrier must either cancel the flight within 10 days prior to the flight date, or, pursuant to the U.S. Department of Transportation (DOT) regulations, perform under the contract in spite of the breach by the operator.

All charter carriers are subject to the jurisdiction of and regulation by the DOT and the Federal Aviation Administration (FAA) under the Federal Aviation Act. The DOT is responsible for regulating economic issues affecting air service, including air carrier certification and fitness, insurance, leasing arrangements, allocation of route rights, authorization of proposed charter operations, and consumer protection. In 1993 the DOT enacted a major overhaul of charter airline regulations, simplifying

the arrangement and sales of charter services while providing adequate consumer protection.

BACKGROUND AND DEVELOPMENT

Charter Airlines. Charter airlines have existed in the United States since the onset of commercial aviation, offering supplemental service to that provided by scheduled operators. Charter airline companies, generally small operations flying a few older aircraft, have never been well known among air travel consumers. The deregulation of the airline industry in the early 1980s offered severe challenges to charter airlines, primarily because it encouraged commercial airlines to offer low fares and plentiful flights to leisure travelers. Many charter carriers, seeking to protect their traditional business, could not compete with the larger commercial carriers and left the business.

While deregulation hampered the charter airline industry in one area, it helped in another. Due to the creation of the hub-and-spoke system, also a product of deregulation, many smaller cities have lacked direct or nonstop service, especially to leisure destinations. Successful charter operations have found niche markets in these cities and have avoided direct conflict with scheduled carriers.

Charter airlines have struggled to improve their image with the flying public. When the largest charter carrier, American Trans Air (ATA), began operations in 1973, the industry had a reputation for “rusty planes, lousy in-flight service and long delays,” said George Mikelsons, chairman of Amtran, the parent company of ATA, in *Travel Weekly*. “It has been a very slow process to get people comfortable with the fact that you can buy a charter flight that is at least the equal of coach class on a good scheduled carrier.”

Charters usually cost 20 percent less than a scheduled carrier’s ticket prices. However, if the major scheduled carriers are undergoing a price war among themselves, the price differential between the scheduled airlines and charters can sometimes significantly narrow. The charter business has succeeded because it is efficient; maintaining that efficiency through finding and effectively serving niche markets will be critical to the industry’s success into the early 2000s. ATA officials believe that the consolidation of the scheduled industry actually will help the charter market. Their reasoning has been that as markets become more consolidated, airlines will be less willing to price seats for tour packages. Also, as the scheduled carriers bring their tour operations in-house, they will be less willing to deal with operators outside their airlines. In turn, independent tour operators will have to depend on charters.

Industry analysts reported an 8.3 percent price rise in 1998 for the charter services sector of the nonscheduled air transportation industry. The overall industry rose at a somewhat lesser pace for 1998. The robust economy was

identified as the key market influence, but the 1998 Northwest pilot strike also contributed greatly to the enhanced charter airline market.

In 1999, however, the new airplanes ordered in anticipation of a continued growth market were being delivered, and a glut of available seat space began to cut into profits. By August 1999, there were 500 domestic planes still sitting, available for purchase or lease—about 100 more than in August 1998. To balance this glut, 268 aging aircraft were removed from the fleet in 1998, followed by 241 in 1999, and 286 in 2000.

In addition to retiring older planes, another key development in the latter 1990s was the rise in “fractional ownership” contracts. Under such plans, companies may purchase, for example, 50 flight hours annually on a standard business jet by purchasing one-sixteenth ownership interest for approximately \$500,000 to \$600,000. In comparison, the company would spend \$6.6 million to purchase the plane outright, in addition to another \$1.2 million annually for maintenance and crew.

Part 135 Operations. Some carriers have begun to operate under the umbrella of a larger charter, such as AMR Combs. Others have ventured into additional markets, such as providing contingency service. United Parcel Service (UPS) developed a contingency program whereby, if a UPS shipment will miss the primary package sort at the hub, the company will call on Part 135 on-demand charter companies to deliver the stranded packages. Some operators have kept their planes at UPS’s Louisville, Kentucky, hub to increase their availability.

Executive Jet Aviation, Inc. has created a “time-share” program called NetJet. Instead of owning an entire jet, NetJet allows executives to charter planes within the continental United States within a four-hour framework, making availability utmost. Corporations purchasing shares in the program are guaranteed that NetJets arrive prepared to fly, and they eliminate maintenance needs, leasing fees for hangars, and a pilot’s salary.

Helicopter Service. Helicopter companies supporting the oil industry, police and public service operations, and the medical profession were all expected to see continued growth through the end of the 1990s. Those companies offering diversified service have been best equipped to produce consistent earnings. For example, Petroleum Helicopters has worked primarily with the oil and gas industry in the Gulf of Mexico but also has become involved in the emergency medical service (EMS) business. Keystone Helicopters, a subsidiary of Keystone Flight Services, has split its contracts between EMS (approximately 80 percent) and on-demand charter and corporate management flying (20 percent). Predictions estimate that the public sector will be the fastest growing market in the helicopter industry.

Another successful approach for helicopter service has been “to fully develop and dominate a niche market,” reported *Aviation Week & Space Technology*. For example, Portland-based Columbia Helicopters has been one of the few commercial operators of heavy-lift aircraft worldwide. The company has specialized in heli-logging, which does less damage to the land than conventional logging methods.

CURRENT CONDITIONS

The September 11 terrorist attacks in the United States had a profound impact on the nonscheduled sector of the air transportation industry. According to the Air Transport Association, charter revenues decreased to \$4.45 billion in 2001, compared to \$4.91 billion in 2000. Over the same time, international charter revenue ton miles (a revenue ton mile equals one ton of revenue traffic transported one mile) fell from 2.7 billion to 2.2 billion, while domestic charter revenue ton miles decreased from 5.9 billion to 5 billion.

A weakened global economy also undermined sales, while increased insurance costs and security measures, both the result of the terrorist attacks, undermined profitability. To bolster sales, many companies began reducing their ticket prices, which further eroded profits for many charter service providers. As a result, industry leaders like American Trans Air and World Airways posted losses in 2001. Many analysts predict that the air transportation industry as a whole, including the nonscheduled sector, will not return to profitability until 2004.

INDUSTRY LEADERS

American Trans Air is the largest U.S. charter airline, holding more than 40 percent of the charter market. In 2001 revenues were estimated at \$1.27 billion, although the firm posted a loss of \$76.3 million. A privately held subsidiary of Indianapolis-based ATA Holdings Corp., the airline has 26 medium- to long-range aircraft in its fleet. ATA employs approximately 7,000 people.

The leisure travel market has comprised the largest part of ATA’s business, accounting for nearly 62 percent of total revenues and nearly 71 percent of available seat miles (ASMs) in 1992. The airline also has flown military charters, with a peak year in 1991 transporting U.S. troops to the Persian Gulf conflict. ATA operates other travel-related subsidiaries, including a travel agency; a training school for pilots, mechanics, and flight attendants; an executive air charter service; and a freight forwarder.

World Airways provides worldwide, nonscheduled air transportation of passengers and cargo for commercial and government customers. World Airways has 15 McDonnell Douglas aircraft in the long-range international market. The airline’s business has been seasonal,

with the highest travel figures from May through July and in December. The company's largest customer has been the U.S. Air Force, which accounts for more than half of its consolidated revenues. World Airways had 947 employees in 2001. Although sales grew 20.4 percent to \$317.9 million that year, the firm posted a \$26 million loss.

The industry remained ripe for entrepreneurial interests through the early 2000s. Aero Jet Services of Scottsdale, Arizona, which launched operations in 1997 with less than \$20,000, posted sales of \$6.5 million in 2000. Employees grew from 3 in 1997 to 30 in 2000. The company manages nine planes for its air-charter business.

AMERICA AND THE WORLD

Charter airline service in Europe, as opposed to that in the United States, offers significant competition to the scheduled airline industry for passenger traffic to leisure destinations. In fact, charter airlines have traditionally carried slightly more than half of all European travelers. The charter industry's success has been due in part to the fact that charter carriers have been subject to fewer regulations than the scheduled airlines. Thus the European market has been of interest to American charter companies like ATA, simply because charter services are well known and well liked throughout Europe.

In January 1993 the European version of open skies legislation was enacted, removing government restrictions on air fares and on cabotage (trade in the airspace between two points within a country) throughout the European Community member countries. This program has allowed airlines to set fares at any level. In 1997 carriers were also able to offer services on domestic routes in other member states. Such legislation is expected to have the same effect on the European charter industry that deregulation had on the U.S. charter industry. Industry leaders predict that the charter carriers will lose market share as the scheduled airlines become free of capacity and price restraints, thus reducing possibilities for American firms to expand into European markets.

RESEARCH AND TECHNOLOGY

The charter industry's ability to compete on a price basis will be contingent on the efficiency of its aircraft operations. Therefore, some U.S. companies have begun to update their fleets. Amtran has added a sixth extended-range Boeing 757 to its fleet. Lauded for its fuel efficiency and endurance, the 757 can amass up to 300 flight hours a month and will be used by ATA for transatlantic charters and military transportation. Another aircraft that may aid in competitive pricing is the new Airbus A320 aircraft, Europe's high-tech twinjet. The A320 is significantly more fuel-efficient than the 727-200 or either the 737 or the MD-80.

The helicopter section of the unscheduled industry should also profit from technological advancements. Of particular importance will be the military tilt rotor. The aircraft can function as a helicopter on takeoffs and landings but is capable of flying at a cruising speed of 300 knots per hour at an altitude of 20,000 to 25,000 feet as a conventional fixed-wing aircraft. While it remains uncertain whether this aircraft will be ordered by the military, the helicopter may be introduced into the civilian market in the early 2000s.

SIC 4581

AIRPORTS, FLYING FIELDS, AND AIRPORT TERMINAL SERVICES

This category includes establishments primarily engaged in operating and maintaining airports and flying fields; in servicing, repairing (except on a factory basis), maintaining, and storing aircraft; and in furnishing coordinated handling services for airfreight or passengers at airports. This industry also includes private establishments primarily engaged in air traffic control operations.

Government air traffic control operations are classified in **SIC 9621: Regulation and Administration of Transportation Programs**. Aircraft modification centers and establishments primarily engaged in factory type overhaul of aircraft are classified in transportation equipment industries, and flying fields maintained by aviation clubs are classified in **SIC 7997: Membership Sports and Recreation Clubs**.

NAICS CODE(S)

488111 (Air Traffic Control)
 488119 (Other Airport Operations)
 561720 (Janitorial Services)
 488190 (Other Support Activities for Air Transportation)

INDUSTRY SNAPSHOT

The North American Airports Council International (NAACI) estimates that the total economic impact of U.S. airports grew from \$379.7 billion to \$506.5 billion, in terms of output, between 1997 and 2001. Over the same period, earnings grew from \$155.5 billion to \$190.2 billion, and employment grew from 5.8 million to 6.7 million. According to the Federal Aviation Administration (FAA), more than 19,300 airports operate in the United States; nearly 30 percent of these are public entities. With more than 50 percent of the top 20 airports in the world, North America transports more passengers and cargo via air than any other region.

The airport, flying field, and airport terminal services industry can be divided into two distinct parts. One segment of the industry offers airport terminal services, covering everything from baggage handling to food service. Typically these companies work with commercial airlines, both domestic and international, and airport management. The other segment of the industry offers aircraft services, including maintenance, repair, aircraft conversion, and sales of equipment and parts. These companies work with commercial passenger airlines but have also provided service to the U.S. military, to makers and end users of general aviation aircraft, and to air cargo carriers.

Airports that can increase the number of runways and thus increase capacity stand to benefit more than those airports that do not have more room for additional runways. While the decrease in traffic following the September 11, 2001, terrorist attacks on the United States eased congestion at airports across the globe, the FAA predicts that U.S. airlines will see a 64 percent increase in revenue passenger miles by 2012. Airplane passenger mind-sets have changed significantly since the early days of flight, and many airports across the country are finding that they need to update their facilities to reflect this change. The five largest airports in the United States based on arriving and departing passenger traffic in 2001

were Atlanta Hartsfield (75.8 million), Chicago O'Hare (66.8 million), Los Angeles International (61 million), Dallas/Ft. Worth International (55.1 million), and Denver International (36 million).

The aircraft and airport services industry has always included a broad range of companies, from small private firms, to divisions of large conglomerates that offer transportation-related services, to divisions within an airline operation. A long recession in the passenger airline industry from 1988 to 1992 hurt the industry, and many airlines ceased operations, merged with other airlines, or cut back in service. All service companies, especially those dependent on the large air passenger carriers, struggled to survive. Smaller maintenance companies merged operations, while the larger conglomerates sold off unprofitable services. Surviving companies diversified both their services and their markets, and many moved into the international arena. During the latter 1990s (excluding the Northwest pilot strike in 1998), the industry reported steady profits. Consolidation continued into the twenty-first century, as many of the industry's leading players changed hands.

ORGANIZATION AND STRUCTURE

Airports in the United States typically contract with outside vendors for the services they provide to their customers, both airlines and passengers. Those vendors, which make up the companies listed in this industry, provide a number of services to people and to planes. Providers of airport terminal services operate food and beverage concessions, gift shops, and newsstands in airport terminals, while providers of airport passenger services offer bus and limousine operations, consulting and training services, passenger screening, airport security, interline baggage service, and skycaps. Aircraft in-flight service companies provide catering operations for commercial passenger airlines.

Other companies provide aircraft terminal services, including ground handling services for commercial carriers, aircraft fueling and cleaning, and baggage handling. Maintenance, repair, and overhaul (MRO) companies provide heavy maintenance, usually working on aging-aircraft programs or on conversions for commercial carriers and military aircraft. Fixed-base operation (FBO) vendors work as a "service station" for aircraft, providing refueling and ground handling services for corporate jets and general aviation aircraft. FBOs sometimes have a terminal lounge for flight crews. Aviation aftermarket companies sell parts and equipment for new or used aircraft, usually as a division of an aerospace company.

Depending upon the type of service provided, aircraft and airport service companies operate on airport grounds, within the airport terminal, or at nearby hangars or produc-

tion facilities. Most companies have corporate headquarters physically removed from these working sites.

The combination of the Gulf War, skyrocketing fuel prices, airline fare wars, rising debt service costs, and the slowdown of the American economy had a devastating effect on the financial condition of several domestic airlines in the late 1980s and early 1990s—and left no airline untouched. By 1993 the air transportation industry had lost a record \$10.5 billion, three large carriers had ceased operations, two were operating in bankruptcy, and one had just emerged from bankruptcy protection. Companies providing service to the air transportation industry shared in the recession; however, the unprecedented recovery of the airline industry in 1995 through 1996 helped rebuild many of the service companies that survived the downturn.

Passenger Services. During the slowdown of the early 1990s, companies providing terminal services were hard hit by price-conscious travelers who limited their out-of-pocket spending in the airports. One company, Dobbs Subsidiaries, a division of the Dial Corporation, was sold to Host International in 1992 due to rising costs. In turn Host, a division of the Marriott Corporation, lowered its prices, offered promotions, redesigned its concession stands, and brought in well-known, fast food chains to entice passengers to use their services.

Unlike most of the other companies in this industry, those offering in-flight catering have been directly dependent upon the operations of the major commercial passenger airlines. Companies capable of accommodating the ever-changing demands of these carriers during the turbulent years of 1988 to 1993 were the ones that survived. Dobbs International was one such company. According to a company report prepared by Donald, Lufkin, Jenrette Securities, despite the difficulties posed by the price wars in the airline industry, Dobbs continued to earn more in revenues and profits because of its success in winning new contracts. Consequently, Dobbs has maintained approximately a 19 percent market share. Other catering companies included CaterAire (formerly Marriott), with 26 percent, Onyx (formerly Sky Chefs), with 19 percent, and UAL Services, with a 15 percent market share.

Aircraft Services. Maintenance operations were also affected by the recession, but this segment of the service industry stabilized by the end of 1993, due in part to diversification. For example, Pemco Aeroplex, a large third-party maintenance operator, maintained a 50-50 mix of military and civilian work to level off the peaks and valleys of the market.

Many providers of fixed-base operations responded to the recession by consolidating operations. The best-known merger took place between Page Avjet Airport

Services and Butler Aviation International, thus creating the world's largest multisite FBO company. Some industry analysts have predicted that merged operations such as these may be the model for FBOs in the early 2000s.

Industry Growth. Many airport and aircraft service companies have looked to strategic alliances or partnerships to create further market growth. For example, UNC, Inc. has developed long-term contracts with major aviation firms and has formed trading company partnerships to add leasing and parts distribution services.

Air transport service companies will continue to improve their services with a reliance on computerization. For example, UNC, Inc. has been using cutting-edge information technology to provide its customers with computerized online parts status. Commodore Aviation also has become completely computerized, allowing instant tracking of work hours required and materials expended.

While 1998 data were affected by the September 1998 Northwest Airlines pilot strike, domestic air traffic nonetheless reported a 4.9 percent increase. However, the net effect of this was lost in the fact that *capacity* rose 9.5 percent during the same period. The resulting overall load factor dropped 2.9 points to 65.9 percent. The excess domestic capacity resulted in a 2 percent decline in average ticket price.

CURRENT CONDITIONS

Over the five years preceding 2002, employment at U.S. airports grew 16 percent, earnings grew 22 percent, and output grew 33 percent. As a result, many airports undertook major renovations and upgrades. The FAA prediction that revenue passenger miles for U.S. airlines would grow 64 percent by 2012 suggested that this trend was likely to continue, despite reduced passenger and cargo traffic in 2002. According to the North American Airports Council International (NAACI), "While the events of September 11 and the current depressed state of domestic air carriers has slowed growth temporarily, projections are that the volume of passengers will return to 2000 levels by 2003 or 2004. Now, before congestion returns, is the time for the aviation industry to adopt measures to increase capacity." Analysts believe that airports can make better use of their existing facilities as well.

The aviation services industry saw consolidation continue into the twenty-first century. In the late 1990s, Swissport International acquired DynAir, a leader in airport and aircraft services, and Gate Gourmet Co. added to its European, Asian, and Latin American airline catering operations with the purchase of U.S.-based airline caterer Dobbs International. Menzies Aviation Group paid \$105 million for Ogden Aviation Services, the world's largest

independent provider of airport services, in late 2000. The following year, France-based Vinci SA acquired Worldwide Flight Services for \$295 million.

INDUSTRY LEADERS

A leader in airport and aircraft services has been DynCorp's Commercial Aviation Services Group, better known as DynAir. With approximately 4,000 employees and \$1.2 billion in revenue, DynAir has provided total ground support services to both domestic and international carriers at more than 80 airports in the United States. DynAir has delivered services to over 100 airlines on more than 150,000 flights and has processed more than 15 million passengers annually. With facilities in Arizona, Florida, and Texas, DynAir has offered a complete range of aviation-related technical services to the operations of commercial aircraft, including periodic checks, nonroutine maintenance, structural inspections, repair and overhaul, and stripping and painting. Other specialized services have included the repair, modification, and installation of transport aircraft avionics and navigation systems, including wind shear alerts, weather radar and radio altimeter systems, complete cargo handling, and fueling services for commercial and general aviation customers. DynAir Technical Services has also provided the professional expertise of contract engineers, mechanics, and technicians. Ground handling firm Swisport International bought DynAir in 1999. As of the early 2000s, the firm continued to operate under the DynAir name.

In the early 2000s, Ogden Aviation Services, the world's largest independent provider of airport services, worked with more than 80 airports in the United States and abroad and with more than 180 commercial airlines. The company provided fueling facilities, baggage loading and off-loading, aircraft cleaning and maintenance, and passenger checking. Once a private subsidiary of Ogden Corp., Ogden Aviation Services was acquired by Menzies Aviation Group in 2000.

Formerly known as Dobbs International, Gate Gourmet Division Americas has been one of the world's largest airline caterers, providing in-flight food service for domestic and international airlines at 52 kitchens in 44 airports in the United States and Great Britain. Gate Gourmet has served 11 major U.S. airlines, 19 national carriers, and 36 international carriers. Gate Gourmet Co. acquired Dobbs in 1999 and eventually replaced the Dobbs name with Gate Gourmet Division Americas.

One of the premier suppliers of aircraft maintenance, repair, and overhaul services has been Goodrich Aviation Technical Services, formerly known as Tramco Inc. The BF Goodrich Aerospace subsidiary has performed maintenance for the fleets of Federal Express, Southwest Airlines, and United Parcel Service (UPS). It services more

than 400 aircraft annually. Company headquarters are located in Everett, Washington.

Created in 1981 as a subsidiary of AMR Corp., Worldwide Flight Services (formerly known as AMR Services Corp.) has provided flight operations services, including passenger services, cargo handling and warehousing, cabin services and facility cleaning, fuel services, and aircraft handling services. The company also has operated flight service centers, marketed used aircraft, provided ground transportation services, and offered security services. By the turn of the twenty-first century, Worldwide Flight was handling cargo at 86 airports throughout the world. Employees totaled 10,000. Castle Harlan Inc., which had acquired Worldwide Flight in 1999, agreed to sell the ground services provider to Vinci SA for \$295 million in 2001.

Lockheed Space Operations, a private subsidiary of the Lockheed Corporation, has provided launch pad preparation, operation and maintenance of facilities, flight hardware processing, and flight technology services. Headquarters are in Washington, D.C.

WORKFORCE

According to North American Airport Council International (NAACI), U.S. airports provide nearly seven million jobs to the communities they serve. Most of the employment in the airport, flying field, and airport terminal services industry has been concentrated in the maintenance, repair, and aircraft service segment. Additional employment in this industry can be found in companies that are not considered primary providers but have been secondary providers of services categorized in this industry. These companies generally have included the food, beverage, and other airport terminal services companies.

Some companies, such as Commodore Aviation, have a large part-time contingency employment base, which has offered flexibility in an industry that has been highly seasonal. For example, Commodore Aviation has full-time employment of about 150 people but has operated with a total of 180 to 500 employees, based on workload needs.

According to the U.S. Department of Labor, jobs in the air transportation industry have been projected to increase 37 percent over the period from 1990 to 2005—much faster than the overall average. An increase in passenger and air cargo traffic—and related employment—has been anticipated in response to increases in population, income, and business activity. New technology was not expected to have any significant effect on air transportation in the long-term future, as most labor saving technology has already been introduced.

It was estimated that 1 in every 15 people employed in the United States owed his or her job to civil aviation, and jobs directly attributable to U.S. airports were estimated at 2.3 million, with total jobs attributable to U.S. airports estimated at 7.6 million. Job opportunities in this industry varied by occupation. Sources estimated that for every \$1 billion invested in airport development, 50,000 jobs were created and sustained. Due to an expected shortage in qualified applicants, the job market for aircraft mechanics has been expected to be very favorable in the long-term future. Job opportunities have also been predicted to be good in entry-level positions, where job turnover has been high, such as baggage handlers, aircraft and interior cleaners, and food service workers.

SIC 4612

PIPELINES, CRUDE PETROLEUM

This category covers establishments primarily engaged in the pipeline transportation of crude petroleum. Field gathering lines are classified in oil and gas extraction industry sections. This major group includes establishments primarily engaged in the pipeline transportation of petroleum and other commodities, except natural gas. Pipelines operated by petroleum producing or refining companies and separately reported are included. Establishments primarily engaged in natural gas

transmission are classified under **SIC 4922: Natural Gas Transmission.**

NAICS CODE(S)

486110 (Pipeline Transportation of Crude Oil)

INDUSTRY SNAPSHOT

According to the U.S. Census Bureau's *Statistical Abstract of the United States*, in 2000 there were 307 firms involved in crude oil pipeline transportation, with revenues totaling \$4.4 billion. According to U.S. Department of Transportation statistics, in 1999 there were 177,463 miles of pipelines transporting crude oil throughout the country, reflecting a slow, steady decline since 1975 when crude oil pipeline totaled 225,889 miles.

Notwithstanding the dependence of the world's economy on crude oil as a fundamental source of energy, the crude petroleum pipelines industry has experienced stagnant growth, stemming from profound structural changes in both the global market for crude oil and the world economic order. Changes in factors affecting the consumption and production of crude oil impact crude petroleum pipeline establishments since the demand for pipelines to transport crude oil is a derived demand. The change in the global supply of oil from a shortage situation in the early 1970s to a surplus situation in the latter 1990s characterizes the general economic environment that crude petroleum pipeline establishments face.

In addition to an uncertain economic climate, the crude petroleum pipeline industry is confronted by several challenges at the start of the twenty-first century. These challenges include increasingly stricter environmental protection regulations, the development of natural gas as a substitute for crude oil-based energy products, and the depletion of crude oil reserves. Because companies have explored and produced more crude petroleum, they have also increased capital spending on pipelines.

ORGANIZATION AND STRUCTURE

The crude petroleum pipeline industry consists of companies that are capital-intensive. As start-up costs for capital-intensive organizations are high, entry into the industry is restrictive, as is indicated by the relatively small number of firms operating with headquarters in the United States. On the other hand, the day-to-day maintenance of capital-intensive industries tends to be relatively moderate, enabling successful companies within the industry to take advantage of economies of scale.

The overwhelming majority of crude petroleum pipeline companies with corporate offices in the United States operated as subsidiaries of other corporate entities. Of the companies headquartered in the United States, only a few were independently listed on any stock exchange. Many of the subsidiary companies were affiliated

with the major oil company giants. Examples include Exxon Pipeline Company, Mobil Pipeline Company, and Chevron Pipe Line Company. The maintenance of a vertically integrated relationship between the oil industry and the crude petroleum pipeline industry indicates a desire on the part of the giant oil companies to control the entire process of production and the natural economies that emerge from capital-intensive industries.

In addition, the Federal Energy Regulatory Commission (FERC) oversees the liquids pipeline industries, legislating and monitoring them. The FERC does not regulate the construction of pipelines and crude petroleum prices; rather it strives to make pipeline transportation an equitable means of shipping petroleum products. Through the FERC, shippers can gain fair access to pipeline transportation, just service conditions on a pipeline, and reasonable rates for transporting petroleum products via pipelines.

BACKGROUND AND DEVELOPMENT

The concept of using pipelines to transport liquids can be traced to both the ancient Romans and Chinese, who developed systems of pipelines and viaducts, utilizing gravity as the mechanism for transporting water. Such early pipeline transportation systems were limited by the terrain of the surrounding countryside due to the lack of an effective lift mechanism.

The discovery and subsequent drilling of crude oil in Pennsylvania by Col. E. L. Drake in 1859 created the need for a cost-effective method to transport the crude to market. Drake laid a two-inch, cast-iron pipeline, roughly 6.2 miles long, and the crude petroleum pipeline industry was born. However, the operation of the pipeline was short-lived. A group of local teamsters, fearing the elimination of their jobs, destroyed the pipeline soon after its operation began. Even so, pipeline transportation of crude petroleum proved to be both viable and cost-effective, and the industry grew concurrent with the nation's expanding oil industry.

Until World War I, crude pipelines were made almost exclusively from wrought or cast iron. After the war, improvements in steel quality led to its utilization as the primary material used in the construction of pipeline. Pipe diameter could be increased from 8 to 26 inches using steel. Also, the introduction of electric arc welding in the 1930s eliminated the "weak link" of screwed couplings.

During the 1930s and through World War II, significant developments took place in the crude oil pipeline industry. The utilization of the "spread" method of pipeline construction lowered construction costs and made the use of pipelines as a method of transporting crude oil more competitive. Furthermore, the size of pipeline projects grew, both in the United States and internationally. In 1934, a 12-inch pipeline over 620 miles long was constructed from Kirkuk, Iraq, to the

Mediterranean Sea. During World War II, a 24-inch crude petroleum pipeline 1,240 miles long was laid from Texas to New York. Advances in both the materials used in the construction of pipeline and in the construction techniques allowed for the development of pipeline that could withstand greater pressure per square inch and that could transport more crude in less time.

The post-World War II era witnessed the peak of crude petroleum pipeline construction. Driven by a demand for oil that doubled roughly every 10 years, "Big-Inch" pipelining became prevalent on a worldwide scale. Pipe size increased from 24 inches to 56 inches in diameter, expanding the capacity to transport crude oil. A better understanding of corrosion led to the development of pipe coatings of bitumen or coal tar enamel over glass-fiber wrappings. With the development of X-ray scanning technology, pipeline could be examined for weaknesses that would have gone undetected in the past. During the 1960s, construction of crude petroleum pipelines moved offshore with discoveries of oil in the Gulf of Mexico, the Arabian Gulf, and the North Sea.

From 1970 through the 1990s, the crude petroleum pipeline industry experienced a period of stagnant growth, both domestically and internationally. While interstate liquid pipeline mileage totaled 173,532 miles in 1972, the total mileage had dropped to 168,364 by 1990. New construction of domestic crude oil pipelines dropped from 1,966 miles in 1980 to 240 miles in 1990. In the United States, retirement of old pipeline had outpaced the construction of new pipeline, and this trend was also evident on a worldwide scale. World totals of new construction in 1980 equaled 8,129 miles. New constructions totaled 652 miles in 1990.

This trend of stagnant growth in the crude petroleum pipeline industry has been attributed to several events. Low oil prices, caused by a surplus or glut in the market for crude oil, had a significant influence on the market for crude oil pipelines. Also, stagnation in the domestic and world economies caused uncertainty and increased risk, especially for industries in which the time between project development and project completion is measured over a period of years. Furthermore, political instability led to a period of restructuring, as markets adjusted to such events as the end of the Cold War, the aftermath of the Gulf War, and the amalgamation of European countries in the European Community. Finally, preservation of the environment has become a global concern, and the world's industrialized nations have adopted a more active role in regulating the environmental impact of most industrial activities.

The primary players in the crude petroleum pipeline industry continue to be the giant, multinational or state-owned oil companies. Given the commitment of the multinational companies to maintaining control over the en-

tire process of production, capital maintenance and development of crude pipeline are likely to continue at a pace calculated to maximize return on investment. Similarly, state-owned oil companies possess the capability to take advantage of large-scale operations and are able to utilize their unique position to expand operations. Furthermore, multinational and state-owned oil entities are able to absorb short-term market irregularities and to capitalize on their tremendous market power. Of the crude petroleum pipeline companies operating with corporate headquarters in the United States, about 80 percent operated as subsidiaries of other corporate entities. The majority of these were in some manner affiliated with the large oil companies.

With the impact of industry on the environment becoming a global issue, both domestic and international organizations have become politically active in attempting to protect the environment from the excesses of industrialization. In the United States the Environmental Protection Agency (EPA) has been given broad powers to oversee and regulate industrial activities in order to control environmental pollution. Legislation affecting the crude petroleum pipeline industry includes the Oil Pollution Liability Act of 1990. The crude petroleum pipeline industry may continue to feel the effects of this trend toward increased regulation in the form of increased risk of litigation and higher operation costs.

Projections for domestic and world crude oil consumption reflect modest increases of 5 to 10 percent. Though the industry has shown signs of recovery, given the maturity of the crude petroleum pipeline industry and the relative longevity of pipeline once constructed, increases in sales revenue, profits, and new construction may become stagnant again after a few years. Consequently, intriguing new uses for old pipeline systems are being explored, including the use of existing pipeline to encase fiber-optic lines used in the telecommunications industry. Williams Telecommunication, the sister company of Williams Pipe Line Company of Tulsa, Oklahoma, is regarded as an innovator in this field. As new technologies are developed, the crude petroleum pipeline industry has the opportunity to respond in unique and innovative ways.

In 1998, crude oil prices dropped to the lowest they had been since 1973. However, in the latter months of 1999, OPEC gained control of its production quotas again, and prices increased more than \$10 per barrel. The volatile market again caused global uneasiness and heightened interest in alternative markets and sources.

To that end, of key import was the November 1999 agreement between Turkey, Georgia, and Azerbaijan to build a 1,080-mile pipeline from the Caspian Sea to the Mediterranean. Several multinational corporations and U.S. companies, including the new BP-Amoco, Exxon, Chevron, and Texaco, contributed \$50 billion to the

project. The new pipeline would bypass Iran and Russia, and secure U.S. access to the Caspian basin. It would also have the secondary effect of enhancing the presence of American political and commercial interests in Central Asia. The Caspian basin deposits were believed to be second in size only to the Persian Gulf, but more recent seismic results indicate that they are substantially smaller, about the size of those in the North Sea.

On the domestic scene, Pacific & Texas Pipeline and Transport Company entered into a joint venture agreement in November 1999 to build and operate a 1,075-mile, 42-inch crude oil pipeline and fiber-optic system which would run from the Port of Los Angeles to Midland, Texas. (The fiber-optic system will be entrenched alongside the pipeline, thus contributing to cost-sharing and environmental conservation. The other party to the joint venture is Pan Kai Development USA, Inc. Bethlehem Steel, Ingersoll Rand, and Westinghouse are involved in the actual construction of the pipeline.

CURRENT CONDITIONS

Total crude oil production in the United States is expected to increase from 4.8 million barrels a day in 2001 to 5.3 million barrels a day in 2007, before declining to 4.2 million barrels a day by 2025. Increased production is targeted to occur primarily on offshore sights. In 2002 pipelines transported 66 percent of all U.S. oil production, totaling over 600 billion ton-miles per year. Water transportation carried 28 percent; trucks, 4 percent; and rail, 2 percent. Total crude oil delivered via U.S. pipelines was 7.9 billion barrels.

INDUSTRY LEADERS

The leading U.S. liquid pipeline companies in 2003 included Shell Pipeline Company LP (formerly Equilon Pipeline Company LLC); Enbridge Energy Partners (formerly Lakehead Pipe Line Company); Williams Pipe Line; Alyeska Pipeline Service Company; and Marathon Ashland Pipe Line LLC.

WORKFORCE

In the early 2000s, control of the domestic pipeline industry was in the hands of between 25 and 40 companies, employing approximately 14,000 persons. (The U.S. Department of Labor, Bureau of Labor Statistics counted 13,680 workers in 2001.) The relatively small number of persons employed in the industry reflects the capital-intensive nature of crude petroleum pipeline companies, where the emphasis is on capital rather than labor. Employment trends in industries wherein establishments are primarily engaged in the pipeline transportation of petroleum and other commodities (except natural gas), of which the crude petroleum pipeline industry constitutes the major segment, reflect a trend toward downsizing in regard to the labor force.

RESEARCH AND TECHNOLOGY

The basis for technological advances in the crude petroleum pipeline industry centers on the search for improved materials, the development of improved methods of welding or "jointing" the pipe, the refinement of specialty pipe for use under extreme environmental conditions, and the investigation of new applications and alternative uses for the pipeline.

Refined steel pipe remains the industry mainstay, allowing for pipe sizes up to 56 inches in diameter. The utilization of new industrial processes permitting refinement of the alloying process remains the most promising area of technological advance in this area. The fatigue life of "Big-Inch" pipe is also affected by conventional arc welding and jointing techniques. Arc welding makes steel pipe susceptible to hairline cracks and hardening in the areas of the pipe close to the welds. Alternative methods indicating the most promise include flash butt welding, friction welding, electron beam welding, screwed and bonded coupling, and cold forging.

The materials used to construct the pipe and the jointing technique used to bond pipe together will be determined in large part by the environmental conditions at the site of the pipeline. Thus, innovation in creating pipe resilient to temperature extremes and able to withstand the pressures of offshore and underwater operations will continue to drive research and development.

Alternative applications of crude petroleum pipelines include using the lines to transport other materials, as well as use of retired pipeline to encapsulate fiber-optic communication lines. Coal slurry is regarded as a primary alternative for transport using the lines, as both domestic and international analysts maintain that coal reserves may constitute as much as four times the amount of oil available. Research continues on finding ways to modify existing pipeline for such use, and such innovations may provide extensive changes in the crude petroleum pipeline industry.

SIC 4613

PETROLEUM PIPELINES, REFINED

This category covers establishments primarily engaged in the pipeline transportation of refined petroleum products of petroleum, such as gasoline and fuel oil. Linking all petroleum pipeline industries together is Industry Group 461: Pipelines, Except Natural Gas, which includes the other major subcategories of the petroleum pipeline industry, **SIC 4612: Crude Petroleum Pipelines** and **SIC 4619: Pipelines, Not Elsewhere Classified**.

NAICS CODE(S)

486910 (Pipeline Transportation of Refined Petroleum Products)

INDUSTRY SNAPSHOT

Pipelines are the leading method of transporting refined petroleum, and they are an especially important mode of transportation in the United States where large volumes of oil must be moved over land. Manufacture of refined petroleum is classified in **SIC 2911: Petroleum Refining**; fuels classified as refined petroleum products include gasoline, kerosene, distillate fuel oils, residual fuel oils, and lubricants—essentially any product made from the distillation of crude oil or redistillation of unfinished petroleum derivative.

The United States has an extensive network of pipelines for the transport of refined petroleum owned and managed, for the most part, by the large, vertically integrated operations of the major oil companies. In 2001, firms in the industry operated a network moving petroleum products through 91,000 miles of pipeline, or approximately 51 percent of the all petroleum pipelines (crude and refined) totaling 177,000 miles. Though pipeline grew at a crawling pace from the mid-1980s through the mid-1990s, the late 1990s ushered in a more successful period for the industry, and demand for refined petroleum products was predicted to increase modestly in the United States and abroad. In 2001, total value of petro-

leum pipeline put in place (carrying both crude and refined products) totaled \$943 million.

The pipeline network contains gathering systems of pipelines, which are used to bring crude petroleum from the oil fields and pump it to storage. Then, oil fields have a network of small-diameter "gathering lines" collecting crude oil from individual wells and transporting the output to a large-diameter "trunk line" for shipment to a refinery. Next, pipelines move refined products to markets. In 2000 U.S. oil refineries moved 7.5 billion barrels of petroleum products.

The ups and downs of the industry have been attributed to several economic forces. The growth of pipelines in general is linked, and ultimately limited by, oil production. Thus, industries like petroleum pipelines in general, and refined products pipelines in particular, are subject to competition from other transport industries such as water carriers, motor carriers, and railroads. As a method of transportation, pipelines transport about 50 percent of refined petroleum, compared to water carriers, which transport about 40 percent. Railroads and trucks transported the remaining percentage of total petroleum (total crude and refined products).

On the negative side, however, three major spills in the 1990s put a dent in the pipeline industry's relatively clean safety and environmental track record. More stringent environmental regulations are being put in place as the twenty-first century approaches and, as might be expected, the larger, vertically integrated producers are in the best position to manage the transition.

ORGANIZATION AND STRUCTURE

Between 40 and 50 companies were estimated to be in some way involved in the operation of refined petroleum pipelines in 1998, with 32 officially reporting to the Department of Energy. Market concentration was also relatively high in the refined petroleum pipeline industry, which has been under allegations of antitrust violations. Because of the heavy involvement of the large oil interests, it is difficult to differentiate the pipeline components of their operations from the other components. Nonetheless, of those firms whose principal business was identified to be refined petroleum pipelines, the top six firms controlled only 11 percent of the market.

The petroleum industry consists of four distinct, but connected, vertical levels as outlined by author and analyst Stephen Martin. These are: production, refining, marketing, and transportation. The refined products segment manufactures finished products ranging from petroleum coke to motor gasoline to fuel oil, heating oil, and jet fuel. Connecting the mines to the refinery and the refinery to the market are specialized transportation networks including pipelines, trucks, railroads, and, most notably, water carriers (tankers and barges).

Pipelines have historically been the most cost-effective means of transportation of petroleum products. Having the advantage of economies of scale, pipelines have construction costs that are proportional to pipeline radius, but pipeline capacity is roughly proportional to the square of the radius. Thus, for example, if pipeline radius is doubled, pipeline capacity will increase by a factor of about four.

While the share of railroads and truck methods has remained virtually unchanged, pipelines' share rose to around 60 percent in the mid-1970s (through 1977), declined to 45.5 percent in 1983, and bounced back to a 54 percent share in the 1990s. Water carriers surpassed pipelines for a short period in the early 1980s but have largely played second fiddle to pipeline market share; water carriers' share of the market declined from 50 percent in 1985 to about 40 percent in 1995. Aside from their economies of scale, pipelines are viewed (with the exception of recent history when two accidents have marred their record) as a safer and more environmentally sound method of transporting petroleum. Historically, spills from pipelines have been dwarfed by tanker spills.

Pipeline operations are large, capital-intensive facilities, and are often part of larger companies operating pipelines for their own use. By law, however, no company can deny access to independent shippers in order to gain market share. Throughout the twentieth century, however, oil companies have been accused of using exclusive control over pipelines to gain expanded control of markets. Because pipelines are such a critical link in the petroleum production process, much regulation exists at the federal level, primarily from the Interstate Commerce Commission (ICC), in order to ensure access of all producers to pipelines and to set rates. In addition to monitoring competitive practices, the ICC sets rates and collects reports that are required to be filed by the companies.

BACKGROUND AND DEVELOPMENT

According to analyst Stephen Martin, the first attempt to transport petroleum by pipe was made by James Hutchings in 1862. Although he failed, his efforts drew attention to other possible means of transporting oil, specifically: to the low cost of pipelines; and, to avoid the market power of the railroads. By the turn of the twentieth century there were 6,800 miles of crude oil pipeline in the United States. The market for pipelines at the time was dominated (90 percent) by the Standard Oil Company. By 1906, the Interstate Commerce Act made interstate pipelines subject to federal regulation, a move directed largely at abuses by Standard Oil.

Refined petroleum pipelines began being used in 1930, as firms discovered that many different products could be shipped through the same pipeline. The emerging cities in the Midwest and West, moreover, created

new markets for refined petroleum, and pipelines won out as the least expensive method of transporting the growing number of refined petroleum products. More than 3,800 miles of refined petroleum pipelines were placed in operation from 1930 to 1931 and another 2,300 miles through 1941.

During World War II much transportation of oil products was diverted from tankers to pipelines. Tankers were needed for the war effort, and it was becoming increasingly difficult for the U.S. Navy to devote resources to protect ships transporting oil from the Gulf Coast to the eastern seaboard. As an added boost to the industry, the federal government helped build the War Emergency Pipeline (WEP), which spanned 1,475 miles and was used for the transport of refined petroleum. The availability of water carriers after World War II is cited as the only impediment to the complete monopolization of the oil transport industry by the pipeline. Other modes of transportation—rail and trucking—held only small niches of the oil transportation market. Figures on intermodal competition showed that, by the early 1970s, pipeline costs were one-fifth as high as rail rates and one-twenty-eighth as high as truck rates. Water transport costs were the only serious competitive threat.

Despite the success of the pipeline industry, a major concern of federal regulators has been that the oil companies exert substantial market control over production and distribution. In 1976, 90 percent of crude pipeline shipments reported to the ICC originated in pipelines that were owned or controlled by the 16 major U.S. oil companies. Nearly 75 percent of refined petroleum shipped that came from refineries went into pipelines owned by the major companies. Only 13 percent of refined petroleum was moved by pipeline firms not involved in other segments of the oil industry.

The expansion of the refined petroleum pipeline industry and its profitability are ultimately limited by two key forces. The first is the force of competition, here in the form of other modes of transporting oil, most notably water carriers such as oil tankers. This includes cost competitiveness, environmental safety, and the industry's ability to absorb the costs of increased environmental regulations. The health of this industry is also limited ultimately by the production of the refined petroleum products that it transports.

In 1992, as part of the revised Clean Air Act, it was mandated that the nation's cities burn cleaner gasoline to cut carbon monoxide levels. The law led to greater reduction of carbon monoxide by 1995, and forced cities with severe air pollution to use even cleaner gasoline. However, the National Petroleum Refiners Association estimated that the Clean Air Act cost the industry between \$10 and \$30 million.

The law created problems for pipeline companies, who were now required to sell different gasolines in different cities at the same time. Gas sold in one city might have tighter restrictions than those of a gas sold in another city serviced by the same pipeline. This forced firms to separate different batches of gasoline along pipelines, which was more expensive for pipeline companies. Nonetheless, overall refinery throughputs have increased over the years, even if only marginally at times.

Despite the industry's renewed economic success, pipe fractures and spills have besmirched its reputation as the safest method of transport. A 1993 spill occurred in the Potomac River near Washington, D.C., and in 1994 a more virulent pipeline disaster dumped about 1.2 million gallons into the San Jacinto River, outside Houston, and caught on fire. In 1996, the U.S. Transportation Department's Office of Pipeline Safety issued a report that revealed the serious condition of the country's largest pipeline, which extends from Texas to New Jersey, owned by Colonial Pipeline Co. The report indicated that the pipeline contained frail, corroded, and cracked portions as well as profound pressure control problems. The report also stated that without repair, operation of the pipeline could prove hazardous to the environment and to life, according to the *Wall Street Journal*. The pipeline, which delivered over 75 million gallons of fuel per day, ran only 20 feet away from homes and businesses in areas. A few months prior to the report, a pipe segment ruptured in Greenville, South Carolina, spewing about a million gallons of fuel into the Reedy River—the fifth largest pipeline spill in the United States. After mending this fracture, Colonial agreed to test and repair the whole pipeline. Colonial estimated that the repairs would run almost \$21 million.

The U.S. Department of Transportation reported in 1999 that there were 86,500 miles of products, or refined oil, pipeline in the country, as of 1997. When added to the 114,000 miles of crude oil pipeline, the total miles of pipeline were over 200,000, approximately 65 times the entire width of the country.

Two major refined pipeline projects in the latter 1990s were the cross-border pipeline connecting Brownsville, Texas, to Matamoros, Mexico, scheduled for completion near the end of 1999; and a joint pipeline project between Williams Company and Texaco Pipeline Inc., connecting Texas, Oklahoma, and some Kansas lines to provide a new route for Gulf Coast refined products and liquid petroleum gas. The Texas-Mexico pipeline was being constructed for the Penn Octane Corporation to sell directly to Pemex, the state-owned Mexican oil company, as well as independent distributors.

With respect to the refined products industry, several major changes occurred in 1998 and 1999. Mergers, consolidations, divestitures, and frank exits within the industry brought many smaller companies into the fold. By 1999,

small refining companies constituted 36 percent of the total U.S. refining capacity. On the other end of the spectrum, one of the biggest mergers was the December 1998 \$53 billion transaction joining BP America with Amoco (the new company known as BP-Amoco). Not far behind was the December 1999 merger of Mobil Corporation with Exxon Corporation, an \$87 billion transaction considered the largest industrial merger ever. As a condition precedent to the final merger, Mobil agreed to sell off its 300 retail gas stations in New Jersey in order to satisfy the Federal Trade Commission's and 29 states' antitrust claims.

CURRENT CONDITIONS

In 2000 U.S. petroleum pipeline companies transported 7.5 billion barrels of petroleum products. Whereas the miles of pipeline dedicated to crude oil transportation has steadily declined since 1965 (from over 149,000 miles to just over 86,000 in 2000), pipelines transporting refined petroleum products have increased over the same period, from 61,443 miles in 1965 to over 91,000 in 2000.

According to the Energy Information Administration, production at U.S. refineries is projected to increase from 16.8 million barrels per day at the beginning of 2002 to between 19.8 million barrels per day and 20.4 million barrels per day. Almost all growth will come from existing facilities, primarily in the Gulf Coast. After working at utilization rates as low as 69 percent during the early 1990s, refineries' utilization rate in 2001 was 93 percent.

The pipeline industry faces numerous ongoing issues, primarily centered around the integrity of the infrastructure and its overall safety. Depending on future regulatory and legislative actions, pipelines will likely be required to commit capital to system integrity management, at the expense of new expansion. In 2002 the U.S. Department of Transportation and the U.S. Department of Energy provided \$8 million for improvements in pipeline integrity and reliability.

INDUSTRY LEADERS

According to the *Pipeline & Gas Journal* 19th Annual 500 Report, in 1999 the leading company for throughputs was Shell Pipe Line LP (formerly Equilon Pipeline Company LLC), which was formed from the combined Shell Pipe Line Corp. and Texaco Pipeline Inc., with a daily throughput of 1.33 million barrels.

When ranked by products deliveries, the top 5 companies in 1999 were: Colonial Pipeline Co. (708 million barrels); SFPP Kinder Morgan, LP (382 million barrels); Buckeye Pipe Line Co., LP (313 million barrels); Shell (301 million barrels); and Marathon Ashland Pipe Line LLC (289 million barrels).

With respect to revenues, the leading 5 companies for 1999 (reporting 1997 operating revenues) were: Ex-

xon Pipeline (\$588 million); Colonial Pipeline (\$562 million); BP Pipelines (Alaska), Inc. (\$550 million); Shell (\$378 million); and Enbridge Energy Partners (formerly Lakehead Pipe Line Co., LP; \$288 million).

RESEARCH AND TECHNOLOGY

The companies themselves have adopted new technology to enhance supervisory control and data acquisition (SCADA) systems, such as 32-bit computers and distributed processing to increase efficiency. Colonial Pipeline and Amoco Gas are two companies that are installing new SCADA and software systems. These new systems are projected to increase efficiency and ease of use in the management of data traffic. For example, using these systems, pipeline systems can easily be drawn and monitored or scanned with graphics software.

Finally, deterioration in pipeline safety has plagued certain companies in the industry. Despite the relatively good safety record of oil pipelines, the National Transportation Safety Board (NTSB) began studying pipeline safety in the wake of two spills of diesel fuel caused by the ruptures of Colonial Pipeline Company pipelines near Simpsonville, South Carolina, and Reston, Virginia, in 1991 and 1993, respectively. As a result, the NTSB is studying 400 pipelines to develop techniques for identifying damaged pipelines.

SIC 4619

PIPELINES, NOT ELSEWHERE CLASSIFIED

This category covers establishments primarily engaged in the pipeline transportation of commodities, ex-

cept crude petroleum, refined products of petroleum, and natural gas. Establishments primarily engaged in the pipeline transportation of refined petroleum are classified in **SIC 4613: Crude Petroleum Pipelines**, and those engaged in natural gas transmission are classified in **SIC 4922: Natural Gas Transmission and Distribution**. Most notably, the industry includes coal slurry pipeline operations and metal ore concentrates.

NAICS CODE(S)

486990 (All Other Pipeline Transportation)

According to data collected by the U.S. Census Bureau in 2001, approximately 16 firms operating 57 establishments were primarily engaged in the operation of pipelines for the transportation of coal slurry, metal ore slurry, phosphate slurry, etc., and other types of pipelines, not elsewhere classified. These establishments employed 735 workers for a total industry payroll of about \$51.56 million. This industry's employment comprised only a scant percent of the total employment for the broader pipeline industry, which is mainly comprised of petroleum and natural gas pipelines.

Most of the U.S. pipelines operated by this industry transport coal suspended in water (crushed/mashed coal mixed with water to create slurry). The United States operates an extensive slurry pipeline system, and pipelines are operated throughout the world, transporting not only coal but other metal ore concentrates. Coal, however, was the first slurry system to be developed, and in 1995 total U.S. coal-slurry output totaled 100 million short tons, including transport by tramway and conveyor. The key developmental factor in coal-slurry technology was its cost competitiveness when compared to other methods of transporting coal. The expense associated with building roads and railroads to the mouth of the mines was prohibitive, and the slurry alternative required a much smaller capital investment. As such, the Black Mesa Company began operating a coal slurry line in 1970 that transported coal 273 miles from a mine in northeast Arizona to a power plant in southern Nevada. This became the prototype for most slurry pipelines, and in the late 1990s pipelines stretched as long as 1,500 miles.

Coal slurry technology involves transporting pulverized coal suspended in water and pumped through pipelines. From the mine, the coal is crushed, formed into slurry, suspended in water, and pumped through the pipe to the power plant. At the end of its journey, the slurry is placed in storage tanks, where various processes remove the water from it. The final result is coal that can be used for burning.

Modern slurry systems were initially developed after World War II and, although coal is the most common commodity transported via slurry, other concentrates—iron-ore concentrate, copper ore, phosphate-rock concen-

trate, limestone, and the mineral gilsonite—are transported as well. The South American Alubrera pipeline, completed in early 1998, is the world's longest copper ore concentrate slurry pipeline, traversing 312 kilometers through the Andean desert, vast grazing lands, rain forests, and flat pampas in Tucumán.

In recent years, pipelines have been built for the transport of carbon dioxide, hydrogen, ethylene, and other liquids. In 1997, pipelines transported about \$18 billion dollars worth of hazardous materials (excluding petroleum and its byproducts, kerosene, etc.) which consisted primarily of flammable liquids such as refrigerated liquid ethylene, butane, sodium hydroxide solutions, propylene, benzene, and butadiene.

From the late 1990s into the early 2000s, this industry has remained small but stable. Nearly all of the firms in the industry are typically either small companies focused exclusively on pipeline transportation or larger firms primarily involved in other lines of business. The clear industry leader in 2001 was Northern Border Partnership LP, based in Omaha, Nebraska, with \$158 million in revenue. Second was TC Pipelines LP of Westborough, Massachusetts, with \$46 million in revenue, followed by Sacramento-based Wickland Oil Co., with \$5 million in revenue.

SIC 4724

TRAVEL AGENCIES

This industry comprises establishments primarily engaged in furnishing travel information and arranging tours, transportation, rental cars, and lodging for travelers. Establishments primarily engaged in arranging and assembling tours directly to travelers or through travel agents are discussed in **SIC 4725: Tour Operators**.

NAICS CODE(S)

561510 (Travel Agencies)

INDUSTRY SNAPSHOT

Travel agents have been significantly affected by two factors in the early 2000s. First, travelers are increasingly using the Internet to book their travel, bypassing traditional agents. Second, the terrorist attacks of September 11, 2001 brought all travel—both business and leisure—within the United States to a screeching halt. In the aftermath of the attacks, security concerns and a depressed economy left agents with few customers. Just as travel agents were looking for consumers to regain confidence in the safety of travel and as the economy showed the first signs of recovery, the United States entered into the Second Persian Gulf War in early 2003, once again leaving Americans feeling the need to stay close to home.

Although experts agree that the economy as well as the travel industry will eventually rebound, even if consumers overcome their cautionary feelings regarding air travel, the future role of travel agents is made murky by the every-growing use of the Internet to plan and book travel arrangements. Agents will also have to deal with less-than-perfect relations with airlines, cruises, and tour groups—all of whom are themselves struggling to stay afloat.

ORGANIZATION AND STRUCTURE

The travel agency industry is young, dynamic, and in a relatively constant state of transformation and growth. While no longer expanding at the explosive rate (almost 20 percent annually) of the early 1980s, the industry continues to grow—in terms of the number of locations—by nearly 6 percent every year. During the 2000s, mergers and acquisitions are expected to be an important facet of the industry.

Regional Distribution. Travel agencies can be found in virtually every community in the United States. The greatest share of travel agency locations has been in the eastern United States (30 percent), with the western United States close behind (28 percent). The South has a 22 percent share, and the Midwest has 19 percent. Central city locations account for more than 50 percent of the total, and the uneven growth of the 1980s—with the suburbs and small towns gaining disproportionate numbers of locations—not only subsided, but reversed itself. The share of rural and town locations dropped quite significantly to 9 percent, from nearly 12 percent in the late 1980s. With the emergence of Satellite Ticket Printers (STPs), automated ticket distribution machines began to replace branch offices altogether, a trend that may well continue.

Consolidation. In examining location revenue trends in the travel agency marketplace, the pattern seems some-

what obscure. Not only is the proportion of larger agencies (those with more than \$5 million in revenue) growing rapidly, but also the proportion of smaller ones (grossing under \$1 million) is increasing at an equally conspicuous rate. The percentage of the industry's large locations has risen steadily to 11 percent, and their share of total industry revenue has risen to more than 33 percent. At the same time, small locations make up almost 30 percent of the industry. While seemingly contradictory, these trends are, in fact, results of the same overall movement of the industry toward consolidation into a number of "mega-agencies," or regional and national branch and franchise networks. Such firms have the resources to set up large offices in prime locations and to establish small branch agencies that are run in coordination with the main offices. Whether or not these smaller branches are profitable, they do augment name recognition, which is of utmost importance to any agency in this increasingly competitive market.

The steady expansion of the industry in the 1990s had a completely different character than the boom period advances of the 1980s. The segment of the industry that expanded most in the 1980s—comprising the majority of the independent, single-location agencies with between \$1 million and \$5 million in revenue—came under pressure. The majority of agency locations still fell into this category in the 1990s, but it was a dwindling majority. Especially significant was the decrease in agency locations at the lower end of this group—those grossing between \$1 million and \$2 million—which were not as eagerly pursued by the acquisition-minded mega-agencies as were those locations with greater revenues.

The high level of consolidation activity in the travel agency industry is best assessed through the steep upturn in acquisitions. Almost a third of all agencies have acquired another agency already, and there are no signs of the buying spree slackening. In 1991 American Express Company purchased Lifeco of Houston, a firm whose airline ticket sales exceeded \$1 billion annually. This acquisition provided a new scale for the already highly charged marketplace environment. Many smaller agencies also felt they had much to gain in terms of access to the latest technological innovations and overall support than they had to lose in giving up their autonomy. For this reason, they pursued buyers. Typically, the cost of purchasing an agency location is set at between 3 percent and 7 percent of its latest annual sales.

Smaller Agencies. Despite the industry's consolidation, it remains first and foremost an industry of small businesses. Even in the face of intensifying competition, single-location firms still make up the vast majority of agencies, and in addition, they have successfully developed alternative business strategies to stay afloat. One common tactic is to seek out corporate clients—89 per-

cent of all agencies handle at least one corporate account. While only large agencies can manage the travel accounts of most medium-sized and large corporations, these accounts make up about only 28 percent of all the corporations that use travel agencies. The rest (those with fewer than 100 employees) compose a huge market for the services of smaller agencies. The average number of corporate accounts an agency manages dropped to 38 from a high of 43 in 1989, proof that small agencies have made inroads into the realm of business travel. Quite simply, more agencies are attracting fewer business clients: certain companies may feel better served by an agency without too many other commitments. The particularized service that a small agency can provide has proven to be an effective selling point in building an agency's business travel base.

Promoting themselves in terms of the unique, personal service that they offer, small agencies have also secured a place in the leisure travel market, a market in which the travel agent is often solicited as an advisor to the traveler. Although not widespread, there has been some noteworthy fragmentation of the leisure market into agencies specializing in travel niches (e.g., student travel, or travel to a certain part of the world).

Consortiums. Membership in travel consortiums is seen as a way of benefiting from consolidation without ceding direct control of the business. Through consortium membership, an agency develops close working relationships with other member agencies. An increase in purchasing power results in significantly higher override commissions from preferred suppliers and in cheaper access to expensive services that foster office efficiency. These immediate paybacks, however, are not the only focus. Many agencies feel consortiums, through annual meetings and newsletters, ensure that they remain up to date on broad developments in the industry. Consortiums also give travel agents a unified voice that increases their ability to influence supplier developments that affect them. In the 1990s nearly half of all U.S. travel agencies became affiliated with a consortium of some sort, and there are few signs of this trend slowing, since business travel consortiums have begun to catch up to leisure travel consortiums in membership numbers.

Of course, consortiums are not only set up for small agencies, and the growing number of business travel associations are welcoming more and more mega-agencies. Access to consortium arrangements will ultimately serve to protect the travel agency industry from complete consolidation by ensuring that it retains some degree of its small-business character while still adjusting to the increasingly complex demands of the American traveler.

Trade Associations. In seeking greater efficiency and better returns in the 1990s, an industry proliferated with

independent operators, consortiums, and mega-agencies still sought a kind of uniformity. Market-driven joint ventures were not, however, the only coordinating mechanisms that served to integrate the industry. For example, several large trade associations act to influence government policy decisions on behalf of the travel complex as a whole. These associations also provide educational services for their members and promote the benefits of using travel agents. The largest of these trade associations, the American Society of Travel Agents (ASTA), boasted 29,000 travel agents in 170 countries in 1999. Seventy to 75 percent of this nonprofit organization's funding comes from its member dues, the rest from an annual conference. The second largest trade association, the Association of Retail Travel Agents (ARTA), has a much smaller membership—3,000 travel agents—and a more specific agenda of promoting their interests. Other important travel agent associations include the Travel and Tourism Research Association and the Alliance of Independent Travel agents. Related associations include the American Bus Association, American Hotel & Motel Association, and Cruise Line International Association.

While providing services for travel agents, such associations also legitimize the trade itself. Because only Rhode Island requires its travel agents to be licensed, an ASTA or ARTA membership offers assurance to both suppliers and consumers that an agent has some qualification beyond the easily obtainable agency accreditation, which is granted by the Airlines Reporting Corp. (ARC). In what has become a very technical field, there has been an increasing need for further standards of expertise, and educational bodies such as the Institute of Certified Travel Agents (ICTA) have begun to serve a crucial role. The ICTA, a 16,000-member association that seeks to improve the level of competence within the industry, offers a course through which agents can become Certified Travel Counselors (CTC), a title that already carries significant weight within the industry. Another certification which has come into demand with the growth of corporate travel is that of Certified Meeting Professional (CMP), which allows an individual to oversee every aspect of a business meeting.

Nine states currently require some regulation, certification, or registration of retail sellers of travel services: California, Hawaii, Illinois, Ohio, Rhode Island, Washington, Iowa, Florida, and Oregon.

Suppliers. Travel agencies rely entirely on commissions from their suppliers. Commissions, as a rule, are set at 10 percent of a booking, but slightly different arrangements can be made with each supplier. Travel agents may contact several suppliers to set up an appointment with each or use one of two coordinating bodies accepted by various suppliers as a kind of clearinghouse establishing the validity of agents. ARC agents are allowed to use standard ticket stock

for more than 100 domestic and international carriers. ARC also provides weekly reconciliation of sales, refunds, exchanges, and commission payments to travel agents via a third party. While ARC appointment is not required of agents, it would be difficult to provide full services without it. A minimum of \$20,000 is required to be appointed or retained by ARC. This acts as both a financial screen and a protection against default.

Airlines are the only suppliers who give significant commission overrides (marginally higher commissions) to agencies with which they have a preferred supplier relationship, whether negotiated through a consortium or through the agency itself. These overrides appear to be relatively effective in influencing agents' booking habits. More than two-thirds of all agencies book particular carriers in order to receive overrides, and these locations obtain overrides on about a third of all the air tickets they book. It is more common for overrides to be passed on to a business client than to a leisure client, mainly because the market for corporate accounts is highly competitive and, because of the higher prices a corporate traveler generally pays for last-minute scheduling, the commission will already be substantial. The use of overrides for leisure travel is on the rise, however, as it becomes an increasingly competitive sector.

The industry's dependence on air travel resulted in a marked consistency of products offered by travel agencies. Airline tickets make up nearly 60 percent of a travel agency's business on average, more than all other "travel products" combined. This attachment to the airline industry poses problems for some travel agencies, and so has prompted an effort within the industry to decrease dependence on airline ticket sales. With air travel continuing to increase, however, this dependency may be unavoidable. The remainder of a travel agency's business comes from cruise bookings (which make up 16 percent of total industry sales), hotel bookings (12 percent), car rentals (8 percent), and rail travel and other bookings (4 percent).

Tour and vacation packages, organized through tour operators with minimum arrangements, have increased in popularity. Packages allow for better control of costs in advance, and assure the customer that they will be taken care of in case of an emergency. For agents, they are easily put together and provide higher, more dependable commissions. Specialized tours (often called Foreign Individual Tours or FITs) are becoming confined to the luxury market, a welcome trend for agents because FITs are often time-consuming to organize.

Car rental companies use a variety of strategies to lure travel agency business, including commission incentives, free client upgrades, low familiarization trip rates, and frequent contests. Regardless of what kind of inducement is offered, however, car rental bookings are

still generally viewed by agents as an added service for their clients. More often than not, an agent will make car reservations based on the efficiency and dependability of the car rental company's system rather than on what rewards are being offered. Payment of commissions has become less of a problem as car rental companies have begun to centralize their payment systems and have designated full-time agent assistants to deal with travel agent inquiries or commission payment concerns. In 1997 a New York State Court of Appeals ruled that rental companies cannot refuse to rent automobiles to drivers on the basis of age. Drivers under 25 or 21 were routinely denied rental because of higher accident rates. Since other states are considering similar legislation, this could, according to a Hertz Corporation spokesman quoted in *ASTA Travel Industry Headlines*, give car rentals "virtually unlimited exposure" to insurance liabilities.

As more hotels acknowledge their dependence on travel agents for reservation bookings, the relationship between the two industries is greatly improving. Evidence of this is seen in the effort by many hotels to simplify and speed up the payment of travel agency commissions. In the past, commission payments could take anywhere from a few days to a couple of months and come with confusing statements from branch hotels. Now, a large hotel company, with a centralized commission payment system, issues payments and statements regularly from one office that deals with individual branch problems internally. Such centralization safeguards travel agents from having to spend valuable time chasing down commissions and makes agents far more comfortable in booking hotel reservations.

STPs and On-Site Agents. In order to meet corporate demand for efficiency and specialized service, two strategies were adopted to better manage the travel accounts of large companies. Some agencies are offering to install satellite ticket printers in corporate offices so that a ticket and/or boarding pass can be distributed directly and immediately to the client. Some 13 percent of all agencies use such delivery systems, with the average number for an agency location being three. A smaller but growing number of agencies have gone so far as to set up on-site departments for their major clients (those who contribute more than \$41 million in sales, for instance). Such departments, which are run and paid for by the agency but work in client-supplied office space, give the company more direct control over its travel arrangements and thus create savings and enforce travel policy. On-site agents also work in conjunction with in-house travel departments to set budgets, negotiate with vendors, and create travel expense reports.

BACKGROUND AND DEVELOPMENT

The Early Years. Because travel agency surveys have only been taken since the early 1970s, it is difficult to

speak with much certainty about the state of the industry prior to this time, except to note that it bore little resemblance to the industry of the 1990s. ASTA was founded in 1931 as a society for steamship agents, at a time when steamships and trains were the predominant means of travel. A small group of agents booked tour packages and cruises in these early days. Later, with the spread of air travel, particularly with the introduction of larger passenger jets in the 1960s, travel agencies became much more prominent. Despite their prominence, travel agencies still remained a select group. For a long period of time, an agent actually had to be appointed by an airline commission in order to book airline tickets. In many ways this obstacle spurred the industry's expansion into car rentals and hotel bookings. For many years, however, travel agencies remained essentially unsustainable without inside connections to the airline industry.

The Deregulation Watershed. In 1978 the Carter administration's airline deregulation legislation, designed by Alfred E. Kahn, chairman of the Civil Aviation Board, transformed the industry completely. In just three years the number of agency locations rose by 30 percent, from 14,804 in 1978 to 19,203 in 1981, and the average revenue per agency was up 23 percent, from \$1.3 million to \$1.6 million. Such broad-based, steep increases were, and remain, unparalleled and clearly point to deregulation as a watershed in the history of the travel agency industry. By eliminating fixed pricing and opening up air travel to competition, deregulation allowed more people to travel more cheaply. The benefits of travel agency services also suddenly became much clearer. With a floating market, and new airlines either popping up or going under with shocking speed, travel agencies were in a better position than anyone else to find the best ticket at the best price. Companies suddenly forced to trim budgets also came to recognize travel agencies as the most cost-effective mode of ticket distribution.

Since the early post-deregulation years, travel agents' enthusiasm for airline competition has cooled somewhat. In particular, the frequent price wars create havoc for travel agencies. When special fare offers are made, for instance, not only are agents unprepared, but their reservation systems are rarely loaded with new fares fast enough to avoid problems. Despite the fact that agencies continue to handle nearly 80 percent of airline ticket sales, no true partnership has evolved between the two industries. As a percentage of all travel agency revenue, revenue generated by the airlines has, in fact, fallen moderately from 63 percent in the early 1980s to around 56 percent. Both sides have tried to reduce their co-dependence; the airlines have developed frequent flier programs as alternatives to preferred supplier relationships, and travel agencies have built closer ties to other suppliers.

A number of travel agents and tour operators were upset when the U.S. Travel and Tourism Agency was eliminated in 1996 along with its \$16.3 million budget. This made the United States the only major country without a national tourist agency. Private industry stepped in, and the new United States National Tourism Organization Act was passed by the United States Senate in September 1996. It is estimated to have an \$80 million budget to promote the United States to foreign tourists. Patterned after the U.S. Olympic Committee, the National Tourism Organization is funded by business sponsors who pay an annual fee to use its logo in advertising and promotion. The organization's avowed goal is to put the United States back on top of the international tourism market.

Despite a leveling off in overall growth, the U.S. travel agency industry remains vibrant and is well-placed to benefit from the promise of future increases in both leisure and business travel. Even in a prolonged recessionary period, cumulative agency revenues have remained up, and it appears that there is still some room for agencies to grow within the travel complex. While they have no real competition in airline ticket sales, tours, and cruises, their proportion of the car rental and hotel reservation markets show room for growth. Even without any marked improvement in their relationship with these two suppliers, however, the industry is so closely aligned to the airline and cruise industries that the years ahead, while they may show further consolidation and cost containment, will surely be prosperous. In addition, the recent focus on airline industry upheaval and the Clinton administration's commitment to airline industry reform was welcome news to agencies who continue to depend on that sector of the travel economy. With the outgrowth of consortiums and mega-agencies, travel agencies have more leverage than ever before, which will enable them to play a significant role in airline industry reforms. Finally, and perhaps most importantly, travel agencies have proven themselves flexible enough to adapt to the ever-changing habits of American travelers.

Travel is currently the leading services export in the United States, bringing in \$93 billion (including water transportation) from 46.4 million international visitors in 1998, which was \$18.7 billion more than U.S. travelers spent abroad that year. Travel and tourism is also the third largest retail industry, next to automobile dealers and food stores. Total 1998 output from both domestic and international travel was approximately \$1.2 trillion, which was 13.6 percent of the Gross National Product (GNP). The entire industry employed 7.6 million people in 1998, up from 6.6 million in 1995. Travel within the United States continues to represent a large segment of the industry: in 1998, Americans spent \$424 billion on travel away from home without leaving the country. Ac-

ording the U.S. Census Bureau, travel agencies brought in approximately \$11.1 billion in receipts for 1998.

Post-deregulation commissions continued to drop through the latter 1990s as commission caps, ticketless travel, and cost cutting all began to take their toll. In October 1999 airlines cut their commissions to travel agencies down to 5 percent, the third reduction since 1995. In effect were a \$50 commission cap on round-trip domestic flights and a cap of \$100 on international flights. Electronic ticketing and Internet booking remained the biggest threats to travel agency income. According to ASTA, however, travel agents were still booking about 80 percent of all flights in 1999 despite the continued threat of direct online purchasing. Some of the most frequented Internet travel sites in 1999 included BizTravel.Com, GetThere.com, Priceline.com, and Travelocity.

Travel Weekly's "1999 U.S. Consumer Travel Survey" reported that travel agents ranked higher than doctors, lawyers, and stockbrokers with respect to the value provided for the work (they were out-ranked by teachers, pharmacists, and accountants). Notwithstanding, the Federal Trade Commission (FTC) reported that Americans lose \$12 billion yearly in travel fraud, mostly from non-registered agencies.

CURRENT CONDITIONS

The entire travel industry was rocked by the events of September 11, 2001, when four commercial airplanes were hijacked by terrorists concurrently, with two crashing into the New York World Trade Center, one into the Pentagon in Washington, D.C., and another brought down prematurely in Pennsylvania by passengers on-board who struggled with the terrorists. The horrific events sent shock waves through the nation, and travel ground to a halt. Travel expenditures fell significantly. In 2000, U.S. consumers spent a total of \$570.5 billion on travel. In 2001 that figure dropped to \$537.2 billion and dropped again in 2002 to approximately \$525.1 billion.

Travel agents are attempting to cope with the stagnant travel industry by focusing less on air travel and more on cruises, vacation packages, alternative means of transportation (e.g., rail and bus), as well as revenue-boosting vacation add-ons such as spa packages, shopping trips, or special evenings-out. However, even when the economy recovers and people begin to travel again, the Internet clearly will remain the agents' long-standing competition. Expedia.com, Priceline.com, Orbitz.com, Travelocity.com, and Cheaptickets.com are proving to be worthy opponents. Some predict that the future of travel agencies will involve a fragmenting into numerous small agencies that primarily handle upscale cruises, local travel, and cruises and large "mega-agencies," who will operate both offline and/or online to provide a mass

marketing approach to consumers looking for discounted prices.

The market arena is also changing for travel agencies regarding airline commissions. A trend beginning in 1995 when commission fees were reduced by Delta, in 2002 the major airlines finally pulled the trigger on what travel agents had expected: zero commissions. The move could save airlines up to \$1 billion annually, and it is also intended to push travelers to book directly with the airline via online reservation options. With no commission-based revenues, most agencies were forced to increase services fees. Although a vast majority of agents were not pleased with the airlines' decision to do away with commissions, most had plans in place to accommodate a new fee-based structure.

INDUSTRY LEADERS

American Express is the world's number one travel agency as well as being a diversified financial services company. In 2002 American Express posted revenues of \$23.8 billion. Carlson Wagonlit Travel Inc. is the second largest travel agency. In 2002 the company posted revenues of \$11.0 billion, down 8 percent from the previous year. World Travel BTI ranks third in the United States, with sales of \$3.8 billion in 2001.

Leading online agencies include Priceline.com, with 2002 revenues surpassing the \$1 billion mark; Expedia, with 2002 revenues of \$590 million; and Travelocity, with 2002 revenues of \$308 million.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, there were 193,000 people employed within the travel agency industry in 2001. Of this total, 98,640 were travel agents, and another 11,000 were reservation and ticket agents. The mean annual salary for a travel agent was \$27,110. General and operations managers, which accounted for under 3 percent of the workforce, earned a mean annual salary of \$64,540.

The American Society of Travel Agents (ASTA) and the Institute of Certified Travel Agents (ICTA) both offer self-study and group courses. There are no federal licensing requirements, but nine states require some form of registration or certification. Employment of travel agents is expected to grow through 2005, primarily by the establishment of new agencies. The full impact of changes in the industry has yet to be determined. The industry is sensitive to the economy, the perception of air safety, and political crises.

With greater economic pressures, though, agencies have been slowly turning away from straight salary compensation and moving toward compensation packages that combine salary and commissions. Such plans are viewed as ways to ease the strain of flat revenues and

rising salaries while bringing employee earnings in line with productivity. Agents paid in this manner (21 percent of all agents) tend to earn 6 to 11 percent more than their straight salary counterparts. Compensation packages have increased competition among agents, however, and concern for a friendly office environment has kept most agencies from resorting to paying commissions, which generally range from 25 to 30 percent of an agent's total earnings.

Benefits packages have also been an area of debate in the industry, with rising health insurance rates the primary focus. Only 31 percent of agencies cover the full cost of their employees' health insurance, and the numbers are decreasing. To help small independents, ASTA has a nationwide health plan that covers more than 1,000 agencies, but the costs are still regarded as far too high by many employers. Still, health insurance ranks second behind familiarization trips as the benefit most commonly provided for by the employer. Agencies that are willing to share some of the costs of such packages can offer substantially lower wage contracts. With skyrocketing health care costs, agents are focusing more and more on benefits packages when choosing an agency.

RESEARCH AND TECHNOLOGY

Travel agencies have provided fertile ground for the application of cutting edge computer technology. Computer reservation systems (CRSs) are used by all but 4 percent of the industry. Of the five CRS vendors, Sabre has the largest market share of the industry at 35 percent; the other vendors include Apollo (23 percent), System One (20 percent), Pars (17 percent), and Data II (9 percent). Agents have become very comfortable with using CRSs and have started to employ them in uses beyond airline bookings. More car rental companies and hotels can be accessed through CRSs than tour companies and cruises, and agents have responded by making the majority of both their car and hotel reservations (68 percent and 53 percent, respectively) by computer. The most important specialized software to appear in conjunction with CRSs is the fare-auditing scan, which checks a system for better fares and/or routing. Such software has already given many large corporate agencies an invaluable marketing tool. Other quality-control software, such as automated accounting systems (used by 51 percent of all agencies), should continue to proliferate within the industry. The U.S. Department of Transportation, in fact, expected to issue new CRS rules that will make it easier for agencies to buy third-party software and hardware for accessing their CRSs.

The emergence of Satellite Ticket Printer Networks (STPNs) and Electronic Ticket Delivery Networks (ETDNs) promises to have a major impact on travel agency ticket delivery. Starting in 1986, STPNs allowed

agencies to set up ticket machines on client premises. The advent of third-party ticketing networks, used by agencies that cannot afford to establish networks themselves, has given agents the ability to issue tickets through their STPNs at a number of different locations. New networks are being developed that are essentially the same manner as STPNs but are not agency accredited by the Airlines Reporting Corp. (ARC). The ARC is expected to approve them, however, and many envision ticketing locations popping up in much the same as automated bank tellers machines. Without agency accreditation, though, ETDN vendors will neither sell tickets nor offer any kind of travel counseling.

Electronic ticketing and bookings via the Internet are revolutionizing the industry. Because of reduced personal interaction, electronic tickets promise to slash transaction costs. Several airlines are promoting direct self-ticketing. USAir Group Incorporated has provided its Priority Travelworks disks, which allow online reservations to 70,000 of the 19 million people in its frequent flyer program. United Airlines Incorporated sells its online connection for \$24.95 a year but also provides for free drinks coupons and headsets. It also charges \$2.50 per hour of connect time which is waived with the online purchase of a ticket. Northwest Airlines Incorporated's online registration is available through Compuserve. Delta, TransWorld Airlines Incorporated, and others plan to introduce their versions. The airlines are well positioned to capture online traffic because of their share in reservation systems such as Sabre, Apollo, and Worldspan, which are used by travel agents.

Hotels, travel agents and quasi-travel agents have also taken to the Internet to allow do-it-yourself bookings to save costs, frequently providing access to databases previously reserved for travel agents and posting significant sales. For example, the Marriott hotel chain allows reservations over the Internet. The travel industry has embraced the Internet at a pace second only to the computer industry, but there are mixed reactions as to the impact of the Internet on travel agencies. Some feel that the ability to make one's own reservations and bookings will eliminate the need for a travel agent, but there is also the speculation that the fundamental role of the travel agent will remain unchanged; that is, they will continue to act as travel consultants because of their knowledge of the industry, although they may work in-house for larger corporations.

TOUR OPERATORS

This classification comprises establishments primarily engaged in arranging and assembling tours for sale through travel agents. Tour operators primarily engaged in selling their own tours directly to travelers are also included in this industry.

NAICS CODE(S)

561520 (Tour Operators)

INDUSTRY SNAPSHOT

Within the entire U.S. travel and tourism industry, the packaged tours industry constitutes the second largest revenue-producing sector of the travel services group, bringing in about half the revenues of air carriers alone. As of 2001, the entire travel and tourism industry was the nation’s leading services export and the third-largest retail industry, following automotive dealers and food stores. To provide some perspective on the enormity of the economic impact of travel and tourism on the U.S. economy, in 2001 alone the U.S. travel industry received more than \$555 billion from domestic and international travelers. The industry has provided some 7.9 million jobs in the United States with a payroll totaling \$174 billion.

From this enormous market, tour operators earn their revenue by providing a host of travel services to a travel agent, who then sells these services to tourists. The types of tours provided vary widely according to the type of tour operating business concerned, ranging from arranging transportation, lodging, meals, and a guide for a week-long, gorilla tracking expedition in Africa, to the simple service of providing newly arrived guests to Hawaii with ceremonial leis. Tour operators frequently offer the following advantages: cheaper price, grouped travel with others with similar interests or same socio-economic level, predetermined costs, and pre-planned activities.

Historically, tourists who have chosen to arrange their vacations through a tour operator rather than through a travel agency do so for several different reasons, which, over the course of the modern travel industry’s existence, have fluctuated in their relative importance to the tour operator industry. Initially, tourists were attracted by the cheaper total price of their vacations when purchased from a tour operator; they also preferred to travel with a group, have the trip’s budget determined beforehand, and not having to worry about what to do, where to go, and how to get there. These benefits, economy, and ease of travel that motivate a consumer to consider a tour package essentially predicate the industry’s existence. Throughout the tour operator industry’s

development, these advantages attracted a certain portion of those contemplating travel, although the number of tourists motivated by economy and ease of travel has varied during different phases of the industry's history.

As time progressed and more people found the time and the extra finances to travel, the tour operator industry also began to attract a new type of customer not necessarily interested in traveling with a group or particularly interested in saving money. These tourists had traveled to numerous destinations numerous times, becoming somewhat inured to the attraction of a particular destination. Instead of traveling, for example, to France for the seventh time, a tourist might consult with a tour organizer to arrange a trip to France specifically tailored to the tourist's interests. These types of tourists represented a growing part of the industry's customer base and led to the creation of fantastic, sometimes eccentric, tours.

ORGANIZATION AND STRUCTURE

On a broad level there are two types of businesses that generate revenue from arranging transportation and entertainment for tourists: wholesale travel businesses and retail travel businesses. Tour operators generally function as wholesalers, although like travel agencies, they may operate as retailers or both. Wholesalers in the travel industry secure large blocks of hotel rooms, or sections of seats on an airplane, or large volumes of any other travel-related commodity by paying a deposit for such reservations. By reserving, for example, 200 rooms in a particular hotel, the wholesaler receives a discounted price from the hotel operator, primarily because the wholesaler has assumed the risk of having the 200 hotel rooms remain vacant, a risk the hotel operator would otherwise assume. To generate revenue and mitigate its newly assumed risk, the wholesale concern then attempts to occupy these 200 hotel rooms with tourists by selling the rooms through a retail concern. The distinction between the wholesaler selling through the retailer rather than to the retailer is an important one, because the retailer, usually a travel agency, does not pay for the block of rooms (thereby assuming the inherent risk), but only attempts to occupy the rooms for the wholesaler, for which the retailer receives a commission from the wholesaler.

Frequently, as a result of the vertical integration by the travel industry, a travel wholesaler also may own a travel retail business and, if so, functions as a wholesaler and a retailer, reserving large blocks of transportation or lodging space, then selling these reservations directly to tourists through its retail travel agency. Some tour operators operate as such, selling tour packages directly to tourists, whereas others sell tour packages through retail travel agencies, in both cases assuming the risk that the tours offered may not attract any customers. Multi-mode

tours are increasingly included in travel packages, for example cruise-tours using planes, boats, and buses.

The many types of tours offered by tour operators generally fall under four different tour categories, although a particular tour may incorporate characteristics from more than one category. Tours may be designed and organized to suit the desires of a specific group of tourists, such as a tour of Rome organized exclusively for lawyers, or a tour of the museums in Rome for art lovers. Tours of this type are known as special-interest tours, which may or may not be led by a tour guide. In early 2000, the Yahoo Web site listed 36 specialized tour categories with a combined total of 946 listings under all categories. Adventure tours lead the group with 601 sublistings, followed by bus tours (42), EcoTours (36), educational and sports tours (33 each), and spiritual/self-discovery tours, which had 27 listings. Other tour operator categories of interest included spring break, whale watching, fishing, gambling, and bird watching.

Tours that are led by a tour guide and are comprised of a group of tourists not necessarily familiar with each other are classified as Escorted Tours. During these tours, a tour director travels with the group and assumes responsibility for confirming hotel reservations, scheduling transportation, overseeing the handling of baggage, leading the group on sight-seeing excursions, and providing language translation when necessary. Generally, during escorted tours, travelers follow a scheduled itinerary created by the tour operator, and travel as a group to appointed destinations at predetermined times.

Foreign independent tours (FIT) or domestic independent tours (DIT) allow travelers more freedom to vacation on their own without following a scheduled itinerary or traveling with a group, yet these tours still offer the traveler the convenience of paying for all facets of a trip prior to departure, including transportation, transfers, lodging, sight-seeing excursions, and often some meals. This type of tour is divided into two varieties: those tourists traveling on an independent tour outside their home country are on a FIT, and those traveling inside their home country are on a DIT. Thirty-six percent of the National Tour Operators Association offered packaged FITs in 1996.

Group inclusive tours (GIT) are the fourth category of tours offered by tour operators and comprise groups of travelers that share a particular mutual affiliation, such as belonging to the same club or business organization. This type of tour differs from an escorted tour in that the travelers in a GIT share a commonality among them, while the members of an escorted tour share no common bond, other than perhaps living in the same region. GITs are also distinct from special-interest tours, not because of the composition of the tour members, but because of differences in the tours themselves. Tourists on special-

interest tours travel to a particular destination for an experience that somehow is reflective of their mutual interests, and travelers in GITs form a group merely to pool their purchasing power and realize savings.

Some tour operators offer travel services only after the tourist or group of tourists arrive at their destination. These tour operators, known as ground operators, often specialize on a particular destination and consequently are located in proximity to the particular destination. As a result, many tour operators are located in regions of the United States that are typically thought of as popular tourist destination points, such as California, Florida, and Hawaii.

Although the tour operator industry is densely populated, the capital required to enter the business is relatively high, making entry into the industry more difficult than the number suggests. Because tour operators generate revenue by paying large deposits for travel commodities that, with hope, will be paid for by future customers, the fledgling tour operator must have enough capital to secure the necessary reservations without first having the opportunity to generate any revenue. Moreover, the tour operator is required to pay in full for reserved travel commodities, whether the tour attracted any tourists, putting the large deposits at risk. Consequently, the number of tour operators is constantly in flux because some companies fail, particularly smaller ones with limited cash reserves, and new companies are established.

Professional Associations. There are two principal associations concerned with tour operators, and they had a combined membership of more than 4,000 in 1999. The United States Tour Operators Association (USTOA) was one of the largest, with a 1999 budget of \$930,000 and a membership of 524. Members must be in business at least three years, carry a minimum of \$1 million liability insurance, and are required to have 18 industry and financial references. The million-dollar security is in the form of a bond and is used solely to reimburse consumers for tour payments or deposits lost in the event of bankruptcy, insolvency, or cessation of operations involving an active USTOA member. The National Tour Association contains 3,800 members and has a staff of 20. Its monthly magazine has a circulation of 5,200.

BACKGROUND AND DEVELOPMENT

The concept of traveling for pleasure is a relatively recent phenomenon that emerged in the latter half of the twentieth century, when society as a whole became more affluent, achievements in aviation made inexpensive air travel available to the masses, and the basic desire to spend vacations away from home combined to make travel, and particularly long-distance travel, a popular and widespread activity. Whether this transformation of the human mindset was merely the product of a people

suddenly and inexplicably desirous for travel, or the result of effective marketing by both national governments and commercial interests is not clear, but whatever the root of the new desire to travel, it did not surface until the dawn of the jet age.

For Americans, travel by plane first became available in the 1930s, when airline service was first established, but many could not afford to fly, and perhaps even more felt no desire to fly, preferring instead to remain close to home. It was not until after World War II that Americans began traveling by plane to any appreciable extent, an activity facilitated by a dramatic increase in their discretionary income and the affordability of travel. But even then, not many traveled, at least not by plane, for it would be another 20 years until more than one in two Americans had ever flown in an airplane. Nevertheless, once Americans began to travel in the 1950s, tour packages designed and arranged by tour organizers appeared immediately, signaling the genesis of the modern tour operator industry at roughly the same time the overall travel industry began to mature into a formidable economic force.

Of course, the tour operator industry did not wholly depend upon air travel to generate revenue. Bus loads of high school and college students traveling together during spring vacations during the 1920s most likely constituted the formal beginnings of the industry. But the business created from those traveling to foreign countries or across the United States by airplane had a significant effect on the development of the industry. During the 1950s, the tour operator industry benefited from several key attributes peculiar to the experience tour organizers offered. First and perhaps most important, tour packages were generally more affordable than traveling independently. Packages usually offered inclusive fares, leaving the tourist with little to pay for after departure and virtually no travel details to arrange either before departure or once traveling. Group travel also companionship in unfamiliar places and unfamiliar cultures. Many tourists traveling during the 1950s were experiencing their first journey of any distance from home. Travel for some represented a somewhat frightening—albeit exciting—endeavor. The tour operator industry was well equipped to assuage this sentiment with comparatively cheap prices, the convenience of pre-arranged travel plans, and the security and camaraderie provided by group travel. Poised as such, the tour operator industry secured a viable foothold in the then burgeoning travel industry, establishing for itself a particular type of clientele that consistently fueled its growth.

By the beginning of the 1960s, tourism was big business, amounting to roughly \$30 billion a year in the United States. Nearly 124 million Americans traveled each year during the first years of the decade. An appre-

cialable portion traveled internationally, spending more than \$2 billion annually in foreign countries. During the 1950s, international travel had become enough of an economic force to attract the attention of government officials. In fact, the Eisenhower administration's attempts to incorporate travel as a focus of foreign economic policy led to the formation of the U.S. Office of International Travel in 1958. Although no branches were established overseas, the Office of International Travel acted as promoter and served as a liaison between the travel industry and government agencies affecting the industry's operation abroad.

Despite federal promotion, several years after the creation of the Office of International Travel the number of U.S. tourists traveling overseas still outnumbered the number of foreign tourists traveling in the United States. By the beginning of the 1960s, this disparity had widened, creating an industry trade deficit of nearly \$1 billion annually. In 1961 John F. Kennedy's administration created the United States Travel Service (USTS) as part of the International Travel Act. With more power than the Office of International Travel and with branches overseas, the USTS, operating within the Commerce Department, promoted travel to the United States and facilitated that travel wherever possible.

The promulgation of the International Travel Act and the consequent creation of the USTS provided a tremendous boost to the tour operator industry, primarily because the USTS focused on persuading large groups of tourists to visit America. Large groups of people translated into tours for tour organizers, who now found themselves infused with business created by the government. With an initial \$2.5 million annual budget earmarked for travel promotion, the USTS, through its Visit U.S.A. program, enabled tour operators to reach a much wider audience than their individual marketing budgets would have allowed. In one of the first successes of the Visit U.S.A. program, 400 Swiss tourists came to the United States, paving the way for additional groups numbering as high as 700 to come from Britain, France, and Germany.

While foreign travel to the United States began to pick up in the 1960s, another tour type began to grow in popularity. At this time exotic tours such as safaris gave hunters an opportunity to shoot wild game in such distant venues as Mongolia, Serbia, and Africa. Despite being considerably expensive—priced between \$3,000 and \$9,000 in the mid-1960s excluding airfare—safari tours attracted up to 200,000 tourists each year by the end of the decade.

A larger niche within the tour operator industry was experiencing an increase in popularity, further bolstering the industry's record growth during the 1960s. This niche would later be known as the special-interest tour, which

included a group of people with mutual interests traveling together to a particular destination. Some of these tours offered virtually no savings to the group traveler when compared to traveling alone. This development, along with the growing number of people paying for expensive safari tours, signified a subtle but crucial change in the reasons tourists selected tour organizers to arrange their vacations. Previously, lower vacation costs were the primary advantage tour operators offered tourists, and in the 1960s that continued to support the industry's existence. Now, however, tourists also were opting for tour operators solely due to their talents at organizing vacations. This evolution occurred slowly, but would prove to be one of the industry's primary selling points.

As the tour operator industry broadened its scope, the U.S. tourism deficit also continued to broaden. Despite the efforts of Kennedy's Visit U.S.A. promotional program, the tourism deficit had increased from \$1 billion at the beginning of the 1960s to \$1.6 billion by 1965, prompting the country's next administration to design a new international tourist program to somehow keep the gap from increasing.

Shortly after assuming office, the Lyndon Johnson administration created the See the U.S.A. program, similar to Kennedy's program in name, but decidedly different in its objective. Instead of solely promoting travel to the United States from overseas, See the U.S.A. also attempted to curb the number of U.S. citizens traveling abroad. For several years the idea of levying a "travel-tax" of \$50 to \$100 was contemplated. Although the threat of an international travel-tax initially produced the opposite of its intended effect—spurring travel abroad before the tax was implemented—other components of See the U.S.A. essentially promoted U.S. destinations for U.S. citizens, which had a positive affect on tour organizers' business. Cities with warm climates and popular tourist attractions in such states as California, Florida, and Hawaii, benefited enormously from the promotional efforts of See the U.S.A., which induced travelers to vacation within U.S. borders.

The next significant federal involvement in the travel industry came in 1978, when the Airline Deregulation Act ended the regulation of domestic air transportation. Regulation had in effect made the industry a consortium of closely allied companies forming what resembled a cartel. Once deregulated, the airline industry assumed its own course of development, unfettered by the strict controls of the Civil Aeronautics Board, which had regulated the industry for the previous 40 years. The airline industry drastically reduced the prices of airfare and quickly became a more populated industry, with 198 new airlines forming in the decade following deregulation. The travel agency industry responded in much the same manner, with the number of agencies soaring from fewer than

10,000 before deregulation to 28,000 by the mid-1980s. For members of the tour operator industry, airline deregulation engendered an upturn in business.

Now catering to a market invigorated by cheaper airfares, the tour operator industry expanded rapidly, attracting new entrants into the business. Between 1973 and 1993, the number of tour organizers increased from approximately 350 to more than 1,500. This increase in participants led to a rise in the number of fallacious agencies, which hurt the industry for the next 20 years and enticed the government to consider regulation of the industry.

Aside from this undesirable manifestation of the industry's growth, the Airline Deregulation Act of 1978 also led to an increase in the industry's sales volume, as travel agents increasingly turned to tour operators to realize larger profits. The precipitous decline in airfare prices proved to be a boon for airline companies, but travel agents dependent on commissions suffered from the drop in ticket prices. To ameliorate their position, travel agencies turned to tour operators and began selling more tours, which offered a much higher commission than cheaper airline tickets.

Buoyed by these beneficial developments as it entered the 1980s, the tour operator industry faced an additional regulatory change. In 1982 the Civil Aeronautics Board, still in the process of dismantling itself after the 1978 Airline Deregulation Act, decided as one of its final acts to deregulate the sale of airline tickets in 1985. This decision put to rest a system that had allowed only airlines and travel agents accredited by an airline industry group to issue tickets. This practice had forced many tour operators to sell tours through retail travel agencies. With greater freedom to enter the retail market, tour operators continued to attract additional business and competition for the second consecutive decade.

As tourists seek more adventuresome and exotic tours in wilderness and other uninhabited areas, concerns about the ecological impact on these environments grew. In 1995 the National Parks Airspace Management Act sought to allow the National Park Service to control airspace above national parks in addition to directing the Federal Aviation Administration (FAA) to develop more stringent federal regulations for air tour operators. The act was aggressively fought by the United States Air Tour Association, as well as the Aircraft Owners and Pilots Association, because it would shift control over air space from the FAA to the Park Service, which both groups felt would be unacceptable.

The air tour operator industry noted that aircraft flying over the Grand Canyon, the central focus of the contested airspace, flew well-defined corridors away from popular areas over only 14 percent of the entire

Grand Canyon National Park. It was also noted that complaints had decreased by 92 percent, from 100 to 8 complaints per million visitors. The National Park Service reported that 92 percent of respondents to a survey reported no adverse sound impact from overflights.

The strength of the national air tour industry was also noted. The estimated impact of the air tour industry was \$625 million. The 275 air tour operators conducted 285,714 flights in 962 aircraft during 428,571 flying hours and carried two million passengers annually, 1.2 million of which were foreign passengers. A total of 240,000 handicapped passengers flew on air tours. The accident rate was 1.9 per 100,000 hours flown. The environmental impact of air tours on the ground was none according to USATA.

According to U.S. Census Bureau reports, tour operators brought in revenues of \$2.9 billion dollars in 1998. Going into the millennium, two key issues dominated the industry: the trend toward mergers and the competition from Internet providers. Forrester Research reported that more than \$12 billion in revenues was generated from online bookings in 1999.

In late 1999, the U.S. Department of Commerce announced its second round of competition to encourage the development of new tourism itineraries across the nation. The department announced five themes that highlight the diverse culture and heritage of the country, and competing tour operators would develop new, never-yet-sold itineraries. The five theme choices were: From Sea to Shining Sea, I Have a Dream, Food for the Soul, Lady Liberty, and America's Cultural Mosaic. The winning tour operators would become official "American Pathways 2000" partners in conjunction with the department's Office of Tourism. American Pathways 2000 includes the NTA, the American Bus Association, the USTOA, the Receptive Services Association, and the International Association of Convention and Visitor Bureaus (IACVB).

CURRENT CONDITIONS

The travel industry in particular suffered in the wake of the September 11, 2001 terrorist attacks and a weakened U.S. economy. Some of the largest airlines, including United Airlines, went into bankruptcy. Faced with new security restrictions, increased operating costs, and ebbing international tourists, tour operators were still feeling the effects of September 11 long after the event. Tour operators brought in an estimated \$2.8 billion in revenue in 2001, down slightly from more than \$3 billion in 2000, according to the U.S. Census Bureau. Tour operators noted a 60 percent drop in travel bookings after September 11, 2001 similar to the drop following the 1991 Gulf War.

Travel expenditures, including spending by U.S. residents and international travelers in the United States on travel related expenses, totaled \$555.2 billion in 2001, down from \$591.2 billion in 2000. International arrivals to the United States declined nearly 12 percent in 2001—the worst decline for a single year in the history of tracking international arrivals to the United States. Declines continued in 2002, off 7 percent from the previous year. However, it was predicted that by 2003 international arrivals would reach 1999 levels of 48.9 million, an 8 percent increase over 2002. Analysts predicted an even stronger 2004, when international arrivals were expected to reach 52.6 million, surpassing 2000 levels.

Leisure travel, which experienced steady growth from 2000 to 2002, began to decline near the end of 2002 and early 2003. The heightened security alert in the U.S. and the war in Iraq were factors. Americans planned 171.2 million leisure trips in spring 2003, which was a decline of 1.6 percent from spring 2002. Domestically, leisure travel accounted for 76 percent of all travel.

Tour operators received another blow from a surge in negative publicity regarding the outbreak of illnesses on various cruise lines in 2002. The Holland America Line took one of its ships out of service for an intensive cleaning after a stomach virus spread, sickening hundreds of people on four separate cruises. Additionally, due to the outbreak and spread of Severe Acute Respiratory Syndrome (SARS) in Asia, several tour operators who specialized in trips to that area were forced to close. Others saw large drops in travel. To offset the decreasing desire to travel to foreign destinations, many tour operators began adding programs to national parks in the U.S. West, including Zion, Grand Canyon, Bryce, Yellowstone, and Grand Teton national parks. Family tours also began gaining in popularity. In any event, tour operators diversifying their products seemed to be an important trend, and single-destination operators suffered the most in the current volatile market.

Consolidation among tour operators was an important pre-September 11 trend that continued in 2002 and 2003. Leading tour operator Grand Expeditions consolidated the operations of two of its eight companies in Alabama. American Express, the leading travel services company, laid off 6,000 workers in 2001. Acquisitions in the industry grinded to a halt. Meanwhile, online companies continued to be the major source of competition to tour operators and travel agents. During March 2003, the number of electronic tickets sold jumped to 80 percent from 60 percent the previous March. Travel agents sales dropped 14 percent to \$5.9 billion in March 2003 from the same month in 2002. Online travel service leaders such as Travelocity, Expedia, and Orbitz threatened to take over from tour operators, with several industry analysts predicting that most tour operators will eventually

join with online companies to boost business. Expedia's acquisition of Classic Custom Vacations in 2002 seemed to hearken the beginning of such a trend. Others disagreed, asserting that while online travel purchases are rising, most are using the Internet for research rather than booking, and more complex travel arrangements are better left to the experts. Indeed, travel agents still sold the majority of leisure travel in 2003.

INDUSTRY LEADERS

Aside from large travel, passenger transportation, and entertainment concerns that also sell tour packages, most independent tour operators are small and privately held. Leading operators included The Mark Travel Corporation of Milwaukee, Wisconsin, which offered 200 destinations worldwide and had 1,800 employees worldwide. TMTC brands included Adventure Tours, AeroMexico Vacations, ATA Vacations, Blue Sky Tours, Funjet Vacations, MexSeaSun, MGM MIRAGE Vacations, Mountain Vacations, Showtime Tours, Southwest Airlines Vacations, TMTC International Services, Town and Country Tours, TransGlobal Vacations, Travel Charter, United Vacations, US Airways Vacations, and Vegas and More. Other operators included Certified Tours Inc. of Fort Lauderdale, Florida, with 800 employees; and Group Voyagers of Littleton, Colorado, with 500 employees.

The industry's Tour Operator Program (TOP), under the umbrella of the American Society of Travel Agents, has developed several safeguards to protect consumers from fraud or misrepresentation. Tour operators must have been in business for the past three years, must participate in one of four approved consumer protection plans, subscribe to a \$1 million errors and omissions policy naming travel agents as additional insurers, accept travel agent bookings and pay commissions, comply with federal and state travel regulations, respond to Better Business Bureaus and other complaints within 30 days, and subscribe to a prescribed code of ethics. The four protection plans with a brief description of their coverage are outlined below.

The U.S. Tour Operators Association requires that a \$1 million security deposit in the form of a bond, letter of credit, or certificate of deposit be used solely for reimbursing consumers who have lost tour payments or deposits because of the bankruptcy, insolvency, or cessation of operations of one of its active members. The funds are also available to consumers whose company failed to refund monies within 120 days of cancellation of a tour or package.

The National Tour Association's Consumer Protection Plan applies to qualifying deposits or prepayment for packaged travel placed by a travel agent on behalf of the consumer. Losses are limited to \$250,000 per bankrupt

member, with maximum liabilities limited to the total assets of the fund at the time.

The Travel Funds Protection Plan is an escrow account for individual deposits by agreement with tour operators and the bank. The deposit account is controlled by the First Bank of America, automatically debits airfare, and releases payment to the tour operator for land and lodging related cost five days after the tour is complete. None of the consumer's money is available to the tour operator in the interim.

The Federal Maritime Commission Program requires owners, operators, and charters of vessels with accommodations for 50 or more passengers embarking from U.S. ports (including territories and possessions) to demonstrate fiscal responsibility in the form of a surety bond, financial guaranty, self-insurance, or an escrow account to protect passengers against loss in the event of nonperformance of water transportation.

AMERICA AND THE WORLD

International visitors generated an estimated \$91 billion in U.S. travel revenues for 2001. Since the late 1980s, the United States has held a trade surplus in travel expenditures (i.e., international tourists spent more in the United States than U.S. travelers spent abroad). For the first time since 1985, total exports for merchandise goods dropped to \$719 billion in 2001. Service exports also sank in 2001, from \$292 billion in 2000 to \$279 billion in 2001. That marked the first decline ever registered in service exports for the United States for the years from 1960 to 2001. Florida, California, New York, Hawaii, and Nevada, were leading U.S. destinations for foreign travelers. Nationals of Canada, Mexico, Japan, the United Kingdom, and Germany made up more than half of the international visitors to the United States. The top five overseas markets to the United States in 2001 were the United Kingdom (4.1 million arrivals, down 13 percent); Japan (4.1 million, down 19 percent); Germany (1.3 million, down 28 percent); France (876,000, down 19 percent); and Korea (618,000, down 7 percent). The United Kingdom surpassed Japan that year to become the biggest overseas market for the United States.

International travel by residents of the United States has also grown steadily. In 1998, 23.1 million U.S. residents traveled overseas. Top international destinations for U.S. travelers in 1998 were the United Kingdom (16 percent); France (10 percent); Germany (8 percent); Italy (8 percent); and Jamaica (7 percent). Most travelers left the country from (in descending order) New York City; Washington, D.C.; Los Angeles; Miami; and Chicago.

SIC 4729

ARRANGEMENT OF PASSENGER TRANSPORTATION, NOT ELSEWHERE CLASSIFIED

This category covers establishments primarily engaged in arranging passenger transportation, not elsewhere classified, such as ticket offices, not operated by transportation companies, for railroads, buses, ships, and airlines.

NAICS CODE(S)

488999 (All Other Support Activities for Transportation)

561599 (All Other Travel Arrangement and Reservation Services)

According to the U.S. Census Bureau, the travel arrangement and reservation services as a whole, of which this industry is a part, generated \$27.7 billion in revenue in 2001. The independent establishments in this category engage in businesses ranging from the sale of cruise line tickets to the organization of vanpools or carpools. These establishments, however, are not affiliated with the passenger carriers or transportation companies to whose services they provide access. They only sell the tickets for passage via various means of transportation. Another sector of business activity for the industry involves the organization of car or van transportation for certain groups. Clients for these types of establishments may include individuals with disabilities who need transportation and are not able to use public or personal transportation; elderly individuals; or those for whom other forms of transportation are not available or feasible.

The industry is influenced by trends and demographics within the United States and foreign travel markets. By the mid-1990s, U.S. travelers took nearly 1.1 billion personal trips annually. This figure showed a marked decline after the terrorist attacks of September 11, 2001, but the travel industry as a whole was recovering as of 2003. In addition to U.S. travelers, the industry benefits from international tourism in America. Expanding international tourism—one of the largest sources of foreign dollars flowing into the U.S. economy—was expected to continue to benefit this industry.

The industry is predominantly serviced by either smaller, more specialized firms or larger companies engaged primarily in other lines of business. The 2001 industry leader was Las Vegas-based Lowestfare.com, with \$112 million in revenue and 200 employees. Second was Boston Coach Inc. of Everett, Massachusetts, with \$90 million in revenue and 1,200 employees.

E-commerce and the Internet helped this industry to expand in the 2000s. Priceline.com gives Internet-users the ability to bid on prices on non-committed travel accommodations for airline tickets, hotels, car rentals, and other travel-related services, free of charge. In 2002 Priceline acquired Lowestfare and added the company to its name-your-own-price travel services. Priceline posted 2003 sales of \$863.7 million with just 293 employees.

SIC 4731

ARRANGEMENT OF TRANSPORTATION OF FREIGHT AND CARGO

This category includes establishments primarily engaged in furnishing shipping information and acting as agents in arranging transportation for freight and cargo. Also included in this industry are freight forwarders, which undertake the transportation of goods from the shippers to receivers for a charge covering the entire transportation, and, in turn, make use of the services of other transportation establishments as instrumentalities in effecting delivery.

NAICS CODE(S)

541618 (Other Management Consulting Services)

488510 (Freight Transportation Arrangement)

INDUSTRY SNAPSHOT

Companies engaged in the freight transportation arrangement business offer numerous services, ranging from import advice to shrink-wrapping freight crates. These firms are transportation middlemen that support the movement of cargo through the services they offer. Although relationships between forwarders and carriers may develop, the companies involved in arranging freight transportation are not affiliated with any particular carrier.

Automation, consolidation of information, and a strong customer orientation were the hallmarks of the industry in the 2000s. Freight transportation arrangements were rendered by two major types of establishments: freight forwarders and customs brokers. Although many large companies offered both types of services, the businesses were distinct.

ORGANIZATION AND STRUCTURE

Freight Forwarders. Freight forwarders operate under many names and licensing requirements. All freight forwarders, however, are transportation intermediaries that arrange the movement of cargo according to customers' needs. Supplementary services such as shipment tracing, warehousing and storage, and the preparation of letters of credit also are offered by forwarders. Freight forwarders often are referred to as "transportation architects."

Through working with numerous air, road, rail, and water transportation companies, these establishments endeavor to find the least expensive and most efficient freight routings possible. Their services are popular with shippers because freight forwarders are not affiliated with one carrier and therefore are not biased or restricted. Also, forwarders are known for their expertise in the ever-changing regulations that affect cargo movements, such as hazardous goods handling, documentation, and insurance. The carriers, in turn, welcome the business from forwarders. In fact, smaller carriers, who cannot afford to maintain sales staffs, depend on the business tendered by forwarders.

All forwarders that are involved in ocean, truck, or rail forwarding must be licensed by either the Federal Maritime Commission (FMC) or the Interstate Commerce Commission (ICC). However, the majority of freight forwarders are licensed by the Federal Maritime Commission as ocean freight forwarders. Some ocean freight forwarders, known as non-vessel operating common carriers, operate as third party carriers and issue their own bill of lading. Since deregulation of the U.S. air transportation industry, air freight forwarders have not been subject to formal licensing requirements; however, most air cargo agents that are involved in international forwarding are endorsed by the International Air Transportation Authority (IATA).

Customs Brokers. Customs brokers provide services to importers and exporters and facilitate the clearance of shipments through customs. One particularly important service offered by a licensed customs broker is advice on regulations and laws pertaining to customs clearance and the power to argue on behalf of a client during the clearing process. In this regard, a customs broker is similar to a lawyer. Brokers may also provide advice and information on quotas for controlled commodities, trademark restrictions, and dumping duties, among other topics.

The customs brokerage industry is highly regulated by the U.S. Department of the Treasury. According to Section 641 of the Tariff Act, customs brokers must be individually and personally licensed by the Treasury, and brokerage firms must obtain a separate license. In order to be licensed, an individual must pass a comprehensive test, which often is passed by fewer than 40 percent of the test-takers.

Financial Structure. The rate structure for both freight forwarders and customs brokers is extremely competitive. These establishments operate on very thin profit margins. Freight forwarders generate revenue through transportation charges, fees for additional services such as warehousing or shrink-wrapping freight, and commissions from carriers. Customs brokers' revenue sources

include document preparation fees, charges for customs clearance, and charges for post clearance services.

BACKGROUND AND DEVELOPMENT

Pack horses were the primary means of transporting freight over land through the seventeenth century. In the mid-to-late eighteenth century, the first freight transportation establishments sprang into existence as services via pack horses. Ironically, supplying pack horse freight transportation frequently cost more than current airline freight rates. Even though traveling over land entailed a much shorter distance east to west than using water routes, the latter was much more practical and cost effective, so the majority of freight was moved over the Mississippi River, the Gulf of Mexico, and the Atlantic Ocean.

In the first half of the twentieth century, the United States mainly relied on truckers, oil pipelines, and inland-waterway carriers for freight and cargo transport. In the 40-year period from 1915 to 1955, railroad freight traffic decreased by 29 percent (as measured in ton-miles). Airlines accounted for less than 1 percent of freight transportation. Yet, the total freight traffic increased approximately 350 percent as a result of the boom in commerce and manufacturing.

Transportation middlemen, performing services similar to modern freight forwarders, operated in Europe in the 1600s. In the United States, these intermediaries arranged transportation by means of stagecoach, river boat, horse, and rail in the eighteenth and nineteenth centuries. However, the birth of the modern freight forwarding industry in the United States did not occur until after World War II, when the IATA allowed air freight forwarders and air cargo agents to solicit freight independently of the air carriers.

The deregulation of the trucking industry in 1980 contributed to a tremendous proliferation of forwarders. Deregulation resulted in a staggering increase in the number of registered truckers, causing confusion in the shipping community. Freight forwarders were needed to help shippers choose from the many newly established trucking companies. As a result, the number of forwarders swelled from 70 in 1980 to 6,000 in 1991. Many of these forwarders were small and barely solvent.

The growth of intermodal traffic during the 1980s and early 1990s also contributed to a rise in the number of forwarders. Intermodal transportation, or the movement of freight via two or more modes of transportation, grew faster than the economy in 1992. Freight forwarders were particularly well-received in the intermodal industry because of their willingness to take responsibility for the cargo as it moved over different modes of transportation. In this way, one bill of lading was issued for the ship-

ment. In 1992, between 400 and 500 forwarders handled approximately 35 percent of all rail intermodal traffic.

Although customs brokers operated as far back as Phoenician times, they have only operated since the early 1900s in the United States. The existence of customs brokers in the modern world can be attributed to myriad tariff laws that the United States and other countries enforce. In 1989, every shipment imported into the United States was subject to 500 pages of customs regulations and 14,000 tariff items. Moreover, importers must comply with regulations put forth by approximately 40 U.S. regulatory agencies, such as the Food and Drug Administration and the Federal Communications Commission.

The demand for freight forwarders has remained stable. However, forwarders and customs brokers have found it difficult to maintain their profit margins, which are estimated to range between 5 and 10 percent. Lower freight rates reduced the commissions forwarders earned from the carriers. Additionally, the costs of automation and improved customer service eroded profit margins. Overall, forwarders and customs brokers significantly improved their service level without a corresponding increase in their rates.

The safeness of cargo and the adequacy of inspections has been an issue in recent years. Freight is only subject to inspection when the shipper is unknown to the freight forwarder; shippers familiar to freight forwarders comprise 80 percent. However, most cargo shipments are not X-rayed or inspected as a matter of routine, and hazardous materials inspectors lack proper training.

In 1989 the Presidential Commission on Aviation Security issued the recommendation that airlines, rather than freight forwarders, be responsible for screening cargo. Until that time, the Federal Aviation Administration (FAA) stipulated that freight forwarders comply with a security program. However, that stipulation went largely unenforced because the Civil Aeronautics Board became defunct in 1984, and it was their responsibility to monitor freight forwarding firms. In 1992, the FAA suggested ways to make freight forwarders accountable for security. Then, in 1994, the FAA began requiring that airlines only conduct business with air forwarders who submit safety plans that adhere to a set of established federal guidelines.

The globalization of the market created challenges for forwarders and brokers. Logistics appeared to be the smallest hurdle, while increased competition from large integrated carriers—who took full responsibility for cargo and promised shippers door-to-door service over great distances—was more difficult for forwarders and brokers to overcome. To mitigate this threat, forwarders and brokers continued to emphasize their ability to pro-

vide the customized service not offered by mega-carriers. Freight transportation arrangers, however, established more overseas networks in response to this globalization.

International shipments—13 million per day in 1999—were growing at 18 percent annually. However, to avoid potential delays in the end-to-end transport of goods, companies were turning more and more to overnight air shipments. In 1999, 80 percent of overnight shipments took place in the United States, but the market for overseas shipments was growing twice as fast. By shipping overnight through companies such as DHL and Federal Express, manufacturers could eliminate or reduce their contracts with intermediaries such as freight forwarders and have the shipments go straight through to their destinations.

CURRENT CONDITIONS

In early 1999, the National Customs Brokers and Forwarders Association of America (NCBFAA), petitioned the FMC to declare forwarders as shippers, thereby making them eligible to join shippers' associations. Memberships in such associations would help to streamline the end-to-end transportation package, as well as to enhance their bargaining powers in securing competitive rates. In 2004, NCBFAA had more than 600 members.

Unlike airline passenger industries, airline freight transportation did not decline due to the September 11, 2001 terrorist attacks, but as of 2003 air cargo still accounted for only 4 percent of international traffic and 2 percent of domestic traffic. Yet, *The Journal of Commerce* reported that forwarders were responsible for the origination of 90 percent of international freight and 60 percent of domestic freight. With half of all international air cargo shipped on passenger planes, the industry can be at the mercy of global political conditions. In 2003, for example, passenger air travel—and cargo shipments by extension—to and from Asia were compromised by the outbreak of Severe Acute Respiratory Syndrome (SARS).

Nonetheless, freight forwarders with global skills and connections will continue to be in the greatest demand. Worldwide e-commerce sales were expected to reach \$3.2 trillion by 2003, according to Forrester Research Inc. International transportation logistics experts who are knowledgeable in import duties, shipping charges, taxes, and returns processing will be worth their weight in gold. The size of the company would not be a factor in resiliency, because smaller companies were often able to meet custom, individual needs more effectively than larger companies.

Intermodal shipments by rail, on the other hand, had increased dramatically by 2003, surpassing coal to become the number one source of revenue for the rail

transportation sector. The market was expected to continue to increase, as financial incentives were offered to investors in the infrastructure and the 4.3 cent fuel tax on railroads was to be eliminated.

In 2002, customs brokers were eagerly anticipating the new computer system, Automated Commercial Environment (ACE). The long delays in development and delivery were virtually erased after the terrorist attacks of September 11, 2001, and the system was pushed forward quickly as a strong line of defense. ACE was to replace the outdated Automated Commercial System (ACS) by consolidating all data for the trade. With the old ACS system, if customs brokers needed import figures, the figures had to be requested from other agencies. In addition, preliminary cargo information would be incorporated as part of the ACE system.

INDUSTRY LEADERS

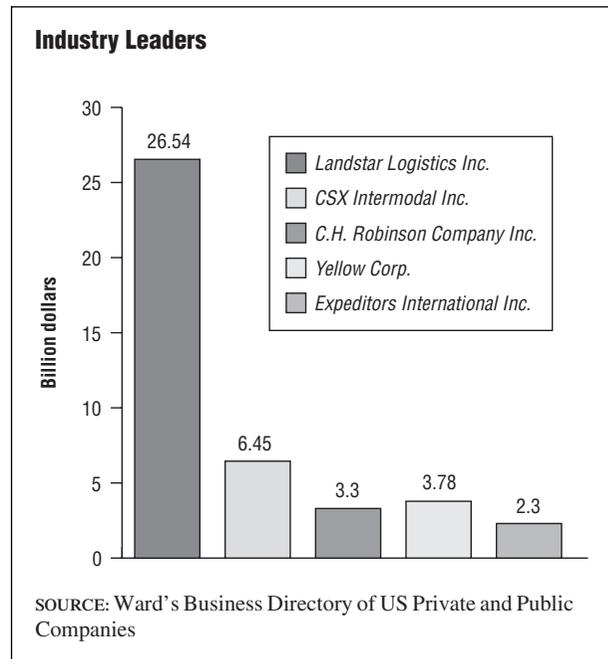

Landstar Logistics Inc. of Jacksonville, Florida, was the industry leader with \$26.5 billion in 2001 revenue on the strength of just 800 employees. In distant second place was CSX Intermodal Inc., also of Jacksonville, with \$6.5 billion in revenue and 10,000 employees. Third was C.H. Robinson Company Inc., of Eden Prairie, Minnesota, with \$3.3 billion in revenue and 3,800 employees. Rounding out the top five were Yellow Corp. of Overland Park, Kansas, with \$3.8 billion in revenue and 30,000 employees, and Seattle-based Expeditors International Inc., with \$2.3 billion in revenue and 8,000 employees.

AMERICA AND THE WORLD

The arrangement of freight transportation continued to develop into a global industry. Shippers found the international market to be particularly demanding because of high costs and complicated tariff schedules, rendering the services of freight forwarders and customs brokers especially valuable. Although international forwarding problems have arisen, such as an FMC sanction against Korean forwarders in 1992, most international forwarding has been negotiated without incident. Shippers in the Far East are unusually receptive to the use of transportation intermediaries.

The freight forwarding community itself attained an international perspective. An excellent example of its global character is United Shipping Associates, a band of 30 small companies from around the world that joined together in an effort to compete with the larger forwarding companies. Although the group was headquartered in Boulder, Colorado, approximately one-third of its members were non-U.S. companies. Through the association, the members developed an international network comparable to that of a large international firm.

Smaller carriers were forced to develop innovative marketing schemes to compete with large firms, while the

large firms focused on improving global networks and customer service. Although globalization, together with automation, appeared to favor the larger firms, smaller firms continued to court shippers with their strong service orientation.

RESEARCH AND TECHNOLOGY

The U.S. Customs Department's automation initiative forced forwarders and brokers to embrace technology. All customs brokers licensed after September 1988 were required to be proficient in the Automated Broker Interface (ABI), a component of the Automated Commercial System, which is the department's system for reducing paperwork. Although this system increased the efficiency and speed of customs transactions, some firms objected to its use on the grounds that it was costly and difficult to implement. Smaller firms claimed the costs were prohibitive. Nevertheless, the Customs Department continued to promote ABI and other automated systems designed to revolutionize the customs clearing process.

In addition to the Customs Department's officially sanctioned automation directive, customers themselves demanded up-to-the-minute information that could only be provided by computer. As more businesses adopted time-based inventory management systems, the demand for flexible and responsive distribution services, as well as accurate and timely information on shipments, increased. Forwarders were forced to install computers to meet these demands.

In an effort to provide this information, many companies replaced their own computer programs with Electronic Data Interchange (EDI), a mainframe system that

provided customers with online access to information on shipments. EDI allowed the freight transportation industry to meet many of the demands of shippers. One of EDI's more popular features is electronic document transmission, including electronic invoicing and remittance. Moreover, the system is well-equipped to meet the demands of just-in-time delivery by minimizing errors and reducing order cycles. The information available through EDI is, however, second hand. Freight forwarders and customs brokers must obtain the status of shipments from carriers before the information is available to customers. Many EDI users are trying to gain direct access to carrier systems in order to better serve their customers.

In addition, the new ACE system was a long-awaited technological advancement for the industry. According to *Country ViewsWire*, ACE was the "most profound change in business practice that the industry has been anticipating since the Customs Modernization Act passed in 1993."

performing services connected with the rental of railroad cars. Establishments, such as banks and insurance companies, which purchase and lease railroad cars as investments are classified based on their primary activity.

NAICS CODE(S)

532411 (Commercial Air, Rail, and Water Transportation Equipment Rental and Leasing)

488210 (Support Activities for Rail Transportation)

INDUSTRY SNAPSHOT

Railcar leasing companies are intermediaries in the transportation industry—they do not solicit or transport freight. Rather, they support the movement of products through the services they offer. Shippers and railroads are the primary customers of railcar leasing companies. Because the anticipated usage time of railcars is relatively short, shippers and railroads tend to lease equipment in order to preserve capital and avoid the prohibitive costs of purchasing and maintaining the specialized equipment.

Rail transportation suffered a decline into the 2000s, but was improving as of 2003. New markets for rail shipments, consolidations, and fewer companies in the industry were all contributing factors in the upswing. However, by the mid-2000s, new proposed safety regulations, such as the installation of reflector tape, was expected to cost the industry millions of dollars over a 10-year period.

ORGANIZATION AND STRUCTURE

Leasing companies offer two basic leasing options: capital leases and operating leases. A capital lease bestows all the economic benefits and risks of the leased property on the lessee. These contracts usually cannot be canceled and the lessee is responsible for the upkeep of the equipment. Capital leases usually amortize the value of the equipment over the life of the lease. An operating lease, also called a service lease, is written for less than the life of the equipment and the lessor handles all the maintenance and service. The operating lease usually can be canceled if the equipment becomes obsolete or unnecessary. Most railcar leasing companies are either operating or capital leasing companies, though some of the larger companies have separate operations offering both types of leases.

Railcar leasing companies are further categorized by their areas of specialization. The largest lessors have the resources to offer diversified fleets, although more often than not they are best known for their expertise in a few railcar markets. The average-sized leasing company is decidedly niche-oriented. There are many types of railcars including boxcars, tank cars, and covered hoppers. These cars are designed to carry specific cargos and have different maintenance needs. Leasing companies with

SIC 4741

RENTAL OF RAILROAD CARS

This category includes establishments primarily engaged in renting railroad cars, whether or not also performing services connected with the use thereof, or in

average-sized fleets tend to specialize in one or two specific railcar types.

Financial Structure. Several elements affect the earnings of railcar leasing companies: new car purchases; the number of cars leased (called the utilization rate and expressed as a percentage of the total fleet); and leasing rates. New cars are purchased during, or in anticipation of, strong economic periods and when tax laws favor investment. Utilization rates usually reflect the overall health of the economy. Though long-term leases sustain utilization rates during recessionary periods, it is difficult to maintain utilization rates above 90 percent during a weak economy. From 1920 through 1994, leasing rates were regulated by the Interstate Commerce Commission (ICC); freight car rates were subsequently determined by free-market forces.

BACKGROUND AND DEVELOPMENT

The railcar renting industry emerged in the late nineteenth century in response to a growing demand for specialty freight cars. By the late 1800s, rail tracks had stretched across the nation; shippers of perishables, such as fruit, and liquids, such as oil, were anxious to take advantage of distant yet rail-accessible markets. Without refrigerator cars or liquid carrying (tank) cars, these shippers were restricted to local markets. Since the railroads were unwilling to provide these cars because of their high cost and seasonal or otherwise uneven demand, the shippers built and maintained private car fleets themselves. The larger shippers rented their cars to smaller shippers who could not afford to maintain their own fleets.

Although the early private freight car companies often were regarded as negative additions to the railroad family, these companies were essential to the development of a number of American industries. For example, midwestern meat packers who were forced to ship only during the cold winter months could operate 12 months a year when refrigerated cars were introduced. Similarly, fruit growers in California could ship perishables all the way to the east coast in refrigerated cars.

Moreover, the mobility of the private railcar fleet suited the shorter seasons of other fruit growing regions. These fleets could follow harvests around the country; peach growers in Georgia, whose crops were harvested in June, had access to refrigerated cars until the end of their summer season, at which point the growers from Michigan could rent the cars for their fall harvest. Since the railroads operated in a specific region, these short demand cycles discouraged railroads from purchasing the refrigerated cars. The private railcar fleets were more flexible than individual railroad fleets.

Although the private car industry originally focused on the short-term needs of shippers and railroads, the

advent of the long-term lease enhanced the industry's strength and size. Throughout railroad history, leases were negotiated between shippers or railroads and banks; however, these leases were financing instruments. The notion of long-term leasing specialty cars was not introduced until 1902, when Max Epstein, the founder of the large lessor GATC, began leasing tank cars. The long-term lease has provided a buffer against economic slumps, allowing some companies to coast through difficult periods on the income from old leases.

The financial arrangements between private car companies and railroads were numerous and varied during the railroad boom. However, the Transportation Act of 1920 empowered the ICC to set maximum and minimum car-hiring rates. Since the availability of specialty cars was vital to the health of both the shippers and the growing industrial economy, particularly because oil was transported in specialty cars, every effort was made to eliminate discriminatory pricing even before the Transportation Act was passed. Nevertheless, despite the efforts of the ICC and other regulatory agencies, discriminatory practices did exist. In fact, Standard Oil Co., which controlled the Union Tank Car Co., was repeatedly accused of manipulating the supply of tank cars to its advantage.

One particularly unpopular practice, used often by Armour Car Lines, a refrigerated car specialist, was the exclusive contract. In this arrangement, the railroads agreed to use only one private car company for all of a particular type of traffic. The car line was obligated to provide enough equipment to handle all the shipments, and to bear the icing costs associated with refrigeration. These contracts were considered discriminatory and monopolistic.

As a result of these types of practices, the industry was highly regulated for more than 70 years. However, in 1992 the ICC voted to eliminate the rate prescription policy in an effort to promote competition and efficiency. Under this de prescription plan, freight cars ordered or put into service on or after January 1, 1991, became subject to free-market rates. Car hire rates for equipment ordered or in service prior to that date were frozen at 1990 levels. The ICC voted to implement the de prescription plan gradually, beginning on January 1, 1994, with complete free market rates prevailing after December 31, 2000. This legislation represented a significant break from traditional railroad-related policy.

More than anything, the costs associated with specialty cars continued to motivate shippers and railroads to lease. In fact, in the interest of streamlining, some shippers who owned small specialty fleets chose to enter sale-leaseback agreements. By selling their cars to an operating lessor and leasing them back under an operating lease, the shipper transferred all maintenance responsibil-

ity to the lessor and shed a business that was usually cumbersome to manage and unrelated to the principal revenue-generating operation. This type of arrangement was typical of the emphasis on cost cutting and efficiency.

The 1990s brought competition from banks searching for financing activities, and weakness in the airline industry created a financial lease vacuum. The relative health of the railroad industry provided an attractive alternative for bankers looking for finance leasing opportunities. This available financing, coupled with low rates made buying railcars an attractive alternative to leasing.

One novel way for securing business was for the lessors to lease railcars themselves. For example, industry leader GATX Corp. added 6,100 new railcars to its fleet between 1997 and 1999. However, it did not purchase the railcars; it leased them from investors who put up the purchase money in return for a stake in the rent when GATX re-leases them to customers.

The 1998 domestic market was slightly depressed because of international economic slumps, particularly in the steel and grains markets. Because of the uncertainty of the market's future, railcar lessors were offering longer-term leases at low rates to accommodate the shippers and keep their business.

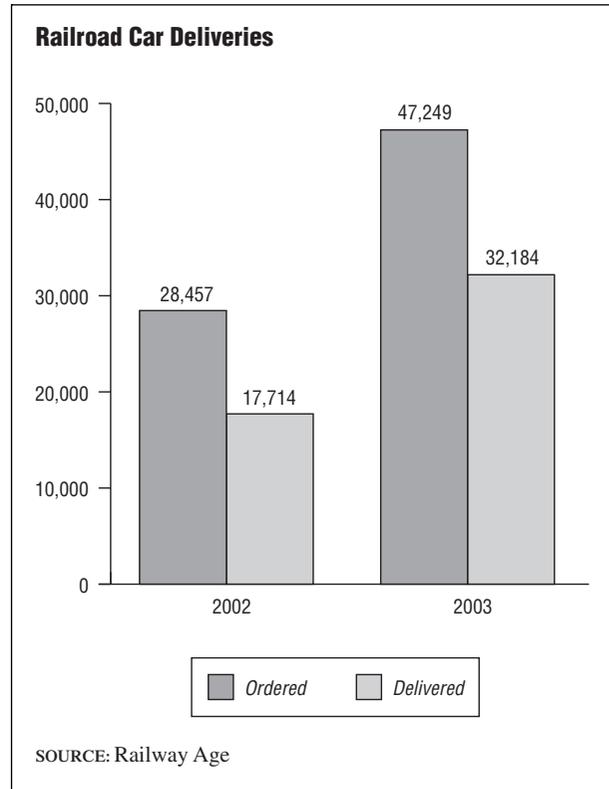

However, 1998 and 1999 were good years to become more competitive and upgrade the fleets. New construction of railcars was close to 70,000 units in 1998. Larger (more than 5000 cubic feet) grain cars and aluminum coal cars were two of the upgrades most in demand. By 1999, lessors owned more than 50 percent of the North American railcar fleet.

CURRENT CONDITIONS

The early 2000s saw a continued decline in freight car demand. By 2002, the industry saw its worst year in a decade and a half. That year, the industry had only 17,714 freight cars delivered, down from the 74,223 cars delivered just three years prior. Regardless, the American Railway Car Institute expected an upswing in the market, with close to 40,000 new freight cars forecast to be built in 2004. In 2003, some 32,184 cars were delivered.

By 2003, intermodal rail transportation had exceeded transportation of coal as the largest segment of the industry, increasing demand for double stacked trailer- and container-on-flat cars to accommodate the increased traffic.

In 2004, the Federal Railroad Administration proposed a new safety requirement that all freight cars have reflector tape installed. Although the railcar industry would have a decade to be in compliance if the requirement took effect, the price tag for tape installation was \$100 per car. In addition, because the tape must be

installed in temperatures exceeding 50 degrees Fahrenheit, rail cars in the northern states would have only portions of the year to complete the installation process.

As of 2004, GE Railcar was still in the process of cleaning up a former site for railcar repair and cleaning that had been closed since 1988. The Environmental Protection Agency was working with the company to clean up contaminated ground water.

INDUSTRY LEADERS

For the most part, the railcar leasing industry is a niche-oriented business comprising small to medium-sized firms that specialize in one or two specific types of railcars. However, a few giant and diversified leasing companies have dominated the industry.

By far the largest lessor is Chicago-based General Electric Railcar Services Corp., a wholly owned subsidiary of GE Capital. A merger with IteL in 1992 left GE Railcar with a fleet of 140,000 freight cars, the largest and most diversified fleet in the industry. The company also had the most extensive repair network with 11 railcar repair facilities, 9 mobile repair facilities, and 6 wheel shops in the United States and Canada. Despite the size and diversification of its fleet, GE is best known for its boxcars. The company's 2001 revenues were \$1.1 billion.

In second place was TTX Company, also of Chicago. It had \$586 million in 2001 revenues and 500 employees.

TTX specialized in intermodal cars. In third place was GATX Financial Corp. of Chicago, with \$500 million in revenues and 200 employees. GATX was the largest lessor in the specialized market of tank cars. Rounding out the top companies was fourth place Chicago Freight Care Leasing Company of Rosemont, Illinois, with \$14 million in revenue and fewer than 100 employees.

RESEARCH AND TECHNOLOGY

Since its inception, the railcar leasing industry has capitalized on the fact that specialized cars are expensive to purchase and maintain. These specialized cars were developed in response to the specific needs of shippers and railroads. As cargo became more specialized, so did the cars in which the cargo was transported, and technology and innovation continued to enhance the industry. Railcars evolved from refrigerated cars to ultra-modern designs such as GATC's Arcticar, a cryogenically cooled railcar for frozen food transport.

Oftentimes, a new railcar design created a niche market. This type of opportunity occurred when Greenbrier/Gunderson introduced the Autostack car in 1992. The development of this car addressed the surge in intermodal traffic. The railroads, and the transportation industry overall, saw an increase in intermodalism in the 1990s. Intermodal transportation is the use of two or more modes of transportation to move cargo. Greenbrier/Gunderson's Autostack car is a technologically advanced design used to transport automobiles via sea and land. The Autostack was such a successful innovation that a separate leasing company called Autostack began operations in 1992. This new car virtually created its own market.

The 1990s, however, added a twist to the specialization effort. The search for streamlining and cost savings encouraged the development of designs that made operations more efficient. General Electric Railcar, for example, redesigned the boxcars used by paper shippers to reduce cargo damage. These changes, such as watertight seals and the elimination of protrusions inside the boxcar that could damage the cargo, reflected the emphasis on quality and efficiency in the 1990s.

Advances in railcar designs and increased confidence in rail transportation continued to bolster the industry. Despite economic factors such as low interest rates that promote buying over leasing, railcar leasing companies were optimistic. Technology and specialization continued to be the critical factors contributing to the success of the railcar leasing industry. One area of design development at the end of the decade was in grain and plastic pellet cars, now ranging in size from 5,100 cubic feet to the giant 5,300-cubic-foot covered hopper. The 286-cubic-foot, rapid-discharge aluminum coal car also was considered a good investment.

SIC 4783

PACKING AND CRATING

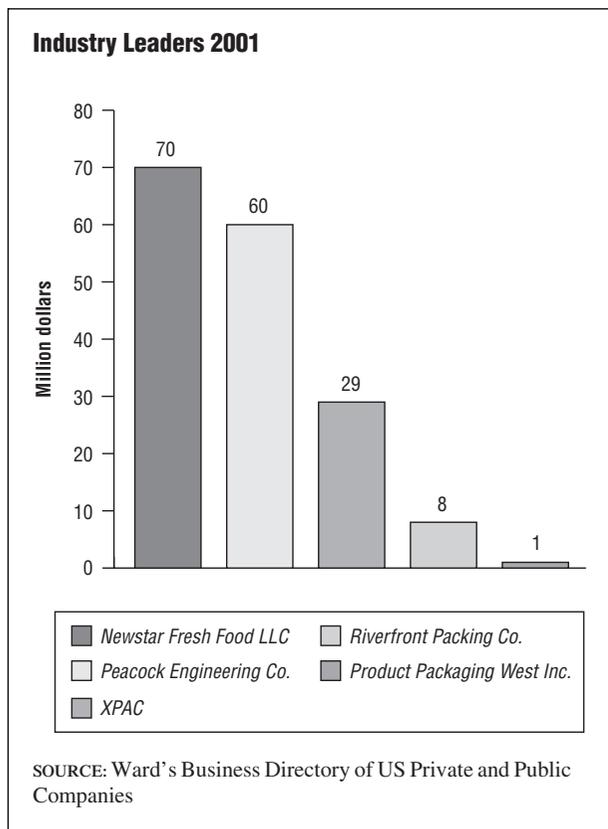

This industry includes establishments that derive more than 50 percent of their revenues from packing, crating, and otherwise preparing goods for shipping. Establishments primarily engaged in packaging and labeling merchandise for purposes other than shipping, such as retail packaging, are classified in **SIC 7389: Business Services, Not Elsewhere Classified**.

NAICS CODE(S)

488991 (Packing and Crating)

Approximately 1,205 firms operated 1,246 establishments in this industry in 2001, employing 13,187 workers with an annual payroll of \$344.6 million. Most of these were small or medium-sized establishments; only 31 firms employed more than 100 workers.

Most large manufacturers in the United States pack or crate their own goods for shipment rather than relying on the specialty firms in this industry; this industry's services also are offered by many firms primarily engaged in other activities, such as shipping of freight. Firms in the industry typically offer a line of shipping-related services, such as supplying packing materials, physically packaging goods to the sender's specification, and transporting goods to and from the packaging plant. Some businesses also arrange for the final shipment of goods, either through third-party services or through their own shipping networks, and may offer clients insurance policies on goods shipped and computer tracking of goods. Firms specializing in the shipping aspects, however, are not included in this industry.

Characteristic of the 1990s was the rise in small business start-ups. With them came the reality that many otherwise-successful entrepreneurs could not afford the packaging and crating of their own goods. A niche market was born: the “co-packing” industry. The term was first used in France in 1998, but quickly spread to the United States. Its concept was simple: by out-sourcing the packing end of the business, many small companies could now direct their resources to sales and marketing. By 1999, co-packing was common jargon in smaller businesses, and had been employed in several larger ones, including Land O’ Lakes Dairy Foods and Quaker Oats.

In the 2000s, the industry was looking to replace polystyrene packing peanuts with something cost-effective and environmentally friendly. Despite their problems, peanuts were inexpensive, effective at protecting against damage, and simple to use. Therefore, companies continue to use peanuts more than any other type of packaging material—50 million pounds in 2002. Inflatable plastic bags and paper fill were looking to fill the need, but each had its drawbacks. For example, both inflatables and Kraft paper required special equipment, making the initial cash outlay cost-prohibitive for many companies.

The industry leader in 2001 was Newstar Fresh Food LLC of Salinas, California, with \$70 million in revenue and 300 employees. Second was Peacock Engineering Co. of Itasca, Illinois, with \$60 million in revenue and

300 employees. In third place was Milan, Illinois-based XPAC, with \$29 million in revenue and 100 employees. Other notable companies were Riverfront Packing Co. LLC of Vero Beach, Florida, and Product Packaging West Inc., of North Hollywood, California.

SIC 4785

FIXED FACILITIES AND INSPECTION AND WEIGHING SERVICES FOR MOTOR VEHICLE TRANSPORTATION

This category covers establishments primarily engaged in the inspection and weighing of goods in connection with transportation or in the operation of fixed facilities for motor vehicle transportation, such as toll roads, highway bridges, and other fixed facilities, except terminals. Included in this industry category are companies that check boat cargo before it is transported on trucks; operate highway bridges, tunnels, and toll bridges; operate truck weighing stations; and conduct various inspections. It encompasses firms that serve private facilities as well as companies that contract to perform services for state and federal regulatory agencies.

NAICS CODE(S)

488390 (Other Support Activities for Water Transportation)

488490 (Other Support Activities for Road Transportation)

Because it is dominated by private, localized firms, statistical data for this industry is sparse. Served by the International Bridge, Tunnel, and Turnpike Association (IBTTA), the industry is largely driven by the need to monitor, for both trade and regulatory purposes, the multi-billion dollar U.S. trucking industry. The *U.S. Industry and Trade Outlook* reported that there were 450,000 motor carriers operating from state to state, in

addition to the thousands of in-state only carriers. Large trucks travel 124 billion miles each year. Truckers pay more than one-third of highway tolls. With 3.9 million miles of roads, including 45,000 miles of interstate highways in the 1990s, numerous enterprises emerged to operate infrastructure, such as toll bridges, and to help enforce a glut of government restrictions. As of 1999, there were 4,715 miles of rural/urban toll roads and 4,533 miles of the national highway system under toll.

At the federal level, the U.S. Department of Transportation (DOT) and the Interstate Commerce Commission (ICC) are the primary sources of industry regulations, and often employ contractors to enforce their codes. Among other duties, the DOT is responsible for maintaining the highway system and developing and enforcing safety measures. The DOT's Motor Carrier Safety Assistance Program (MC-SAP) of 1982, for example, conducts annual safety inspections of many of the nation's 250,000 large trucks. The ICC regulates carrier rates and services and enforces weight and size restrictions on trucks that use interstate highways. During the latter part of the 1990s, several states were implementing the Commercial Vehicle Information Systems and Networks (CVISN), an automated electronic system for screening trucks in lieu of having them stop for weight and safety inspections. The nationally-standardized system is expected to decrease congestion at weigh stations and more efficiently target high-risk operators.

Commercial trucking has been an important mode of commercial transportation in the United States since the 1930s. The ICC, which was formed in 1887, began regulating the industry in 1935 under the Motor Carrier Act. It was not until the 1950s and 1960s, however, that a large inspection and weighing industry emerged to monitor the trucking industry, which was booming. When the DOT was established in 1966, a profusion of new rules were developed that created a need for commercial motor vehicle inspection and weighing services.

Although the use of motor vehicles for the transport of commercial goods increased significantly during the 1980s and early 1990s, the trend since the early 1980s had been toward federal deregulation. The Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 mandated uniform state standards that substantially reduced the need for many types of interstate inspection services by the late 1990s. On the other hand, new opportunities for government contractors will likely arise from expanding DOT commercial transport safety programs.

Companies that operate toll roads, bridges, and tunnels benefited from growing trucking activity throughout the 1990s. Although railroad and plane commercial shipping industries were becoming more competitive, the trucking industry was benefiting from reduced regulations and the integration of new information systems that

were boosting efficiency. Advanced satellite systems, for example, had been launched early in the decade to track and coordinate truck transportation networks.

The Transportation Equity Act for the 21st Century (TEA-21) expired in 2003, and alternative funding sources for highway projects had not been identified into the following year. But by 2004, the Federal Highway Administration (FHWA) expected to begin phasing out the gas tax and using tolls as a principle means of road financing. Toll projects were viewed as superior to many other alternatives, because they are generally cost effective both in terms of construction and user cost, in addition to relatively fast installation periods. Technologies such as electronic toll collection (EZ Pass) were praised as a way for not disturbing traffic flow.

Commercial truckers were expected to boost their 80 percent share of the U.S. freight industry. However, job growth in the weighing and inspection industry was expected to diminish because of labor-saving automation, such as bar-code scanners and vehicle tracking information systems. Automation will reduce toll road and bridge operation jobs as well. In 1999, there were 118 toll facilities that operated with electronic technology, up from 49 in 1995. During the 2000s, the trend was for technology to continue to take over many aspects of the weigh station industry. By 2003, states such as Louisiana were installing weigh-in-motion devices that measured truck height, weight, and axles while the truck was in motion, eliminating the need for drivers to stop at weigh stations.

Other technologies expected to be implemented on a wide scale early in the new millennium include infrared inspections, which use infrared "guns" aimed at passing trucks to check for faulty brakes, exhaust leaks, over-inflated tires, and other hazardous conditions. Collision-warning devices—radar-activated flashing lights which signal when a truck is advancing too quickly on a car or when a truck is about to veer into a car hidden in its blind spot—also are expected to enhance the safety of transportation on the nation's roads.

SIC 4789

TRANSPORTATION SERVICES, NOT ELSEWHERE CLASSIFIED

This category covers establishments primarily engaged in furnishing transportation or services incidental to transportation that are not classified elsewhere. Included in this industry are stockyards that do not buy, sell, or auction livestock; and pipeline terminals.

NAICS CODE(S)

488999 (All Other Activities for Transportation)
487110 (Scenic and Sightseeing Transportation, Land)
488210 (Support Activities for Rail Transportation)

Fril Car Inc. of Brewton, Alabama, was the industry leader in 2001, with \$957 million in revenue. Suggs Transportation Services Inc. of Clinton, Maryland, was in second place with \$238 million in revenue. Other notable companies were Rescar Inc. of Downers Grove, Illinois, with \$133 million in revenue, and Hulcher Services Inc. of Denton, Texas, with \$132 million in revenue.

This composite industry was worth less than \$1 billion in 1997. Its 100 establishments employed less than 2,000 people in the United States.

The U.S. Department of Agriculture generally controls the rail stockyards industry. The USDA administers the Packers and Stockyards Act of 1921. The Act contains various financial protections for the industry, and serves as the policing law to control unfair, deceptive, or anti-competitive practices. The 1999 budget for the Packers and Stockyards Administration Association was \$13.5 million, with 178 employees.

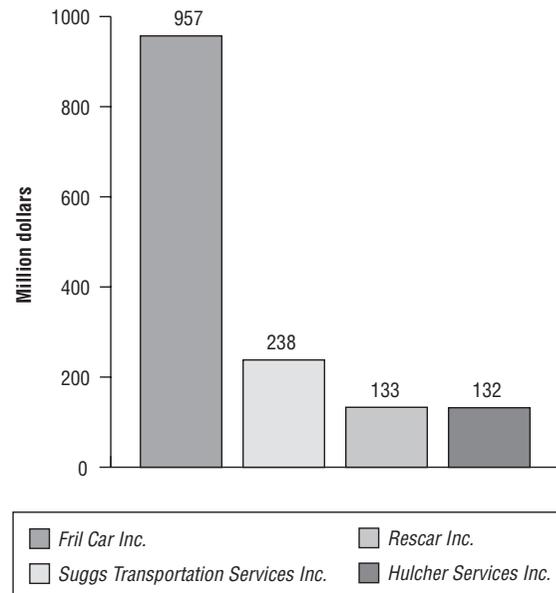

One of the largest pipeline terminals is the Alyeska Valdez Marine Terminal, which services the Trans Alaska Pipeline system. Alyeska, which delivers 20 percent of the nation's domestic crude oil supply, loads an average of 42 tankers per month at the Valdez terminal.

RADIOTELEPHONE COMMUNICATIONS

Establishments included in this category are primarily engaged in providing two-way radiotelephone communications services, such as cellular telephone services. This industry also includes establishments primarily engaged in providing telephone paging and beeper services and those engaged in leasing telephone lines or other methods of telephone transmission, such as optical fiber lines and microwave or satellite facilities, and reselling the use of such methods to others. Establishments primarily engaged in furnishing telephone answering services are classified in **SIC 7389: Business Services, Not Elsewhere Classified**.

NAICS CODE(S)

513321 (Paging)
513322 (Cellular and Other Wireless Telecommunications)
513330 (Telecommunications Resellers)

INDUSTRY SNAPSHOT

The first wireless telecommunication services, apart from radio, were developed in the 1960s, and the first experimental cellular systems were installed in 1979. Even by 1985, only a few hundred thousand Americans

were using cellular telephones. Rapid growth during the 1980s and 1990s, however, catapulted the wireless telecommunication industry to prominence.

The wireless telecommunication services industry in the early 2000s was comprised primarily of cellular telephones, paging services, and personal communications service (PCS) networks. These various services allow customers with mobile telephones to send (and receive) calls to (and from) people with landline phones, pagers, or hand-held wireless phones. As digital wireless technology became more pervasive (accounting for about 89 percent of subscribers in 2002), data of various types including short messages, news reports, and Internet content were also transmitted over digital wireless systems. Cellular service subscribers typically pay a monthly subscription fee plus an additional per-minute usage charge. According to the Cellular Telecommunications and Internet Association (CTIA), in 2002 there were an estimated 140.8 million mobile wireless subscribers, generating about \$76.5 billion per year.

Like the rest of the telecommunications industry, the wireless industry was marked by significant turbulence as the 1990s drew to a close. The sweeping changes in the regulatory landscape brought about by the Telecommunications Reform Act of 1996, and the emergence of PCS systems as viable competition to cellular networks, promised lower costs and improved services to consumers. It also increased the stakes tremendously for industry players. A boom in infrastructure investments during the late 1990s led to overcapacity and high debt for these firms. In addition, as the market for wireless services became increasingly saturated, competition for new subscribers became fierce.

ORGANIZATION AND STRUCTURE

By the end of the 1990s the general consolidation of the telecommunications industry had blurred the distinction between the traditional landline telephone companies and wireless. Companies that aspired to be dominant players in the industry moved to establish themselves in all types of communication delivery. Moreover, success in the fiercely competitive mobile market was seen to hinge to a great extent on national coverage. However, the huge capital investment required to build the networks necessary to be a big winner created the need for mergers, joint ventures, and other forms of strategic alliances.

How a Cellular System Functions. A cellular telephone system consists of three main components: the cellular site or station, the mobile telephone switching office (MTSO), and the mobile telephone unit or pager. The mobile telephone unit is simply a low-powered portable transceiver. A pager is a wireless receiving device.

The term “cellular” refers to the network of cells or transceivers that support a company’s service area. Each

service area is broken down into several communication cells that have a radius of 2 to 20 miles. Each cell is equipped with a low-power transceiver and antenna, known as a base station, which sends and receives wireless telephone transmissions. Ideally, the cells should be arranged so that they efficiently canvass an entire service area, but cells often overlap or miss certain areas.

When a mobile phone user makes a telephone call, the transceiver in the cell receives the call and immediately routes it to the regional MTSO that oversees all the cells in its service area. The MTSO, which acts as a central nervous system, is connected to each cell by a landline or a microwave link. The MTSO analyzes the telephone call to determine whether the caller is a “roamer” (someone operating outside of his or her home service area) or a subscriber. Once it determines how to bill the call, the MTSO connects the call to a landline, or “trunk.” Depending on the number dialed, the call is routed to a long-distance or local carrier. Among other tasks, the MTSO monitors the caller’s signal strength within other cells. If the caller passes from one cell to another, the MTSO will “hand-off” the call to the next cell without interruption.

When a caller on a landline telephone calls a cellular phone user, the call is received by the MTSO, which sends an individualized “page” message to its cell sites to locate the mobile phone. The cellular phone responds to the page by sending a signal to the cell, after which the MTSO causes the mobile phone to ring. If the user elects to answer the call, the MTSO establishes contact between the communicators. The entire process requires only milliseconds. The MTSO works similarly for cellular callers that are contacting other mobile phones and for callers that are trying to reach a person’s paging device.

Advantages. The advantage of using a cellular system is “frequency reuse.” Because the Federal Communications Commission (FCC) grants a limited number of channels, or frequencies, to the cellular telephone service industry, it would be impossible to have only one or a few transceivers in each service area. Multiple cells allow the same channel, or frequency, to be used by many callers in the same service area. Furthermore, each cell can be subdivided into sectors, usually three, using directional antennas. As a result, a single service area can have thousands of callers communicating on several hundred designated channels.

PCS. PCS systems operate similarly to cellular services. However, PCS systems use comparatively low-powered phones that operate at a higher radio frequency. As a result, the systems use smaller cells that allow a greater concentration of users. In addition, PCS systems utilize digital technology that transmits a caller’s voice as a numerical code. Most standard cellular systems, in con-

trast, used analog technology that mimicked sound waves. Many systems were being converted to digital in the second half of the 1990s, and by the early 2000s nearly 89 percent of all wireless subscriptions were digital. Digital transmission delivers greater sound quality and makes more efficient use of limited frequencies.

The net result of PCS differences is a cellular network with as much as 20 times the capacity of a standard cellular service area. This increased capacity allows PCS to spread costs over a potentially larger subscriber base. In addition, PCS phones require less power, weigh less, and are cheaper to manufacture. PCS has the potential to allow a cellular user to utilize the same phone number for his or her landline and wireless communication devices, so that other callers would not have to know his or her location before calling.

Besides increasing the efficiency and sound quality of wireless telecommunication systems, advancing digital technology also promised to open an entirely new market to the cellular service industry—data transmission. Many analysts expect data transmissions to rise rapidly in the next decade, as users of new electronic devices begin transferring digitized data over telephone lines and wireless systems. Although existing cellular systems allow users to transmit data over analog systems, such transmissions are typically troublesome and expensive. Signal fading and interference often hamper the process, though new Cellular Digital Packet Data (CDPD) standards and digital packet-switched networks offer potential solutions to analog transmission problems.

Regulation. Under regulations enacted in 1981, two operating licenses were granted for each Cellular Graphic Service Area (CSGA): One license was given to the local landline carrier or phone company, and the other was awarded to a wireless carrier through a lottery. Each carrier received half of the available frequencies. In addition, each of 428 designated Rural Service Areas (RSAs) was served by one or two carriers. In September of 1993, the FCC initiated a set of rules aimed at governing PCS. The commission allocated significant bandwidth for PCS licenses and divided the United States into 51 major trading areas (MTAs). The MTAs contained 492 basic trading areas (BTAs), each of which corresponds to a metropolitan area. The FCC auctioned off the licenses for these markets in six blocks between December 1994 and January 1997. Some blocks, called the “entrepreneur blocks,” were set aside for bidding by businesses with gross revenues of less than \$125 million and total assets under \$500 million. Provisions were also made for companies owned by women and minorities.

The Telecommunications Act of 1996, signed into law February 8, 1996, swept away 62 years of regulation of the telecommunications industry. The legislation was

intended to promote competition across the industry, resulting in the development of new technology, the creation of new businesses and new jobs, and ultimately lower prices. Local telephone companies (telcos), long-distance providers, wireless companies, and cable television operators would be free to offer any and all telecommunications services. Since all the major landline entities were already cellular providers, this did not have an immediate effect on the wireless industry, but the long-range goal of the major industry players was to provide “one stop shopping” for consumer’s telecommunications needs, leading to a general consolidation of the industry.

BACKGROUND AND DEVELOPMENT

The Detroit Police Department used the first mobile radio system on April 7, 1928. The spectrum for radio transmission was broadened seven years later to include FM, or frequency modulation, signals. FM transmission technology paved the way for the mobile radio systems, which were widely used during World War II. After the war, American Telephone and Telegraph (AT&T)—which at the time held a virtual monopoly over phone service in America—introduced the Improved Mobile Telephone Service (IMTS), which made possible extremely limited cellular communication systems. The service was so restrictive that even by 1970, the Bell system in New York City could simultaneously sustain a total of only 12 mobile-phone conversations. Bell Laboratories developed the cellular telecommunication concept during the 1960s. In the early 1970s, using a relatively small amount of bandwidth allocated by the FCC for mobile telephone communication, several crude wireless phone services began. A total of 44 channels were available. Only a few channels were allocated to each major metropolitan area because of the risk of interference from high-powered mobile transmitters.

As technology improved during the 1970s, the federal government began to reconsider cellular potential. Around 1980, under the guidance of AT&T, the first practical framework for mobile service in the United States, advanced mobile phone service (AMPS), was born. The FCC allocated space for AMPS in the Washington, D.C., test market, but it was not until 1983, in the Chicago and Baltimore markets, that companies provided relatively inexpensive, efficient, consumer cellular service in the United States. In 1982, the FCC allocated the equivalent of 622 additional channels to the cellular mobile phone industry, resulting in a flurry of activity and capital investment in high-tech cellular networks. An additional 166 channels were assigned in 1986, bringing the total to 832. In addition, frequency reuse strategies exponentially expanded the capacity of pre-1980s systems.

Foreseeing a bright cellular future, phone companies and well-heeled private start-ups began investing heavily in the development of cellular networks. Besides the local telephone operating companies, major players included communication giants such as AT&T and McCaw Cellular Communications. Industry investment grew from \$354 million in 1984 to \$1.43 billion in 1986. A still insignificant subscriber base resulted in a capital investment per subscriber of nearly \$4,000 in 1984 and about \$2,300 in 1986.

As cellular systems gained public acceptance and service and phone prices began to fall during the mid-1980s, the industry started to gain momentum. Cellular service revenues climbed from around \$1 billion per year in 1985 and 1986 to about \$4 billion in 1989. During the same period, the aggregate U.S. subscriber base rocketed from several hundred thousand to nearly 4 million. Encouraged by booming sales, cellular service providers continued to sacrifice short-term profits as they fueled massive capital investment programs. As cumulative industry outlays ballooned from \$1.74 billion in 1987 to a staggering \$5.21 billion by 1990, increased usage reduced the total investment per subscriber to \$1,189.

Lower prices and new high-tech phones and accessories contributed to increased cellular service during the early 1990s, despite a lingering U.S. and global recession. The number of cellular users soared to about 10 million in 1992, reflecting an annual growth rate of about 20 percent. Only a few years earlier, analysts had predicted that the industry would achieve the 10 million mark around the turn of the century. Likewise, industry revenues almost doubled 1989 levels when they rose to more than \$7 billion. The industry passed a major milestone in June of 1992, when service was established in the last of the 305 MSAs, paving the way for a seamless national cellular network.

The most significant trend in the wireless communications industry in the later 1990s was the shift toward PCS. Some industry participants viewed it as an expansion of local telephone networks, whereas others saw it as a way to bypass landline communications. Many companies saw PCS as an extension of the existing cellular network, and others thought of it as a replacement. The FCC envisioned PCS as including a wide variety of services including mobile telephone, paging, cordless telephones, and other related wireless communication technologies. The FCC granted some experimental licenses in 1990, and the first commercially available network began in the Washington-Baltimore area in late 1995.

The first PCS licenses, for the 51 major trading areas (MTAs) in the United States, were auctioned off between December 1994 and March 1995. Eighteen bidders won 99 licenses, earning \$7.7 billion for the U.S. Treasury. The number of licenses purchased for each market put

tremendous competitive pressure on everyone. Financial pressure was also great because of the cost of building the networks along with the cost of the licenses. Moreover, many communities opposed the construction of the many transmitting towers necessary for the low-power networks. The FCC, however, along with most industry observers, expected the investment to pay off bountifully within 10 years.

In the face of PCS expansion, cellular companies tended to reduce investment in new cells and turned to other strategies to head off new competition. Some directed funds into stronger marketing efforts while others, like AT&T Wireless, switched more networks over to digital systems, advertising the first nationwide digital wireless service.

As the 1990s drew to a close, the wireless communications industry continued its explosive growth. Between June 1998 and June 1999, the industry experienced its greatest one-year increase in subscribers—25.5 percent, to more than 76 million, according to the CTIA. Total annualized revenue for service in June 1999 was estimated at \$37 billion, an increase of 26 percent. Capital investment also surged 33.1 percent, reaching a total cumulative investment of more than \$66 billion. The first half of 1999 exhibited a new phenomenon in this industry—the average monthly local wireless phone bill increased, by a little less than one dollar. At \$40.24, it was still much less than half the figure in 1987, when it was \$98.83. A report by J.D. Powers and Associates said that in 1998 wireless customers used the phones an average of 199 minutes per month, whereas usage in the first 10 months of 1999 was up to 242 minutes. The growth in usage was expected to continue.

Service continued to improve as well, as more systems were converted to digital transmission and as carriers extended geographic reach. AT&T Wireless announced a new rate plan called Digital One that eliminated roaming and long distance charges. Other companies that served wide geographic areas followed with similar plans.

Satellite-Based PCS. Piggybacking off the PCS concept were several proposals for massive global satellite communication networks that would vastly expand the reach of terrestrial PCS. Ideally, the systems would allow phone users to communicate with anyone in the world through their mobile phone, while bypassing long-distance landline carriers. Although the service would not initially compete with land-based cellular services because of price differences, economies of scale and decreasing fees could eventually allow satellite systems to dominate global telecommunications.

The first such network to go into service was the Motorola-inspired Iridium, Inc. Iridium established a

global satellite network that allowed customers to call or be called anywhere on earth, any time, using hand-held wireless telephones. According to the plan, 66 low-orbit satellites were interconnected with earth stations and public telephone networks. Iridium, with the financial backing of investors on almost every continent, launched its first satellite in 1996 and began offering commercial service in 1998. Marketing efforts were not as successful as expected, however, and in August 1999 the company filed for bankruptcy protection. ICO Global Communications, a similar satellite venture, followed suit later that month. A third enterprise, called Globalstar, began rolling out its service to selected customers and partners around the world in October 1999.

High-tech entrepreneurs Craig O. McCaw and Bill Gates proposed the most ambitious satellite plan in 1994. McCaw sold his McCaw Cellular Communications to AT&T Wireless in 1994 for \$11.5 billion, and subsequently launched Teledesic Corporation. Gates, the founder of Microsoft, invested \$4 billion of his own money in the venture largely on the basis of McCaw's track record in growing McCaw Cellular. Dismissed by critics, the Gates/McCaw venture called for a \$9 billion network of 840 low-orbiting satellites. McCaw's vision differed from others in that, instead of creating a globe-girdling telephone network, his aim was to span the world with a satellite-based Internet. Teledesic was scheduled to begin offering service by 2001. In the meantime, McCaw and others involved with Teledesic announced plans to invest in ICO Global, thus hoping to salvage that effort and protect the satellite communication vision.

One technological issue facing the industry during the late 1990s was competing standards for digital transmission. Some major carriers rolled out systems using code division multiple access (CDMA) technology, while others were based on time division multiple access (TDMA). The European industry adopted Global System for Mobile (GSM). Various industry groups and regulatory bodies such as the International Telecommunication Union (ITU) were working on the thorny issue of the next generation of wireless technology, loosely referred to as 3G. ITU-200 is a standard that specifies a minimum set of capabilities for 3G services, including high-bandwidth communication anywhere in the world, global roaming, and a single system for residential, office, and mobile use. The primary decision yet to be made was the choice of a CDMA or TDMA air interface. At the end of the 1990s it seemed unlikely that a single technology would be agreed upon, but standards were set that would most likely ensure compatibility in user equipment.

CURRENT CONDITIONS

In addition to a weak economic climate, by the early 2000s wireless telecommunication providers were trou-

bled by the large network infrastructure investments they made during the boom years of the late 1990s. Saddled with debt, industry players operated in a climate characterized by cutthroat competition for a dwindling supply of new subscribers. With the majority of corporate, middle- and high-income users already subscribing to wireless services, providers sought to grow their subscription bases by going after younger consumers, as well as those with lower income levels. However, the latter strategy did not come without consequences. For example, Sprint's attempt to profit from this demographic led to additional debt from unpaid bills, as well as high cancellation rates.

Figures from the CTIA placed wireless subscriber revenues at \$76.5 billion in 2002, up from \$65.3 billion in 2001 and \$52.5 billion in 2000. Although this was a positive sign, the bottom lines for industry players were not faring as well. For example, in its assessment of the overall telecommunications services industry—which also includes wire-line providers—Value Line reported that while industry revenues increased, net profits fell drastically. Revenues rose from \$289 billion in 2000 to \$291.2 billion in 2001. However, net profits fell from \$24.5 billion to \$10.2 billion during the same time frame. Value Line estimated that revenues would fall to \$285.5 billion in 2002 and reach \$288.5 billion in 2003. During the same period, net profits were expected to fall to \$8.6 billion and then reach \$10 billion.

By the early 2000s, new products and services that complemented existing wireless and PCS systems were emerging. In fact, as early as late 1999 hand-held wireless devices with the capability to send and receive e-mail, browse the Internet, and even trade in the stock market were available for purchase. Although most wireless phones were Internet-ready by the early 2000s, U.S. consumers as a whole were slow to adopt wireless Internet services. However, industry analysts were hopeful that so-called “third-generation” (3G) data services, which companies were expected to begin adopting by 2003, would inject new life into the wireless telecommunications industry. 3G will serve to converge wireless networks that carry voice, video, and data and improve quality in the process.

According to the Federal Communications Commission, “3G systems will provide access, by means of one or more radio links, to a wide range of telecommunication services supported by the fixed telecommunication networks and to other services that are specific to mobile users. A range of mobile terminal types will be encompassed, linking to terrestrial and/or satellite-based networks, and the terminals may be designed for mobile or fixed use. Key features of 3G systems are a high degree of commonality of design worldwide, compatibility of services, use of small pocket terminals with worldwide

roaming capability, Internet and other multimedia applications, and a wide range of services and terminals.”

In August of 2002 Sprint rolled out PCS Vision, the first nationwide 3G service. In addition to traditional voice communications, subscribers were able to take and send digital photos with their phones, communicate via e-mail, access the World Wide Web, and more. According to the company, PCS Vision delivered graphics that rivaled desktop PCs in terms of quality. Other leading wireless service providers also have provided their customers with wireless data transmission capabilities. However, Sprint was the first to do so on a national basis.

INDUSTRY LEADERS

According to Standard & Poor's, during the early 2000s Verizon Wireless was the leading wireless service provider, with more than 30 million subscribers and a market share better than 26 percent. Cingular was second largest, with 22 million subscribers and more than 19 percent market share. Close behind with 20 million subscribers and approximately 17 percent of the market was AT&T Wireless, followed by Sprint PCS, which claimed more than 14 million subscribers and nearly 13 percent of the market. In order of market share, the industry's other leading firms included Nextel, Voice Stream, Alltel, and U.S. Cellular.

Bedminster, New Jersey-based Verizon Wireless, Inc., was the undisputed industry leader in 2002, with sales of \$19.3 billion and 40,000 employees. The company is a subsidiary of Verizon Communications, Inc., and United Kingdom-based Vodafone Group PLC. It originated in 2000, when Vodafone and Bell Atlantic combined their wireless interests in the United States. In addition to its headquarters in New Jersey, Verizon Wireless has regional U.S. Headquarters in Morristown, New Jersey; Schaumburg, Illinois; Alpharetta, Georgia; and West Irvine, California. The company claims to have developed the “first national high-speed data network,” and to have offered the “first downloadable applications over the air onto phones.” In 2003, Verizon Wireless offered customers a boggling array of service plans, including eight voice packages, six Internet and data service plans, and a variety of value-added services.

SIC 4813

TELEPHONE COMMUNICATIONS, EXCEPT RADIOTELEPHONE

This category covers establishments primarily engaged in furnishing telephone voice and data communications, except radiotelephone and telephone answering services. This industry also includes establishments primarily engaged in leasing telephone lines or other methods of telephone transmission, such as optical fiber lines and microwave or satellite facilities, and reselling the use of such methods to others. Establishments primarily engaged in furnishing radiotelephone communications are classified in **SIC 4812: Radiotelephone Communications**, and those furnishing telephone answering services are classified in **SIC 7389: Business Services, Not Elsewhere Classified**.

NAICS CODE(S)

513310 (Wired Telecommunications Carriers)

513330 (Telecommunications Resellers)

INDUSTRY SNAPSHOT

Since the invention of the telephone in 1877, the demand for telecommunication services has steadily expanded. Even when competition from wireless systems increased during the 1980s, wireline service sales grew at a rate of more than 5 percent annually, and long distance calling volume expanded by 12 percent. In 2000, total local service revenue exceeded \$120 billion, and toll service revenues topped \$108 billion, according to figures from the Federal Communications Commission (FCC).

The Telecommunications Reform Act of 1996 made the most sweeping changes in the industry in 62 years. Aimed at reducing segmentation between local phone service, long distance service, wireless service, and cable television, the act sought to lower prices, improve services, drive greater technological innovation, and create new business and jobs for the United States. By the early 2000s, one of the most obvious results of the reform was the rapid pace of mergers and acquisitions in the industry. For example, by 2002 only four of the seven regional Bell holding companies created by the breakup of AT&T in 1984 remained: Verizon Communications, Inc.; SBC Communications, Inc.; BellSouth Corp.; and Qwest Communications International, Inc.

ORGANIZATION AND STRUCTURE

The wireline telecommunication services industry includes firms that provide electronic communications using wire networks or fiber optic lines. The massive U.S. wireline infrastructure incorporates 750,000 miles of aerial wire, 3.5 million miles of cable, and, following massive infrastructure build-outs during the 1990s, some 90 million miles of optical fiber. The Federal Communications Commission (FCC) reported that by the mid-1990s all the telephone companies together served nearly 94 percent of U.S. households.

Although the Telecommunications Act of 1996 removed legal barriers in general, the industry is still largely divided into long distance carriers and local telephone companies (telcos). Local telcos provide basic telephone services. They bring telephone access lines into homes, hook up new customers, and service local lines and equipment. Telcos also connect customers to long distance carriers, and sometimes handle intrastate toll calls that are considered long distance.

In addition to basic services, many local telcos also publish phone directories, offer operator assistance, and provide numerous add-on services. Examples of such services are: voice mail, caller identification, call-

waiting, touch-tone dialing, wide area telephone service (WATS), separate digital lines, 1-900 billing services, and video conferencing.

By far the majority of local telephone lines are serviced by the Bell Operating Companies (BOCs)—called “Baby Bells” because they are the offspring of the 1984 American Telephone and Telegraph Company (AT&T) divestiture. At the time of the breakup there already were a few established independent local phone companies, notably GTE. Together these companies and the BOCs are referred to as Incumbent Local Exchange Carriers (ILECs), as opposed to new local carriers, called Competitive Local Exchange Carriers (CLECs).

In addition to the BOCs and independents, competitive access providers (CAPs) offer local telephone services. Started in 1992, CAPs typically furnish dedicated fiber optic telephone lines that connect corporations and long distance carriers. Because CAPs are not subject to the same pricing regulations with which the BOCs must comply, they can often deliver service to high-volume corporate customers at reduced rates. Early on some observers feared that these companies would siphon off debilitating amounts of high margin business, but the telcos have not suffered greatly from their presence. The terms CAP and CLEC are now often used interchangeably.

Long distance carriers, the other division of the wireline telecommunication services industry, provide national and international services via wire and fiber optic lines. Their services often utilize satellite and microwave systems as well. Long distance carriers typically pay a hefty fee to have local carriers route long distance calls to their lines, although the rates have steadily declined since 1997.

Since 1984, when its virtual monopoly of the telephone industry was ended by the Federal courts, AT&T has steadily lost market share in the long distance segment. The FCC reported that in 2000, AT&T held a 39 percent share of long distance revenue. Worldcom held about a 22 percent share, while Sprint had about 9 percent.

AT&T, Worldcom, Sprint, and some other large services are referred to as “facilities-based” carriers because they maintain the infrastructure necessary to connect calls. In addition to facilities-based carriers are “resellers,” companies that complete customer calls using a transmission facility leased from a large carrier.

Digital Communications. Most telephone networks transmit voice and data communications using analog technology, which sends a type of sound wave over the phone line. A digital system sends bits of numeric data, making it much faster, cheaper, and more reliable than analog transmission. In addition to the data communica-

tion options offered by the standard carriers and the CAPs, a new breed of wireline service companies is providing data communication services. Value-added network (VAN) providers furnish contract services such as electronic mail, credit card verification, and electronic data interchange. These companies typically lease lines—which they use to set up data communications networks for their customers—from carriers at bulk rates. Many VANs are able to efficiently link a company's global computer networks. By contracting with a VAN, a company also can avoid incompatible national regulatory and technical communications standards and receive consolidated billing.

BACKGROUND AND DEVELOPMENT

The first attempts at an electrical telegraphing system occurred in the mid-1700s in Europe. One experimental system used 26 wires—including one for each letter of the alphabet. Numerous telegraph models were developed with limited success during the late 1700s and early 1800s. American Samuel F.B. Morse introduced the first commercially successful telegraph in 1844. “What hath God wrought?” were the first words to be transmitted on the 37-mile pole line between Baltimore, Maryland, and Washington, D.C. Under Morse licenses, open-wire pole lines were soon erected all over the United States and Canada.

Alexander Graham Bell is credited with inventing the telephone in 1876, although fellow American Elisha Gray's work closely paralleled Bell's efforts up to that time. The technology was immediately put to use in sophisticated telephone systems by the National Bell Telephone Company (originally the Bell Telephone Company). Western Union Telegraph Company also began offering phone service, using technology developed partly by Gray and Thomas Edison. But as a result of an out-of-court settlement regarding a patent dispute, Western Union sold its phone operations to Bell in 1879.

The public embraced Bell's phone service immediately. By March of 1880, there were more than 30,000 U.S. telephone subscribers and 138 telephone exchanges. By 1887, just 10 years after the commercial introduction of the telephone, there were more than 150,000 subscribers and about 146,000 miles of wire. In addition, nearly 100,000 people had phone service in Europe and Russia.

As telephone services proliferated, a demand for long distance services arose. Bell established the American Telephone and Telegraph Company in 1885 as its long distance subsidiary. Important equipment and wire advances allowed commercial service to be implemented between Boston, Massachusetts, and Providence, Rhode Island, by the 1890s. Distances gradually increased with the introduction of new equipment, such as relays, loading coils, amplifiers, and repeaters. Although microwave sys-

tems allowed limited telephone communications with overseas telephone users in the 1940s, large-scale wireline telecommunication was not available until the 1950s.

Bell Telephone and AT&T. Broad patent rights enabled the National Bell Telephone Company, which became the American Bell Telephone Company in 1878, to completely dominate the telephone service and equipment industry throughout the late 1880s and early 1900s. Bell built a nationwide network by licensing local operating companies to deliver service for 5 to 10 years. Bell received \$20 per phone each year and reserved the right to buy the local network at contract expiration. Although Bell's patent rights terminated in 1894, only a few independent companies emerged as competitors. By 1899, Bell maintained a network of 800,000 lines.

AT&T became the parent company of the Bell system in 1899. Subscribership ballooned to 3.12 million by 1907, boosted by an overwhelming demand for phone service from isolated rural Americans. Moreover, new management during the 1910s was able to drastically improve the company's performance. AT&T adopted a strategy of expansion, centralized management, and increased research and development. AT&T management also followed a monopolistic course, believing that competition had no place in the telephone industry.

AT&T began buying up independent operators in the 1910s and 1920s. It also started delivering telegrams over phone lines. In 1915, AT&T completed the first telephone line that connected the east and west coasts of the United States. By 1921, AT&T served 64 percent of the 21 million phones installed in the United States and owned many of the networks used by almost all of its independent competitors. By 1929, the company was generating annual revenues of more than \$1 billion. Despite setbacks during the Great Depression, AT&T service continued to expand at a rate of more than 1 million new customers every year during the late 1930s and 1940s. In 1955, it laid the first transatlantic cable, linking its customers to Europe.

AT&T grew quickly during the 1950s and 1960s, meeting surging demand with an influx of new products, services, and technological breakthroughs. By 1966, the company had over 1 million employees and served about 85 percent of the households in the areas in which it operated. Despite pressure by antitrust regulators to cede its market dominance, AT&T continued to grow during the 1960s and 1970s, becoming the largest company in the world. By the early 1970s, AT&T was serving roughly 80 percent of the phone users in the United States and providing 90 percent of all long distance service. Antitrust suits filed separately by MCI and the Justice Department in 1974 signaled an end to the company's unfettered reign.

The Communications Act of 1934 established telecommunications as a regulated industry under the jurisdiction of the FCC. The act directed the FCC to regulate the industry based on “public interest” rather than free market competition. For most of the twentieth century, the FCC believed that a regulated monopoly that could establish a standard nationwide telephone network was in the best interest of the public. The FCC and state regulatory bodies set the rates that AT&T could charge for their services, allowing the company to cover its costs but not generate excess profits. In addition, the Justice Department kept an eye on AT&T to make sure that it did not illegally compete in other industries.

In the 1970s, antitrust pressures began to change regulator’s attitudes toward AT&T. Many people felt that AT&T and its Bell companies did not have enough of an incentive to install new technology and improve efficiency. Furthermore, potential industry competitors were pressing for permission to compete with AT&T using proprietary technologies. MCI, for example, wanted to compete using its microwave long distance technology. Although MCI received permission to offer limited service during the early 1970s, its 1974 suit was the regulatory turning point.

In 1982, after a lengthy court battle, AT&T agreed to divest its operations. The monopoly was broken in 1984, when AT&T was divided into eight pieces. Under the Modification of Final Judgment (MFJ), AT&T became a regulated long distance carrier and its 22 BOCs were organized into seven regional holding companies. Among other results of industry deregulation, competitors were allowed to enter the long distance service industry. Federal and state regulators planned to slowly remove restrictions on AT&T as competitors became established. When AT&T was divided in 1984, it had sales of \$36 billion from long distance toll services. This represented 88 percent of U.S. wireline long distance services sales. In 1995 its toll service revenues were \$47 billion, but this represented only 55.6 percent. By 1998 its share was down to 43.1 percent.

Regulators began to loosen restrictions on AT&T and the Baby Bells in the late 1980s. In 1989 they removed profits caps on AT&T, and in 1991 they reduced pricing constraints. In 1995 the FCC ended its classification of AT&T as a “dominant carrier.” The Baby Bells, though still hampered by state price and profit regulations, were enjoying greater flexibility and competing in some new markets in the mid-1990s. For example, U.S. West formed partnerships with several CAPs outside of its local service region to offer data-transport services.

The Telecommunications Act of 1996, signed into law February 8, 1996, swept away 62 years of regulation of the telecommunications industry. The legislation was intended to promote competition across the industry,

resulting in the development of new technology, the creation of new business and new jobs, and ultimately lower prices. Local telcos, long distance providers, wireless companies, and cable television operators would be free to offer any and all telecommunications services.

A major provision held that the Baby Bells—and any new local telephone network developers—must allow competition for local service using their local networks. They are also required to allow the resale of their services, much like long distance service is resold by a great number of small long distance companies. Finally, they must provide the customers of these resellers the same type and quality of service that they provide their own customers.

The major benefit of the new regulations for the Baby Bells is freedom to enter the long distance market upon demonstrating that they have opened local networks to viable competition. Having done so, they will also be able to join with other companies, local or long distance, to form subsidiaries to offer long distance service jointly. The goal is to provide “one stop shopping” for all telephone services.

One of the goals of Federal regulation continues to be universal service. Companies that provide service in a region must make it available to everyone at an affordable price, even in areas where the costs of providing the service are much higher. Companies that offer such service receive subsidies from a fund that, under the new legislation, will be supported by all interstate telecommunications providers.

Other provisions of the Act allow BOCs to manufacture telecommunications equipment. It further allows telephone companies to offer video programming and other utility companies to offer telecommunications services through subsidiaries set up for that purpose.

A defining characteristic of the telecommunications industry throughout the 1990s was the large number of mergers, acquisitions, and joint ventures. In anticipation of deregulation, many companies joined with companies in other segments of the industry. In 1994, for example, AT&T acquired McCaw Cellular Communications, the largest cellular provider in the United States at the time. Altogether, 746 such transactions were announced in the industry between January 1994 and June 1996, with a value estimated at \$110.7 billion. Nearly 73 percent were mergers of service providers, that is, wireline, wireless, and cable TV operators. The rest involved equipment and software providers.

In 1998 mergers and acquisitions in the U.S. telecommunications industry were valued at \$234.8 billion, four times the figure for 1997. Among these were the merger of MCI and WorldCom, Ameritech and SBC Communications, AT&T and TCI, and Bell Atlantic and

GTE. Early in 1999 the trend continued as AT&T made a deal for MediaOne Group, a major cable company, MCI Worldcom made a bid for Sprint and Sprint PCS, and Vodafone AirTouch announced a merger with Bell Atlantic, the largest U.S. local phone company. A relative newcomer, Qwest Communications International, primarily a long distance provider to business, closed a deal for U.S. West, the Denver-based BOC. Industry analysts expected the trend toward consolidation to continue into the new century, including more international ventures as the European market moved toward deregulation beginning in January 1998.

The industry as a whole continued its steady growth. Total local service revenues in 1998 were reported by the FCC at \$101.9 billion, an increase of 5.6 percent. Competition, however, had not developed to any great extent, as the ILECs accounted for more than 96 percent of the revenue. Even so, there was some improvement, as in 1993 they accounted for 99.7 percent. The long distance segment of the market showed similar growth, with an increase of 6.1 percent in long distance conversation minutes. Long distance showed somewhat more competition than local service, with AT&T holding only 43.1 percent of the market. MCI Worldcom garnered 25.6 percent, and Sprint captured 10.5 percent. All other long distance carriers together held the remaining 20.8 percent.

The growth in popularity of the Internet, as a business tool as well as a medium for nonbusiness consumers, was having an impact on the strategy of industry players. AT&T's bid for MediaOne, the leading cable company, as well as other cable carriers, had in view cable's potential for carrying large amounts of digital data, as well as local telephone traffic. Other wireline industry powers were acquiring wireless cable companies and other new companies developing Local Multipoint Distribution Systems (LMDS) and Multichannel Multipoint Distribution Systems (MMDS), both for their potential to provide a way to bypass the local telephone company and for their potential to provide the broadband delivery of data necessary for the Internet.

CURRENT CONDITIONS

During the mid- to late 1990s, telecommunications service providers engaged in massive infrastructure build-outs in anticipation of the coming convergence of voice and data communications via a single network. However, by the early 2000s, a capacity glut—and high levels of debt—developed when demand did not materialize as expected. For industry players, this led to falling profits and stock values. In its assessment of the overall telecommunications services industry—which also includes wireless providers—Value Line reported that while industry revenues increased, net profits fell drastic-

ally. Revenues rose from \$289 billion in 2000 to \$291.2 billion in 2001. However, net profits fell from \$24.5 billion to \$10.2 billion during the same time frame. Value Line estimated that revenues would fall to \$285.5 billion in 2002 and reach \$288.5 billion in 2003. During the same period, net profits were expected to fall to \$8.6 billion, and then reach \$10 billion.

As profits fell, so did capital investment levels. For example, according to *The Economist*, in late 2002 investment bank Morgan Stanley indicated that capital spending might decrease as much as 34 percent for the entire year. Coupled with an already weak economic climate, this led to challenging times for the industry.

By the early 2000s, the Telecommunications Act of 1996 had not achieved the intended effect of getting Baby Bells to open their markets to competition. These firms had successfully limited competition through a variety of means. According to Standard & Poor's, research firm IDC reported that the Baby Bells controlled more than 77 percent of local and long distance wireline revenues in 2001. This percentage was expected to be 74 percent by the year 2005. By early 2002, Verizon had obtained FCC approval to provide long distance service in Connecticut, Massachusetts, New York, Pennsylvania, Rhode Island, and Vermont. SBC had obtained long distance rights in Arkansas, Kansas, Missouri, Oklahoma, and Texas. Although the other two Baby Bells had submitted applications, they had yet to win approval from the FCC to provide long distance in any state.

For the Baby Bells, the outlook was relatively positive as the industry moved toward the mid-2000s. In addition to their solid positioning in the local telephone service market, three of these companies—BellSouth, SBC (Cingular), and Verizon (Verizon Wireless)—benefited from ownership stakes in the nation's two leading wireless telephone companies. However, long distance providers faced a more competitive landscape as they lost market share to wireless telephone companies offering free nationwide long distance plans, and to Baby Bells entering their markets. The rising use of e-mail, chat, and Internet telephony offered additional competition for long distance players.

INDUSTRY LEADERS

Though it steadily lost market share in the highly competitive long distance market after 1984, AT&T remains the largest company in the industry, with about 39 percent of the market. In 2002, AT&T reported revenues of \$37.8 billion. Since 1984 its toll revenues have rarely declined from quarter to quarter and have dipped only twice from one year to the next. As of 2003, AT&T claimed to serve some 50 million consumers, as well as 4 million business customers.

WorldCom's MCI Group, which includes the company's long distance services, reported 2001 sales of \$13.8 billion. WorldCom had been a rather small reseller of long distance in the early 1990s, but followed the path of mergers and acquisitions to become the second largest U.S. long distance carrier, with 22 percent of the market in the early 2000s. In 2002, two of WorldCom's senior executives, including CEO Bernard Ebbers, left the company following allegations of fraud and an investigation by the Securities and Exchange Commission.

Through its subsidiary Sprint FON Group, Kansas-based Sprint Corporation is another industry leader, with about 9 percent of the long distance market. Sprint's wireless subsidiary, Sprint PCS Group, is an established player in the wireless phone business, with almost 13 percent of the market during the early 2000s. In addition to its involvement in the long distance and wireless segments, Sprint's Local Telecommunications Division "provides local telephone service to 5 percent of the nation's domestic local exchange market," via 8.23 million phone lines in 18 states, according to the company.

Qwest Communications is the fourth largest long distance carrier, with 2002 revenues of approximately \$15.5 billion. VarTec Telecom, Inc., the parent company of long-distance direct-seller Excel Telecommunications, was another industry leader, with 2001 sales of \$1.3 billion.

In the local service market, the Baby Bells continue to dominate, although their number is diminishing. Prior to 1998, Bell Atlantic had merged with NYNEX, and SBC Communications had emerged out of the union of Southwestern Bell and Pacific Telesis. During 1999, SBC acquired Ameritech, the Midwestern Baby Bell, leaving only U.S. West and BellSouth. Bell Atlantic also completed a merger with GTE, the largest non-Bell company, resulting in Verizon Communications, Inc. Finally, Qwest made a deal for U.S. West, leaving BellSouth Corp. as the sole remaining Baby Bell.

RESEARCH AND TECHNOLOGY

Besides capital spending on labor-saving automation, U.S. wireline telecommunication service industry investments were targeted at several emerging technologies in recent years. During the mid-1990s, the most important area of research and development was digital transmission. Both long distance and local carriers raced to develop and integrate new digital technology that would increase line capacity and speed and allow the efficient transmission of data, voice, and video. ISDN deployment was being retarded by the lack of agreed standards in the United States. Telcos also invested in other data transmission technologies, such as Switched Multimegabit Data Service (SMDS), frame relay, and asymmetric digital subscriber line (ASDL). These tech-

nologies, combined with advancing fiber optic and ISDN efforts, resulted in vast data transmission improvements. Technologies not traditionally associated with wireline networks were also attracting attention from the industry, including fixed wireless systems and cable modems.

An important element of the move to digital transmission was the development of a fiber optic network, the basis of the much-touted "information superhighway." Fiber optic networks can carry a lot more traffic than copper, making them much more suitable for the transport of large volumes of data and video. In 1998, local carriers increased their deployment of fiber by 21.5 percent, with ILECs deploying 2.1 million miles of fiber and CLECs deploying 1.3 million. The effort by the CLECs represented an increase of 73 percent over the previous year. By the early 2000s, some 90 million miles of fiber optic cable had been deployed. However, some analysts considered this aggressive deployment overkill, estimating that less than 10 percent of this capacity is actually used.

SIC 4822**TELEGRAPH AND OTHER MESSAGE COMMUNICATIONS**

This industry covers establishments primarily providing telegraph and other nonvocal message communications services including cablegram, electronic mail, and facsimile services. Also within this industry are establishments providing one or more of the following services: mailgram, photograph transmission, telegram, telex, and various telegraph services. Online and Internet services, many of which provide electronic mail services, are classified under **SIC 7375: Information Retrieval Services**.

NAICS CODE(S)

513310 (Wired Telecommunications Carriers)

INDUSTRY SNAPSHOT

The telegraph and other message services industry was an industry in decline at the end of the 1990s. Although the telegraph was the oldest form of telecommunications, it has been steadily replaced by newer forms of data transmission such as e-mail over the Internet. However, Western Union, long the U.S. leader in this industry, was still a vibrant company and still offered telegraph and telex service, but has turned to various forms of money transfer as its bread-and-butter. Newer methods of nonvocal message transfer, such as broadcast facsimile and fax-on-demand services, were still viable businesses, but served rather specialized markets.

BACKGROUND AND DEVELOPMENT

The word “telegraph” has been in use since 1792 when Frenchman Claude Chappe of France used it to describe a visual signaling system he invented. However, it was Samuel F. B. Morse—sending a message using his new system of dots and dashes between Baltimore and Washington, D.C., on May 24, 1844—who set a communications revolution in motion. On October 24, 1861, America’s two coasts were linked by a single telegraph wire. This event put the legendary Pony Express out of business. In 1866 the Western Union Telegraph Company introduced stock tickers, enabling stockbrokers to receive minute by minute information from the New York Stock Exchange.

Even after the invention of the telephone by Alexander Graham Bell in 1876, the telegraph continued to be a vital communications medium. In 1930, the telegraph began to increase in popularity following a 40-year decline, a result of the use of teletypewriters, which did not require a skilled operator to use Morse Code and had the added benefit of providing a printed record of a commu-

nication. In 1933 Western Union introduced the singing telegram. In the 1960s the telegraph lines and poles that blanketed the nation were replaced by a microwave radio system.

Until the 1970s, telegrams and telexes were the most frequently used ways of transmitting written messages within the same day. The development of communications satellites and related technological improvements further enhanced the flexibility of the telegraph. But with the increasing use of personal computers and modems, and the advent of the “Information Superhighway” for person-to-person communications (either from one computer to another or through electronic bulletin boards and online service providers), the telegraph no longer had the same prominence it enjoyed for most of the twentieth century.

Western Union, the largest telegram and mailgram service in America, saw a dramatic drop in its service levels over the years, from an all-time high of 200 million telegrams at its height in 1929 to less than one million at the start of the 1990s. In 1980, there were eight telegraph carriers, according to the U.S. Federal Communications Commission’s *Statistics of Communications Common Carriers*. By 1994, there were two. Operating revenues showed a similar downward trend, decreasing from \$1 billion in 1980 to \$579 million in 1994. U.S. revenue from international telegraph service declined from \$63 million in 1980 to \$4 million in 1997. International telex service revenues declined from \$325 million to \$110 million over the same period.

Although still available at the end of the 1990s, the telegram and the telex were relics of a bygone age. Specialized forms of message delivery services, however, continued to fill certain market needs. Western Union listed at least 20 different services on its Web site. Many of these were ways to pay bills, transfer money, or collect money owed, but others were various forms of message delivery, including the famous singing telegram. Among its services for businesses and organizations were the Hotline, a method organizations could use to enable their members and supporters to send a message to government officials or other decision-makers.

Another form of message delivery service that had a ready market at the end of the century was facsimile. Many small businesses such as packaging stores, print shops, and even convenience stores sold facsimile services for the many consumers who did not own a fax machine. On a bigger scale, a number of businesses provided a range of facsimile services for business. Broadcast fax enabled an organization to send a message to a list of fax telephone numbers very similar to a mass mailing. Fax-on-demand services provided businesses an automated system to supply documents of many kinds to interested parties by fax. The company providing the

service would store the client's documents electronically, and anyone who wanted a document, such as a sales brochure or product information sheet, could simply call a toll-free number, identify the document wanted, and receive it by fax in just a few minutes.

CURRENT CONDITIONS

Although telegraph services were in all but dead, e-mail services were booming in the early 2000s. Of households with Internet service, e-mail was ranked as the most popular activity with 52 percent of wired households. Another service, instant messaging, was also growing in popularity. Instant messaging allowed various Internet users to send and receive messages in real time.

Although many hailed the boom of e-mail as a legitimate opportunity for marketing purposes, it was not without its problems. With the boom of e-mail and marketing over the Internet came spam. Spammers are marketers and others who send out millions of automatically generated, unsolicited e-mails, or spam, to users. By some estimates, spam volume grew some 150 percent in 2002. Internet providers saw clogged servers, and users saw their e-mail in-boxes quickly filling up with unwanted messages. The proliferation of spam has led Internet providers and other companies to come up with anti-spam programs to protect legitimate e-mail marketers, as well as annoyed users. Twenty-nine states have passed spam laws making it illegal to send unsolicited commercial e-mail. In 2002, another seven anti-spam bills were proposed in Congress.

INDUSTRY LEADERS

Western Union, perhaps the oldest company in the telecommunications industry, now is a subsidiary of First Data Corporation, the leading bank card transaction processing company in the United States. Although it still offers telegraph and other message services, Western Union's 26,000 agents, many of which are located in supermarkets, primarily transfer money, sell money orders, and collect debt payments. The company provides many such financial services for consumers who do not use banks. A new service developed with Electronic Data Services Corp. enables money transfer via ATM machines. The sender uses a debit card to initiate the transfer but the recipient does not have to own a card. Instead, the recipient uses codes received from the sender to access the money from another ATM.

Xpedite, a business unit of Ptek Holdings, Inc., is a leader in document distribution services. It offers broadcast facsimile and fax-on-demand services, as well as e-mail, telex, cablegram, and mailgram services both domestically and internationally. Xpedite processed about two billion messages in 2001.

SIC 4832

RADIO BROADCASTING STATIONS

This industry consists of establishments engaged in broadcasting radio programs to the public. This includes commercial, religious, and educational stations and establishments primarily engaged in broadcasting and broadcasters that produce radio program materials used by other stations.

NAICS CODE(S)

513111 (Radio Networks)

513112 (Radio Stations)

INDUSTRY SNAPSHOT

In late 2002, this industry consisted of approximately 13,300 radio stations in the United States, including more than 4,800 commercial AM stations, more than 6,100 commercial FM stations, and more than 2,300 noncommercial FM stations. The industry enjoyed increasing advertising revenues during the 1990s, culminating in a record year in 2000. In 2001, weak economic conditions caused revenues to fall for the first time in many years. However, the industry began to recover in 2002, when revenues totaled \$19.6 billion. Although the success of radio might seem paradoxical in the age of computers, 99 of every 100

households had a radio, with the average number of radios per household at 5.6. The typical listener tuned in for 3 hours and 20 minutes on average each day.

Regulatory changes following the passage of the Telecommunications Act of 1996 increased the limit on the number of radio stations one company could own. As a result, there was a sharp increase in the level of merger and acquisition activity resulting in industry consolidation. The largest merger in the history of radio was announced in November 1999 when Clear Channel Communications, which owned the largest number of radio stations in the United States, acquired AMFM Inc. (formerly Chancellor Media Corporation) for \$23.5 billion.

ORGANIZATION AND STRUCTURE

The radio station industry is divided into two basic groups, commercial and noncommercial stations. Commercial stations earn their revenues from advertisers who pay for radio advertising time based on listener ratings. Noncommercial stations (also called “educational” or “public” stations) earn revenues from public subscriptions or, in the cases of colleges and religious stations, from the institutions they represent.

Network programs, mainly news, are transmitted to many more radio stations than are owned by the network. Similarly, outside programming, such as pop music’s Top 40 countdowns, are produced within the entertainment industry and sold to stations throughout the country.

Many of the large radio stations hire media research firms. The differences between large and small stations are also revealed by their internal organization. Large stations have additional station management and employ promotion and public affairs directors to better understand listener tastes. Small radio stations conduct these services exclusively in-house.

BACKGROUND AND DEVELOPMENT

The first radio station in the United States was KDKA in Pittsburgh, which began operating in 1919. The concept of using radio waves to broadcast information and entertainment spread quickly, and by 1922, 570 licensed stations operated in America. With this emerged the idea of networking, by which stations form chains to broadcast programs simultaneously. In 1926 the National Broadcasting Company (NBC) was established with two networks of 24 radio stations under its parent company RCA. By 1928 Columbia Broadcasting Systems (CBS) had established a network of 16 stations.

During the 1920s this industry saw many innovations as stations experimented with power, looking for ways to increase frequency distance and strength, and with acoustics, learning which environments blocked out unwanted background sounds. The 1930s witnessed a large increase in radio listeners. This was due in large

part to the fact that it was a source of free entertainment during the Great Depression. As the depression came to a close, World War II would continue to keep the public tuned in, and by 1939, 1,465 stations were licensed in America, with network stations having 90 percent of the audiences.

The early 1940s continued with a slow and steady increase in the number of radio stations operating, and by 1945, 95 percent of all homes in America had a radio. The end of the 1940s saw an emerging interest in television, which took away from radio’s audiences.

Television’s presence had a negative impact on the radio industry’s expectations for growth and the formats of radio programs. Across America many radio-station owners sold their stations; others kept their stations, but sold their large studios intended for staged performances. Radio stations changed their format during the 1950s from presenting story and news programs, which were more graphically presented on television, to mostly music. The 1950s also saw a development that helped radio retain some level of popularity: the transistor radio—created at Bell Laboratories—allowed radio manufacturers to produce small portable radios, bringing this medium outdoors and into cars.

During the 1950s and into the 1960s, FM radio stations, which were created in the 1940s, appeared with a better, static-free sound quality than existing AM bands. By 1961 FM offered stereo sound as well. These features appealed to audiences of special interest groups, such as classical music fans. By the end of the 1970s there were 2,000 FM radio stations in the United States, but with many of them operating for limited hours and regarded as providing only background music.

During the 1960s the growth in rock and roll recordings and the widespread acceptance of portable radios helped AM stations to continue to flourish. By the end of the 1960s, there were 4,300 AM stations in the United States; of those, roughly half transmitted only during the daytime.

The 1970s and 1980s saw a change from AM to FM stations, as FM stations started to offer programming similar to AM, mainly popular and rock and roll music, and had better sound quality. By the mid-1980s, FM radio had taken over much of AM’s audiences and held 70 percent of the nation’s radio listeners. AM radio stations reacted to their loss of popularity by offering more news and talk radio, and some converted their equipment for stereo broadcasting. Further losses for AM radio, however, were predicted, as well as eventual closure of the band.

Radio Stations and the Government. Throughout the history of this industry, government legislation played a major role. In 1927 the newly formed Federal Radio

Commission ordered electronic requirements on equipment, the costs of which caused nearly 150 stations to close, including 100 educational stations. In 1934 the Federal Communications Commission (FCC) was established. This governing body issued licenses for television and radio stations and enforced regulations dealing with ownership practices, radio frequencies, and broadcast programming (the most notable being restrictions on offensive language).

During World War II the FCC placed a wartime freeze on the establishment of new radio stations. At this time, the FCC also ordered this industry to conserve its power use by 10 percent, allowing energy use for other industries contributing to the war effort.

Throughout its history, the FCC influenced programming by legislation related to issues such as rebuttal practices for editorial statements and political remarks and restrictions against offensive language. The Communications Act of 1934 prohibited the FCC from censorship, but it could enforce criminal fines and probations of license for "obscene or indecent language." In 1978 the Supreme Court affirmed that the FCC had the authority to act against radio (and television) stations that broadcast indecency during times that children were likely to be listening. The FCC, however, did not enforce fines until 1987.

In 1940 the FCC set up a duopoly policy limiting station owners to only one AM station and one FM station in a given locality and up to four stations nationally. In the 1970s the laws on this were changed to seven AM and seven FM stations. In the 1980s the FCC eased regulations further to 12 AM stations and 12 FM stations nationally. By 1992 the FCC allowed owners two AM stations and two FM stations in a single locality and 18 AM stations and 18 FM stations nationwide. When the Telecommunications Act of 1996 was passed, these rules were changed yet again; the act lifted all national restrictions and increased single market ownership to eight stations, with a maximum of five FM stations.

Controversy over Arbitron. Arbitron, a national research firm, provided the ratings used by radio stations and their advertisers to determine advertising prices and other marketing terms. Arbitron used a combination of statistics based on government census reports and data collected from diaries filled in by sample groups of listeners. Radio stations paid for this service by purchasing periodic reports and surveys. Over the years there was tension between station owners and Arbitron for the most part about the accuracy of ratings, but also in the 1990s about Arbitron's pricing policies. Listener diaries relied on the accuracy of listeners and on the size of the sample group. Arbitron's pricing policies drew criticism from the Radio Advertising Bureau and the National Association of Broadcasters because Arbitron changed its policy from

charging stations based on their revenues to charging them based on the size of their listening audience.

The Telecommunications Act of 1996 had a dramatic impact on the radio industry. The largest radio corporations, which had grown in profit and size during the 1980s by acquiring additional stations, were given the opportunity to expand even further, thanks to the looser ownership guidelines. The resulting consolidation of station ownership among a relative handful of large companies was characterized as "the modern version of the Oklahoma land rush," by the *Pittsburgh Post Gazette*. Broadcast companies quickly sought to achieve a concentration of stations in single major markets. This boon to large companies meant the prospect of hard times for small owners and for radio station employees. The *Minneapolis Star and Tribune* reported an estimated 30 percent employment cut in the industry on a national basis.

During the year following deregulation, the size of the growing companies was tested at the urging of advertising executives. As a result, the U.S. Department of Justice ruled that broadcasting companies would be limited to a 40 percent share of any given market. Radio advertising revenues increased by 12 percent in 1998 to \$15.2 billion. Ad revenues were conservatively forecast to increase by another 9 or 10 percent in 1999, based on a 9 percent increase for local advertising, 12 percent for national spot advertising, and 11 percent for network advertising. Strong advertising growth was supported by a robust economy, continuing industry consolidation, new advertisers, and cross-media marketing.

Major industry consolidations included the \$4.1 billion merger of Chancellor Media and Capstar Broadcasting in 1998, which created the nation's largest radio station owner in terms of 1998 revenue. As of March 1, 1998, Chancellor owned 97 stations (69 FM and 28 AM). Through the Capstar merger and other acquisitions, Chancellor owned 465 stations by the end of 1998 and had estimated 1998 revenues of \$1.9 billion. A year later, in November 1999, Chancellor—which had changed its name to AMFM Inc. earlier in the year—was acquired by Clear Channel Communications, which owned 459 stations at the end of 1998. The \$23.5 billion acquisition was the largest merger in radio history.

Another major acquisition affecting the radio industry was the 1999 merger of CBS Corp. and Viacom, valued at \$36 billion. In 1998 CBS had acquired 98 radio stations from American Radio Systems Corp., vaulting it into the second spot among radio station owners in terms of 1998 revenues, estimated at \$1.7 billion. Viacom's acquisition of CBS, though, was expected to force the new company to divest up to 10 radio stations. In the Washington, D.C.-Baltimore, Maryland, market, for example, Viacom and CBS together owned 11 radio stations, exceeding FCC limits.

CURRENT CONDITIONS

Powered by significant growth during the late 1990s, the radio industry achieved a record year in 2000. That year, revenues increased more than 12 percent, reaching \$19.8 billion. However, a number of negative factors impacted the industry in 2001. Topping the list was a weakening economy, made worse by the terrorist attacks against the United States on September 11. As companies cut spending levels, the advertising market suffered in general. Specifically, the radio segment saw revenues drop 7.4 percent, falling to \$18.4 billion.

After surviving a year that *Mediaweek* called “devastating,” the radio industry began to recover in 2002. Revenues rose 6 percent to \$19.6 billion as the radio segment outperformed other forms of media. *Mediaweek* reported that, according to different industry analysts, radio advertising revenues were expected to grow between 5 and 7 percent in 2003, as the recovery continued.

The events of September 11 and America’s war with Iraq, which began in early 2003, increased the attention radio stations placed on timely news coverage. For example, industry leader Clear Channel Communications established its own news service with some 174 news bureaus and 450 reporters. As part of this approach, large broadcasting companies mapped out strategies for disseminating more information faster. Many directed listeners on music stations to affiliated news channels, where updates on military developments in the Middle East were provided as often as six times per hour.

INDUSTRY LEADERS

Companies owning radio stations grew dramatically since the passage of the Telecommunications Act of 1996. By the early 2000s, consolidation had changed the face of the industry considerably. By this time, the leading radio station owners included Clear Channel Communications, Inc. (1,225 stations, \$8.4 billion in 2002); Cumulus Media, Inc. (270 stations, \$252.6 million in 2002); Citadel Broadcasting Corp. (200 stations, \$323.5 million in 2001); Infinity Broadcasting Corp. (185 stations, \$3.7 billion in 2001); and Cox Radio, Inc. (80 stations, \$420.6 million in 2002).

Following its acquisition of AMFM, Clear Channel was clearly the industry leader. By the early 2000s it owned 1,225 radio stations in the United States and had interests in some 240 international stations. Clear Channel also owned approximately 776,000 outdoor advertising displays in markets throughout the world, along with 39 television stations. In late 2002, Clear Channel operated the leading Web radio network, according to Arbitron ratings. The firm’s MeasureCast rating revealed that people spent some 5.8 million hours listening to Clear Channel’s Internet radio stations in November alone.

Citadel Broadcasting Corp. operated almost 200 stations in some 41 markets during the early 2000s. Before the end of 1999 it acquired 35 radio stations for \$190 million from Broadcast Partners Holdings LP, giving Citadel ownership of 161 radio stations in 34 markets. The acquisitions continued into the early 2000s. For example, the company acquired more than 85 stations in 2000.

Hertel Broadcasting, which changed its name to Hispanic Broadcasting Corporation in 1999, was radio’s largest Hispanic broadcaster in the early 2000s, with 2001 revenues of \$240.8 million. By 2002, the company operated some 65 stations in key markets such as Miami and Los Angeles. In 1999 it created the HBC Radio Network, took a 4.1 percent interest in Z-Spanish Media, and acquired a second Spanish-language radio station in Las Vegas, Nevada. As of early 2003, Clear Channel had a 26 percent stake in Hispanic Broadcasting, at which time the company was in the process of acquiring even more stations.

AMERICA AND THE WORLD

Because radio frequencies operate at low and medium levels, there has not been an international market for radio stations in the strict sense. High-frequency (shortwave) bands, however, were allocated for broadcast between nations through the U.S. Information Agency. Most of these stations were managed by Voice of America (VOA), Radio Free Europe, and Radio Liberty, which broadcast mostly in foreign languages and were not regulated by the FCC.

For more than 40 years, these services were government owned, but in the early 1990s a presidential task force suggested privatization on the premise that pro-Western ideals were not needed in the newly democratized Eastern Europe. The VOA Europe responded by airing English-language popular music and selling advertising time. Such formats were expected to be successful, especially in Eastern Europe, where there was a strong interest in American culture and in learning English; moreover, at this time many new radio stations in Eastern Europe were run on small budgets, where the use of prerecorded popular programs had a market. In 1996 Voice of America broadcasts expanded to Tuzla, Bosnia-Herzegovina, while U.S. troops participated in peacekeeping efforts in that country. That same year, the Asia Pacific Network was also created, having been mandated by the U.S. International Broadcasting Act of 1994. The act prescribed a “new broadcasting service to the people of the People’s Republic of China and other countries of Asia, which lack adequate sources of free information and ideas, which would enhance the promotion of information and ideas, while advancing the goals of U.S. foreign policy.”

RESEARCH AND TECHNOLOGY

Satellite transmission and Internet broadcasting—known as “netcasting”—were impacting the radio industry at the start of the twenty-first century.

Satellite Radio. During much of the 1990s, radio broadcasters awaited the formulation of FCC guidelines that would give them the ability to market national services akin to that of cable television. In 1997 the FCC auctioned two satellite radio licenses to CD Radio for \$83.3 million and its rival, XM Satellite Radio, for \$89.8 million. Using a technology called the unified S-band, these satellite services sought to offer a range of programming choices to a national audience. After spending 1999 signing up content providers, CD Radio and XM Satellite Radio were set to launch satellites in early 2000. By 2003, the technology was being used in cars. Industry leaders like XM had poured several billion dollars into the technology and were pushing to sign up subscribers in order to recoup their investment. By 2004, General Motors—which had an ownership stake in XM—planned to offer XM’s service in 44 of its 57 different vehicle models.

Internet Radio. A less pressing but inevitable source of competition emerged on the Internet. Netcasting of radio programming initially was hampered by technological obstacles that reduced the quality of its sound, but showed a potential to provide listeners with unprecedented options. As computer technology became more mainstream, with more than one-third of American households equipped with computer modems in 1999, competition for the “desktop” audience increased. This trend continued into the early 2000s, as more Americans obtained high-speed connections that enabled them to leave their computers connected to the Internet all the time. Most radio stations had their own Web sites by the early 2000s, and slightly less than half supplied streaming audio via the Internet. According to different estimates, by the early 2000s, 18 to 25 percent of people in the United States listened to Internet radio.

Low-Power Radio Stations. A low-power FM (LPFM) radio station initiative introduced by the FCC in 1999 might result in competition for local listeners with established FM stations. Since 1978, when noncommercial educational radio licenses were discontinued because of interference concerns, only college radio stations and specialized programming such as traveler’s advisories had operated legally at low power. Between 1997 and 1999, the FCC shut down 480 LPFM stations that were operating without a license. Most of them specialized in alternative music, commentary, and news stories targeted to local communities. During 1999 the FCC commissioned studies of the interference issue and invited comments on the LPFM initiative. Although the proposal to

license LPFM stations attracted the opposition of the radio establishment, it was supported by religious broadcasters and a coalition called the Media Access Project.

Digital Radio. In November 1999 the FCC formally began the process of creating a terrestrial digital radio service. It began evaluating competing technologies, with “in-band, on-channel” appearing to be the favored technology. Companies such as USA Digital Radio, Lucent Technologies, and Digital Radio Express, however, were pursuing competing technologies. The FCC has studied digital radio since 1990. In 1995 the FCC approved a satellite-delivered digital radio system. By 1999 the agency felt that digital technology offered promise for a land-based service. This technology was expected to become available sometime in 2003. Although it was expected to deliver very clear signals, digital radio required the use of special software, and transmission signals were affected by distance.

INDUSTRY SNAPSHOT

During the early 2000s, the television broadcasting industry was challenged by weak economic conditions that had a negative impact on corporate spending and thus advertising revenues. This decline included the fall of many “dot-com” companies that previously had spent hefty sums on advertising. These conditions were made even worse by the terrorist attacks against the United States on September 11, 2001. While the industry achieved positive growth during most of the 1990s, in 2001 revenues fell for the first time in 10 years, dropping from \$44.8 billion in 2000 to \$38.9 billion in 2001. In addition to a difficult economic climate, the industry has faced a number of other challenges brought on by new competition, regulatory changes, and technological developments.

In recent years, the long-established networks—ABC, CBS, and NBC—have struggled for the top ratings position, as two of the three acquired new owners. In 1995, Disney purchased ABC and Westinghouse purchased CBS. CBS subsequently merged with Viacom Inc. in 1999. The established networks also had to contend with Fox Broadcasting, which established itself in the 1990s as the fourth major broadcast network. Smaller “netlets,” not yet meeting the Federal Communications Commission’s definition of a network, were established by Paramount and Warner Brothers in 1995, and in 1997 Pax Communications launched a seventh network, PAX TV. The increased reach of cable television, direct broadcast satellite operators, and even the Internet are eroding audiences for network broadcasts. New federal rules regarding ownership, programming content, and digital transmission continue to reshape the competitive landscape.

In this frenetic atmosphere, the once-bleak outlook of the networks in the early 1990s improved considerably later in the decade. Although they continued to see a drop in audience share from the 1980s, the networks still held a strong position in prime-time ratings and saw increased advertising revenues. Beginning in 1995, the major networks gained new syndication revenues resulting from a relaxation of federal regulations. They also began creating their own cable networks, such as ESPN2 and MSNBC, using their considerable production resources. Furthermore, viewing audiences had made it clear that they did not want cable television service that did not include local broadcast network affiliates. Thus, the networks became increasingly concerned with production and programming, as they created a strong role for themselves in the growing

SIC 4833

TELEVISION BROADCASTING STATIONS

This category covers establishments primarily broadcasting visual programs by television to the public, except cable and other pay television services (discussed in **SIC 4841: Cable and Other Pay Television Services**). Included in this industry are commercial, religious, educational, and other television stations. Also included are establishments primarily engaged in television broadcasting and that produce taped television program materials. Sepa-

system of television delivery and services. Writing for *Time*, Richard Zoglin commented, "If the network business is thriving, it is as a radically different sort of business. The line between distributors (the networks) and suppliers (outside producers) is being blurred. The networks, given the chance to produce and own their own shows, are acting more like studios, while the studios, afraid of being squeezed out, are trying to become networks."

ORGANIZATION AND STRUCTURE

The networks include in their stables both network-owned stations, which are often flagship stations in major media markets, and affiliated stations, independently owned stations that have contractual agreements with a network to broadcast their lines of programming. *Variety* noted in December 1996 that the merger of Westinghouse with CBS "had no greater impact than on the station side, where both companies had established strong station businesses long before their teaming." At the same time, the acquisition of New World Communications by Fox Televisions Stations Group contributed to the radical changes that took place among station holdings. Fox vaulted from being a medium-sized group to being the largest operation by the end of 1998, with 23 stations (including channels in New York, Los Angeles, Chicago, and Philadelphia) and 35 percent penetration of U.S. television households.

In early 2002, Viacom (home to CBS and UPN) was the industry leader, with 39 stations reaching almost 40 percent of the U.S. market. Fox was second, with 35 stations reaching about 38 percent of the market. Paxson Communications ranked third with 69 stations reaching some 33 percent of U.S. television homes. NBC followed with 13 network-owned stations reaching slightly more than 30 percent of all American homes. Tribune Broadcasting ranked fifth with 23 stations and almost 29 percent penetration. Other industry leaders included ABC, with 10 stations and almost 24 percent market coverage; Univision (33 stations, 21 percent coverage); Gannett Broadcasting (22 stations, 18 percent coverage); Hearst-Argyle (34 stations, 16 percent coverage); and Trinity Broadcasting (23 stations, 16 percent coverage).

A shake-up in station ownership started in May 1994 when Fox lured 12 stations affiliated with the other networks to its side, including several in major markets. This affiliation switch, the biggest in television history, signaled a significant change in the balance of power between the networks and individual television stations. Dennis FitzSimons, president of Tribune Television, noted in *Business Week* that the deal highlighted "the importance of the distribution of programming—something that has been ignored recently. Furthermore, it gives the control back to the stations." Fox's success in these matters subsequently inspired the creation of addi-

tional netlets, the United Paramount Network (UPN) and the Warner Brothers (WB) Television Network, which launched in January 1995 with more than 80 percent national coverage.

BACKGROUND AND DEVELOPMENT

The first television networks in America—NBC, ABC, CBS, and DuMont—were actually divisions of major radio networks or subsidiaries of television and radio manufacturers. Recognizing that centralized sales and distribution companies could be more profitable than scattered businesses, networks offered programs to individual stations that the affiliates could not afford to underwrite individually. Advertisers were fond of the network arrangement as well, for it enabled them to reach the entire nation with one commercial contract rather than dozens.

In the early years of television, the networks competed for programs, viewers, and advertisers in much the same manner as they do today. CBS was the recognized leader of the networks by any measure, while a number of other fledgling networks failed to crack the wall separating the leading triumvirate from the rest of the pack. The DuMont Network was the hardest of the challengers; at one point DuMont had 80 stations under its banner and twice that many part-time affiliate subscribers. The company's financial fortunes fell, however, and ABC plucked a number of the network's chief attractions. By 1955 the company folded; the affiliates it owned became the Metromedia chain of independent stations.

With the outbreak of World War II, England and Germany, America's chief competitors in television technology, halted their research programs. By remaining at peace for two additional years before entering that conflict, by continuing government-sponsored television research even during the war, and by realizing the benefits of advances in electronics that resulted from the war effort, the United States took a major lead in this technology.

The Federal Communications Commission (FCC) then sought nationwide standards guaranteeing that all Americans could enjoy equal access to television and that no single television company, beginning with industry pioneer NBC, could achieve a monopoly. From this point on, much of the government's regulation of the limited available airwave space reflected the dichotomy of television being a public service people were entitled to, as well as big business.

Initially, the high costs of establishing a television station and the paucity of television sets meant that losses far outweighed profits. The popularity of the television increased dramatically in a very short time, however, and profits in the industry grew every year between 1951 and 1986, at which point growth was stalled. Network growth was also radically affected by the growing pay television industry that, by the early 1990s, established itself as a

major rival. The big three broadcast networks had a 91 percent share of the prime-time television audience during the 1978-79 season, which dropped to 75 percent in 1986-87, and further to 61 percent in 1993-94. Part of an overall loss in audience share, however, was credited to the success of Fox Broadcasting, which drew viewers with its coverage of National Football League (NFL) games and strong children's shows.

Competition. In 1995 cable systems actually experienced a drop in subscribers and reached about 65 percent of television homes. Subscribers balked at price hikes that followed rate deregulation, and some opted for satellite television services. In order to give broadcasters the chance to compete against pay television services and the netlets, the FCC agreed to gradually lift a ban on the syndication of network programming. Previously, networks were wholly dependent on advertisers for their revenue and had access to the airwaves only by permission of the government, whereas cable companies could charge subscribers as well as advertisers. In 1993 the networks gained rights to profit from reruns of their prime-time shows. This triumph for the networks affected the outside producers that made and financed much of the prime-time programming. Permitted to undertake a greater proportion of in-house production of prime-time programming, the networks could now negotiate for more financially rewarding deals with outside producers. By 1995 all such restrictions on network ownership of programming and on their right to syndicate programs were lifted.

Networks War with Nielsen. With an eye on advertising revenues, the networks found fault with Nielsen Media Research, the company that had long provided the broadcasters and advertisers with viewer ratings. Changes in Nielsen methodology coincided with a reported decline in NFL football ratings, which caused both NBC and Fox to question their validity. CBS also complained about the accuracy of ratings for the *CBS Evening News*. The networks were concerned that Nielsen's new methods of selecting participants and an increased sample size were skewing the resulting ratings. In December 1996, Fox, CBS, NBC, and ABC joined ranks to criticize the research company by placing ads in media and advertising trade publications that denounced Nielsen's claims of reliability. As *Broadcasting and Cable* reported, the ads read "Our confidence in Nielsen is DOWN" and "There is a growing disparity between local overnight ratings and national ratings." At the same time, the FCC was asked to investigate Nielsen's services.

Programming Content Debate. Another issue that the networks and the cable television industries faced was that of violent programming content. Under pressure from the federal government, CBS, ABC, NBC, and Fox all agreed to place parental advisory labels on violent

programming—in order to avoid having a system imposed upon them. The group unveiled its age-based ratings system that was similar to that of the movie industry in December 1996, which labeled programs (with the exception of news) with one of six categories ranging from children's programming to shows for mature audiences: TV-Y, TV-Y7, TV-G, TV-PG, TV-14, and TVM. Viewers saw the appropriate icon in the upper left corner of the television screen at the beginning of the program and, if the program exceeded one hour in length, at the beginning of subsequent hours. On June 4, 1997, television executives met with representatives of the American Medical Association and the National PTA to review the ratings system. Several networks agreed to add V (for violence), S (for sexual content), and L (for language) to the age-based system.

At the same time, the federal government was proceeding with plans to give parents the ability to black out violent programming with a device called the V-chip. Mandated by the White House and Congress in 1996, television manufacturers were waiting for FCC specifications before adding the chip to new television models and designing V-chip converter boxes. By 1999 V-chips were being installed in new television sets, and the broadcast networks were implementing a system that would help parents select programs based on their content. Many of the major cable networks were also committed to designing their own rating system, although some refused to comply based on First Amendment issues.

During 1999 several major deals were announced that would further concentrate the industry. Viacom announced a \$35.9 billion buyout of CBS. NBC announced it would acquire a 32 percent interest in Paxson Communications, which owned or had a significant financial stake in 72 television stations, for \$415 million. Following its announced merger with Viacom, CBS offered \$2.15 billion to acquire Chris-Craft Industries, which operated 10 television stations (including stations in New York City and Los Angeles) and owned 50 percent of UPN.

In late 1999 current FCC regulations limited companies from owning stations that reached more than 35 percent of the national television audience. The industry, however, expected the ownership limit to be raised, sooner if not later. NBC, for example, could not acquire more than a one-third interest in Paxson under FCC ownership limits, because Paxson-owned stations were already reaching more than 34 percent of television viewers. NBC, however, had an option to acquire up to 49 percent of Paxson after February 1, 2002, if the FCC raised its current ownership limit.

The top four networks experienced declining viewerships from 1997 to 1999 and, for the future, faced the possibility of an explosion of competitors. The advent of digital television will boost channel capacity, making

cable networks even more formidable competitors. For the 1999-2000 season, fewer than half of the new network shows were expected to achieve a double-digit share of audience, compared to 1997-98 when 76 per cent of the new network shows achieved a 10 or better audience share.

Among the major networks the battle for prime-time ratings continued to be very intense and very close. In the 1998-99 season CBS barely edged NBC for the top spot with a 9 household rating and 14.3 audience share, compared to NBC's 8.9 household rating and 15 percent audience share. ABC ranked third, followed by Fox, WB, and UPN.

CURRENT CONDITIONS

After rising from \$40 billion in 1999 to \$44.8 billion in 2000, industry revenues fell to \$38.9 billion in 2001 in the wake of a sluggish economy that included the fall of dot-com advertisers and overall reductions in corporate spending. The terrorist attacks of September 11, 2001, only made these conditions worse. However, by 2002 conditions began to improve. Standard & Poor's estimated that revenues would reach \$40.5 billion that year.

Major developments like the terrorist attacks of September 11 and the U.S.-led war with Iraq, which began in March 2003, impacted the way broadcast networks delivered news, as well as the costs involved. According to *Broadcasting & Cable*, a survey conducted by Frank N. Magid Associates revealed that 45 percent of viewers turned to cable news first for the latest information about the war, whereas 22 percent turned first to the so-called "Big Three" networks' evening news broadcasts first. Local TV news came in third, at 20 percent. In addition to lost advertising revenue due to periods of commercial-free coverage, the conflict in Iraq was expected to cost broadcasting networks \$30 to \$40 million. The publication explained that networks had trained "correspondents for combat and for chemical and biological attacks, outfitting them with military-grade gas masks and chemical suits. Nearly every aspect of coverage, from new technology to deployment, has been rehearsed and tested. . . . TV and print journalists are traveling with military units, embedded into military units, and, in some cases, they have the ability to televise their reports live."

During the early 2000s, the industry faced many of the same challenges that were evident in the late 1990s. Network broadcasters continued to slowly lose viewers to cable operators offering digital services like video-on-demand and high-speed Internet access. In addition to cable companies, other forms of competition included the Internet, film studios, telephone companies, computer companies, consumer-electronics companies, and publishers.

Industry Consolidation. Consistent with past trends, consolidation continued to affect the industry. ABC,

CBS, and NBC took in more than 40 percent of the advertising revenue for the television broadcast industry during the early 2000s, and they were expected to continue to lead the industry in both television advertising and viewership. In addition to providing programming, the networks also owned television stations. By the early 2000s there were approximately 1,290 individual broadcast stations operating in the United States, up from about 1,200 in 1998. The top 25 owners controlled 36 percent of the nation's commercial stations in 1998. However, by 2001 the 10 leading owners controlled 23 percent of all stations (up from 19 percent the previous year).

Digital Television. At the close of 1996 the industry moved one step closer to digital transmission of television signals, as the FCC selected a DTV standard. The "Grand Alliance Standard" was adopted minus specifications regarding picture formats on which the broadcast, computer, and film industries could not agree. Video compression, sound delivery, and transmission of signals were part of the specifications. The commission still needed to determine how long broadcasters could use existing analog channels, how digital channels would be assigned, and if high-definition programming would be required. Although the FCC initially mandated that all television stations be capable of transmitting high-definition television by May 2002, this deadline was not enforced and conversion became voluntary. In addition, some industry analysts indicated that consumer adoption of HDTV, which requires the purchase of relatively expensive television sets, would likely take a great deal of time before it reached a high percentage. More specifically, some estimated that it could take 20 years or more before adoption levels reached the 80 percent range.

INDUSTRY LEADERS

The three leading broadcast networks—ABC, CBS, and NBC—are also the longest established. In terms of prime-time ratings, ABC was the leading network at the beginning of the 1990s, but by the decade's end it had been overtaken by both NBC and CBS. By 2001-2002, NBC led the industry in the ratings race, followed by CBS, ABC, and Fox. By station ownership, Viacom (which owns CBS and UPN) led the industry with 39 stations and 39.5 percent market penetration at the beginning of 2002. NBC owned 13 stations with a market penetration of 30.4 percent, and ABC owned 10 stations with 23.8 percent market penetration. ABC was owned by the Walt Disney Co., NBC by General Electric, and CBS was acquired by Viacom in 1999. All three broadcast networks and their parent companies had ownership interests in cable television networks or other media properties.

The Fox Broadcasting Company was launched in 1986 and aggressively pursued young viewers, especially teenagers and adults ages 18 to 34. By the 1998-99

season, Fox was established as the fourth broadcast network; it finished second to NBC in the key demographic of adults ages 18 to 49 and first among teenagers. Fox Broadcasting was part of the Fox Entertainment Group, which also included Fox Filmed Entertainment; Fox Sports Networks, LLC; and baseball's Los Angeles Dodgers, Inc. Through Fox Television Studios, the company owned 35 television stations. Fox's parent company was Rupert Murdoch's News Corporation, which owned 81.4 percent of Fox Entertainment following an initial public offering that made 18.6 percent of the company's stock available to the public.

With an interest in 69 television stations, Paxson Communications owns the largest broadcast television station group. In 1999 NBC invested \$415 million in Paxson and took a 32 percent ownership interest in the company. In 1997 Paxson launched a new network, PAX TV. PAX TV reached approximately 85 percent of U.S. households in 2002 through 69 company-owned stations and 63 network affiliates. In 2002, the company recorded annual sales of \$277 million.

In addition to its ownership of CBS, several cable channels, and a variety of other entertainment subsidiaries, Viacom is the parent company of the Paramount Television Group. It owns 39 stations and is the largest television broadcasting group in the United States by reach, covering 39.5 percent of all U.S. viewing households. In 2002, the company recorded annual sales of \$24.6 billion and employed 120,630 people.

Other major television station owners include Tribune Broadcasting, a subsidiary of the Tribune Co., which owns and operates 26 major market television stations reaching more than 80 percent of U.S. television households. By the early 2000s, Tribune Company was part owner of the WB Television Network.

CABLE AND OTHER PAY TELEVISION SERVICES

This industry covers establishments primarily engaged in the dissemination of visual and textual television programs on a subscription or fee basis. Included in this industry are establishments that are primarily engaged in cable casting and that also produce taped program materials. Separate establishments primarily engaged in producing taped television or motion picture program materials are classified in **SIC 7812: Motion Picture and Video Tape Production**.

NAICS CODE(S)

513210 (Cable Networks)

513220 (Cable and Other Program Distribution)

INDUSTRY SNAPSHOT

The cable television industry was developed in the United States in the late 1940s to serve small communities unable to receive conventional television signals due to difficult terrain or physical distance from television stations. Cable also provided improved television reception to remote areas. The original systems were centered around a collective antenna for regions with poor or nonexistent reception. Cable systems located their antennas in areas where reception was good, picked up broadcast signals, and then relayed them by cable to subscribers for a fee. In 1950 cable systems operated in only 70 communities and served 14,000 subscribers.

By 1995 there were approximately 11,800 cable systems with 62 million subscribers (65.3 percent of all television households) in the United States. The average cable system provided 30 or more channels, as well as other services such as custom programming and pay-per-view options. The average monthly fee for a cable subscription was \$23.00.

By late 2002, total subscriber counts amounted to approximately 73.5 million, a household penetration rate of nearly 69 percent. Through digital compression, cable operators gained the ability to offer more than 100 channels. Between 1995 and 1999, cable fees rose faster than the rate of inflation. Even though there are thousands of cable operators, the industry has been dominated by the top 25 companies, which in 2001 accounted for more than 98 percent of U.S. subscribers, up from about 90 percent in 1999. Following passage of the Telecommunications Act of 1996, which removed several regulations regarding ownership, the industry experienced increased merger and acquisition activity that is likely to continue. This activity resulted in further consolidation within the cable industry.

During the late 1990s and early 2000s, satellite television services made their presence felt in the pay television industry by providing an alternative to increasingly expensive cable service. Providers dramatically reduced set-up costs and eventually offered free equipment and installation to consumers who agreed to annual service contracts. Viewers received many more channels for a monthly fee that rivaled cable rates. The biggest drawback to satellite television was its inability to carry local broadcast channels, but this limitation was removed by federal legislation toward the end of 1999. Satellite services claimed only 4 percent of the market in 1996. The fastest growing segment of the satellite service industry was direct broadcast satellite (DBS), which grew from 2.3 million subscribers in 1995 to 8.2 million subscribers

in 1998. By 2001 this total had mushroomed to 17.4 million, and subscriber ranks were expected to reach nearly 20 million in 2002.

ORGANIZATION AND STRUCTURE

Traditional underground cable lines are just one of several methods used to transmit video signals from the broadcaster to the home. Pay television companies must decide which transmission method or combination of methods is the most effective in serving their customers. Overall, there are four basic ways to broadcast a video signal:

- **Terrestrial:** a transmission tower on the ground sends a picture directly to a television aerial. This is easy to install but reception is often poor and only a few channels can be carried. This is the method traditionally used to broadcast network channels.
- **Coaxial or fiber-optic cable:** TV signals travel through an underground cable. Installation is time-consuming and expensive. Cable is used primarily in densely populated urban areas.
- **Microwave, multichannel:** a multipoint distribution system (MMDS) carries signals from a television studio to a microwave transmitter, which then relays them to rooftop receivers on apartment blocks. These receivers are relatively small dishes that are easy to install and maintain. Microwave transmission is a low-cost alternative to cabling and is feasible in areas where there are large distances between transmitting stations and subscribers (e.g., South America).
- **Satellite:** a broadcaster uplinks a signal to a transponder on a satellite, which retransmits either to home dishes or to a satellite master dish (SMATV) located on the roof of a high-rise block. Satellite transmission is common in remote rural areas. Subscribers pay hook-up and access fees to the satellite owners.

Cable television operators rely primarily on four revenue streams: advertising, installation services, basic cable subscriptions, and premium channel subscriptions. In 2002, the industry earned \$49.4 billion in subscriber revenues and \$14.7 billion in advertising revenues. Cable operators were expected to enjoy a trend of increasing subscription and advertising revenues in the foreseeable future.

Cable Regulation. The domestic cable industry is highly regulated by the U.S. government. Regulations affect cable system ownership, rate structures, channel limits, types of programming, and permission to access programming. This involvement is due to the high fixed investment in installation, the fact that the industry lends itself to being a natural monopoly with limited competi-

tion, and the sensitive nature and importance to national security of communications technology.

Ownership in the cable television industry is fragmented because of the regulatory environment in which companies compete. The Federal Communications Commission (FCC), the government agency empowered to regulate cable TV companies, has given municipalities the authority to grant cable licensing contracts on a geographic basis. Municipalities generally bid out these contracts and then grant exclusive franchise rights to provide service in a given area in return for a commission of 3 to 5 percent of revenues.

In 1986 the FCC decided to allow cable companies to freely set monthly service rates and rate increases in any market that already provided at least three over-the-air broadcast signals to nonsubscribers. Prior to 1986, cable companies were limited to a mandated 5 percent cap on annual rate increases. Re-regulation was proposed in 1992 because various groups claimed that the cable industry abused its privilege to set monthly rates by gouging consumers. Congress, under pressure from consumer groups, haggled with President George Bush, who was against reregulation. After a failed attempt by the FCC to control the situation by redefining some rules, Congress overrode the president's veto and passed the controversial Cable Television Consumer Protection and Competition Act of 1992. This bill reversed cable companies' freedom to set rates. However, local governments were given the power to regulate rates for basic cable programming in their areas.

The act also contained programming regulations. Programming could no longer be denied to competitors and had to be offered at "fair terms." The bill required cable companies to pay royalties to over-the-air broadcasters. Networks have complained for years that cable companies were in essence charging subscribers for network-developed programming that was free to them and pocketing a subscriber fee. One other provision of this bill limited the size of multiple-system operators and the number of channels a system could devote to programming in which it had an interest.

New technologies have prompted cable companies to team with telecommunication companies in order to provide interactive services to subscribers. In August 1992 the FCC permitted Tele-Communications Inc. (TCI) and Cox Enterprises to buy Teleport Communications Group, a company that connects long distance carriers and provides large corporations with private fiber-optic communications networks. This ruling opened the door by allowing cable companies to enter the telecommunications business and vice versa.

Telephone companies were slow to react to this decision, primarily due to regulatory concerns. Not until Feb-

ruary 1993, when Southwestern Bell Corp. announced that it agreed to purchase two cable TV systems in the Washington, D.C. area, did a telephone company move into traditional cable markets. This action led other telephone companies to search for cable acquisitions.

A regulation implemented in June 1992 allowed the television networks to buy local cable TV systems. However, a TV network's cable holdings could not exceed 10 percent of the nation's homes that are passed by cable wire or 50 percent of the households in a single market. In addition, a 1984 ruling stated that a company cannot own a TV station and a cable system in the same market. The intended effect of these rulings was to speed up the unraveling of traditional network and affiliate relationships. The resulting alliances between cable and over-the-air industries would impact the competitive environment among entertainment providers.

The Telecommunications Act of 1996 also did much to deregulate cable television, with the hope of further stimulating competition in the television industry. The act served to revise 62 years of telecommunications law and eliminated some of features of the 1992 Cable Act that were seen as punitive by the industry. Most notably, fees for upper service tiers would be deregulated on March 31, 1999, in large cable systems, while such services were deregulated immediately in smaller franchises. The bill also eliminated the 1984 restriction that prevented individual companies from offering cable and phone services to the same market.

Government regulations have a significant impact on the ways in which cable companies compete. In the mature cable TV market, revenue growth comes primarily from rate increases. Government regulations impact existing companies by limiting revenue growth from this source. In the long run, the industry is expected to benefit from being pushed to develop other revenue resources, such as cable modems and telecommunication services. The regulatory environment is constantly changing—and there are gains that will accrue to the companies best able to influence and adjust to new regulatory initiatives.

Investment in Fiber Optics and Digital Compression.

Investment in fiber-optic technology and digital compression allowed cable providers to expand channel capacity, offer interactive services, and carry voice, data, and video signals simultaneously on a single line. Each of these areas represents a significant opportunity to increase revenue. Both technologies, however, required an enormous investment for cable companies. Installation of fiber-optic cable and the introduction of digital boxes in cable homes was a gradual process.

Fiber optic cabling improves signal quality and range. Companies that invested in fiber optics to improve transmission quality gained an edge in the bidding process used

to award franchise rights for geographic areas. The greater the number of franchise rights, the greater the number of subscribers—and the greater the amount of total revenue accruing to a company. During the 1990s, four of the largest players in the industry (TCI, Time Warner, Continental Cablevision Inc., and Cablevision Systems Corp.) invested heavily in this strategy. TCI invested \$2 billion in the mid-1990s, a clear indication that the industry viewed investment in fiber optics as a critical component in ensuring long-term financial success.

Expanded channel capacity allows cable providers to increase revenue by offering additional programming and pay-per-view channels. The creation of new cable networks was straining the existing cable carriage space in 1997, as CBS, A&E (Arts and Entertainment), Rainbow Programming, and BET (Black Entertainment Television) all prepared to start major cable networks. The need to expand channel capacity was underscored by the fact that many new networks were finding their first home on satellite television, where a greater number of channels are offered.

Expanded channel capacity also allows cable companies to offer advertisers more options. Traditionally, broadcast networks have demanded the highest advertising dollars and yet have devoted less on-air time to commercials than cable networks. During the mid-1990s, however, cable advertising revenues increased, and the cable networks began increasing the minutes per hour devoted to advertising. Between 1990 and 2002, advertisers increased their spending on cable television from \$1.1 billion to \$14.7 billion.

Studies revealed that the total time Americans spent viewing television was rising, while the audience share of the three major networks was on the decline. Viewers began spending a larger proportion of their viewing time watching cable channels as opposed to network programming. This increased viewership positioned cable companies to gain a large percentage of increasing advertising dollars.

Ability to Influence and Respond to Regulation. Because regulations change so frequently, the ability to influence and leverage new regulations becomes a crucial success factor. If a company can dictate how a regulation is written or interpreted in order to exploit an internal core competency, then it will be best positioned to profit from the change. Conversely, cable companies can be negatively impacted by regulations that restrict their ability to expand service areas, affect rate structures, and introduce new products.

During the late 1990s, cable operators and telephone companies entering the television business were not only adjusting to the new FCC guidelines set by the Telecommunications Act of 1996; they also faced the demands of local governments that were trying to maintain local

control of rates and public rights-of-way. An April 1996 ruling eliminated rate regulation in areas where a cable company had non-DBS competition. Local governments complained that better proof of the new competition's effectiveness was needed in each case before rate deregulation was allowed. Squabbles of use of public rights-of-way also cropped up, as in the case where the city of Troy, Michigan, required TCI to obtain a telecommunications franchise when it wanted to create a new system. Such arguments prompted cable and telephone companies to join in asking the FCC to rein in local regulators.

Programming Capabilities. A *MediaWeek* poll revealed that 65 percent of cable TV subscribers would cancel their subscriptions if broadcast signals were dropped. The poll suggested that network-affiliated TV stations have considerable leverage in their retransmission consent fee negotiations with cable providers. But, ironically, during the 1990s the networks were waiving retransmission consent fees in exchange for getting cable operators to air network-owned cable programs. Offering more options to the customer results in increased advertising income and subscription revenue. This increased cash flow assists in the development of new and improved services, further driving the company's revenue growth.

Economies of Scale. Size is necessary to achieve economies of scale and to provide cash flow for investments into research and development, development of new programming and markets, and acquisitions. Large companies can gain economies of scale in purchasing equipment, satellite time, and programming. In addition, by being large enough to be able to purchase its own satellite, a cable company gains significant control over costs and programming. Through ownership of large libraries of information (music, video, etc.), the cable company not only controls costs, but also drives other competitors through access to that programming. Finally, programming consists mainly of large fixed costs; with a large cable company, this fixed cost is spread over a larger base, resulting in increased profits. This is particularly important for development of fiber optics.

Satellite and Telephone Company Competition. Customer dissatisfaction and rising cable costs have served to feed the growing satellite television industry with new viewers. At the beginning of 1999, direct broadcast satellite (DBS) had about 10.5 million subscribers compared to cable's 67 million, but it was growing by 26 percent a year in spite of not being able to provide local broadcast channels. However, at the end of 1999 that roadblock was removed when the U.S. Congress passed legislation that would allow DBS to offer local channels, thus giving satellite subscribers access to broadcast network programming.

Satellite television also underwent major changes among its key players in the late 1990s. Primestar, the second largest DBS provider with 2.3 million subscribers, was sold in January 1999 by its cable company owners to DirecTV, the industry leader. However, the sale did not guarantee DirecTV would pick up all of Primestar subscribers, thus leaving the door open to EchoStar, which moved up from third to second in the industry and was regarded as the fastest growing DBS company. EchoStar had recently picked up the assets from Rupert Murdoch's failed satellite venture. DirecTV was owned by Hughes Electronics, which in turn was owned by General Motors. In December 1998 DirecTV acquired United States Satellite Broadcasting, which provided top-of-the-line premium services that customers could order on top of the 185 channels offered by DirecTV. By 1999 neither DirecTV nor EchoStar were profitable, and EchoStar was carrying nearly \$2 billion in debt.

Phone companies have been investing in and upgrading phone lines to fiber optics for some time—with the intention of transmitting video signals. Companies such as Tele-Communications, Inc., U.S. West, Bell South, Time Warner, Microsoft, IBM, Sony Corp., Intel, and Silicon Graphics tried to position themselves as major providers of service and support in this emerging playing field. During the 1990s, even utilities were laying fiber-optic cable when they installed new lines in order to position themselves as water, gas, electric, voice, data, and video providers.

By 1996, however, it was clear that the movement into television programming and delivery services had slowed. One telephone group, made up of Bell Atlantic Corp., NYNEX Corp., and Pacific Telesis Group, made news when it decided to sell Tele-TV, a television programming business. The companies had committed to pooling \$300 million dollars in the joint venture. At the time, opportunities in long distance telephone service and Internet access appeared to have greater potential rewards. One area in which potential for telephone company participation looked more promising was in markets with less than 50,000 people. These markets were deregulated in 1996 to allow cable and telephone companies to enter each other's service area.

Industry Consolidation. The entry of AT&T into the cable industry, as well as major mergers and acquisitions following passage of the Telecommunications Act of 1996, resulted in more subscribers for the top cable operators. Size and clout were becoming more significant factors, with new technologies such as wireless, fiber optics, and digital compression requiring large investments. By 1999 the top 10 cable operators accounted for 71 percent of all U.S. cable subscribers, compared to 45 percent in 1994. In mid-1999 the top five cable operators

(AT&T, Time Warner, Comcast, Charter, and Cox) controlled nearly 68 percent of all U.S. cable subscribers.

CURRENT CONDITIONS

The cable television industry has proven to be very resilient. The industry has successfully responded to recession, regulation and deregulation, and the entry of meaningful video service competitors such as telephone companies, direct broadcast satellite systems (DBS), and computer firms. The future appears to hold more of the same, although competition is increasing from DBS providers. The introduction of new technologies and system upgrades will continue to make it possible for cable firms to expand digital services and gain new subscribers. The cable companies that are leading the way in these developments are expected to reap the lion's share of success.

Despite weak economic conditions that had a negative impact on network television and radio broadcasting companies, as well as the print media sector, the cable industry fared relatively well during the early 2000s. Figures from the National Cable & Telecommunications Association (NCTA) reveal that subscriber service revenues increased from \$40.9 billion in 2000 to \$43.5 billion in 2001 and \$49.4 billion in 2002. Although advertising revenues—which rose from \$11.9 billion in 1999 to \$14.3 billion in 2000—did decline slightly to \$14.2 billion in 2001, they reached a record \$14.7 billion in 2002.

Digital cable services, including emerging video-on-demand offerings and high-speed Internet services, continued to represent a prime growth area for cable providers, as the market for basic services became relatively saturated. Following significant infrastructure developments during the 1990s, digital cable services began taking off in 2000, when some 9.7 million subscribers took advantage of the service, according to the NCTA. By the end of 2002, this number had mushroomed to 19.2 million subscribers. This was good news, because many industry players were saddled with bad debt from the capital investments made in the 1990s. With capital investment on the decline in the early 2000s, analysts anticipated increased profits.

Some cable operators were benefiting from telephone services, which they conveniently bundled with other services at competitive prices. NCTA estimates show that the number of residential customers taking advantage of cable telephony rose from 180,000 in early 2000 to 2.5 million by the end of 2002.

Despite the fact that cable operators were positioned to benefit from the aforementioned service offerings, DBS providers were a significant source of competition in the early 2000s. The Television Bureau of Advertising (TBA) reported that, according to Nielsen Media Research, penetration of so-called "alternate delivery systems" (ADS), which include DBS, were increasing while

wired cable levels were declining, reaching a six-year low in early 2003. The TBA further explained that “national ADS penetration reached 16.7 percent in February 2003, up from 14.7 percent in February 2002. Direct broadcast satellite (DBS) delivery, the largest component of ADS, is now estimated at 15.6 percent, up from 13.2 percent in February 2002. Over the same period, wired cable penetration fell from 70.3 percent to 68.6 percent—the last time wired cable was that low was in August 1996.”

INDUSTRY LEADERS

The names of the industry leaders changed dramatically in the late 1990s, and industry rankings changed frequently as competitors sought to add more subscribers through mergers and acquisitions. By late 2002, the top 10 cable companies were Comcast Corp., with 21.6 million subscribers; Time Warner Cable (10.9 million); Charter Communications (6.7 million); Cox Communications (6.3 million); Adelphia Communications (5.8 million); Cablevision Systems Corp. (three million); Advance/Newhouse Communications (2.1 million); Mediacom Communications Corp. (1.6 million); Insight Communications (1.3 million); and CableOne (721,400).

Comcast Corporation. With roughly twice as many subscribers as its nearest competitor, Comcast Cable was the undisputed industry leader in 2002. Comcast’s strong position within the industry is attributable to its acquisition of AT&T Broadband. According to the company, it is the leader in eight of the nation’s top 10 markets, and some 70 percent of its subscribers live within the top 20 markets. Other acquisitions also have been key to Comcast’s growth. For example, in November 1999 the company acquired Philadelphia-based cable operator Lenfest Communications for \$5.3 billion. The acquisition increased Comcast’s subscriber base by 20 percent to 7.2 million subscribers.

Time Warner Cable. AOL Time Warner is the world’s largest media and entertainment company. Time Warner Cable (TWC) is one of the many media/entertainment subsidiaries that deal with businesses ranging from Time, Inc. (publishing) to Warner Music Group to HBO (programming). In 2002 TWC was the second largest cable operator in the United States, with almost 13 million subscribers. TWC has aggressively sought multiple cable systems within the same geographic locations. Known as “clustering,” this process achieves superb operating efficiencies and economies of scale.

Known as the industry leader in fiber optic cable installation and interactivity, TWC delivered the world’s first interactive cable TV service to New York in 1991. The 150-channel system, called Quantum, provided locally targeted programming as well as 57 pay-per-view channels. As the industry leader in the percentage of

subscribers in fiber-optic addressable systems (81 percent), Time Warner is well poised to progressively bring its customers into the mainstream of advancing cable technologies. In 1999 the company began an aggressive national roll out of the first phase of its new digital cable service, and by 2003 it claimed 2.5 million digital video customers. At that time, TWC offered high-speed Internet connections and was preparing to launch an Internet-based local phone service.

Charter Communications. Charter Communications is a relative newcomer to the cable industry. Founded in 1993 in St. Louis by Harold Wood, Barry Babcock, and Jerry Kent—all former executives of Cencom Cable Associates—Charter Communications was the tenth-ranked cable operator in 1998 when it was acquired by Microsoft cofounder Paul Allen for \$4.5 billion. Earlier in the year Allen had acquired Marcus Cable for \$2.8 billion. Marcus and Charter each had about 1.2 million subscribers at the time, giving Allen control of 2.4 million subscribers and making his company the seventh-largest MSO. Additional acquisitions allowed Charter to become the fourth-largest cable operator in 1999, and the third largest by 2002. At this time, it served customers in 40 states and offered broadband services like other industry leaders.

Cox Communications. In 1999 Gannett Co. exited the cable industry by selling its cable subsidiary, Cablevision, for \$2.7 billion to Cox Communications. Cablevision served about 522,000 subscribers in Kansas, Oklahoma, and North Carolina. Following a string of acquisitions for Cox, the addition of Cablevision’s subscribers gave Cox a base of six million subscribers, putting it at the number five industry position. By 2002 Cox had grown to be the fourth-largest industry player and was engaged in high-speed Internet services. In addition, the company was making capital investments that would enable it to provide telephone services.

Direct Broadcast Satellite Companies. The two leading DBS companies in the early 2000s were DirecTV Inc. and EchoStar Communications Corporation. After acquiring PrimeStar, DirecTV had 7.8 million customers at the end of 1999. By 2003, this number had increased to 10.5 million. DirecTV was a unit of Hughes Electronics Corporation, which provided digital television entertainment and satellite and wireless systems and services. Hughes Electronics in turn was a unit of General Motors Corporation.

Headquartered in Littleton, Colorado, EchoStar Communications Corp. was founded in 1980 and filed for a DBS license in 1987. It established EchoStar Satellite Corporation to build, launch, and operate DBS satellites, and in 1992 was given a DBS orbital slot. In 1995 the company established the DISH (Digital Sky Highway)

Network and launched its first DBS satellite. EchoStar achieved rapid growth during the early 2000s, expanding its customer base from 3 million in 1999 to more than 8 million by early 2003.

AMERICA AND THE WORLD

The cable industry is highly regulated, not only in the United States but also overseas. As a result, high entry barriers exist, causing companies to compete on a national basis. U.S. companies serve U.S. subscribers, European companies serve European subscribers, and so on. Because the U.S. market is saturated, American companies are looking to expand overseas in an effort to sustain growth. Asia, Latin America, and Europe have been identified as areas with high potential. The strategies companies are pursuing to break into overseas markets include joint ventures and alliances.

The major obstacles companies must overcome to become global are government regulation and lack of infrastructure. In Asia, for example, most governments still maintain tight control over the industry, which limits a foreign national company's ability to compete. Often, they restrict the screen time allotted to foreign programs and limit transponder hours. Cultural and industrial issues influence government regulation. Japan and Malaysia worry that foreign programming could upset the country's social harmony, while local monopolies exert their influence to prevent competition.

However, market demands are forcing Asian governments to either loosen the grip of state broadcasting monopolies or set up new channels to meet the demands of viewers for higher quality programs. Hong Kong is leading the change in Asia, with Singapore, South Korea, and Taiwan following.

Regulations in Europe are easing slightly. The presence of the European Union has allowed for the development of some unified standards. However, European countries are reluctant to allow U.S. companies to expand into their markets due to cultural differences.

Lack of capacity is also a major factor limiting U.S. companies' entrance into foreign markets. There is a need to develop a cable infrastructure in growth regions. For example, there are simply not enough satellite transponders servicing overseas locations. In the United States, there is one transponder for every 300,000 people. In Europe, the ratio is one per 1 million people, while in Asia it is one per six million people. Using the existing system can be costly to a broadcaster. The broadcaster can expect to spend \$1 million to \$1.5 million American dollars per year to rent a transponder. In addition, there are usually local government license fees, plus fees to landlords for the use of high-rise apartments.

In addition, Latin America suffers not only from a severely lacking cable infrastructure, but also a lack of financial resources. This has led regional cable companies to rely on MMDS as the transmitting method. MMDS, although still regarded as a start-up technology, has proven to be a low-cost, reliable method of delivering pay television, relative to cable and satellite broadcasting.

The cable industry will never be more than a multidomestic industry as long as regulation denies ownership of all or a majority share of a local cable company by a foreign organization. The opportunities for growth in the emerging markets will be enjoyed by local companies, but the opportunities for cross-border operations still exist. A lack of technology and programming expertise provides opportunities for U.S. companies to partner with the regional operators to gain footholds in overseas markets, preempting European and Asian providers. However, as these new markets grow, they will develop the programming to cater to local preferences and culture. To stay competitive, U.S. companies will have to adapt and develop programs for these new markets, instead of just offering dubbed-over U.S. programming.

RESEARCH AND TECHNOLOGY

Cable television companies have implemented system upgrades using digital compression and fiber-optic cable. They also are meeting consumer demands for fast access to the Internet by providing high-speed cable modems.

Although there have been a number of advances in cable technology, the most promising is digital compression. Compression technologies enable broadcasters to squeeze several channels of video programming onto a single existing channel in much the same way as compression software conserves storage space on a computer. Compression converts the analog signals, currently used in broadcasting, to digital signals. This allows 10 channels to be transmitted along the same bandwidth of coaxial cable that would normally be capable of handling a single uncompressed signal. Compression would allow cable companies to offer more than 500 channels.

Even with the advent of compression technology, coaxial cable does have its limitations. Coaxial cable uses radio waves to transmit video images. Its drawbacks include a limitation on the number of signals that can be transmitted simultaneously and the distance that such signals can travel before they begin to degrade. Its advantage is that it is already installed in millions of homes across the country. Fiber-optic cable, on the other hand, uses light to transmit video images. It is superior to coaxial cable in terms of bandwidth or signal capacity, transmission speed, signal distance, and clarity. However, fiber-optic cable has a daunting limitation—it is prohibitively expensive.

Fiber-optics technology has allowed companies to develop "video-on-demand," an interactive service that allows customers to order the transmission of movies and special events and view these programs at their leisure. These systems are expected to be able to handle high-definition television and provide links to computers, facsimile machines, and personal communications networks.

The development of cable modems has allowed cable companies to enter the Internet access business. At a time when established providers have struggled to deal with quickly expanding numbers of Internet users, cable operators hope to use the superior speed of cable modems to lure away their customers. Cable modems take advantage of the industry's use of coaxial cable, which can provide transmission speeds up to 400 times faster than traditional phone lines.

SIC 4899

COMMUNICATIONS SERVICES, NOT ELSEWHERE CLASSIFIED

This category covers establishments primarily engaged in furnishing communications services not elsewhere classified. Examples of such services include radar station operation, radio broadcasting operated by taxicab companies, satellite earth stations, satellite or missile tracking stations operated on a contract basis, and tracking missiles by telemetry and photography on a contract basis. Establishments primarily engaged in providing on-line information services on a contract or fee basis are classified in **SIC 7375: Information Retrieval Services**.

NAICS CODE(S)

513322 (Cellular and Other Wireless Telecommunications)

513340 (Satellite Telecommunications)

513390 (Other Telecommunications)

INDUSTRY SNAPSHOT

Because of an increased interest in communications technologies and information transmission, satellite systems have been driving growth and commanding high visibility in **SIC 4899: Communications Services, Not Elsewhere Classified**. Difficult economic times and a weak telecommunications market had a negative impact on the industry during the early 2000s. Continued expansion depends on increased demand for services to small mobile satellite terminals and telephones, the need for more television relay services, expansion of the Internet, and the growth of direct television broadcasting via high-powered satellites. By the early 2000s, many weather, communications, and remote-sensing satellites were in operation, along with a number of multiple-satellite systems.

ORGANIZATION AND STRUCTURE

Commercial space launches, satellite communications goods and services, and satellite remote sensing are the major segments of this industry and provide the bulk

of its revenue. Voice and data communications, mobile services, vehicle tracking and navigation, and broadband data transmission for the Internet are growing segments. Beginning with its inception in the 1960s, this industry has been the realm of government agencies, the military, and international consortia. In recent years, however, new technologies and increased privatization have resulted in new applications for satellite services and earth stations.

Communications Satellites. Communications satellites allow the exchange of live television programs and news and sports events—such as the Olympics—between nations and continents. Linking earth stations located in more than 50 countries carry international telephone services. Communications satellites transmit signals via microwaves, which are very short radio waves sent from or received by bowl-shaped reflectors or from antennas. Earth-based (terrestrial) systems send out extremely high frequency signals from transmitters to repeater stations and back to receivers. The waves form narrow beams, which travel in straight lines. For this reason, receivers must be located within line of sight of one another and usually are placed on towers. Transoceanic microwave systems became feasible with the advent of satellite technology.

Satellite systems work in much the same way as terrestrial systems, except that the signals are relayed from an earth station to an orbiting satellite. The equipment aboard the satellite receives these signals, amplifies them, and rebroadcasts them to another earth station. Satellites are better suited for long-haul, single-to-multipoint transmissions than are terrestrial systems, because they are not susceptible to being blocked by geographical obstructions. Satellites also are preferable for reaching regions where the cost of laying cable would be prohibitive. Their large bandwidth accommodates a variety of video and data transmissions. Compared to terrestrial systems, satellite systems have the disadvantages of echo, less signal security, and a slight transmission delay, which varies according to the altitude of the satellite.

As a transmission technology, communications satellites also compete with fiber-optic cables because both systems transmit data. Over time, the cost of transmitting information via satellite has become almost as low as the cost of transmitting via land. It is unlikely that one technology will win out over the other, because each has its advantages. In fact, a study done by COMSAT Corp. showed that cable and satellite technologies complement one another in many respects.

The satellites considered to be the most competitive alternatives to cable are Ku-band, beam-hopping, multibeam satellites. These conserve energy by allowing simultaneous switching among beams. Other cable com-

petitors are C-band, fixed multibeam satellites that use a series of beams but do not permit rapid switching between them. The beam-hopping, multibeam system costs an estimated 27 percent less than cable, whereas the fixed multibeam is estimated to cost nearly half as much as cable.

The part of a communications satellite that is “for sale” is the transponder, which broadcasts signals. Transponders are transmitter/receiver devices. Early satellites had single transponders, but by the 1990s some satellites had as many as a dozen or more (leased full-time or occasionally). The cost of leasing varies, depending on variables such as the time of day, frequency, power, duration of lease contract, orbital position, and type of satellite. In recent years, the rate for domestic analog C-band channels ranged from \$200 to \$600 per hour, or \$55,000 to \$230,000 per month. Leasing a higher frequency, Ku-band transponder ranged between \$250 to \$800 per hour, or \$150,000 to \$210,000 per month.

Fixed and Mobile Services. Fixed satellite services (FSS), which include fixed broadcasting, data transmission, and telephone service, have accounted for about 85 percent of all U.S. satellite service revenues. An estimated 65 percent of these revenues were generated by video transmissions for news feed services, cable TV networks, and national broadcast networks. The advantages of communications satellites have made their services attractive for “narrowcasting” applications for educational or corporate programming. Private business television (BTV) is a rapidly growing area of information transmitted via private networks with very small aperture terminals (VSATs). Users have grown to rely on these systems for intracorporate data, video, and telephone communications. Retail companies use VSATs for credit card authorization and remote inventory control, and the travel industry relies on VSAT services for its reservation systems.

Mobile satellite services (MSS) are a more recently developed services market. Whether mobile satellite services will continue to expand will depend on the allocation of enough of the radio frequency spectrum to accommodate multiple communications systems. Market growth will depend in part on the success of newer technologies based on clusters of microsatellites in low orbits, as opposed to traditional technologies based on very large, high-cost satellites in geostationary orbits. Satellites in lower orbits are less expensive to build and launch, but more of them are required to cover the same areas as a larger satellite in geosynchronous orbit. Satellites in low earth orbit are referred to as LEO systems.

Both domestically and abroad, land mobile satellite services (LMSS), which include applications such as navigational services, cellular telephone services, and

digital radio, are expected to be the fastest-growing MSS application. About 80 percent of mobile satellite service revenues come from LMSS applications, such as location and messaging services for trucks; aviation and shipping make up the balance of the mobile market.

Remote Sensing. Remote sensing is the gathering and storage of information around the earth's surface—such as weather patterns—via optical and infrared cameras, radar, or other sensing equipment in an orbiting spacecraft. Uses for remote sensing satellite data include agricultural forecasts, shipping, fishing, oil and mineral prospecting, cartography, forestry, and pollution surveys.

BACKGROUND AND DEVELOPMENT

Between 1958 and 1963, the United States launched several experimental communications satellites, including Score, Echo, Telstar, Relay, and Syncom. Built by American Telephone and Telegraph Co. (AT&T), Telstar was launched on July 10, 1962. Telstar was powered by solar cells and chargeable batteries, and it demonstrated international satellite communications capabilities by transmitting American speech and television transmissions to Europe. In December of the same year, NASA launched its communications satellite, Relay, for communication experiments. On July 26, 1963, Hughes Aircraft Co.'s Syncom II, the first synchronous communication satellite, was launched by NASA. Hughes' Syncom III, launched the following August, relayed the first sustained trans-Pacific television broadcast during the 1964 Olympics.

Many satellites have been launched for military use. The largest satellite ever built (1,600 pounds, versus less than 200 for most satellites) was launched in 1969 and was designed for use by the U.S. Army, Navy, and Air Force in communicating with mobile field units, aircraft, and ships. The first commercial satellite, Early Bird, was launched in April of 1965. Commercial activity in this sector heated up in the 1980s following new federal policies to privatize space activities. The technology used in commercial satellites, such as satellite launch vehicles and guidance systems, was originally developed for military purposes.

In 1962, the U.S. Communications Satellite Act provided that the sole right of U.S. ownership of satellites for international communications would rest with a single private corporation, the Communications Satellite Corp. (Comsat), which was incorporated in 1963. This move prompted European common carriers to band together into a consortium. In August of 1964, the International Telecommunications Satellite Consortium (Intelsat), an international corporation for the construction, launching, ownership, and operation of communication satellites, was established. Intelsat is an international not-for-profit consortium of 143 countries whose members contribute

capital in proportion to their use of the system and receive a return on their investment. All users pay Intelsat utilization charges, which vary depending on the type, amount, and duration of the service used. The Intelsat system provides four major services to users in more than 180 nations: public switched telephone services, private line network (business) services, broadcasting (video and audio) services, and domestic and regional services. The Intelsat system is accessed by thousands of earth stations, ranging in size from 50 centimeters to 30 meters. COMSAT is the U.S. government's representative to Intelsat and is the sole source of access to Intelsat for U.S. companies.

A new generation of satellites was launched in the early 1990s to replace aging satellites with higher powered, higher capacity models, many with combinations of both C-band and Ku-band capacity. The life of a satellite is determined by its altitude and how much fuel it has to power the onboard rockets that keep it in its orbital pattern. This fuel usually runs out after about a decade of operation. The new satellites contain twice as many transponders as their predecessors and have the digital compression technology to expand their capacity by squeezing several channels of video per transponder. One example of the new breed of high-capacity satellites is AT&T's Telstar 401, which began operation in January of 1994. Telstar 401 has 24 C-band transponders and 24 Ku-band transponders.

Demand was expected to remain high for small, low-cost satellites, called lightsats and microsats. Lightsats weigh less than 1,000 pounds and microsats less than 250 pounds. These smaller models are increasingly the models of choice for new communications systems. In 1994, Hughes Communications Inc. began its direct-to-home satellite service, DirecTV, which incorporates the United States' first high-powered direct broadcast satellite. DirecTV delivered more than 150 channels of programming to homes using 18-inch dishes and receivers. Similar services were launched by RCA Corp. and other companies.

An offshoot of direct-to-home satellite communications was the use of DSS technology to facilitate computer communications. Competing directly with the telephone companies and the new cable modems announced by the cable industry, the satellite industry—led by DirecTV—began offering high-speed satellite links to the Internet. According to DirecTV, its direct broadcast satellite (DBS) system, when combined with a personal computer, would allow consumers to receive digital video programming and a variety of new entertainment, multimedia, and interactive data services on their PCs. The key advantage of the system was its speed. At up to 30 megabytes per second (mbps), the new DirectPC system allowed users to download information and files

more than a thousand times faster than standard modem connections.

At the end of the 1990s, satellite-based communication was poised for great expansion. In 1996 there were 54 commercial satellites in orbit around the earth, but by 1999 the number had more than tripled (to 175), and more than 500 were scheduled to be launched in the next three to five years. Most of these were elements of systems or constellations of multiple satellites, ranging from a few GEO satellites to hundreds in low earth orbit (LEO). Although the number of such systems changed as the sponsoring companies consolidated their efforts and new proposals were put on the table, there were about 29 constellations launched or planned in 1999. These systems targeted four different applications: voice, broadband data transmission, messaging, and geodesy and navigation.

The first of these new systems to actually get into service was Iridium, a 66-satellite network for mobile telephone service. It began voice and pager service in 1998 but filed for bankruptcy protection in August 1999. It had problems with supplying its handsets, which also were very expensive compared to a regular mobile phone, and its per-minute charges were high. These factors, combined with other marketing and support failures, resulted in much slower growth in the number of subscribers than was expected, and the company was unable to meet some of its debt payments.

ICO Global Communications, another voice-oriented satellite venture, also filed for bankruptcy protection in August 1999, in part because the problems with Iridium made it difficult to attract the investors it needed to proceed. ICO stands for Intermediate Circular Orbit, which is another name for medium earth orbit (MEO). Service was expected to start in summer of 2000, using a system of 9 or 10 MEO satellites. ICO began as a spin-off from Inmarsat, which offered an expensive mobile voice service previously and uses technology already proven in service. Globalstar, the second voice-oriented system to begin service, suffered a major setback when it lost 12 satellites in a failed launch in September 1998. Nevertheless, it began limited "friendly user" service in October 1999. The full system was designed to use 48 satellites and cover the world between 68 degrees north and south latitudes. Its initial service coverage was much smaller.

Satellites were expected to provide 10 to 15 percent of the global broadband Internet and data transmission service early in the twenty-first century. This market was projected to grow from \$200 million in 1999 to \$37 billion by 2008, according to Pioneer Consulting. The most ambitious and well publicized broadband scheme was Teledesic, which dubbed itself "the Internet in the Sky." Its initial backers were Bill Gates, CEO of Microsoft, and Craig McCaw, highly successful pioneer of

cellular telephone service. It was planned to use 288 LEO satellites to provide Internet access anywhere in the world, beginning service in 2004. Systems planned to compete in this market included SkyBridge, an 80-satellite LEO constellation backed by Alcatel, the Paris-based telecommunications equipment manufacturer, and Spaceway, a constellation of GEO satellites backed by Hughes Electronics, the leading U.S. satellite builder and operator. Hughes also has filed with the Federal Communications Commission (FCC) for a MEO constellation of 20 satellites and another GEO system of 14 satellites.

A number of satellite ventures designed to forward messages—short non-voice transmissions—were planned or underway. Although much less glamorous than global mobile telephone or broadband Internet access, these systems have immediate real-world applications. Orbcomm had 35 of its satellites in orbit by 1999, out of a proposed 48. The Orbcomm system was designed to enable businesses to track remote assets such as trailers, heavy equipment, gas storage tanks, and wells and pipelines and maintain communications with remote workers anywhere on the globe. Leo One, a 48-satellite constellation, planned to offer store-and-forward messaging. E-Sat planned a six-satellite system focused on meter reading applications.

Satellite-based navigation systems were well established by the end of the 1990s, but additional constellations were planned. The Global Positioning System (GPS), funded and operated by the U.S. Department of Defense, was a system of 24 active satellites that enabled users to determine their position using satellite radio signals. Civilian users could use the Standard Positioning Service (SPS) without charge or restriction. Glonass was a similar Russian system in use. GNSS-2 was planned by the European Community to create a navigation system independent of foreign military control.

In September 1999 the first commercial remote imaging satellite was launched. It was designed to take black-and-white and full color photographs of any place on earth. Journalists were looking forward to using its images, which were to be of much higher resolution than what was previously available. Frost & Sullivan, a technical marketing research firm, expected the market for satellite imaging to grow at an annual rate of 17.1 percent through 2005. New remote sensing satellite systems were planned, including Skymed-Cosmos, focused on the Mediterranean basin, and Tsinghua, designed for disaster monitoring. Remote sensing using single satellites already was well developed by the end of the 1990s.

CURRENT CONDITIONS

Challenging times existed within the communications services industry during the early 2000s. Partially to blame was a downturn in the telecommunications sector.

Ambitious telecommunications infrastructure build-outs during the prosperous 1990s were not met with anticipated demand. For service providers, this led to overcapacity, high levels of debt, and, ultimately, drastic cutbacks in capital spending. By 2003 a number of providers had declared bankruptcy or were in poor financial shape. In late 2002, *The Economist* revealed that, according to investment bank Morgan Stanley, annual capital spending might decrease as much as 34 percent.

One major roadblock for satellite companies during the early 2000s was the unexpected growth of terrestrial wireless networks. Once used solely for voice communications, providers began using these networks for data transmission at ever-increasing speeds. Because of cut-throat competition among equipment companies, it became more affordable to roll out scalable wireless networks for data communications, as opposed to launching more expensive satellite networks that had to be rolled out in their entirety, thus requiring a more substantial investment up front. Conditions such as these hindered Teledesic's ability to move forward with its plan to build an "Internet in the Sky." In late 2002 the company cut most of its staff and halted construction of the first two satellites it had ordered.

The industry faced other challenges as well. In the August 2002 issue of *Communications Today*, SES Americom CEO Dean Olmstead explained that in-orbit spacecraft defects and high levels of capital investment in complicated systems for which there was not sufficient demand were but two factors contributing to the industry's woes. Olmstead also criticized the industry for "pursuing a business model that no service provider will make a financial commitment to back."

Despite these bleak conditions, the Satellite Industry Association (SIA) reported that on a worldwide basis, the industry fared relatively well during the early 2000s. Industry revenues climbed from \$73.7 billion in 2000 to \$78.6 billion in 2001, and then reached \$86.8 billion in 2002. Satellite services continued to represent the lion's share (57.5 percent) of these revenues. According to the SIA, this category almost tripled in size between 1996 and 2002, fueled by demand for consumer video services. Within the services category, the majority of revenues (\$42.5 billion) were attributable to subscription and retail services, with the remainder coming from the satellite transponder leasing. Throughout the world, 2002 sales related to satellite launches rose 23 percent. However, within the United States a decrease in the number of launches and falling prices caused sales to fall 9 percent. Satellite manufacturing sales climbed 27 percent in 2002, rising from \$9.5 billion in 2001 to \$12.1 billion in 2002. Within the United States, sales increased 16 percent during this time period, climbing from \$3.8 billion to \$4.4 billion.

INDUSTRY LEADERS

The leading satellite company, as opposed to generic space company, is Hughes Electronics, a subsidiary of General Motors. Now almost entirely a builder and operator of satellites, its revenues in 2002 totaled \$8.9 billion. One of Hughes' subsidiaries, DirecTV, had 10.5 million subscribers to its satellite TV service in early 2003. Competitor EchoStar Communications Corp., which operates DISH Network, had 8.1 million subscribers.

Boeing is the world's largest space company, but is not a major player in the satellite business. Lockheed Martin, also a leading space company and the world's top defense contractor, became involved in the industry after acquiring Comsat Corp. in the late 1990s. Loral Space and Communications was another industry leader in the early 2000s, earning \$1.2 billion in 2002. According to the company, in addition to serving as the second-largest commercial satellite manufacturer, it also is an international leader in the area of "fixed satellite services, including transponder leasing for corporate data networks, broadband data transmission, content services and Internet connectivity."

Formerly known as Orbital Communications Corp. (OCC), ORBCOMM LLC operates a network of 30 low earth orbit (LEO) satellites and "terrestrial gateways" that are used for messaging between remote workers and to monitor everything from pipelines and storage facilities to construction equipment, trucks, trailers, rail cars, shipping containers, and aircraft. The company filed for bankruptcy in 2000 and came under new ownership in 2001.

SIC 4911

ELECTRIC SERVICES

This industry classification includes establishments engaged in generating, transmitting, and distributing electricity. Establishments providing electric services in combination with other services, where the electric services account for less than 95 percent of revenues, are classified in **SIC 4931: Electric and Other Services Combined**; **SIC 4932: Gas and Other Services Combined**; or **SIC 4939: Combination Utilities, Not Elsewhere Classified** according to the major service supplied.

NAICS CODE(S)

- 221111 (Hydroelectric Power Generation)
- 221112 (Fossil Fuel Electric Power Generation)
- 221113 (Nuclear Electric Power Generation)
- 221119 (Other Electric Power Generation)
- 221121 (Electric Bulk Power Transmission and Control)
- 221122 (Electric Power Distribution)

INDUSTRY SNAPSHOT

The electric service industry is less than 150 years old, but it runs America. In the span of a century, electricity replaced gas as a preferred means of lighting and succeeded steam engines in many growing industries. Electric service utilities are the nation's largest business,

gauged according to capital investment and market value. Electricity is so widely available in modern American society that service disruptions are newsworthy. Throughout the twentieth century, its use consistently increased. Although industry forecasters disagree about how rapidly demand will continue to grow, they generally agree that demand for electricity will continue to increase into the foreseeable future.

Electricity is measured in watts. A watt is a basic unit of electrical power equal to about 1/746th of one horsepower. A kilowatt is equal to 1,000 watts; a megawatt is equal to one million watts; a gigawatt is equal to one billion watts. Electricity is sold in kilowatt-hours (kWh). One kWh equals the amount of electrical energy needed to keep 10 100-watt bulbs burning for one hour. Not all the electricity generated is available to be sold. Some is used by the power plant and some is dissipated during transmission and distribution. Furthermore, because electricity cannot be stored, it must be used or lost.

The Energy Policy Act of 1992 marked the beginning of the deregulation of the electric services industry. By 1999, almost half of the states had passed, or had pending, new legislation that provided for restructuring of the industry, open access to transmission lines, and wholesale/retail competition among producers, transmitters, and distributors of electricity.

At the beginning of the twenty-first century, the electric power industry in the United States was in disarray. Service reliability became a serious issue during 2000 when segments of California experienced power shortages and outages. Later, questions were raised concerning whether power companies had artificially engineered the shortage to drive up prices. Accounting scandals made headlines when power-giant Enron was forced to declare bankruptcy after its accounting practices were revealed as fraudulent. The fallout from the Enron scandal brought on a sudden and severe lack of trust in the public trading of power. In turn, the industry experienced a debilitating liquidity and capital problems. These difficulties all took place in the midst of fragmented and inconsistent state-led deregulation efforts conducted in the middle of a recessive economy. Profits fell, and those companies able to stay afloat reported very slim profit margins.

ORGANIZATION AND STRUCTURE

There are several kinds of electric service establishments in the United States. Investor-owned companies are owned by shareholders; cooperative utilities are owned by their members and are operated to meet members' needs. Public utilities are nonprofit government agencies such as municipalities, public power districts, and irrigation districts. The federal government also produces electricity under the direction of agencies such as

the U.S. Army Corps of Engineers and the U.S. Bureau of Indian Affairs. The largest federal producer is the Tennessee Valley Authority, which provides electricity to both wholesale and retail markets.

Although public utilities and rural cooperatives account for about 90 percent of the nation's more than 3,200 electricity utilities providers, they are generally small. Cooperative electric utilities provide service to their members, who are usually in rural areas where investor-owned electric utilities would find it uneconomical to operate because of low population densities. In 1999, there were 932 cooperatively owned utilities, 2,010 non-profit publicly owned, and 10 federally owned utilities, and 267 for-profit, investor-owned utilities.

Electricity providers differ by class of ownership and vary greatly in size, services, profitability, and organization. An integrated utility may operate its own generation plants as well as maintain its own transmission and distribution lines. Other companies may distribute electricity to customers but buy it from other producers rather than generate it. Some rural cooperatives operate with less than 100 employees and own under \$1 million in total assets. Some corporations supply electricity to customers through subsidiary companies in several states. These giant organizations may employ tens of thousands.

The North American Electric Reliability Council (NERC) was established in 1968 by the electric utility industry and consists of ten regional reliability councils. The councils are responsible for setting and maintaining standards to foster reliable service within the three power grids that supply electricity to the contiguous United States: the Eastern Power Grid (also known as the Seven Interconnected Regions Power Grid), the Western Power Grid, and the Electric Reliability Council of Texas Power Grid. As of 1998, there were more than 200,000 circuit miles of high-voltage transmission lines in the three power grids.

Electric service producers operate several types of generating stations in order to meet customers' constantly changing energy demands. Three classes of power plants are base-load, intermediate-load, and peak-load stations. Base-load plants meet the normal minimum demand of a company's customers. They are usually the largest and most efficient of a company's generating units. Intermediate-load plants handle increases in demand that are less than the highest, or peak, demands. They perform as transitional power providers and can function as standby units when unexpected problems arise. Peak-load generating stations are used to meet short-term, high demand. Peaking units are usually quick starting but the least efficient.

Electricity is created by electric generators that convert mechanical energy into electric power by rotating a

magnet within coiled wires. The mechanism that causes the magnet to rotate is called a "prime mover." Different kinds of prime movers are used to generate electricity in different circumstances. Most generators are turbines that are spun when a liquid or gas is forced against their blades. Steam, hot air or combustion gases, and water are the most common prime movers.

Steam turbines produce most of the electricity generated in the United States. The steam required to operate the turbines is created through burning fossil fuels, such as coal, petroleum, and gas, or through nuclear fission. Steam turbines generally operate in base-load power stations. Gas turbines and internal-combustion engines are most frequently used as peaking units. A type of gas turbine that operates in conjunction with a steam turbine is called a combined-cycle generating unit and is typically used for intermediate-level generation. Hydroelectric-generated power is created when flowing or falling water is used to spin a turbine. Hydroelectric units can serve as base-load or peaking stations.

BACKGROUND AND DEVELOPMENT

The U.S. demand for electricity began during the last two decades of the nineteenth century. In October 1879, Thomas Edison created the first long-lasting incandescent light bulb. In December of the following year, he founded the Edison Electric Illuminating Company in New York for the purpose of building the nation's first centralized generating plant. The company's Pearl Street station took two years to build, and on September 4, 1892, its generator was turned on. It supplied electricity for 158 lamps, 52 at the editorial office of the *New York Times* and 106 in the office of financier J. P. Morgan. A year later, the company was serving 513 customers. By the end of the decade, Edison's companies had constructed 500 isolated-generating units and 58 centralized-power stations.

Edison faced competition from George Westinghouse, a proponent of alternating current, who purchased the United States Electric Light Company. Alternating current, shunned by Edison who preferred direct current (DC), gradually emerged as the preferred form of electricity because it could be transmitted at lower costs. The industry expanded as new companies began producing the products innovators created, including longer-lasting light bulbs, different kinds of generators, and motors.

By the turn of the century, one out of every 13 factories utilized electric motors. Cities replaced gas street lamps with electric lights. Electric trolleys became a preferred mode of transportation. Generators became larger and more efficient. Technologies to transmit power over longer distances were developed. Increased production created economies of scale and lower prices. In 1892

the cost per kilowatt-hour from a centralized station was 22 cents; 30 years later the cost was seven cents.

In 1907, Wisconsin and New York became the first two states to establish independent regulatory commissions. By the end of World War I, 26 other states had established similar commissions. Under the direction of state regulators, electric service companies became public utilities instead of competitors. Regulators established service territories and granted specific companies monopolies within the territory. One motivating factor that led to the establishment of monopolies was the goal of eliminating the expense of duplicate transmission systems.

During the 1920s, holding companies acquired the largest portion of America's generating capacity. By the middle of the decade, 16 companies controlled about 75 percent of the nation's electricity. Many companies continued to operate independently, while others cooperated with neighboring utilities to form power pools, agreements under which companies shared resources to achieve greater efficiency and reliability.

In 1920, Congress enacted the Federal Power Act to regulate licensing of nonfederal hydroelectric ventures; the Federal Power Commission was created to enforce its provisions. The act was amended in 1935 to include regulations for interstate transmission, and monitoring rates for wholesale transactions of electric power.

By the mid-1930s, electric services were commonplace in urban but not rural areas. An estimated 85 percent of farms still had no electricity. On May 11, 1935, President Franklin Roosevelt created the Rural Electrification Administration to fund projects undertaken by rural cooperatives.

In 1935, Congress passed the Public Utility Holding Company Act (PUHCA). PUHCA outlawed pyramiding and limited holding companies to single-integrated operating systems. The act was opposed by the nation's large holding companies, which had to reorganize in accordance with its provisions.

World War II brought increased demands for electric power. Following the war, further improvements in generators and transmission technologies increased the availability of low-priced electricity. Between 1945 and 1965, the average generating plant size multiplied sevenfold and demand increased at a rate of approximately 7.8 percent per year. The 1940s also ushered in the nuclear era. On December 3, 1942, Enrico Fermi created the first self-sustaining nuclear chain reaction. The first usable electricity generated by atomic power occurred at the Argonne National Laboratory in Idaho on December 20, 1951. In 1957, the Shippingport Nuclear Station in Pennsylvania became the country's first nuclear plant to supply electricity to a utility's power grid.

During the 1960s nuclear power gained prominence. Seven new reactors were ordered in 1965, 20 in 1966, and 30 in 1967. Despite growing anti-nuclear sentiments among segments of the U.S. population, nuclear power continued to contribute a growing amount of electricity to the nation. In 1979, an accident at the Three Mile Island station in Pennsylvania led to increased scrutiny of the nuclear power industry and new regulations exacerbated the financial difficulties many nuclear projects faced.

No new domestic orders for nuclear power plants have been placed since 1978, but electric utilities have continued to complete plants that were under various stages of construction. From 1980 to 1990 the number of operating nuclear plants in the United States increased from 70 to 111.

Other transformations also challenged the electric service industry during the 1970s. The Arab oil embargoes of 1973 and 1979 disrupted fuel oil supplies and increased prices. Inflation and high interest rates caused base-load plant construction costs to soar. Measures necessary to protect the environment brought increased regulatory requirements. As prices increased and the economy slowed, demand dropped to under 3 percent per year.

In 1977, Congress created the Department of Energy. The Federal Power Commission was abolished and its responsibilities were split between the Department of Energy and the Federal Energy Regulatory Commission (FERC). In 1978, Congress passed the Public Utility Regulatory Policies Act (PURPA). One of PURPA's goals was to encourage conservation and efficiency in power generation. PURPA injected competition into the electric service industry by requiring utilities to purchase electricity from certain producers defined as "qualifying facilities" (QFs). As a result, cogeneration facilities (plants that produced electricity along with other forms of energy) and small producers relying on renewable resources such as water, wind, solar, and geothermal power began supplying power to the nation's power grids.

By 1988 nontraditional producers of electricity produced six percent of the total generation in the United States. Forecasters expected independent producers to play an increasing role and to provide as much as 15 percent of the nation's power by the end of the twentieth century.

As the electric services industry entered the 1990s analysts debated whether new generating capacity was necessary. Many older base-load plants were reaching the end of their licensed operating span. An estimated 25 percent of the country's fossil-fueled generating plants were scheduled to reach the end of their planned life span by the year 2000.

The approach of the twenty-first century left many problems unsolved and questions unanswered: the growth of non-utility generating companies led to questions about accessing transmission lines, a comprehensive national nuclear waste management program remained elusive, forecasters disagreed about whether the nation possessed sufficient generation capability to meet demands in the new century, and provisions of the Clean Air Act Amendments of 1990 required changes in generation technologies.

In addition to regulations on gaseous emissions, the Clean Air Act of 1990 listed 189 elements and compounds to be studied to determine regulatory requirements for their emission. One element was mercury. During normal operations in coal-burning generating units, mercury turns into a gas that can escape regular emissions collection systems. Because of the environmental problems inherent in fossil-fueled generation, some utilities expressed a renewed interest in nuclear generation. Nuclear fission creates heat without producing combustion by-products. Consequently, its proponents offered it as a clean alternative to fossil fuel.

Also in 1990, the Nuclear Power Oversight Committee identified 14 issues that needed to be addressed before substantial expansion of America's nuclear generating capacity would be practical. The areas included improving operations at existing plants, resolving waste storage issues, establishing consistent regulations and standardized reactor designs, political support, and available financing.

Non-utility generating companies represented a likely source of additional power production in the early 1990s. In 1992, Congress passed a comprehensive Energy Act that removed restrictions on independent power producers and opened wholesale markets to competition. Under the terms of the legislation, independent power producers were granted access to utility transmission lines. In addition, the act enabled large holding companies to operate in multiple states more freely.

The North American Electric Reliability Council estimated that national reserve capacities, a measure of unused generating ability, would drop below 20 percent by the end of the century and that in some areas reserve capacity would fall more. Some industry analysts calculated that high demand increases would accompany a recovering economy. They predicted reserves would be insufficient to meet the nation's needs in the twenty-first century. The Energy Information Association, an agency of the Department of Energy, projected demand increases between 1990 and 2010 in the range of 1.3 to 1.9 percent per year.

By the mid-1990s, the electric services industry had entered a period of radical change. Technological ad-

vances and an increasing demand for customer choice had prompted public utilities commissions in over 20 states, as well as the FERC, to propose deregulation of electricity generation, slowly exposing existing monopolies to competition, and giving consumers the opportunity to buy power from any broker or supplier, not just their local monopoly.

On April 24, 1996, the FERC officially opened the electric services business to competition with two separate rulings, Order Nos. 888 and 889. Order No. 888 required that public utilities offer to sell electric power to other providers or utilities at the same rates they charged themselves. At the same time, the utility providing transmission service (the "wheeling utility") would be compensated for the use of its lines. Order No. 889 required electric utilities to establish electronic systems to share information about available transmission capacity.

By 1997, competition in the industry had accelerated dramatically, spurred by the rise of a growing number of independent power producers, brokers, and energy marketers. In the third quarter of 1996 alone, these tough new competitors sold enough electricity to power 31 million homes—this from an industry that had not even existed a few years earlier. Independent producers and marketers came in all sizes, from small brokers such as California-based New Energy Ventures to Houston-based giant, Enron. During 1998, California, Massachusetts, and Rhode Island added to the ranks of states that opened their retail electricity markets. As of April 1999, there were 19 states with legislation allowing retail competition.

The deregulation of the industry also created spin-off markets in wholesale auctions of electricity and the trading of electricity futures and options contracts on the New York Mercantile Exchange (NYMEX). Moreover, a new type of monopoly entered the market. In 1998, almost two-thirds of electric utilities did not have their own generating capacity; about 55 percent of domestically consumed electricity had been sold to the utilities by other utilities or non-utilities. When power producers began increasing their use natural gas, a new utilities super-power appeared on the horizon. Instead of natural gas companies buying out their smaller natural gas competitors, they began buying out electric utilities companies to provide multiple services to end-users. Thus, by the millennium, some of the largest utilities providers were in fact "hybrid" entities offering both electricity and natural gas services to their customers. Consequently, by 1999, the new monopolies were power companies that generated, transmitted and distributed electricity, plus offered consumers their natural gas and sometimes their water, all on one monthly bill.

A newcomer to industry jargon in 1998 was the Independent System Operator or "ISO," which the in-

dustry set up to operate power transmission systems as the competition in the wholesale market intensified. Five ISOs were operating across the nation in 1999, to ensure non-discriminatory access to transmission grids.

Sales of electricity to ultimate consumers increased by 3.2 percent in 1998, for a total of 3.24 trillion kWh. The industry generated \$218 billion in sales for 1998, although the national average revenue per kWh decreased for the fifth year in a row. Coal remained the leading source for power generation, holding about 51.7 percent of the 1998 market, followed by nuclear power (18.6 percent) and natural gas (15 percent). Nuclear powered generation actually dropped between 1995 and 1998, but the nation experienced sustained above-normal temperatures during the summer of 1998, resulting in high demands for electricity; seven nuclear units that had been out of service were restarted during 1998. Residential end-users captured the largest share of the market, at 35 percent, followed by industrial users at 33 percent and commercial users at 29 percent.

With respect to environmental concerns, air emissions from electric utility fossil-fueled plants were estimated to have increased in 1998. The largest noxious agent, carbon dioxide, increased by an estimated 3 percent in just one year.

CURRENT CONDITIONS

The electric power industry got off to a rough start in the twenty-first century, with the dark cloud of distrust hanging over the sector after California experienced severe power shortages and outages during 2000 and 2001 and Houston-based Enron was raked over the coals for fraudulent accounting practices. Although energy merchants tried to stem the flow from the Enron scandal, in July 2002, El Paso Corp., Reliant Energy, Duke Energy, and Dynegy, among others, were accused of creating artificial shortages the previous year to drive up prices, causing another sharp decline in utility stocks and consumer and investor trust.

Distribution sales began to fall in the second quarter of 2001, by 3 percent, and continued to fall every quarter through 2002. Total sales during 2001 for the 250 largest distributors of electrical power fell by 8.4 percent to an estimated \$36.9 billion and profits reported in 2002 decreased approximately 3 percent from 2001. Although the industry was forecasted to move toward recovery during the second half of 2003, the transition toward positive growth was expected to be slow.

The patchwork efforts at deregulation added further to the industry's instability. When the industry deregulated, too many power plants were built too fast, causing a surge in the margin between supply and demand. Supply was at its highest since 1992, but in 2001 demand was at its lowest since 1987. As a result of lack of investor

funding, continued construction of power plants has been scaled back. Only one out of every seven proposed new plants that has received government approval is actually under construction. Nonetheless, the supply-demand margin is expected to double by 2004. A rebound in the economy, a return of cold weather, and new standardized federal regulation are expected to help stabilize the industry in the upcoming years.

INDUSTRY LEADERS

Reliant Resources, a subsidiary of CenterPoint Energy (formerly Reliant Energy) provides energy to more than 13 states, South America, and India. The company serves 1.6 million electricity customers and 2.8 million natural gas customers in the United States alone. It reported 2002 sales of \$11.6 billion, but a net loss of \$560 million.

American Electric Power (AEP), the top North American energy trader in the United States, distributes electric power to nearly 5 million customers in 11 states. AEP reported sales in 2002 of \$14.6 billion, but a net loss of \$519 million.

Duke Energy is the leading energy marketer in the United States with an array of power generation, transportation, and distribution capabilities. The company distributes power to two million customers in North Carolina and South Carolina. Revenues in 2002 totaled \$15.7 billion with a net income of \$1 billion. Even though the company remained profitable during 2002, net sales and net profits were down from 2001 totals by nearly 74 percent and 46 percent, respectively.

Other leaders include Xcel Energy and TXU. Xcel, which distributes electric power to nearly 3.2 million customers, reported 2002 sales of \$7.2 billion but a net loss of \$3.9 billion. Dallas-based TXU provides electricity to 2.7 million customers. It reported a net loss of \$4.2 billion on sales of \$10 billion in 2002.

WORKFORCE

Despite reductions in numbers of workers, the electric services industry continues to be a major employer, providing jobs for 369,820 people in the 2001, according to the U.S. Department of Labor, Bureau of Labor Statistics. The utility industry employs people in four major areas: generation, transmission, distribution, and administration. Because the industry relied on emerging technology, it needed engineers and scientists as well as clerks and technicians. Electrical power line installers and repairers, the industry's largest single category of workers at 12 percent of the total workforce, earn a mean annual salary of \$48,440. Power plant operators, which account for 5 percent of the workforce, earn a mean annual salary of \$49,630.

AMERICA AND THE WORLD

In 1998, the United States led the world in net generation of electricity, with 3.6 trillion kWh produced; Japan was second. Other leaders were China, Russia, Canada, Germany, and France. The United States imported 39.5 billion kWh from Canada and exported 12 billion kWh back to Canada.

Although the United States led the world in fossil and nuclear generation, it was second in hydroelectric production. Canada was the world's top hydroelectric producer, with 319 billion kilowatt-hours of hydroelectric power generated. Canada was followed by the United States (304 billion kWh), Brazil (225 billion kWh), Russia (173 billion kWh), Norway (118 billion kWh), and China (143 billion kWh).

Nuclear power was also a method through which some countries were addressing pollution concerns. Lithuania produced a greater percentage of its domestic electricity (85 percent) through nuclear generation than any other nation. The United States produced the world's largest amount of electricity from nuclear power (673 billion kWh), yet nuclear generation accounted for only about 22 percent of its total production. Behind the United States, other top nuclear countries included France (358 billion kWh), Japan (286 billion kWh), and Germany (154 billion kWh).

RESEARCH AND TECHNOLOGY

As the electric service industry prepared for the twenty-first century, researchers were studying many potential technological innovations. Advanced light-water reactors (ALR) were being developed by General Electric and Westinghouse. Another improvement over older, conventional reactors was the use of passive safety systems, which depended on natural physical laws (such as gravity) rather than human intervention to respond to problems.

Electric utilities implemented a number of methods to reduce sulfur emissions from burning coal. Some began using a process in which the coal was crushed and treated to reduce its sulfur content. Others switched from high-sulfur content coal to low-sulfur coal. Still other utilities invested in a process called "flue gas desulfurization" (commonly referred to as "scrubbing") to remove sulfur from the gases created by combustion. One promising innovation was the development of an integrated gasification combined-cycle (IGCC) power plant. The IGCC generator was designed to use partially oxidized coal as a fuel, a process that virtually eliminated air pollutants.

In the 1990s, the combined output from all other renewable sources, such as hydroelectric, wind, geothermal, and biofuels (which included wood, waste, and

alcohol fuels), totaled only about one percent of the electricity generated in the United States. One hopeful experiment with solar generation was conducted in a California desert. Approximately 900 mirrors were set to focus light from the sun and generate 10 megawatts of power. If the project met expectations, Southern California Edison planned to consider building 200 megawatt plants using the technology. In another solar project, Southern California Edison and Texas Instruments were testing a new type of solar cell using tiny silicon balls. The material, called "Spherical Solar", held promise for application in remote sunny areas, especially Third World nations.

Developments in wind generation technology also looked encouraging. During the early 1980s wind generators produced power at an average cost of 30 cents per kilowatt-hour. By the early 1990s costs had dropped to 11 cents per kWh. Researchers hoped that improved technology would produce wind-generated power at a cost of six cents per kWh by 2010. Site selection for wind generation was critical because even small differences in average wind speed had substantial effects on the amount of electricity generated.

Another source of renewable energy under exploration was geothermal power. Most of the geothermal production in the United States was from a single plant operated by the Pacific Gas and Electric Company in California. Investigators were researching methods to extract heat from hot dry rock, which is found everywhere on earth at sufficient depths. One study underway in New Mexico during 1992 offered promising results. Scientists drilled a hole 12,000 feet deep and pumped water into it. They were able to extract 100 gallons of water per minute at temperatures high enough to generate electricity.

Not all the research underway during the decade involved power generation. Many utilities were investigating robot technology for use in operations, maintenance, transmission, and distribution. Interest in robotics intensified when utilities realized that robots could be used in potentially hazardous situations. The use of robots helped reduce human exposure to radiation following the Three Mile Island accident. Robots could also work on lines carrying live current or inside vessels with toxic substances. A robot able to perform maintenance tasks on live wires was commercially introduced and another, able to inspect high-voltage lines and towers, was under development. A pipe-crawling robot, developed by Public Service Electric & Gas's Energy Technology Development Center, was able to inspect pipes where human access was impossible and perform some types of repairs.

In 1996, the world's first utility-scale molten carbonate fuel cell (MCFC) power plant began operation in

Santa Clara, California. Generating two MW of power from natural gas without combustion and with very low emissions, the plant was part of a demonstration program closely monitored by more than 30 utilities that had signed tentative commitments to purchase commercial MCFC units.

SIC 4922

NATURAL GAS TRANSMISSION

This industry classification includes establishments engaged in the gathering, transmission, and storage of natural gas. Establishments involved in natural gas exploration and drilling are classified under oil and gas exploration industries. Establishments involved in both the transmission and distribution of natural gas are classified in **SIC 4923: Natural Gas Transmission and Distribution**. Establishments involved in natural gas distribution to end users are classified in **SIC 4924: Natural Gas Distribution**.

NAICS CODE(S)

486210 (Pipeline Transportation of Natural Gas)

INDUSTRY SNAPSHOT

Natural gas, as it exists in the ground, is not a single kind of gas, but rather a mixture of hydrocarbons, molecules made up of hydrogen and carbon, existing naturally in a gaseous state. The hydrocarbon gases include methane, ethane, propane, butane, and, frequently, impurities such as water, hydrogen sulfide, nitrogen, and helium. Methane, the lightest of the gases, is the most important gas for the energy industry. The heavier gases (ethane, propane, and butane) are sometimes included in the natural gas mixture transported by a pipeline, but usually they are removed for use in other industries, such as in the manufacture of industrial chemicals.

Traditionally, the natural gas industry has consisted of three primary activities: exploring for and producing natural gas; transporting the gas from production centers to market regions; and distributing gas to end users. Throughout the development of the industry, some companies have been involved in all three areas, while others have focused their efforts on only one or two.

The natural gas transmission segment of the industry includes gathering lines, storage facilities, and pipeline systems. In 2001, the United States had 206,000 miles of interstate mainline transmission pipeline with a daily delivery capacity of 119 billion cubic feet (bcf). Gathering lines transport gas from producing wells to facilities, where impurities are removed, and to processing plants that separate methane from other types of natural gas. Methane can then be injected into storage or sent through transmission pipelines.

The gas pipeline segment of the natural gas industry has changed little since the 1992 enactment of the Federal Energy Regulatory Commission's (FERC) Order 636, which "unbundled" pipeline operations from the sale of natural gas thus allowing customers to purchase the use of the pipelines independent of the purchase of natural gas. Because of the squeeze on the availability of capital for new investments, the industry saw little growth during the early years of the twenty-first century.

ORGANIZATION AND STRUCTURE

Within the United States, gas flows primarily in a northeasterly direction toward the eastern states and the Midwest from four major producing areas based in Texas, Oklahoma, Louisiana, and the Gulf of Mexico. A smaller, but increasing, amount of gas is transported from Texas and Canada into California. Most of the natural gas is transported through interconnected webs of underground pipelines. Individual pipes vary in size from about five feet in diameter to less than an inch. The largest pipes collect gas in producing areas; the smallest pipes deliver

gas to individual households. By the latter 1990s, more than 256,000 miles of pipeline transported the gas to 47 of the contiguous states (Vermont imported its gas from Canada).

Long-distance pipelines transport gas under pressure, usually about 1,000 pounds per square inch. The gas travels through the pipeline at a rate of about 15 miles per hour. As it moves through the system, local gas utilities and large individual users, such as industrial customers or electricity-generating power plants, make withdrawals. To keep the gas moving, compressor stations along the pipeline restore gas pressures, which otherwise would drop because of withdrawals and friction.

One advantage to natural gas as an energy source is that it can be stored. Natural gas usage fluctuates seasonally, typically showing slack demand during the summer months and dramatic increases during the winter when it is used for space heating. During times of low use, inexpensive gas can be purchased and injected into storage for use during times of high demand when the price usually is higher. Some companies meet more than half of their winter deliveries with gas from storage.

Not all gas in storage is available for use, however. In order to maintain adequate pressure in a storage reservoir, a quantity of gas, referred to as "base gas," must be maintained. The gas available to be withdrawn is called "working gas."

BACKGROUND AND DEVELOPMENT

The natural gas supplied in the United States comes from two basic kinds of sources, referred to as conventional and unconventional. Conventional gas is recovered from gas fields, both onshore and offshore. According to a traditionally held belief, conventional natural gas deposits were formed through long geological processes in combination with the decay of biological material. Under appropriate conditions, the gas became trapped in permeable rock and was covered by an impermeable cap.

Gas reservoirs consist of areas where the gas is contained within porous rocks and between the pieces that make up rocks. The amount of gas a rock formation can hold is based on how many of these tiny holes exist within the structure. Natural gas within a porous rock formation is prevented from migrating to the surface and into the atmosphere when a nonporous cap covers it.

Unconventional gas reservoirs have different geological characteristics. Some types of unconventional gas resources include: "tight gas" or "tight sands gas," which is found in low-permeability rock; "Devonian shale gas," which is found in shale deposits from the Devonian geological period, approximately 350 million years ago; "coal-bed methane," which is natural gas that has been formed along with the geological processes that

formed coal; "natural gas from geopressurized aquifers," which refers to gas dissolved under high pressure and at high temperatures in brines located deep beneath the earth's surface; "gas hydrates," which are ice-like structures of water and gas located under the permafrost; and "deep gas," which is found at levels much deeper than conventional gas. Although there is no scientific consensus, some believe deep gas originated from inorganic sources and that it exists everywhere as a result of the geological processes that formed the earth. Of the unconventional gas sources, the one most important to the gas transportation industry was coal-bed methane.

Recorded use of natural gas dates back thousands of years. The ancient Chinese used natural gas, piped through bamboo poles, to boil water to make salt. In the seventh century, natural gas transported through secret pipes fueled "eternal fires" in temples near the Caspian Sea, where people came to see the mystery and to worship.

In the United States, natural gas discoveries date back to 1775. George Washington reportedly saw flames rising from water near the location of present-day Charleston, West Virginia. That same year, other gas discoveries were made by French missionaries in the Ohio Valley.

In 1821 the discovery of natural gas in a well in Fredonia, New York, led to the nation's first pipeline. William Aaron Hart piped gas from a 27-foot-deep well to provide lighting for nearby buildings. Two other major developments occurred in 1872. The nation's first long pipeline (25 miles) was completed and provided natural gas to Rochester, New York. Also, the first iron pipeline transported natural gas, carrying it 5.5 miles to serve about 250 customers.

Toward the end of the nineteenth century, natural gas fields in Ohio, Pennsylvania, and West Virginia yielded nearly 80 percent of the natural gas produced in the United States. The National Transit Co., a subsidiary of John D. Rockefeller's Standard Oil Co., transported the largest share of the nation's gas. In 1898, Standard founded the Hope Natural Gas Co. to serve the West Virginia area, and the East Ohio Gas Co. to serve residential and industrial users in Ohio.

At the turn of the century, large gas fields were discovered in Texas, Louisiana, and Oklahoma. As a result of their discovery, national production doubled between 1906 and 1920. By 1925, approximately 3.5 million customers used natural gas, most of them living within a few hundred miles of the producing sites. Lack of pipelines and other means of transportation thwarted efforts to fully utilize the resource.

Seamless, electrically welded pipe developed in the late 1920s enabled pipeline companies to carry gas at

higher pressures. This meant that large quantities could be transported over longer distances. The world's first high-pressure, thin-wall, large-diameter gas transmission line was constructed in 1930 by the Natural Gas Pipeline Co. It transported gas produced in Texas, Oklahoma, and Kansas to the Chicago area. The nation's first all-welded, high-pressure natural gas pipeline was constructed by the Hope Natural Gas Co. in 1936.

The development of pipeline technologies made long-distance gas transmission feasible, and the 1930s brought an increased awareness of the product's potential as an important energy resource. Until that time, gas was discovered almost incidentally as the nation searched for oil reserves. If a company drilled for oil and found nothing, it could simply walk away from the dry well. Gas wells, on the other hand, were considered a nuisance, because if a company struck gas, the well had to be capped. If gas was discovered along with oil, the gas was routinely burned off, a procedure called "flaring."

The mid-1930s marked a time of changes in governmental regulation of the gas industry. In 1935, the Public Utility Holding Company Act required holding companies to divest themselves of public utility subsidiaries. As a result, ownership of many local distributing companies changed.

In 1938, in response to Federal Trade Commission reports that pipeline companies were employing monopolistic price setting practices, Congress passed the Natural Gas Act, under which natural gas became a regulated commodity. The Federal Power Commission, given the responsibility of administering the Natural Gas Act's provisions, assumed control over pipeline rates. Actual price controls on gas were not instituted until after World War II.

World War II played an important role in the development of the U.S. natural gas pipeline industry. During the war years, the Axis powers sank tankers transporting fuel oil from Texas to the eastern seaboard. To help transport oil for the war effort, the government built two large-diameter oil pipelines between 1942 and 1944. Following the war, these pipelines were sold and became part of the nation's transcontinental natural gas pipeline grid. The result was that by 1947 gas from Texas could be piped to both U.S. coasts.

Offshore drilling technologies also were developed during the late 1940s. The first offshore lease sales were held by the state of Louisiana on August 14, 1945. The first successful offshore Gulf of Mexico production began in 1947.

Technological advances proceeded as methods for underground storage were created. In 1951, Consolidated Natural Gas and Texas Eastern Transmission Corp. opened one of the world's largest underground gas storage facilities at Oakford Field in southwestern Pennsyl-

vania. At the facility, natural gas was stored in an existing, but depleted, gas field.

In 1954, the U.S. Supreme Court's Phillips decision expanded the federal government's jurisdiction by granting the Federal Power Commission the authority to regulate the interstate gas market and control gas prices. This decision created a division between interstate and intrastate sales. The division between interstate and intrastate markets, which had begun to affect the availability of natural gas as early as the mid-1960s, became more profound. Because pipeline companies could get higher prices in intrastate markets, nationwide supplies began to dwindle. In 1975, the Federal Power Commission issued Order 533, which permitted pipeline companies to transport gas on behalf of end users who purchased it directly from producers. The order was intended to help large users avoid supply cuts because of declining gas supplies on the interstate market.

Low price ceilings also affected the rates at which new gas fields were discovered. Exploration began declining during the late 1960s, and as the discovery rate dropped, some industry watchers concluded that the nation was running out of natural gas reserves.

In 1973, however, production of natural gas in the United States was at its highest at 21.7 trillion cubic feet. Increases in natural gas production helped offset reductions in oil imports due to the OPEC oil embargo. U.S. natural gas consumption also peaked in the early 1970s. During 1972, the nation consumed 22.1 trillion cubic feet and set record usage levels in the residential, industrial, and electric utility sectors.

A cold winter during the 1976-1977 heating season highlighted supply problems within the natural gas industry. Some large companies, like Consolidated Natural Gas, were forced to cut deliveries to industrial customers holding "interruptible" contracts. Typically, gas had been sold under "interruptible" or "noninterruptible" agreements. Interruptible contracts, primarily sold to industrial users with the ability to switch to other types of fuel when necessary, called for the delivery of gas when supplies were available. Noninterruptible contracts, which were more expensive, called for a guaranteed amount of gas to be delivered.

Localized gas shortages during the late 1970s caused concerns about its availability and led to increased interest in expanding storage capacities. The gas shortages also led to the Power Plant and Industrial Fuel Use Act of 1978, which placed restrictions on the use of natural gas for generating electricity and for industrial uses. Congress also passed the Natural Gas Policy Act of 1978, which called for price deregulation and increased exploration and development, especially of potential nonconventional gas supplies. The act attempted to correct the

price distinctions between interstate and intrastate markets by setting different prices on different categories of gas for both types of markets. It also made provisions to phase out wellhead price controls and to make pipelines more accessible to gas users wishing to purchase transportation services only.

Until the creation of the U.S. Department of Energy (DOE) in 1977, statistical information regarding the natural gas industry was compiled by the Bureau of Mines under the auspices of the U.S. Department of the Interior. Thereafter, the Energy Information Administration, an agency within the DOE, assumed responsibility for collecting information regarding the natural gas industry. Also during this time, the duty of regulating interstate natural gas markets was transferred from the Federal Power Commission to the Federal Energy Regulatory Commission (FERC), an independent office of the DOE.

FERC launched its restructuring efforts in the mid-1980s, and the process was completed with the issuance of Orders 636 and 636A in 1992. The new regulations were intended to promote competition within the industry and to restructure interstate pipelines by requiring them to offer their services separately rather than bundled together. Formerly, pipelines bought and sold gas at unit prices that included associated charges for transportation and storage. Without the ability to access pipeline delivery services separately from gas purchases, customers were unable to buy gas from other suppliers.

The new regulations required pipeline companies to “unbundle” services. This meant that they could not exclusively sell packages combining sales, transportation, and storage services. The restructuring orders dictated that all services be offered and priced separately. As a result, customers were allowed to buy gas from sources other than the pipeline. Consequently, many pipeline companies abandoned their customary merchant function, turning their attention toward selling gas transportation services and leasing storage capacity.

The unbundling of pipeline services brought open access to gas transportation service. Large end users and local distribution companies increasingly made separate agreements under which gas purchases were arranged with producers or brokers, and transportation services were purchased from pipeline companies.

Also, as part of its Order 636, FERC identified four types of costs pipeline companies could recover from their customers, including gas utilities, as they sought to comply with the new regulations. The costs pipeline companies were permitted to pass on were: the cost of purchased gas that would have been recaptured under previously existing bundled contracts; the cost associated with reforming or canceling remaining contracts to buy gas; the cost of abandoning facilities or contracts ren-

dered unnecessary; and the cost of installing new facilities required to comply with the regulations.

The gas transportation industry began responding to these legislative initiatives in the 1980s. Additional FERC orders issued during 1983 and 1984 addressed questions surrounding access to natural gas transportation systems. In January 1985, under the deadline set by previous regulations, most price controls on gas expired.

The environmental advantages of natural gas remain significant, especially when compared to coal, which still fuels the bulk of the electricity generated in the United States. Used as a fuel in a power plant, natural gas produces 100 percent less sulfur pollution than a coal plant; 100 percent less ash, sludge, or solid waste; 95 percent less particulate emissions; and 81 percent less nitrogen oxide emissions. According to one natural gas company, substitution of natural gas for coal globally on a 50/50 basis by the year 2010 would result in a 35 percent decrease in the volume of global carbon emissions.

In 1999, natural gas was the leading source for heating energy in the United States, holding more than 50 percent of the market. Heating oil still controlled 30 percent of the market, and electricity controlled 10 percent. The remaining 10 percent was divided among miscellaneous heat energy sources such as coal, wood, and propane. By 2010, government analysts predict annual consumption of natural gas to be near 30 trillion cubic feet. To satisfy that anticipated market, as much as \$32 billion will be needed for new pipelines, and more than \$2 billion for storage facilities.

Notwithstanding, in December 1999, FERC voted 3 to 2 to refuse certification of the proposed \$678 million, 401-mile Independence Pipeline intended to carry natural gas from the western United States and Canada to the East Coast. FERC also issued a hold on the \$528 million Transco Market Link project connecting Pennsylvania and New Jersey, as well as the \$125 million ANR Supply Link Project between Chicago and Ohio. FERC's hold was intended to address not only environmental concerns for the high-pressure pipelines, but also to address objections to the ostensible need. Meanwhile, American Natural Resources Corp. (ANR) proposed in December 1999 to build a 130-mile pipeline under Lake Michigan to connect Milwaukee, Wisconsin, with northern Indiana. Its competitor, Wicor, Inc., concurrently proposed a 150-mile Guardian Pipeline from Joliet, Illinois, to Ixonia, Wisconsin. ANR remained the top company nationally in 1999, when ranked by total gas throughput (4,511,426 Mmcf).

CURRENT CONDITIONS

Natural gas transmission is being affected by two related conditions. First, supply and demand of natural gas shifts based on the location of resources and the location of increasing demands in growth areas of the

United States. New pipelines are needed to carry natural gas from the source to customers. Second, the lack of available capital for new investments has stymied pipeline expansion. The result is a shortage of transmission capabilities in numerous U.S. locations. At the same time, these shifts provide new opportunities for future pipeline expansion.

The region of the Rocky Mountains produces more natural gas than it uses, driving prices down and lowering the incentive for new exploration and drilling. However, new efforts are being made to increase the flow of product from the Rockies into California, which continues to require more energy than it produces. Other projects have been proposed to move natural gas from the Rockies eastward. Areas of the Northeast, including New York, as well as the Southeast, have experienced some pipeline capacities strains during the early 2000s, which may eventually require the installation of additional pipeline flow capacities to meet growing demands.

Another concern for the industry is aging pipelines that suffer from deterioration and corrosion. According to the "Gas and Liquid Transmission Pipelines" sector of the Federal Highway Agency's Cost of Corrosion Report, published in 2003, corrosion-related costs associated with the transmission pipeline industry is estimated to run between \$5.4 billion and \$8.6 billion annually, with a total cost of \$541 billion to replace the 484,000 miles of pipelines.

INDUSTRY LEADERS

El Paso Energy Corp., based in Houston, Texas, is the largest gas transmission company (by pipeline miles) in the United States, controlling an acquired 60,000 miles of U.S. and international pipeline. The company, which has assets of \$48.2 billion, reported a net loss of \$1.5 billion on revenues of \$12.2 billion in 2002.

Another leading gas transmission enterprise, The Williams Companies Inc., operated 14,000 miles of coast-to-coast pipeline in 2002, as well as its own reserve containing 2.8 trillion cubic feet of natural gas, and had assets of \$35.2 billion. The company is involved in gathering, processing, and transporting natural gas, and it also operates a 20,000-mile communications field made by installing fiber-optic cable inside unused pipelines. In 2002 the company reported a net loss of \$755 million on revenues of \$5.6 billion.

In 2000 Duke Energy joined Phillips Petroleum's GPM Gas Corp. to create Duke Energy Field Services. The company, a subsidiary of Duke Energy, controls 57,000 miles of pipeline and produces 400,000 barrels of natural gas liquids per day in 71 processing plants across the country, making it one of the nation's largest midstream natural gas operators.

Once the world's largest energy trader, the Houston-based Enron Corp.'s energy kingdom crashed in the autumn of 2001 when fraudulent accounting practices were discovered, revealing huge gaps in the company's books. The Enron scandal made national headlines for months, and the company's bankruptcy was the largest in U.S. history at the time. After selling off its main energy trading unit, the scaled down company continues to own some 15,000 miles of gas pipelines in North American as well as in Central and South America.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, the industries involving gas production and distribution employed 124,280 people in 2001. Among the occupations listed, one third of the jobs were in secretarial and clerical occupations; 8 percent were in management positions; 11 percent were in construction and extraction (including nearly 7,000 positions for pipe layers and pipe fitters); 19 percent were installation, maintenance, and repair occupations; and 9 percent were production-related occupations.

AMERICA AND THE WORLD

Imports and exports both played an important role in U.S. natural gas markets. During the 1990s imports from Canada and exports to Mexico were at their highest levels in history. Net imports of natural gas from Canada were 3 trillion cubic feet in 1998, constituting 14 percent of overall 1998 U.S. gas consumption. The United States also imported liquefied natural gas from Algeria (69 billion cubic feet in 1998). The liquefied natural gas, transported by special tanker ships and kept in liquid form through refrigeration and pressure, entered U.S. pipeline systems after being re-gasified at special facilities in Louisiana.

Canadian gas, however, accounted for the bulk of U.S. imports. The North American energy giant TransCanada controls 13,888 miles of pipeline in its Alberta System, 9,176 miles of the Canadian mainline, and 110 miles of ANG Pipeline. In 1999, TransCanada also had partnership interests in 7,100 miles of North American pipelines.

In terms of natural gas production, the United States ranked second in the world, averaging about 17 trillion cubic feet per year. The world's top producer, the former Soviet Union, produced about 26 trillion cubic feet per year. Canada ranked third, producing about 3.5 trillion cubic feet annually. The world's fourth largest producer, the Netherlands, supplied about 3 trillion cubic feet per year. The Netherlands obtained gas from both onshore and offshore facilities, exporting it through pipelines to Germany, Belgium, France, and Italy.

One of the longest international gas pipeline systems, the Trans-Mediterranean Pipeline, stretched more than 1,500 miles from the Sahara Desert in Algeria (on the north African coast) to northern Italy. The Trans-Mediterranean was designed to transport gas under the Mediterranean Sea, deliver it to markets in Italy, and eventually link to a European pipeline grid.

In the latter 1990s, worldwide demand for natural gas stood at approximately 77 trillion cubic feet. By 2015, demand was expected to more than double, reaching 135 trillion cubic feet. In North America, natural gas usage for industry and electric power generation was expected to lead growth in gas demand with U.S. energy consumption expected to increase by 30 percent over the 1995 to 2015 time frame. On a worldwide basis, consumption of natural gas was growing at a rate of nearly 3 percent annually, compared to 1 percent for other fossil fuels, and another 355,000 miles of natural gas pipelines were to be added to the world gas grid by 2015—mostly in Asia, Europe, the Middle East, and Africa. This growing demand coupled with the trend toward privatization brought on by the FERC's deregulatory measures, as well as easier access to foreign markets, boded well for U.S. gas transmission companies. Companies like Enron and Williams moved quickly to establish themselves in international markets and to consolidate their positions at home.

SIC 4923

NATURAL GAS TRANSMISSION AND DISTRIBUTION

This industry classification includes establishments engaged in both the transmission and distribution of natural gas. Establishments involved in natural gas transmission, but not its distribution to end users, are classified in **SIC 4922: Natural Gas Transmission**. Establishments involved in natural gas distribution, but not its transmission from supply regions to market areas, are classified in **SIC 4924: Natural Gas Distribution**.

NAICS CODE(S)

221210 (Natural Gas Distribution)

486210 (Pipeline Transportation of Natural Gas)

INDUSTRY SNAPSHOT

Composed almost entirely of methane, natural gas is a combustible gaseous fuel used in residential and commercial applications. It is produced, transported, and consumed in measures associated with cubic feet. One cubic foot is equal to the volume of gas that could be contained in a cubic area measuring one foot in all three dimensions under a pressure of 14.73 pounds per square inch at 60 degrees Fahrenheit. Although the energy content of natural gas can vary depending on its precise chemical composition, 1,000 cubic feet of natural gas has the energy equivalent of approximately one million British thermal units (Btu). A Btu is a standard unit used to measure the amount of heat produced by an energy source.

By the turn of the twenty-first century, natural gas usage was becoming increasingly important in generating electricity. Much safer than nuclear energy and significantly cleaner for the environment than coal, natural gas took over as the energy source of choice in power generation plants and many industrial complexes. The effects of the Clean Air Act were expected to expand its role even farther. In addition, natural gas played a significant role in industrial cogeneration (retaining and distributing the heat energy produced by generating electricity).

During the early years of the 2000s, the natural gas industry was suffering from the effects of a sluggish

economy, inconsistent deregulation, and upheaval in the energy industry as a whole, caused in part by the California energy crisis during 2000 and the demise of energy giant Enron after that company's fraudulent bookkeeping practices came to light. The situation led to large-scale sell-offs, downsizing, and a sharp decline in many companies' equity. Although natural gas makes up just one-third of the entire energy industry, because most energy companies have diversified interests that span the market, the beginning of the twenty-first century saw the industry weather a difficult storm of consumer and investor distrust. As a result, even though natural gas usage was expected to increase, production capabilities were declining.

ORGANIZATION AND STRUCTURE

Natural gas is transported and distributed under a myriad of federal and state regulations. Interstate pipelines fall under the jurisdiction of the Federal Energy Regulatory Commission (FERC). Local distribution companies (called LDCs or gas utilities) fall under the domain of their state's public utility commission.

The complete natural gas distribution chain, from the point of production to the point of use, was historically controlled by monopolies. During the 1980s and early 1990s, deregulation brought increased competition and fragmented the industry. Before deregulation, producers supplied gas to transporters. Transporters provided gas, primarily under wholesale agreements, to distributors. Distributors delivered gas, primarily under retail agreements, to end-users. Following deregulation, the natural gas industry saw the expansion and extension of traditional roles as well as the introduction of new participants such as brokers, independent marketers, marketing affiliates, and consultants.

Various segments of the natural gas industry are represented by trade associations. The American Gas Association represents the interests of local distributing companies. The Natural Gas Supply Association represents major gas producers. The Interstate Natural Gas Association of America represents pipelines. Some other related organizations are: the Independent Petroleum Association of America, representing small independent gas producers; the Domestic Petroleum Council, representing some large independent gas producers; and the Process Gas Consumers, which consists of industrial gas users. The Natural Gas Council represents producers, pipelines, and local distributors. It works to increase gas availability and the reliability of natural gas supplies as well as to promote increased consumption.

BACKGROUND AND DEVELOPMENT

The natural gas industry originated in Titusville, Pennsylvania, in 1859. Former railroad conductor Colo-

nel Edwin Drake struck oil 69 feet below the ground surface in the small town. The spot marked the first transportation pipeline in the United States, running just over five miles.

Because there was no easy way to transport natural gas into homes, it was used primarily to light city streets in the nineteenth century. The 1885 invention of the Bunsen burner, which mixed air with natural gas, allowed the use of the fuel's thermal properties. Gas producers responded to the discovery by promoting natural gas as a heating fuel for use in warming water or cooking food.

Natural gas was not, however, widely used until after World War II, when metallurgy advances, welding techniques, and pipe rolling greatly improved the methods of transporting the fuel. Thousands of miles of pipeline were laid from the post-war period through the 1960s, when natural gas began to be widely used in American industry as well.

Congress passed the Natural Gas Act of 1938, marking the first governmental regulation of the industry. This act sought to protect consumers from the monopolies that were forming in the industry by regulating the price of natural gas. The gas shortages in the 1970s and 1980s caused the eventual move away from price regulation, which resulted in increased demand for gas supply and decreased prices. Marketplace competition led to innovation and technological improvements. The deregulation of segments of the industry has, overall, had positive results with regard to pricing and demand. Because natural gas is often thought of as the cleanest source of energy, the Clean Air Act Amendments of 1990, which called for cleaner fuel sources, boosted the demand for natural gas.

Domestic demand for natural gas hit its peak in 1972 when consumption was 22 trillion cubic feet. In succeeding years, questions about gas availability and climbing prices led to shrinking demand. Consumption fell to 16 trillion cubic feet in 1986 before beginning to grow again. By the early 1990s, natural gas was making a sustained comeback, which continued into the millennium. Natural gas gained popularity as a favored fuel because of its environmental advantages and its availability as a domestic resource.

By the end of the 1990s, natural gas supplied about one-half of the nation's energy needs. Industry watchers noted several trends indicating increased reliance on natural gas. For example, in 1990, natural gas was used in 59 percent of new single-family home construction, up from 43 percent in 1985. By 1999, it was up to 70 percent. According to the American Gas Association (AGA), there were more than 1.3 million miles of natural gas transmission and distribution pipelines traversing the nation, delivering supplies to 60 million commercial and residential

customers. The U.S. imported about 14 percent of its natural gas in 1998, primarily from Canada. That same year, the United States exported natural gas to Japan (66 billion cubic feet) and Mexico (53 billion cubic feet).

Gas service is provided in all 50 states by 1,200 gas distribution companies, pulling from about 288,000 natural gas wells. In 1999, American users consumed approximately 20 trillion cubic feet of natural gas. By 2010, that figure is expected to reach 30 trillion cubic feet. The largest percentage of consumption goes to residential users, who account for about 50 percent. U.S. industry uses about 40 percent. A small amount, equal to approximately 0.0004 trillion cubic feet, has been used to fuel natural gas vehicles. As the industry continues to deregulate, prices to end-users continue downward. Between 1987 and 1997, prices dropped an average of 14 percent, while the industry grew annually by approximately 2 percent.

Between 1999 and 2000, 84 new pipeline projects were proposed which would increase delivery capability by 23.2 billion cubic feet per day. Year 2000 expenditures for pipeline development and expansion were estimated at \$6 billion. There were 410 underground natural storage sites in the United States as of the end of 1998, with the largest number of them located in the Midwest (128).

The latter 1990s saw many nuclear power plants and coal-burning power facilities shut down or convert to natural gas facilities. This trend was particularly true in the eastern half of the nation, in highly-industrialized areas.

CURRENT CONDITIONS

Once a thriving part of the U.S. economy, the energy industry suffered some serious setbacks during the first years of the 2000s. First, during 2001, California suffered serious power shortages and outages. By 2002 fingers were being pointed at several major energy providers, including El Paso Corp., as being responsible for creating artificial shortages to drive up prices in the ill-conceived, greedy attempt to make huge profits from the newly deregulated energy sector. On the heels of the California crisis, Enron Corp., then the nation's largest energy company, imploded after being pinned with fraudulent and corrupt accounting practices. The result was a sudden and severe withdrawal of support from Wall Street investors, causing some companies' equity value to drop as much as 90 percent. The industry went into a tailspin of sell-offs, lay-offs, and downsizing. Credit, once readily available to the energy industry, was nearly impossible to obtain as investors and bankers alike remained wary of the volatile industry.

Deregulation shouldered at least part of the blame for the sorry state of the energy industry. Inconsistent deregulation policies led to confusion as well as producing out-of-control market-driven policies implemented by energy

companies such as Enron. One result was the attempt to re-regulate the industry, which put energy companies on edge. Many companies cancelled or postponed any growth projects, as well as exiting trading activities. Kristin Domanski noted in *The Oil and Gas Journal* in December 2002, "As trading operations have been scaled back or disappeared altogether over the last 12 months, the critical mass that once made up the vibrant wholesale natural gas and electricity community has turned off the lights and gone home."

Although supplies stood above the five-year average at the beginning of 2002, in March 2003 natural gas storage supplies hit a record low, which supported natural gas prices into the spring and summer months, past the peak winter months. If the U.S. economy began to move out of recession during the latter half of 2003 and into 2004 as predicted, natural gas usage was expected to increase approximately 4 percent and prices should remain steady. Despite the low storage levels, production was not expected to increase. The average number of gas-directed drilling rigs in the United States declined from 939 in 2001 to 691 in 2002.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, the industries involving gas production and distribution employed 124,280 people in 2001. Among the occupations listed, one-third of the jobs were in secretarial and clerical occupations; 8 percent were in management positions; 11 percent were in construction and extraction; 19 percent were in installation, maintenance, and repair occupations; and 9 percent were production-related occupations.

INDUSTRY LEADERS

Southern California Gas Co., a subsidiary of Sempra Energy (one of the largest natural gas transmission and distribution holding companies) was the leading LDC, with 6.1 million customers. Sempra reported revenues of \$6 billion in 2002. Pacific Gas & Electric Co. (PG&E), which had four million gas customers, filed for Chapter 11 bankruptcy in 2001 after suffering significant damage to its business during the California energy crisis. In 2002 PG&E reported a net loss of \$874 million on revenues of \$12.5 billion, down from a net income of \$719 on nearly \$20 billion in sales in 1998.

Another multifaceted natural gas enterprise was Consolidated Natural Gas Company (CNG), which merged with Dominion Resources in 2000. Dominion has assets totaling nearly \$38 billion, including 6.1 trillion cubic feet equivalent of gas and oil reserves, 7,900 miles of pipeline, and a natural gas storage system with a capacity of 960 billion cubic feet, the nation's largest. Its subsidiaries operate in all segments of the gas industry,

including exploration, production, transportation, storage, purchasing, reselling, and distribution. The gas storage fields receive injections of gas during low demand periods to help meet high demand during the winter heating season. Dominion reported a net income of nearly \$1.4 billion on revenues of \$10.2 billion in 2002.

While traditional transmission and distribution gas companies like CNG and Pacific Enterprises have been reorganizing to adapt to industry-wide changes, non-traditional entities called GTMs (gatherers, transporters, and marketers) have been emerging. GTMs operate in a more flexible environment because they are not tied to pre-existing, long-term contracts. Two of the nation's leading GTMs are Associated Natural Gas Corporation and Western Gas Resources, Inc. Both are headquartered in Denver.

In early 2000 Phillips Petroleum's GPM Gas Corp. joined Duke Energy in a major joint venture. The spin-off company, Duke Energy Field Services, controls 57,000 miles of pipeline, with a daily production in the early 2000s of 5 billion cubic feet of natural gas and 400,000 barrels of natural gas liquids per day, in 71 plants across the country. One of the largest midstream natural gas operators in the United States, Duke Energy Field Services, a subsidiary of Duke Energy, reported a net loss of \$47 million on revenues of \$5.5 billion in 2002.

RESEARCH AND TECHNOLOGY

In 1999, Congress appropriated \$246 million for natural gas research, design, and development programs at the Department of Energy (DOE). Priority projects included natural gas turbines and microturbines, natural gas cooling technologies, and natural gas vehicles and fuel cells. The Gas Research Institute also announced its 1999 Pacesetter Awards to member companies who help promote adoption of new natural gas technologies. The 1999 winners included Enron Gas Pipeline Company for surveying 160 compressor stations for fugitive emissions, using the Hi-Flow Sampler for leak detection and measurement, and the City of Richmond, Virginia, for helping to secure a gas industry consortium and co-funding for testing Methane de-NOX reburn technology at a 240-MW coal-fired plant.

Overall, research efforts undertaken by transmission and distribution companies focused primarily in two areas: expanding natural gas markets and improving natural gas conveyance. One of the most popular technologies under investigation was the evolution of natural gas fueled vehicles (NGVs). In 1999, about 60,000 NGVs were in operation in the United States, increasing in number by about 10,000 annually. Although the amount used for NGVs accounted for only a small fraction of U.S. natural gas consumption, it represented a 26 percent increase over 1990. Four states—Arizona, Indiana, Ohio,

and Washington—made up approximately 60 percent of the nation's demand for natural gas for vehicle use. Advanced NGVs have been proven to reduce carbon monoxide and nitrogen oxide emissions by as much as 90 percent. As of 1999, the AGA announced that 13 states had 30 or more compressed natural gas (CNG) vehicle fueling stations, and usage was expected to increase.

Another emerging technology involved gas-powered cooling for refrigeration and air conditioning. Although large air conditioning systems have already been developed for use in industrial and commercial applications, air conditioning units small enough for private home use have been typically electric. That trend began to reverse in the 1990s, and the industry expected to introduce its first residential model natural gas dehumidifier in 2000. In 1999, gas-powered appliances were typically about 10 percent more expensive to purchase than their electric counterparts, but were less expensive to operate. In addition to expanding markets for natural gas, gas-cooling technologies were expected to help reduce summer peaks in demand for electricity.

During the 1990s, several gas distribution companies were experimenting with first generation natural gas fuel cells, manufactured by United Technologies Corporation (Connecticut) and by Westinghouse. Natural gas fuel cells produce electricity and heat by combining hydrogen in the gas with oxygen in the air. Brooklyn Union Gas Company, for example, installed a 200-kilowatt fuel cell at a health care facility in New York, and Southern California Gas Company installed fuel cells for diverse customers including hospitals, food-processing facilities, and a mass transit agency. Because natural gas fuel cells yield low emissions at their point of use, the technology looked promising for densely populated areas and for use inside buildings. Under early gas fuel cell agreements, fuel cells were installed and maintained by local utilities that charged for the electricity and heat used.

In the arena of natural gas conveyance, one area under investigation was pipeline maintenance. According to estimates of the U.S. Department of Transportation, approximately 800,000 to 900,000 leaks in gas mains and service lines occur every year. In addition to presenting a potential disaster, lost gas represents lost earnings. In order to make gas line repairs, utilities must find the precise location of defective pipe segments, remove soil or pavement at the site, repair or replace the pipe, and then restore the site. However, in 1999, the Gas Research Institute announced a joint venture with Germany's Karl Weiss GmbH & Company to bring to North America the new "trenchless" technologies for pipeline maintenance (requiring only two digging holes) and installation of the cured-in-place (CIP) liners to service lines and mains. New technology has increased the development of polyethylene piping that can withstand higher pressures, from

100 to 125 psig. Other developments include new devices for detection of natural gas leaks. Overall, the industry spent \$4 billion in 1999 for safety, with reportable incidents dropping from 290 in 1988 to 206 in 1998.

A pipe repair technique jointly developed by Consolidated Natural Gas Company, East Ohio Gas Company, and PLS International (a company specializing in robotics technology), the PLS 3000, used a sealed probe to examine low-pressure gas lines while they were still in use. The probe was expected to help identify specific problems such as water infiltration, pipeline distortions, cracks, or other problems in the pipes and pinpoint their locations. Although early models proved expensive, initial users judged the PLS 3000 cost effective in urban areas where excavation costs were substantial.

SIC 4924

NATURAL GAS DISTRIBUTION

This industry classification is comprised of establishments engaged in the distribution of natural gas to end users. Establishments involved in both the transmission and distribution of natural gas are classified in **SIC 4923: Natural Gas Transmission and Distribution**.

NAICS CODE(S)

221210 (Natural Gas Distribution)

INDUSTRY SNAPSHOT

From the years 2000 to 2015, natural gas consumption in the United States is expected to increase 25 to 30 percent (or about 2 percent annually, according to the U.S. Department of Energy). At the turn of the twenty-first century, 70 percent of new homes being built were piped to receive natural gas. The biggest gain in usage, however, is expected to come from electric utility companies that continue to shut down their nuclear energy or coal-burning facilities and convert to natural gas energy.

In 2003 there were over 1,200 local distributing companies (LDCs) in the United States, with control of over 833,000 miles of pipeline. Although many of these companies continue to operate a monopoly within their distribution area, deregulation has begun to take hold in some regions, offering consumers choices in their natural gas purchases by "unbundling" natural gas production, transportation, and distribution into separate activities. According to the Energy Information Administration, as of December 2002, 27 states had no unbundling programs in place, 6 states were completely unbundled, and the remaining states were in the initial phases of separating specific services.

ORGANIZATION AND STRUCTURE

Gas utility companies receive their supplies of gas from a transmission system at a transfer point called the “city gate.” The utility then delivers the gas through mains and distribution lines to end users in a particular geographic area. There are four traditional classes of gas utility customers: individual residences, commercial establishments, industrial facilities, and electric utilities. There are two types of customers within these classes. “Core” customers require stable amounts of gas on demand because gas is their only source of fuel. “Non-core” gas customers can switch to other types of fuel when gas is unavailable or too expensive. Residential and commercial customers are typical core customers; industrial and electric-generating companies are examples of non-core customers.

LDCs are subject to regulation by state public utility commissions (PUCs). PUCs establish rates for different classes of customers. Prices per unit are typically lower for larger users. In setting rates, PUCs attempt to find an appropriate balance between the different interests of consumers, who want low rates, and company investors, who seek adequate returns on their investments.

In addition to state PUCs, federal regulations also influence the gas distribution industry. In 1992, the Federal Energy Regulatory Commission (FERC) issued its Order 636. Although Order 636 had its most direct impact on the gas transmission industry, it also affected local distribution companies. Its provisions necessitated changes in the way distribution companies arranged for gas purchases, transportation, and storage. FERC’s order also permitted pipelines to pass transition costs on to distribution companies.

The natural gas distribution system continues to “unbundle” in a deregulated industry, giving end users more choices than ever over who delivers their gas supplies. Many local distribution companies (often referred to as LDCs or gas utilities companies) saw their largest and most profitable customers switching to alternate gas sources. In some cases, industrial users and electric utilities contracted with pipeline companies to construct direct access to transmission systems and bypass the LDC altogether. In other instances, the customer purchased the actual gas from independent suppliers but continued to buy transmission services from the LDC.

To cope with the changing industry environment, LDCs have begun far-reaching marketing efforts. They have offered services to large industrial users, such as natural gas storage, in attempts to keep profitable customers within the system. They have obtained new industrial customers by promoting fuel switching away from electricity and oil. LDCs have also expanded efforts aimed at increasing demand through the development of

new technologies, including vehicular natural gas and natural gas fuel cells.

BACKGROUND AND DEVELOPMENT

The nation’s earliest gas distribution companies delivered synthetic gas, manufactured from coal, to cities for use in lighting. In the late 1800s, naphtha gas (derived from crude petroleum) replaced coal gas. By the time the first company to distribute natural gas, the Fredonia Gas Light and Water Works Company, was formed in New York, approximately 300 companies were already delivering manufactured gas. Other local distribution companies were formed in the closing years of the nineteenth century. Two examples are Brooklyn Union Gas Company, which was incorporated in 1895, and East Ohio Gas Company, founded in 1898 by the Standard Oil Company. Many early gas distribution companies were owned by holding companies involved in other segments of the natural gas industry. The Public Utility Holding Act of 1935 required large holding companies to divest themselves of their public utility companies.

In 1937, Texas became the first state to require the addition of an odorant in distributed natural gas. Ethyl mercaptan, originally introduced in Germany in 1880, aided in detecting natural gas leaks and provided an early warning system to help prevent disasters. The use of mercaptan and mercaptan blends gave natural gas, a compound that has no inherent smell, a distinctive odor.

During World War II, fuel oil and gasoline rationing led to an expansion of natural gas markets. Production during the war years increased by 55 percent. Natural gas was a key ingredient in more than 5,000 industrial processes and was used as an industrial fuel and in the manufacture of explosives. Natural gas usage continued to increase following the war and from 1945 to 1954 consumption doubled.

To meet demand, local distribution companies purchased gas from an available pipeline that reached their area. The pipeline typically sold the gas at a single price that represented an average of all the categories of gas handled by the pipeline and included charges for transportation and storage. Changes in federal regulations during the 1980s and 1990s required pipelines to “unbundle” their services and offer gas utilities access to gas transmission services separately from gas purchases. As a result, local distribution companies were permitted to buy gas from a variety of sources.

As the gas distribution industry entered the 1990s, residential use accounted for about one-fourth of the nation’s natural gas consumption. Because residential use fluctuated according to weather patterns, weather was an important issue. The industry judged “normal weather” as the mean of temperatures experienced over a 30-year period and adjusted its norms every ten years. A “degree

day” was defined as a measurement comparing the daily mean temperature to a guide of 65 degrees Fahrenheit. Although the decade began amid a series of years with warmer than average temperatures and a slowed economy, demand for natural gas grew.

Environmental and conservation efforts contributed to increased demand for natural gas. In some instances, state regulatory agencies required electric utilities to use more natural gas and to encourage their customers to switch from using electricity during peak demand periods. Often the preferred replacement fuel was natural gas.

Wisconsin and Vermont required electric utilities to help retail customers shift from electricity as their primary source of energy in instances where switching to fuels would be cost effective. Under the ruling, residential customers with electric heat were offered assistance in converting to other fuels.

Maximizing use of their system’s capacity by providing gas to a variety of users is a vital concern to local distribution companies. Gas utilities hoped that improvements in natural gas cooling technologies for uses such as refrigeration and air conditioning would help balance winter and summer demand.

Another concern facing local distribution companies was “bypass.” Bypass referred to a process under which natural gas suppliers provided direct sales and service to large users, circumventing the local gas utility. According to bypass proponents, the practice provided an opportunity for customers to shop around for the best gas prices. According to critics, bypass provisions unfairly affected small users, such as residential customers, because the distribution companies lost substantial loads resulting in higher fixed costs being passed on to the remaining customers.

For the nation as a whole, deregulation meant that industries that used a lot of natural gas became more competitive internationally, while consumers paid more of the real cost of the gas they used. Analysts saw the trend toward unbundling as being in the consumer’s best interest; an increasing number of companies began to offer unbundled delivery at the residential level as well as at the level of larger customers. In spite of deregulation and other changes, profits among natural gas distributors continued to soar.

As of August 1999, residential end users in 23 states and the District of Columbia were able to purchase natural gas from one of several suppliers but have their local utility company deliver it. These options accommodated roughly 22 million (or 40 percent) of the 55 million households with natural gas service. Between 1996 and 1999, four million residential customers actually switched to a non-utility supplier. According to a December 1998 report published by the U.S. General Account-

ing Office (GAO), residential customer choice programs resulted in individual savings of 1 to 15 percent on the total gas bill. New York State was a leader in offering customer choice to residential customers, and Ohio made customer choice a state policy. As of 1999, Georgia had the largest number of residents exercising purchase options. The state’s largest natural gas utility, Atlanta Gas Light, continued to offer delivery services of natural gas, irrespective of the residential user’s purchase source. In 1997, 88 percent of all gas consumed by electric utilities companies was purchased under this option, as was 33 percent in commercial/industrial facilities.

In the early 2000s, the American Gas Association (AGA) estimated that overall natural gas consumption would increase 40 percent by the year 2015. By 2010, the United States was expected to use 30 trillion cubic feet (tcf) annually. In order to accommodate these needs, industry analysts estimated new pipeline costs to be as much as \$32 billion, plus another few billion to provide for storage. New England states were anticipated to be the first to require more pipeline construction, as nuclear and coal energy facilities continued to shut down and/or convert to natural gas. The Southeast was also a priority.

According to *Pipe Line & Gas Industry’s* 1999 interview with Dick Terry, chairman of AGA, residential natural gas customers paid 14 percent less for natural gas in 1997 than they did in 1987. Much of this savings was attributable to “unbundling” and gas utilities’ reduction in operating and maintenance costs, down by nearly 2 percent annually between 1990 and 1995. The price drop was more dramatic for the larger users, electric utilities and industrial customers, who paid 17 to 18 percent less.

Other factors have contributed to the steady but consistent growth of the industry. New technology has increased the development of polyethylene piping that can withstand higher pressures, from 100 to 125 psi. Other developments include new devices for detection of natural gas leaks. Overall, the industry spent \$4 billion in 1999 for safety, with reportable incidents dropping from 290 in 1988 to 206 in 1998. Finally, in 1999, the Gas Research Institute announced a joint venture with Germany’s Karl Weiss GmbH & Company to bring to North America the new “trenchless” technologies for pipeline maintenance (requiring only two digging holes) and to install the cured-in-place (CIP) liners to service lines and mains.

CURRENT CONDITIONS

Continuing deregulation remains the most influential factor in the distribution of natural gas within the United States. Prices are no longer regulated; therefore, supply and demand determine the cost of natural gas. Interstate pipeline no longer owns the gas transmitted but serves only as the transportation component of the process of moving natural gas from supply to the end user.

However, LDCs that focus on distribution alone have not taken over local markets as quickly or as successfully as was expected following deregulation. One problem for LDCs is liability for consumers who do not pay their bills. As the last in line from production to transportation to distribution, LDCs are the ones left holding the bill, namely the unpaid bill. Also natural gas distribution makes up just one-third of the energy industry, all of which underwent deregulation. Faced with the challenges of deregulating the entire industry, local areas tended to bypass issues that would successfully implement the separation of transmission from distribution. As a result, most LDCs continued to perform both transmission and distribution functions related to their businesses.

During the early 2000s the energy industry as a whole was significantly disrupted. During 2000 California experienced energy shortages and outages, which were later blamed on poor decisions and greedy policies among several energy providers who stood accused of creating an artificial crisis—or at least negatively contributing to the problem by withholding supply. When Houston-based Enron imploded under allegations of shady accounting practices in 2001, the bottom dropped out of the energy industry. As a result, credit ratings plummeted and investors disappeared, making it difficult for new distributors to enter existing markets, leaving established LDCs with very little influx of new competition.

INDUSTRY LEADERS

Southern California Gas Co., a subsidiary of Sempra Energy (one of the largest natural gas transmission and distribution holding companies), was the leading LDC, with five million customers. Southern reported 2002 operating revenues of \$3 billion. Next was Pacific Gas & Electric Co. (PG&E), which reported four million gas customers in 2002. Although PG&E was considered the largest utility holding company in the United States in 1998, with 4.6 million electric customers in addition to its gas customers, the company suffered significant losses during the California energy crisis and filed for Chapter 11 bankruptcy in 2001. In 2002 PG&E reported a net loss of \$874 million on revenues of \$12.5 billion, down from a net income of \$719 on nearly \$20 billion in sales in 1998.

One of the fastest-growing LDCs was Southwest Gas Corporation, exemplary of the unbundled industry's opportunities. Southwest obtains its gas from approximately 70 suppliers then forwards it to 1.4 million end users through its 22,000 miles of transmission and distribution pipeline. Southwest reported 2002 sales of \$1.3 billion, resulting in a net income of \$44 million.

Other industry leaders were Public Service Electric & Gas, with 1.7 million customers and 2002 revenues of

\$1.6 billion; Columbia Gas Distribution Company, with 1.4 million customers and 2002 revenues of \$1.8 billion; and Nicor, with 1.9 million customers and 2002 revenues of \$1.9 billion.

SIC 4925

MIXED, MANUFACTURED, OR LIQUEFIED PETROLEUM GAS PRODUCTION AND/OR DISTRIBUTION

This industry classification includes establishments involved in manufacturing and/or distributing manufactured gas, liquefied petroleum gas (LPG), or mixtures of manufactured gas with natural gas. Examples include blue gas, coke oven gas, manufactured gas, synthetic natural gas from naphtha, and liquefied petroleum gas distributed through mains. Establishments involved in the sale of liquefied petroleum gas in steel containers are

classified as **SIC 5984: Liquefied Petroleum Gas (Bottled Gas) Dealers.**

NAICS CODE(S)

221210 (Natural Gas Distribution)

INDUSTRY SNAPSHOT

Manufactured gas, liquefied petroleum products (LPG), and gas mixtures play an important role in specific industrial applications and in places beyond the reach of natural gas pipelines. Some of the most widely used manufactured or liquefied petroleum gases include coke oven gas, water gas, naphtha gas, acetylene, propane, and butane. Coke oven gas and water gas are both derived from coal. To make coke oven gas, vapors are collected from heated coal and then purified. Water gas is produced by forcing steam through hot coal or coke. Naphtha gas is made from crude petroleum. Acetylene can be made from water and calcium carbide or by breaking apart methane molecules. Propane and butane are both natural gas liquids. They are typically separated from methane during natural gas processing.

BACKGROUND AND DEVELOPMENT

Although the ability to produce manufactured gas from coal dates back to the early years of the 1600s, the technology to use it commercially did not develop until the closing years of the eighteenth century. In Great Britain, William Murdock was the first to make large-scale application of gas lighting. Murdock installed outside factory lighting and 900 gas lamps in British cotton mills. In subsequent years, coal gas increased in popularity for municipal lighting. In 1817, Baltimore became the first U.S. city to contract for gas street lighting.

The gas industry grew during the 1800s, until the introduction of electric lamps drew lighting customers away from coal gas. The manufactured gas industry lost more customers during the early 1900s as natural gas became more widely available. By the early 1960s, the volume of natural gas sold was about 50 times greater than the volume of manufactured gas. By 1990, manufactured gas accounted for only about 1 percent of the gas consumed in the United States.

The decline of the manufactured gas industry continued in the 1990s as the popularity of natural gas increased. Notwithstanding, there remained a market for manufactured gas. For example, in 1997, Indianapolis Power & Light (IP&L) converted some of its coal-burning boiler units to steam boilers using coke oven gas. The utility signed a 20-year agreement to purchase the coke-oven manufactured gas from Citizen's Gas & Coke Company in Indianapolis. The conversion from raw coal burning was expected to reduce air pollution of sulfur dioxide emissions by 2,200 tons per year. IP&L provided

electric service to about 410,000 customers and 270 commercial customers.

The increased presence of liquefied natural gas (LNG) in the market facilitated distribution to areas previously out of reach, and led to numerous closings of manufactured gas plants. Nationally, these closed plant sites were considered potential environmental hazards due to the presence of numerous toxic substances that may have been manufactured or buried there. In December 1999, the town of Mount Belvieu, Texas was host to an environmental battle over the renewal of permits for operators of LPG storage wells. Most of these underground wells were in salt caverns located under the town itself. But in recent years, many salt caverns in the Southwest have had problems with salt dissolves coming from the caverns and polluting the indigenous soil and water. Also in 1999, the U.S. Department of Transportation settled its two-year legal battle over its interim rules for excess flow valves on cargo tanks, following an incident in North Carolina that resulted in the release of 50,000 gallons of propane. In 2003, the estimates of abandoned manufactured gas plants in the United States that posed possible environmental hazards ranged from 1,000 to 50,000.

CURRENT CONDITIONS

During the early 2000s global demand for liquefied gas products was growing, especially in Asia, where demand has nearly tripled since 1985. In the United States, the petroleum industry accounts for over half of all liquefied petroleum consumption. According to the National Propane Gas Association, U.S. consumption of propane in 1999 was 19.6 billion gallons. Of that total, 9.8 billion gallons were used by the industrial, chemical, and utility industries; eight million gallons were consumed for residential, commercial, and recreational use; 1.4 billion gallons were used in agriculture (primarily for grain drying); and 0.4 billion were used in internal combustion engines.

During 2002 the LPG market was slowly recovering from the U.S. recession that combined with unusually warm weather patterns in large North American markets to create an oversupply and drive prices down. Prices for petroleum were running in the mid-\$20 per barrel range during the second quarter of 2003, and the oil industry was beginning to show signs of recovery, which, in turn, will lead to increased demand for LPG products. However, prices will remain depressed until high inventories are reduced.

INDUSTRY LEADERS

One of the largest distributors of manufactured gas in the United States was Gasco. Gasco, originally named Honolulu Gas Company, was established in 1904 to pro-

vide gas service to Hawaii's largest city. Hawaii, being separated from the contiguous United States, was never linked to the mainland's transcontinental natural gas pipeline grids. Gasco was purchased from BHP Hawaii Inc. in 1997 by Citizens Electric for \$100 million. However, in latter 1999, parent company Citizens Utilities decided to sell off its interest in Gasco and focus instead on telecommunications.

Another leading company involved in the production of manufactured gas was Indianapolis Coke, the manufacturing division of Indiana-based Citizen's Gas and Coke Utility, the only gas distribution utility in the United States that still mixed coke oven gas in its send-out product. Serving approximately 250,000 customers, the company produced a variety of coke mixtures for industrial use by pouring a raw coal mixture into ovens 50 feet wide and 15 feet tall, heating it to over 1,800 degrees Fahrenheit, and baking it in the absence of air for 26 to 30 hours. Once produced, the coke was cooled and sized according to whether it was to be used in the steel, mineral wool, sugar beet, or secondary smelting industry.

Overall demand for LPG was up in 1999 by over 2 percent from 1998, but demand fell off during the winter of 2001 to 2002 due to unseasonably warm weather conditions and volatility in the oil industry. Some of the leading companies included AmeriGas, Cornerstone, Ferrellgas, Heritage, Star Gas, and Suburban Gas Company.

SIC 4931

ELECTRIC AND OTHER SERVICES COMBINED

This industry classification consists of companies primarily providing electricity, but also furnishing other utility services. Companies in which the electricity sales account for 95 percent or more of the revenues are listed in **SIC 4911: Electric Services**.

NAICS CODE(S)

- 221111 (Hydroelectric Power Generation)
- 221112 (Fossil Fuel Electric Power Generation)
- 221113 (Nuclear Electric Power Generation)
- 221119 (Other Electric Power Generation)
- 221121 (Electric Bulk Power Transmission and Control)
- 221122 (Electric Power Distribution)
- 221210 (Natural Gas Distribution)

BACKGROUND AND DEVELOPMENT

The roots of the U.S. electric utility industry can be traced back to 1878, when the first private electric company, Edison Electric, began operating in New York City. The first city-owned electric system began operating in Butler, Missouri, in 1881. By 1900, utilities of both types had proliferated; there were more than 800 publicly owned systems and about 2,000 private power companies. Most electric utilities were vertically integrated, controlling generation plants as well as the transmission and distribution lines to customers in multiple states.

Modern state utility regulation was born in Wisconsin in 1907. The Wisconsin Public Utilities Commission charter served as a model for other state efforts. It was the first to require operating permits for all utilities to initiate service, and it was the first to regulate rates of service and to control the issuance of securities by regulated public utilities.

From 1910 through the 1920s, the number of electric utilities declined. Many were controlled by a small number of holding companies, which were, in turn, owned by other holding companies. By 1932, three holding companies controlled 45 percent of all U.S. electricity generation. They charged excessive rates, had high debt-to-

equity ratios, engaged in self-dealing, and provided unreliable service. Most highly leveraged holding companies that stayed solvent in the 1920s collapsed after the stock market crash, unable to service their debt.

The 1930s saw federal government involvement in power production in rural areas through the Tennessee Valley Authority, the Rural Electrification Administration, and five federal Power Marketing Administrations formed to sell cheap power to municipal and cooperative systems.

In 1935, Congress passed the Federal Power Act and the Public Utility Holding Company Act. The Federal Power Act created a Federal Power Commission (now the Federal Energy Regulatory Commission) to regulate interstate and wholesale electric power transactions. The Public Utility Holding Company Act required holding companies that own or control more than 10 percent of another utility to provide the Securities and Exchange Commission with detailed financial information.

Between 1935 and 1978, little changed. In 1978, primarily in response to the oil crisis, Congress passed The Public Utility Regulatory Policy Act (PURPA), designed to lessen domestic dependence on foreign oil and encourage alternate energy sources. PURPA required utilities to purchase electricity generated by small independent producers using wind or geothermal energy, or by cogenerators, which simultaneously produce electricity and thermal energy. Congress also passed the Fuel Use Act, which prohibited burning natural gas in new power plants to conserve what was then thought to be a dwindling supply.

The next major change was the Energy Policy Act of 1992, which increased competition in wholesale energy markets, allowing utilities to operate independent generating plants outside service territories and enter into wholesale power agreements. However, authority over retail electric sales—sales of electricity directly to homeowners and businesses—was left to regulatory commissions in each of the 50 states.

In 1996, the Federal Energy Regulatory Commission issued Order 888 and Order 889, two final rules governing access to utility power lines. Order 888 required utilities to offer nondiscriminatory access to their power grid, even to direct competitors. Order 889 required utilities to share information about available transmission capacity through electronic information systems. FERC also announced a new policy to review proposed mergers in 12-15 months.

The industry was in the process of transitioning to a competitive market during the 1990s, and the final outcome of that ongoing national debate was uncertain. Part of the uncertainty stemmed from a bifurcation in regulatory responsibilities between federal and state governments. Federal law regulated the wholesale power market, that is,

sales or bulk power between power suppliers or across state lines. State regulators, however, regulated sales of power to retail end-users, such as homes and businesses.

About 30-40 percent of a burned fuel's energy is converted to usable electricity. The remaining thermal energy (the heat produced by the burning fuel) is dissipated into the atmosphere without recapture. Because of the low energy efficiency of electricity-producing plants, research focused on recapturing some of the lost thermal energy. This process, known as "cogeneration," allows plants to produce and market both electricity and the heat that is produced in the process (usually in the form of piped steam heat).

A new wave of large cogeneration projects emerged toward the latter decade and into the millennium, representing viable power sources. Most cogenerated power remains in the manufacturing sector, with the paper and chemical industries as leading users. The potential savings in energy remains tremendous. For example, in 1998 more than 2.66 trillion cubic feet of natural gas, almost 60 million barrels of petroleum, and 56.8 million short tons of coal were all burned off in order to produce electricity.

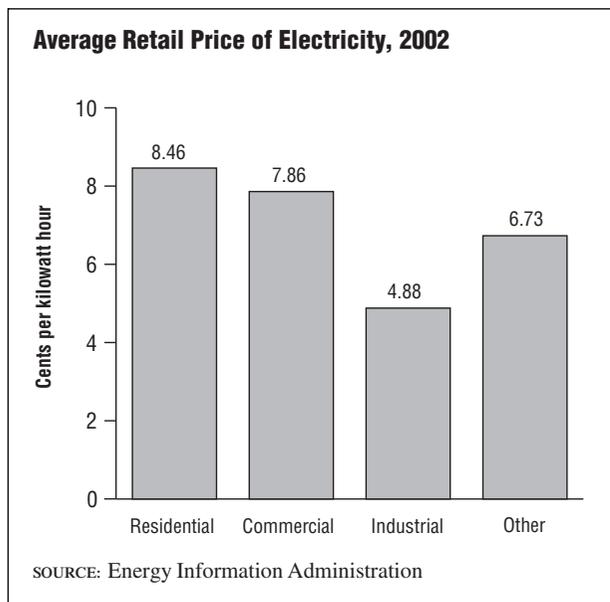

With the continued deregulation of electricity and rising environmental concerns, the appeal of on-site electric generation continued to grow. The Federal government also had taken a renewed interest in cogenerated power because of the decrease in global carbon emissions. On December 10, 1998, the Department of Energy announced its goal to double the capacity of cogenerated power by 2010. Partially in anticipation of this expected growth, the Comprehensive Electricity Competition Act of 1999 contained provisions addressing required interconnections between cogenerative power producers and distribution utilities.

CURRENT CONDITIONS

In 2002, 3.8 trillion kilowatt hours of electricity were generated for the industrial, commercial, and electric power sectors combined. The average retail cost was 7.21 cents per kilowatt hour. Electricity demand was expected to grow about 2 percent annually into 2025. Prices were expected to decline by about 8 percent from 2004 to 2008.

The trend toward energy efficiency continued in the 2000s. According to the American Council for an Energy Efficient Economy (ACEEE), state funding for energy efficient programs in 2003 was expected to be about 32 percent more than just three years prior.

The electric services industry took a huge hit on August 14, 2003, when the largest blackout in the history of North America occurred along much of the northeastern part of the country, due to a power grid failure. As a consequence, the industry created voluntary reliability standards for power grids. In addition, the focus in the

2000s was on diversification of power sources, including “green” sources.

INDUSTRY LEADERS

Consolidated Edison Inc. of New York was the industry leader in 2001, with revenue of more than \$18.8 billion and 14,300 employees. In New York City alone, Con Edison had 3.1 million customers in 2003, both business and residential. The company posted sales of more than \$9.8 billion in 2003.

Newark-based Public Service Enterprise Group Inc. was in second place with 2001 revenue of \$17.9 billion and 13,400 employees. Xcel Energy Inc. of Minneapolis was third with \$15.0 billion in revenue and 15,800 employees. Other notable companies were Niagra Mohawk Holdings Inc. of Syracuse, with \$12.6 million in revenue and 7,600 employees, and Aquila Inc. of Kansas City, Missouri, with \$12.0 billion in revenue and 8,200 employees.

SIC 4932

GAS AND OTHER SERVICES COMBINED

This industry classification consists of companies primarily providing gas distribution services, but also supplying other utility services. Companies in which natural gas distribution accounts for 95 percent or more of revenues are classified in **SIC 4924: Natural Gas Distribution**.

NAICS CODE(S)

221210 (Natural Gas Distribution)

ORGANIZATION AND STRUCTURE

Gas utilities, called local distribution companies (LDCs), provide customers with two services: gas transportation, or moving the gas from the pipeline to the customer, and supply, whereby the LDC buys the gas and resells it to the customer. The LDC transports gas for all its customers and supplies gas to other suppliers. The utility earns a rate of return for transporting gas but receives nothing for supplying it to those other than end-use customers. The LDC earns the same fee for transporting gas, regardless of who supplies the gas.

Gas utilities had several competitive advantages over electric utilities. While electric utilities were just beginning to experiment during the mid-1990s with allowing customers to choose among energy suppliers, large gas customers had been extending the freedom to choose their gas supplier to the smallest of customers, including homeowners. Both industries were deregulated.

By the end of the 1990s, natural gas supplied about half of the nation's energy needs. When electric utilities providers began to use natural gas for electric power generation, a new utilities superpower appeared on the horizon. Instead of natural gas companies buying out their smaller natural gas competitors, they began aligning with electric utilities companies to provide multiple services to end-users. Thus, by the millennium some of the largest utilities providers were in fact “hybrid” entities offering electricity and natural gas services to their customers. Industry leader NiSource, for example, had 3.3 million natural gas customers and 440,000 electric customers in 2003. These “co-generation” facilities appeared to be on the rise nationally and internationally. Another spin-off industry from these consolidations was the combination of gas pipelines and fiber-optic networks, thus servicing the energy and communications businesses.

BACKGROUND AND DEVELOPMENT

While state governments began to regulate the venting of natural gas in the late 1920s, federal government regulation of interstate sales of natural gas was a product of already existing federal regulations governing interstate sales of electricity. The same public outcry that led to passage of the Federal Power Act and the Public Utilities Holding Company Act in 1935 led Congress to create regulations for natural gas. (See **SIC 4931: Electric and Other Services Combined**.)

The Natural Gas Act, passed in 1938, was even more stringent than its electricity counterpart, giving the Federal Power Commission (now the Federal Energy Regulatory Commission) explicit authorization to fix “just and reasonable” pipeline rates, ban discriminatory tariff practices, and determine legitimate costs. In 1942, the act was amended to require interstate sales of gas for resale elsewhere to be at the lowest possible rate.

Historically, the same type of regulation used for electric utilities has been applied to interstate natural gas pipelines. Tariffs were set to recover the costs of operation and gas purchases, depreciation of investments in facilities, and to provide a regulated rate of return on business assets.

In 1954, the Supreme Court of the United States decided the Federal Power Commission had authority to regulate prices all the way back to the well. After delaying its response to the court’s mandate for several years, the commission began regulating wellhead gas prices on a case-by-case basis, then experimented with setting “area rates” based on broad geographic regions. There were higher rates for “new gas,” or newer discoveries, and lower rates for “old gas,” or existing production.

During the late 1960s, regulated prices for interstate pipelines were relatively cheap compared with prices in intrastate markets. Within higher intrastate market prices, interstate pipelines, who could pay only the low regulated prices, were unable to meet growing demand for gas supplies. Burgeoning demand for natural gas forced pipelines and LDCs to allocate demand. The imbalance between demand and supply brought increasing pressure on Congress to deregulate wellhead prices.

In 1978, Congress passed the Natural Gas Policy Act, an extremely complex law with more than 20 different categories of gas and prices ranging from \$0.30 per thousand cubic feet (mcf) to \$10/mcf. But by the early 1980s, gas demand dropped due to a recession, and improved production technologies made gas available in almost unprecedented volumes. The supply and demand equilibrium was again out of synch. In 1989, Congress passed legislation phasing out price controls on most types of natural gas.

In 1992, the Federal Energy Regulatory Commission issued Order 636, which forced gas transmission companies to become common carriers of natural gas and ordered them to redesign their rate structures, essentially changing the way local gas distribution utilities obtain their natural gas. That same year, Congress passed the Energy Policy Act, which increased competition within the electricity industry. In 1996, FERC issued Orders 888 and 889, final rules governing access to utility power lines. FERC also announced a policy to consider mergers within a 15-month period.

According to the 1997 Economic Census, 119 establishments reported combined services, with their primary service being gas distribution. The industry was worth \$2.85 billion. These figures did not include another 145 establishments of combined service (electricity-gas) where the primary service was electricity. In comparison, that industry was worth \$28 billion in 1997.

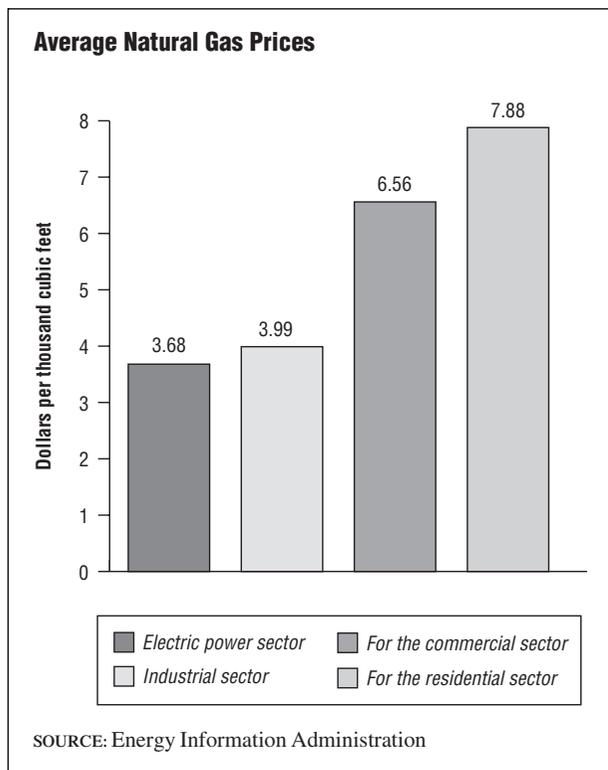

By 1999 the gap had significantly decreased, due in large part to advanced technology for shared trenches between natural gas distribution and fiber-optic networking. Using thousands of miles of pipeline routes, pipeline companies had coupled with communications companies to create dual-service routes, making pipeline assets much more profitable and cutting costs for laying communications cable lines. As of 1999, about 200,000 miles of fiber-optic line existed in the United States. Because of increased need for Internet and telecommunication lines, that figure was expected to grow exponentially.

CURRENT CONDITIONS

There were a total of 592 firms operating 2,831 establishments in 2001. The vast majority (2,194) were large operations with more than 500 employees. Total industry employment was 95,348 workers earning an annual payroll of more than \$6 billion.

In 2002, 22.7 trillion cubic feet of natural gas was consumed by all sectors. Prices varied from sector to sector, ranging from \$3.68 dollars per thousand cubic feet for the electric power sector, to \$3.99 for the industrial sector, to \$6.56 for the commercial sector, and \$7.88 for the residential sector.

Demand for natural gas was expected to increase annually into 2025. Both the commercial and residential sectors were projected to increase demand by 2 percent annually. The electric power sector was expected to continue to be one of the larger consumers of natural gas, as coal would be used less as a power source, and demand from this sector was expected to grow from 2002’s 27 percent of the natural gas market to 29 percent by 2025. The industrial segment was expected to increase its consumption from 7.3 trillion cubic feet to 10.3 trillion cubic

feet in the same time period. Prices were expected to decline into 2006, until wellhead prices increase.

INDUSTRY LEADERS

The industry leader in 2001 was NiSource Inc. of Merrillville, Indiana, with \$16.9 billion in revenue and 9,300 employees. NiSource's customer base exceeded 3.2 million in 2003. The company boasted one of the country's largest natural gas transmission and underground storage systems. Its pipeline system alone stretched 16,000 miles.

Other notable companies in the gas and combined services industry were San Diego-based Sempra Energy, with \$15.2 billion in revenue and 11,500 employees; MDU Resources Group Inc. of Bismarck, North Dakota, with \$2.9 billion in revenue and 7,000 employees; Vectren Corp. of Evansville, Indiana, with \$2.9 billion in revenue and 1,900 employees; and UGI Corp. of Valley Forge, Pennsylvania, with \$2.6 billion in revenue and 6,300 employees.

RESEARCH AND TECHNOLOGY

The deregulation of the utilities industries opened the door for significant cross-mergers between gas and electric companies. By the end of the decade, shared technologies enhanced the profitability of both industries: pipeline companies, which traditionally held rights-of-way over miles of lines, could now have a financial stake in sharing those routes and passageways with other industries. Moreover,

the growing technology created a form of commodity trading: fiber-optic bandwidth futures.

Within the natural gas supply market, progress in technologies associated with exploration and development of gas reduced costs and expanded the amount of gas that could be economically recovered from a well. Some examples are the use of advanced computer-imaging technologies to explore underground reserves, offshore drilling deep in the Gulf of Mexico, and unconventional recovery techniques for getting more gas from reserve wells.

Technological advances in generation technologies also were important. For example, 60 percent of all additions to electric generating capacity since 1990 have been natural gas, and state-of-the-art gas turbines were increasingly being used in electricity production. Also, a significant opportunity existed in distributed power generation—modular electrical generators ranging in size up to 50 megawatts. These new turbines were easy to site and build, allowing them to serve one large customer or several large customers in one area. They also made maximum use of the gas distribution network already built to accommodate the customer's needs.

As of 2004, the Energy Information Administration was expecting that alternative sources for natural gas would increase, due to improved technology. Such alternative sources included shale, tight sand, and coalbed methane.

SIC 4939

COMBINATION UTILITIES, NOT ELSEWHERE CLASSIFIED

This industry classification includes combination electric and natural gas utilities not categorized elsewhere.

NAICS CODE(S)

- 221111 (Hydroelectric Power Generation)
- 221112 (Fossil Fuel Electric Power Generation)
- 221113 (Nuclear Electric Power Generation)
- 221119 (Other Electric Power Generation)
- 221122 (Electric Power Distribution)
- 221210 (Natural Gas Distribution)

The 2001 industry leader for combination utilities not elsewhere classified was Westar Energy Inc. of Topeka, Kansas. Westar had \$6.4 billion in revenue and 5,600 employees. As of 2003, the company boasted 650,000 electricity customers. Most of its facilities were coal-fired, and the company had a 5,900 mega watt generating capacity. Other notable companies in 2001 were Edison Mission Energy of Irvine, California, with almost \$5.0 billion in revenue and 1,100 employees; Northern Indiana Public Service Co. of Merrillville, Indiana, with \$3.8 billion in revenue and 6,000 employees; MGE Energy Inc. of Madison, Wisconsin, with \$542 million in revenue and 700 employees; and Dalton Utilities of Dalton, Georgia, with \$258 million in revenue and 300 employees.

By the turn of the twentieth century, there were more than 2,000 private utilities and more than 800 publicly owned utilities in the United States. About three dozen of these early companies were combined electric and gas distribution companies. This occurred at a time when

municipal lighting and heating were largely produced through the generation of synthetic coal gas. When street lighting was developed, the gas producers became electric suppliers. When natural gas became available in the 1900s, the utilities continued to serve as gas suppliers as well.

In the early 1900s, state governments begun regulating electric utilities; state regulation of the venting of natural gas used in electricity production began in the late 1920s. Complaints of excessive rates charged by utilities for electric service led Congress to pass two pivotal laws in 1935: The Federal Power Act and the Public Utility Holding Company Act. The first law created a Federal Power Commission (now the Federal Energy Regulatory Commission, or FERC) to oversee interstate power transactions and transactions between wholesale bulk energy suppliers. The second law reined in previous abuses linked to pyramiding holding companies in the United States. A third influential law was the Natural Gas Act of 1938, which gave FERC authority to fix pipeline rates. In 1942, the act was amended to regulate interstate sales of gas.

Historically, the same type of regulation used for electric utilities has been applied to natural gas utilities. In 1954, the Supreme Court of the United States gave FERC the authority to regulate prices all the way back to the well. The commission experimented with "area rates" that set higher rates for new gas discoveries and lower prices for "old gas," or existing production. During the late 1960s, burgeoning demand for natural gas forced gas utilities to allocate demand. In 1978, Congress stepped in again by enacting the Natural Gas Policy Act, an extremely complex law with more than 20 different categories of gas prices. By 1989, Congress gave up trying to regulate supply and demand, passing legislation to phase out price controls on most types of gas.

In 1992, FERC issued Order 636, which forced gas transmission companies to redesign rate structures, essentially changing the way local gas distribution companies obtained natural gas. That same year, Congress passed the Energy Policy Act, which increased competition within the electricity industry. In 1996, FERC issued Orders 888 and 889, final rules governing access to utility power lines. FERC also announced a new policy to consider mergers within a 15-month period.

Natural gas companies that have strong marketing capabilities have even stronger impetus to acquire or merge with electric companies in order to increase the gas companies' share of the power marketing pie. Gas marketers with the ability to also market power will buy a foothold in the electricity market through acquisitions or strategic alliances.

In the past, when gas-to-gas company mergers were proposed, they were reviewed by the Federal Trade Commission and other agencies. Electric utility mergers, however, are overseen by FERC, but even FERC doesn't know how to handle overlap between an electric company and a gas company. The agency did address electric and gas mergers in its new merger policy, issued in late 1996; these mergers were to be considered on a case-by-case basis. FERC was being cautious because a large number of mergers in an industry will reduce the number of active players in the market, raising questions of market power. Combination utilities in retail markets that were once the province of two distinct, unaffiliated gas and electric companies raised similar issues of market power and customer choice.

The governmental deregulation of the utilities industries in the 1990s was intended in part to break up monopolies and create market competition. The privatization of the industry forced more cost-effectiveness, and ultimately consumers were paying 7-15 percent less for natural gas in 1997 than they were 10 years previously. However, the utilities companies used the profits to buy out smaller competitors on the open market—something not possible when the utilities were under governmental rather than Wall Street's control.

In the latter half of the 1990s, natural gas comprised more than 50 percent of the energy market. As older nuclear power facilities and coal-burning electric utilities companies shut down, they were replaced by or converted to natural gas energy facilities. When electric utilities providers began to use natural gas for electric power generation, a new utilities super-power appeared on the horizon: instead of natural gas companies buying out their smaller natural gas competitors, they began aligning with electric utilities companies to provide multiple services to end-users. Thus, by the millennium, some of the largest utilities providers were in fact hybrid entities offering both electricity and natural gas services to their customers.

By 2002, natural gas usage still outpaced that of electricity. That year, 22.7 trillion cubic feet of natural gas was consumed, as compared with 3.8 trillion kilowatt hours of electricity. The average gas cost was \$5.53 per thousand cubic feet, and the average electricity cost was 7.21 cents per kilowatt hour. Both were expected to increase about 2 percent annually into 2025. Both industry segments were expecting to pursue alternative renewable power sources into the 2000s.

SIC 4941

WATER SUPPLY

This category includes establishments primarily engaged in distributing water for sale for residential, commercial, and industrial uses. The industry is dominated by government-controlled establishments such as municipal service districts and public utilities. However, private companies are active in the construction and improvement of water supply facilities and infrastructure. Water distributed for irrigation purposes is classified in **SIC 4971: Irrigation Systems**.

NAICS CODE(S)

221310 (Water Supply and Irrigation Systems)

INDUSTRY SNAPSHOT

The oceans, land, and atmosphere that make up and surround the earth hold the equivalent of nearly 1.4 billion cubic kilometers of water. Of that total, approximately 96.5 percent is contained in oceans, 2 percent is in the form of ice, and a small amount exists as vapor in the atmosphere. Fresh water that is available for human use is just 1 percent of the total water supply, and that supply is dwindling as supply cannot keep pace with demand. According to *Planning*, Christine Whitman of the Environmental Protection Agency (EPA) said in March 2002, "Water is going to be the biggest environmental issue that we face in the twenty-first century, in terms of both quantity and quality."

By the millennium, more than 80 percent of U.S. water companies were controlled by governmental entities. However, an increasing number of smaller utilities were being acquired by larger systems, a trend that industry experts called consolidation. There also was an increase in privatization—private companies that contract to operate or to purchase the public utilities. Moreover, many larger systems were investing in new testing and treatment methods. The entire industry had been bolstered in the 1990s by federal amendments to the 1996

Safe Drinking Water Act (SDWA) and the 1998 Clean Water Action Plan.

ORGANIZATION AND STRUCTURE

The water supply industry is highly fragmented and consists mainly of municipal utilities or regional entities. In 1997, the United States Environmental Protection Agency (EPA) divided the nation's 55,000 water systems into three categories: 694 large systems served more than 50,000 people; 6,800 medium systems served between 3,301 and 50,000 people; and 46,500 small systems served fewer than 3,300 people. The largest system serves 16 million; the smallest serves 25 people.

A water utility or company is responsible for providing its community with water that is free of objectionable tastes and odors and does not contain significant color or turbidity. The water also must meet strict federal, state, and local health and safety regulations. It is the utility's job to build and maintain a distribution system that is capable of providing an adequate and uninterrupted supply of water for residential, commercial, industrial, and institutional customers. In addition, the water supplier must maintain adequate water pressure for the community's firefighting needs.

Although most water supply entities are owned or controlled by local or regional governing bodies, a variety of organizational structures are represented in the industry. In addition, water and wastewater management systems are often integrated, resulting in an organization that also operates a sewerage system and waste treatment facilities. The two primary categories of water suppliers are local and regional.

Local organizations include utilities arranged under various management structures. A utility commission, for example, is governed by a policy-making body such as an appointed or elected commission or board of directors. This utility structure offers the advantage of removing the policy-making body from direct political influence. Furthermore, the revenues required by the utility are generated by the commission specifically for water supply purposes with no competition from general city funds. A utility controlled by elected council, in contrast, often is subject to political forces from other city departments and divisions with which the council members also are associated. Planning decisions can become complex and are sometimes bogged down by political infighting. The advantage of a utility that is controlled by a common governing body, as opposed to a separate utility commission, is that the goals of the water utility can be more easily coordinated with the aims of other city departments and agencies.

Regional water authorities provide service directly to customers or through smaller government entities, such as cities and townships. Regional authorities provide many economies of scale that increase water quality and

reduce costs. They also offer the advantage of a coordinated large-scale water system that would be impossible to achieve with scattered independent local utilities. However, regional systems must transport water over greater distances, which can reduce efficiency.

An increasing number of for-profit entities supplied water needs in the late 1990s. These companies either operated or maintained some portion or all of the water utility's operation. Also, there were a few instances of outright sale of a utility to a private company. In 1999, an estimated 20 percent of all water suppliers were managed or owned by private companies.

Source and Price. Water companies extract water mainly from natural and man-made reservoirs, underground aquifers, and waterways. In addition, some water is reclaimed through wastewater treatment, and a small amount of water is derived through desalinization. The water typically is pumped to a treatment center where impurities are filtered out. Before distribution, the water is purified with chemicals such as chlorine and aluminum sulfate.

Besides natural impurities and sediment, a variety of manmade contaminants and sources must be countered by water treatment managers. Sources of pollutants include septic tanks, landfills, surface impoundments, pesticides, and fertilizer used on millions of acres of farmland, highway salt, and thousands of industrial chemicals that enter the environment every day.

Revenues for water companies and utilities are generated through taxes and securities issues. Much of their income, however, is derived from water usage fees. A traditional rate structure is the declining block rate. Under this system, customers pay a fee for each unit of water they use, and the fee declines for each subsequent block of water consumed. Two other rate structures are the flat rate and the increasing block rate, which are greater incentives for consumers to conserve water.

BACKGROUND AND DEVELOPMENT

Although water supply systems have been in existence since early Roman times and before, community water treatment and delivery systems similar to those existing today did not appear in the United States until the late 1800s. Demand for water treatment proliferated during the industrial era when the urban population grew and more people had access to indoor plumbing and municipal water supplies. During the economic expansion that followed World War II, demand for water increased as industrial, residential, and agricultural needs increased.

New federal regulations that mandated cleaner water also were important to industry growth. The Water Facilities Act of 1937, the Water Pollution Control Act of 1948, and the Water Supply Act of 1958 were early federal initiatives that helped to expand the industry. In

addition to setting water quality standards for communities, these laws arranged to channel vast federal resources into the development of water supply and treatment systems. Other significant legislative efforts included the Water Resources Research Act of 1964, the Water Resources Planning Act of 1965, and the National Environmental Policy Act of 1969.

Some of the most sweeping and consequential laws propelling industry growth were enacted in the 1970s, when environmental concerns became paramount. The Water Bank Act of 1970, the SDWA of 1974, and the Clean Water Act of 1977 were three important laws that increased the importance of both water and wastewater treatment facilities. These laws resulted in billions of dollars worth of public water treatment projects. New legislation and government expenditures continued in the 1980s, with the passage of laws such as the Water Resources Research Act of 1984, amendments to the SDWA in 1986, and the Water Supply Act of 1988.

During the 1960s, 1970s, and 1980s, water standards were tightened, regulations increased, and communities continued to spend billions of dollars on water systems. By the mid-1990s, the cost of complying with the SDWA was estimated to cost water companies from 15 to 50 percent of their annual capital budgets.

Competition for Water Sources. Globally, 12,500 cubic kilometers of fresh water is available per person each year (the figure includes water stored by dams and reservoirs). However, the supply is unevenly distributed, and a large percentage is lost to flooding. Global demand for water has risen sharply since World War II. Between 1920 and 1940, for example, global water demand rose from about 400 to 600 cubic kilometers per year. By 1960, the figure had grown to 2,000 cubic kilometers. By 1980 and 1990, world demand increased to about 3,000 and 3,500 cubic kilometers per year, respectively. By 2000, this number was expected to be approximately 3,800 cubic kilometers per year. Water supplies in various regions of the globe are under increasing stress in the face of increasing population and scarcity of natural supplies. In other areas, water supplies are adequate, but poor irrigation practices consume supplies. An average of 87 percent of accessible fresh water resources in the world are consumed by irrigation and agriculture, leaving a limited supply for industrial and residential demands.

In North America, fresh water available per person each year is 10,500 cubic kilometers (the figure includes water stored by dams and reservoirs). This supply also is unevenly distributed; the western United States is classified as an arid and semi-arid region. The U.S. Geological Survey breaks down the consumption of fresh water as follows: irrigation, 40 percent; thermoelectric power, 39 percent; public supply, 11 percent; industry, 6 percent;

livestock, 1 percent; domestic, 1 percent; mining, 1 percent; commercial, 1 percent.

Water supply scarcity is a critical problem in arid and semi-arid western states, where irrigation consumes 90 percent of accessible fresh water supplies. In a number of western states, water is being drawn out of aquifers faster than nature replenishes it. Most notable is the depletion of the Ogallala Aquifer, which sits beneath 115 million acres between Texas and Nebraska. Recognizing the problem, governors of the western states issued a policy statement calling for increasing efficiency in water use management. Agencies of the federal government also began to implement water use efficiency measures and set new standards for water-conserving plumbing fixtures. Water conservation measures were becoming a way of life in the 1990s.

These measures are needed, according to the U. S. Geological Survey report, because the era of using big water projects such as dams and reservoirs to control water supply is over. Instead, existing water resources will have to be managed effectively.

Amendments to the SDWA in 1996 had a positive reception from the nation's water suppliers and companies that supply water equipment, services, and materials. The amendment introduced flexibility into the requirements for testing of contaminants—testing could be limited to those that were most likely to be found in their supplies and those most likely to harm certain members of the community, such as pregnant women, the elderly, and the young. Water systems that already were in compliance with the 1986 SDWA would need to make minor investments to comply with the 1996 amendments. In addition, the SDWA created a revolving loan fund to help water systems come into compliance with the legislation.

The EPA surveyed a sampling of the nation's 55,000 water systems to determine what infrastructure changes would be necessary through the year 2014 to meet the revised safe drinking water standards. The EPA reported that \$12.1 billion would be needed immediately to comply with the current SDWA. The survey showed that 84 percent of that amount is needed to test and treat water supplies for microbiological contaminants. However, through the year 2014, infrastructure needs were large, totaling \$138.4 billion. This figure included the replacement or refurbishment of distribution piping and water storage tanks and adding or improving sources of water. Medium and smaller sized water systems needed the most funding to comply with the SDWA. The revolving loan fund for upgrading community drinking water systems allots \$9.6 billion or \$1.2 billion annually through the year 2003.

Since most of the country's water systems are small (90 percent of them provide for 10 percent of the people),

they had smaller budgets for the costly upgrading or replacement of infrastructure. Consolidation with larger, usually investor-owned utilities became more commonplace. Large investor-owned companies such as American Water Works and United Water Resources, two utilities that were actively acquiring in the late 1990s, had resources and economies of scale that small water suppliers did not have.

In addition, cities with larger waterworks utilities switched or considered bids for privatization, either by way of outright sale, lease, or management contract. An analyst quoted in *Civil Engineering* suggested that the proportion of public utilities to private might reach 50/50 by the year 2020. Cities that have some form of privatized water systems included Phoenix, Indianapolis, New Orleans, Houston, and Colorado Springs. The 1997 changes to Internal Revenue Service regulations regarding fees, length of contracts, and the sale of facilities were considered a positive sign to an estimated 30 U.S. cities considering this type of public-private "partnership" in the last years of the decade.

Public concern about the safety of drinking water increased after the 1993 cryptosporidium outbreak in Milwaukee, which resulted in more than 400,000 illnesses and 100 deaths. One quality control expert called cryptosporidium the biggest challenge faced by the water supply industry in 40 years. In 1997, the EPA asked water systems serving more than 100,000 users to conduct pilot tests for treatment of cryptosporidium. This microorganism is highly resistant to treatment, and it is difficult to detect. In 1999, four people died and dozens were hospitalized following ground water contamination from manure runoff into a local well feeding the county fairgrounds. For almost a week following flood-related sewage contamination in September 1999, New Jersey residents had to boil their tap water before they could use it.

The EPA reported that in the 1990s alone, there were more than 370,000 confirmed releases of oil contaminants from leaking underground storage tanks. A contaminant "buzz word" at the end of the century was MTBE (methyl tertiary butyl ether), a common gasoline additive which caused fairly widespread contamination of the country's drinking water—about 9 percent of all samples taken. A known carcinogen, MTBE is not removed by conventional treatment or filtration processes. For this reason, a growing number of states, including California, have banned the use of MTBE in gasoline. Under the 1998 Clean Water Action Plan, states identified more than 20,000 lakes and stream segments that had contaminants exceeding one or more of the quality standards.

A 1999 survey conducted for the Water Quality Association found that 60 percent of adults believe that their health is affected by the quality of drinking water, and nearly 50 percent reported that if purchasing a home, they

would more likely purchase one with a home water treatment device. Approximately 75 percent of all Americans expressed concerns about the quality and safety of drinking water. By 1999, Americans were spending \$3 billion annually on bottled water and home water treatment units.

In October 1999, under provisions of the amended SDWA, most Americans received their first annual drinking water quality report from their local water supplier. Starting in 2001, the EPA will require suppliers that serve more than 10,000 people to begin monitoring for 12 unregulated contaminants. The purpose of the new requirement is to help determine whether these contaminants are present at a level or frequency that would warrant regulation at a later date. On October 19, 1999, the EPA also signed a proposed version of a radon-monitoring rule for eventual implementation. It requested \$41.5 million for its fiscal year 2000 budget, although it was authorized \$54.6 million.

In 1999, the EPA began publishing survey results of approximately 935 public beaches, which regularly monitor water quality. The agency's own review of 1,062 coastal beaches and the Great Lakes the previous year indicated that 350 had an advisory or closing, mostly as a result of fecal coliform contamination.

Also signed into law in 1999 were the Water Resources Development Act, authorizing \$6.3 billion for flood control and shore protection by the U.S. Army Corps of Engineers and the Chippewa Cree tribe of the Rocky Boy's Reservation Indian Reserved Water Rights Settlement and Water Supply Enhancement Act of 1999. Under the latter act, the United States became a party to the eight-year negotiations between the tribe and the state of Montana over water supplies on the reservations, as well as future rights to water stored in the Tiber Reservoir.

One of the most important pieces of legislation to appear in 1999 was the EPA's new rule regarding Class V injection wells, which numbered from 700,000 to one million that year. These wells are used primarily for the in-ground disposal of antifreeze, motor oil, gasoline, human waste, and other waste materials associated with light industries such as commercial printers. Eventually, these toxic materials are leached into ground water and end up being consumed by humans in diluted amounts. Under the new rule, large capacity wells and cesspools were to be prohibited from use by April 2000, and all such wells were to be phased out by 2005.

There were a minimum of 55,000 water systems supplying water to more than 225 million Americans in 1999. To help ensure the safety of the nation's drinking water, the government provided more than \$9.6 billion through the year 2003 to help these systems comply with safe drinking water regulations. Total compliance with

amendments to the SDWA of 1996, as well as agency coordination under the 1998 Clean Water Action Plan, will cost more than \$1 trillion dollars by 2030. Of greatest concern was the nation's groundwater, which by 1999 was being withdrawn at a rate of approximately 77.5 billion gallons per day. Of sobering reality is the fact that every gallon of water withdrawn from the ground takes an estimated 280 years to replace. Although surface water from streams and lakes is replaced rapidly, it was ground water that supplied 95 percent of rural America's drinking water and half of the nation's drinking water in 1999. Furthermore, groundwater provided more than 40 percent of all crop irrigation and livestock watering. Thus, the alarming potential for human consumption of contaminants became an increasing concern.

CURRENT CONDITIONS

Urban sprawl has depleted local water sources in many areas, where the natural water supply cannot keep pace with development. To compensate, developed areas depend on pumping water in over long distances or drawing water out of aquifers, layers of soil that hold significant moisture. Whereas shallow aquifers are supplied by local rainfall, deep aquifers that collect water over long periods of time from precipitation over a large area are essentially nonreplenishable as water is pumped out much faster than it can be replenished. If water is removed too rapidly and not replaced, the soil may contract, leaving it less able to retain water. For example, in the San Joaquin Valley in California, an area covering more than 13,000 square kilometers, the ground has subsided at least 30 centimeters in some places and as much as nine meters in others. In certain areas of the High Plains aquifer, which encompasses 450,000 square kilometers from South Dakota to the Texas panhandle, over half of the subterranean moisture has been depleted and water levels have dropped as much as 45 meters.

During the first years of the 2000s, the arid and highly populated areas in the West continued to confront the growing demand and declining supply of usable water. California, which boasts one of the nation's most significant ongoing water supply problems, has been a leader in addressing the politics of water usage. A 2001 state law required developers of subdivisions of 500 or more units and large commercial projects to submit proof that water is available to the area. If the developer cannot, the project faces rejection. Multiyear drought in the upper Midwest, the East, and Florida has forced numerous regions to own up to the reality of water supply issues. In 2002 some areas, including New York City and the state of New Jersey, began placing water-use restrictions on its residences.

Along with the challenges of supply issues, the industry is faced with the significant erosion and decay of

the nation's 700,000 miles of pipes that transport water into U.S. homes. As pipes corrode, water pressure decreases and foreign materials such as bacteria and debris may enter the system. To address the negative health effects, officials flush out the water and add large doses of chlorine to kill contaminants, but this is a short-term solution. It is becoming clear that the country's water-pipe system, much of which is over one hundred years old, needs a major overhaul. The cost to replace and repair the water infrastructure is estimated to be between \$151 billion, according to the EPA, and \$1 trillion, according to industry advocacy groups.

Increased privatization of the water system is being seriously considered to help alleviate the country's water woes. Although at the end of 2002 only 15 percent of utilities were investor-owned, big water corporations are beginning to make inroads into the market. France's Vivendi and Germany's RWE, both international water conglomerates, have begun operating in the United States. In 2002 Indianapolis undertook the largest U.S. water privatization to date by contracting with USFilter in a \$1.5 billion agreement. Whether the water industry continues down the road toward privatization or remains primarily publicly owned, forecasters unanimously predict that the cost of bringing clean, filtered, usable water into American homes will go up.

INDUSTRY LEADERS

American Water Works, owned by Germany's utility giant RWE, is the largest investor-owned water utility in the United States, with operations in 22 states and an estimated 6,400 employees serving 19 million consumers. In 2002 the company reported \$1.4 billion in revenues. A few of its competitors, although considerably smaller, included United Water Resources, Vivendi, and Philadelphia Suburban.

The Metropolitan Water District of Southern California (MWD) is the largest provider of drinking water in the United States, serving about 16 million people through 27 public agency members. The Water District is part of a project involving private firms to make seawater drinkable. The district also was involved in making \$7 billion in capital improvements in the final years of the decade.

RESEARCH AND TECHNOLOGY

In 1999, a research team from the New Jersey Institute of Technology announced the development of a new technique designed to rid water of organic microbes without the carcinogenic after-effect of heavy chlorination. The Spectral Fluorescent Signatures targets carbon-based pollutants that are most likely to become carcinogenic following disinfection. If eventually implemented after further testing, the proposed treatment technique

would reduce byproduct formation, thereby reducing the amount of additives needed to disinfect water.

The University of Cincinnati has been working on the use of glowing zebra fish to identify pollutants in drinking water. Firefly genes were inserted into the DNA of the inch-long zebra fish, causing them to light up when exposed to PCBs. University staff have stressed that the fish are not harmed and eventually lose their glow when removed from polluted areas.

Another non-chemical way to disinfect water is through the use of ultraviolet (UV) light rays. Although the technology has been known for several years, it has not been used widely for drinking water application in the United States. However, it is commonly used in Europe, especially in Finland. Because of concerns about the carcinogenic properties of chlorine, there has been renewed interest in the development of UV treatment facilities in the United States.

Plans for a desalinization plant that would convert seawater into a portable or drinkable source were launched by the West Coast Regional Water Supply Authority in Florida. Another desalinization venture was undertaken by MWD, the largest provider of water in the country, which also faced a severe water deficit. Four private companies with interest and expertise joined MWD in the venture. In the late 1990s, there only were two desalinization plants in the United States, one in Key West, Florida, and the other in Santa Barbara, California.

SIC 4952

SEWERAGE SYSTEMS

This category includes establishments primarily engaged in the collection and disposal of wastes transported through a sewer system. These private and public organizations usually treat the wastewater they collect before discharging it into the environment.

NAICS CODE(S)

221320 (Sewage Treatment Facilities)

INDUSTRY SNAPSHOT

Conventional sewerage treatment in the United States today releases nearly 27 million tons of carbon dioxide into the air each year. Wastewater management has become big business now that federal amendments to the Safe Drinking Water Act (SDWA) of 1996 and the Clean Water Action Plan of 1998 have put new life and new money into environmental protection. Concurrently, the increasing deregulation of public utilities and the privatization and public-private partnership development in wastewater treatment has caused the industry to grow at a faster pace than other industries in the United States.

The Environmental Protection Agency (EPA) has strengthened its legislation by imposing criminal and civil penalties on violators of the wastewater cleanup mandates. From Royal Caribbean Cruise Line's 1999 multi-million-dollar fine for dumping waste into the intracoastal waters to the \$1.3 million fine and prison sentence for a Richmond, Virginia wastewater treatment executive, EPA continued to show that it meant business when it said "clean up." As municipalities worked to meet the EPA's expectations, all were looking at the huge price tag of repairing or replacing sewage infrastructures.

ORGANIZATION AND STRUCTURE

Organizations in the wastewater industry are responsible for collecting wastewater from homes, businesses, and institutions, for treating wastewater to acceptable

standards before discharging it into a waterway, and for disposing of residues called sludge. These activities entail building, operating, and maintaining a transport system and constructing and operating primary treatment facilities that remove or dilute toxins, synthetic debris, human waste, and other refuse.

Wastewater managers are expected to devise a system that transports wastewater as much as possible by gravity and that offers almost no threat of disruption in flow or service. The manager must also ensure that wastes do not seep into water supplies and that plant effluents are treated in a manner that does not significantly harm the environment. In accomplishing their duties, managers must comply with numerous state and federal regulations, financial restrictions, and political pressures. In addition, wastewater managers are often charged with developing resource recovery programs.

The majority of wastewater treatment plants consist of holding reservoirs that contain, chemically treat, and aerate wastewater until pollutants have settled out and the water can be safely jettisoned into a natural waterway. A few treatment plants use other systems. Approximately 300 municipal and industrial artificial marshland wastewater treatment systems were in operation across the country in the late 1990s. These marshes use plants and microorganisms to absorb and biodegrade the organics.

The two main sources of wastewater are residential and industrial. The large majority of residential wastewater is discharged into local sewer systems and treated by local utilities or publicly owned treatment works (POTWs). In 1999, there were approximately 16,000 POTWs across the nation. However, it was estimated that millions of homes still maintained on-site disposal systems, including septic tanks, cesspools, and outhouses—septic tanks alone numbered over 23 million in 1999.

Industrial waste is often pretreated at its source to remove hazardous wastes that require special handling. After being treated in surface impoundments or on-site treatment plants, the water is either discharged directly into the environment or released into local POTWs. About 80 percent of all industrial wastewater is eventually processed by POTWs. Industries that discharge waste into POTWs become subject to many of the same state and federal standards that regulate municipal wastewater facilities.

Types of Organizations. Most organizations that provide wastewater treatment services are publicly owned and operated as nonprofit entities. They may be established under a variety of organizational structures. A regional wastewater authority, for example, provides service either directly or through governmental entities such as cities, townships, water and sanitation districts, and counties. The regional authority may provide direct service and billing to

individual customers, or it might offer wholesale service to several governmental entities that would in turn provide service and billing to local customers.

Large centralized treatment facilities, such as regional authorities, benefit from economies of scale. The drawback of this type of arrangement, however, is that centralized facilities often require pumping of wastewater over long distances. As a result, they tend to be less energy efficient and produce greater amounts of residue in a concentrated area than satellite (or local) treatment plants. Municipal special service districts, which represent a more localized wastewater organizational structure, avoid these drawbacks. Localized utilities though, often have higher costs and lack capital for investment in new technology.

In addition to POTWs, some wastewater treatment facilities are operated by private companies that have a profit motive. These companies bid to either own or manage the wastewater plants or a portion of the operation for a set period of time. The private company's incentives for providing quality service are both profit and the hope of winning the bid again when the contract ends. The private companies also inject private capital into the operation, which frees the community's capital for other uses.

BACKGROUND AND DEVELOPMENT

The first sanitary sewer system was built in 1843 in Hamburg, Germany. Twelve years later, construction began in Chicago on the first U.S. sewer system. In the 1870s, the first U.S. wastewater treatment plants were built. By the end of World War II, wastewater treatment plants served nearly 30 percent of the 145 million Americans. As population and housing increased significantly after the war, so did wastewater treatment plants and sewer systems.

The proliferation of professional wastewater treatment was stimulated by federal government efforts to control pollution caused by residential and industrial discharge. The Federal Water Pollution Control Act (WPCA) of 1956, for instance, established a grant program to help communities construct state-of-the-art facilities. Amendments to the WPCA in 1972, as well as the Clean Water Act of 1977, boosted development of wastewater infrastructure by mandating clean water standards. For example, the National Pollutant Discharge Elimination System (NPDES), created by the Clean Water Act, set limits on the amount and quality of effluent and required all municipal and industrial dischargers to obtain permits.

A few of the other laws and regulations that impacted the wastewater industry, either directly or indirectly, were the Water Facilities Act of 1937, the Water Resources Research Act of 1964, the National Environmental Policy Act of 1969, and the Safe Drinking Water

Act of 1974. In the 1980s, important legislation included the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980, amendments to the Safe Water Drinking Act in 1986 and 1996, the Resource and Conservation Recovery Act (RCRA), and the Water Quality Act of 1987. The Safe Water Drinking Act was amended in 1996. The Clean Air Act and the Clean Water Act of 1998 were essentially reauthorizations of the earlier acts.

When the number of contaminants, particularly chemicals, began increasing at a rapid pace, Americans began to demand a cleaner environment, and federal regulations became more stringent during this time. As a result, the number and capacity of wastewater treatment plants ballooned. Privatization was one technique used to control the rising cost of POTWs. Private wastewater companies typically existed only in areas that were too small or remote to support a municipal treatment system. New legislation encouraged many communities to privatize utilities to achieve cost savings. Initial results of privatization efforts were mixed, and some analysts suggested that private companies often operated at a higher cost than municipally owned systems.

The federal government, however, continued to encourage municipalities to take on wastewater treatment responsibilities. An EPA grant program was announced in 1997 for rural communities with fewer than 3,000 residents. These communities were eligible to receive grants from a \$50 million fund established by the EPA and authorized by congressional appropriations in 1996 as part of the Clean Water State Revolving Fund loan program. This loan fund offered loans at low interest for wastewater treatment and projects.

Because this loan source was shrinking just at the time equipment from the 1970s and 1980s needed improvements, more plants were looking at the feasibility of privatization. In addition, changes in 1997 to Internal Revenue Service (IRS) regulations regarding fees, length of contracts, and the sale of facilities were considered a positive sign to an estimated 30 U.S. cities considering this type of public-private "partnership." The percentage of public to private wastewater plants was anticipated to reach 50/50 by the year 2020.

Because in some locales water and wastewater are under the same roof, there are many variations of private involvement in public wastewater plants. Some companies may operate just one phase of the operation, and in another city, one company may operate and maintain the entire water and wastewater process. An industry consultant estimated that in 1997 there were more than 500 contracts for facilities with capacities greater than one million gallons per day (mgd). Some cities had successful arrangements while others found private involvement problematic. Some of the cities that have some form of

privatized wastewater systems are Indianapolis, Indiana; Cranston, Rhode Island; New Orleans, Louisiana; Fulton County, Georgia; and Schenectady, New York.

In 1999, the Association of Metropolitan Sewerage Agencies (AMSA) represented more than 210 wastewater treatment facilities nationwide, up from 160 members just a few years earlier. AMSA members now serve the majority of the country's sewered population. Collectively, AMSA facilities treated and reclaimed approximately 18 billion gallons of wastewater each day in 1999. AMSA reported that sewer service rates rose a modest 2.3 percent in 1998, about 0.7 percent above the level of inflation as measured by the Consumer Price Index.

AMSA is a member of a coalition of 60 public and private groups known as the Rebuild America Coalition. The group focuses attention on strengthening the nation's infrastructure at the federal, state, and local government level. The 1999 Rebuild America Infrastructure Survey, released in January 1999, indicated that 70 percent of those Americans surveyed stated that quality infrastructure was "very important" to their quality of life. According to the survey, an easy majority of the American public would support a one percent increase in taxes for the guarantee of safe and efficient sewage and water treatment and the return of fishes to local waterways. Only 13 percent of those surveyed believed that the quality of their tap water had improved in the previous five years. Conversely, 30 percent believed that water quality of local rivers, lakes and coastal areas had actually deteriorated. As of 1999, local governments shouldered 90 percent of the funding burden for clean water programs. Americans were split in their opinions as to whether this burden should shift to the federal government or remain with the state and local communities.

During the latter years of the decade, global warming and "El Nino" seasons created numerous floods and heavy rains. Sewer overflows (SSOs) became a national nightmare. The EPA attempted to form a committee to draft national policies for the prevention of SSOs during heavy storm events, at a proposed cost of more than \$80 to \$90 billion to the American public. In July 1999, five national organizations, including the AMSA, the National League of Cities, and the National Association of Counties, walked out of committee talks in protest of the proposed EPA regulations. As one participant noted, "Leaving communities vulnerable to lawsuits and enforcement actions is no way to deal with this issue. The realities of operating a sewage collection system have somehow been lost in these talks."

CURRENT CONDITIONS

The main problem facing the wastewater industry is the involuntary release of sewage into the country's water supply as well as a rapidly deteriorating sewage infrastruc-

ture. The EPA is responding with increased regulations, but many municipalities are feeling the financial burden of upgrading systems to achieve compliance. The EPA has targeted combined sewer systems that use the same pipes to transport wastewater, sanitary sewage, and storm water, which can overflow into the local water supply during heavy rains. At the beginning of 2003, 772 U.S. cities used combined systems. Municipal sanitary sewer systems, which collect only sanitary sewage and wastewater, are also facing stricter regulations from the EPA under revisions to the National Pollutant Discharge Elimination System permit, namely an increased effort to avoid spillovers and improve reporting when spillovers do occur. The EPA estimates that the new regulations will cost an additional \$93.5 million to \$126.6 million annually.

Much of the effort to provide adequate sewage systems will be targeted at upgrading a rapidly deteriorating infrastructure. Steve Allbee, a project director for the EPA, told *Waste News* in January 2003, "Cities will have to increase revenue 3 percent above inflation to pay for the improvements the federal government is asking for, the EPA's gap report says. That could mean almost doubling water bills in the next 20 years. This is a very big public policy problem, and it is hitting a large number of cities and will continue to do so."

INDUSTRY LEADERS

USFilter, based in Palm Desert, California, is a subsidiary of French-owned water conglomerate Vivendi Environnement. In 1997 the company acquired Wheelabrator, one of the pioneers in operating and maintaining public wastewater utilities, from WMX Technologies of Oak Brook, Illinois. This acquisition established USFilter, which owns Culligan, as North America's largest private water and wastewater service organization, operating more than 200 municipal and industrial water and wastewater treatment plants. In 2002 the company reported revenues of \$4.2 billion and employed 15,500.

American Water Works Company, owned by Germany's utility giant RWE's water unit, Thames Water, is one of the largest U.S. water utility holding companies. Along with providing water utilities to 2.5 million customers (10 million people in 20 states), it also operates wastewater treatment facilities in some areas. The company reported a net income of \$161.5 million on \$1.4 billion in sales in 2002.

Other industry leaders include United Water Resources and Ionics Inc. United Water Resources provides water and wastewater treatment services to approximately 7.5 million people in 16 states. The company reported revenues of \$500 million in 2001. Ionics Inc. of Watertown, Massachusetts, reported a net income of \$4.8 million on revenues of \$335 million in 2002.

One of the largest publicly owned and operated wastewater utilities in the United States is the Hyperion treatment facility, the largest of four wastewater plants in Los Angeles, California. Hyperion serves 4 million people in a 600 square mile area. The plant can handle 450 million gallons of wastewater per day and is unique in that it burns its sludge residue to help produce the energy that operates the plant.

WORKFORCE

Workers in the wastewater treatment industry are typically employed by POTWs, engineering and construction companies that build and improve facilities, or consulting firms. The industry hires a disproportionate share of engineers and chemists. Consultants typically provide services such as hydraulic analysis and modeling, feasibility and financial studies, design and specifications for construction, lab services, resource recovery, hazardous waste management, and environmental litigation.

According to the U.S. Bureau of Labor Statistics (BLS), the industry employed approximately 177,000 persons in 2001 and predicted good job opportunities through 2006.

RESEARCH AND TECHNOLOGY

Several companies continued to offer marsh wastewater treatment, called constructed wetlands, for smaller communities. This treatment method is estimated to cost 50 percent less than traditional mechanical treatment systems and operates without chemicals. The "living machine" is an artificial marsh, using tanks rather than a pond, where organisms and plants do the same work of biodegrading and absorbing. This method is an alternative in locations where soil conditions prevent the use of a pond. Living Earth Technology Co. installed its system in one municipality and found it about 15 percent less expensive in terms of capital costs than competing technology and approximately the same in terms of operating costs. There was 66 percent less sludge than conventional methods, and no chemicals were used to treat the wastewater. Therefore none of the remaining waste was considered an environmental hazard.

An article published in the Winter 1998/Spring 1999 issue of *Earth Island Journal* proposed the adoption of "sewage forests," trees specifically planted and grown near sewage treatment plants. According to the article's author, Daniel Wickham, the trees seem to thrive in the fertilized soil and they provide a tremendous service by absorbing phenomenal amounts of carbon dioxide from the atmosphere. He cited one such experimental forest in Martinez, California, in which redwoods have grown 40 feet tall in as little as nine years.

A new process for wastewater treatment systems in cold climates uses modified snowmaking equipment to

treat wastewater without the use of chemicals. The process, similar to freeze drying, flash freezes the wastewater after solids have been removed. The quick freezing explodes bacteria and separates gases as the water is sprayed into the air. Harmless nutrients remain, which are released into the soil during the spring thaw.

Of course, making lemonade from bad lemons is the American Way. In September 1999, the ThermoEnergy Corporation announced its creation of a thermochemical process that makes combustible fuel oil out of wastewater sludge. The Sludge-to-Oil Reactor System (STORS) boasted a nonbiological technology that eliminates the anaerobic sludge digestion unit from wastewater treatment. The company alleged that the resulting fuel product has 90 percent of the heating value of diesel fuel.

On-site sewerage treatment plants are used by companies such as Anheuser-Busch, Inc. The company reduced its wastewater treatment costs by installing anaerobic/aerobic bio-energy recovery systems. The new technology required about 75 percent less energy than traditional aerobic treatments and cost about half as much to install. Methane gas produced by the new system replaced about 15 percent of the natural gas used as fuel at the breweries. On-site treatments are not limited to factory settings—a Santa Monica office park has an on-site sewage treatment plant that uses the treated water for its lake and landscaping.

SIC 4953

REFUSE SYSTEMS

This category includes establishments that are primarily engaged in the collection and disposal of solid waste. Firms in the industry operate incinerators, solid waste treatment plants, hazardous waste facilities, landfills, and other disposal sites and services. Companies that only collect and transport waste without such disposal are classified in **SIC 4212: Local Trucking Without Storage**.

NAICS CODE(S)

562111 (Solid Waste Collection)

562112 (Hazardous Waste Collection)

562920 (Materials Recovery Facilities)

562119 (Other Waste Collection)

562211 (Hazardous Waste Treatment and Disposal)

562212 (Solid Waste Landfills)

562213 (Solid Waste Combustors and Incinerators)

562219 (Other Nonhazardous Waste Treatment and Disposal)

INDUSTRY SNAPSHOT

In the late 1980s and early 1990s, the refuse industry was struggling to overcome the effects of a recession, which included reduced waste and a more competitive business environment. Many refuse companies were also buckling under stringent new environmental regulations. As it entered the millennium, the industry was continuing to seek new ways to safely handle growing amounts of waste at the same time that landfill space was rapidly declining. The industry placed a greater emphasis on recycling efforts, and by 1998, there were 9,000 curbside recycling programs in the United States. There also was a strong move toward privatization of former municipal operations, consolidation of firms, and increased flexibility of government regulation of the industry. About 2,400 landfills were still functional in 1997, and these, along

with hundreds of incinerators, consumed the bulk of America's trash (not including hazardous waste).

However, by 1999, new problems loomed on the horizon. Of major concern was that the "clean-up" of America was causing new toxic byproducts. MTBE additives to gasoline fuel, ostensibly to reduce air emissions, ended up contaminating ground water. Methane gas fumes released from landfills had reached toxic levels in many states, and dioxin, a byproduct of incinerated waste, was brought under EPA monitoring. Moreover, chloroform, a byproduct carcinogen created during the disinfection phase of water treatment, was detected in high levels in approximately one to three percent of drinking water samples reported in 1999 by the U.S. Geological Survey.

During the early years of the 2000s, landfills remained the primary means of waste disposal in all regions except New England, where incineration dominated. Although recycling quadrupled between 1990 and 2001, from 8 percent to 32 percent, the industry saw a leveling off of recycling programs. While Americans increased recycling during the 1990s, they also decreased their garbage output for the first time in over 30 years. Between 1960 and 1990, average garbage output jumped 70 percent from 2.7 pounds per day to 4.6 pounds per day, before dropping to 4.46 pounds per day in 1998. That total edged back up past 4.6 pounds per day by the end of the decade. The rapid increase in waste production can be attributed to a 50-fold increase in the use of plastic as well as a doubling of all other waste material. The recent leveling off in waste production is due in part to increased efficiency in packaging by manufacturers and the rapid implementation of recycling programs. However, refuse management is expected to be a source of ongoing concern as environmental issues continue to arise.

ORGANIZATION AND STRUCTURE

The refuse industry traditionally has been fragmented in comparison to other businesses. Organizations range from local firms and government bodies that manage consumer garbage to companies that handle hazardous and specialty waste. However, from the mid-1990s on, there was a trend toward acquisition of smaller firms and privatization of former municipal efforts, which often were absorbed by large private companies. Municipal and government entities, which owned 85 percent of landfills in the early 1990s, owned less than 70 percent by 1997. Several large U.S. corporations also were active in all aspects of waste management on a global scale.

The two largest segments of the refuse management market are municipal solid waste (MSW) and hazardous waste. MSW includes non-hazardous garbage discarded by homes, businesses, and governments. In 1997, 217 million tons of MSW was generated across the nation,

constituting eight million tons more than in 1996. The largest part of trash was paper and yard trimmings, which accounted for 51 percent of all MSW. By 1999, nearly 30 percent of MSW was recycled. Recycled solid waste prevents the release of more than 33 million tons of carbon into the atmosphere each year.

Hazardous waste includes liquid and solid materials that are toxic or radioactive. Liquid waste commonly emanates from nuclear energy facilities and U.S. Department of Defense activities. Solid waste often comes from mining and milling operations (especially from extracting uranium ore), sludge in abandoned storage tanks, and contaminated equipment and structures. Large amounts of both solid and liquid hazardous materials also emanate from chemical, medical, and petroleum industry activities, as well as from the mishandling of those wastes by businesses, governments, and consumers.

Disposal Methods. By 1998, landfills were managing about 55 percent of MSW, 30 percent was being recycled, and 15 percent was combusted. In raw figures, this meant that approximately 60 million tons of material were recycled rather than dumped into landfills or incinerated. The highest recycle recovery rates are batteries (93.3 percent) and paper/paperboard products (41.7 percent). About 41 percent of yard trimmings are also recycled.

Like MSW, most hazardous waste is sent to landfills. Various types of toxic waste are also incinerated and even recycled. Solid waste landfills differ from MSW fills in that they are usually built to contain the waste for a long period of time, and a greater effort is made to break down or neutralize the refuse, thus making hazardous waste fills more expensive to build and operate. Highly radioactive waste may be sealed in special drums or tanks where it can be held indefinitely.

BACKGROUND AND DEVELOPMENT

Municipal Solid Waste. Prior to the industrialization of the United States, most people managed their own waste. Garden and organic waste was composted and used as fertilizer and soil conditioner. Scrap wood, glass, metal, and other debris were often taken to a local dump or burned on one's property. A garbage collection and landfill industry emerged, however, as industrialization occurred and large urban areas began to develop in the 1800s. In fact, WMX Technologies, Inc., one of the largest refuse companies in the world, originated in 1894 as a collector of Chicago's waste.

The waste disposal industry flourished after World War II. As the U.S. economy and population expanded, so did the amount of garbage produced per capita. By 1960, in fact, Americans were discarding a combined total of over 100 million tons of garbage per year, prompting some people to call the United States the

“disposable society.” In order to handle mass quantities of garbage created by the new suburban consumer society that evolved in the 1950s and 1960s, municipalities began building large numbers of landfills and incinerators. By the early 1970s, 300 to 400 municipal landfills were opening each year.

During the 1970s, the MSW environment began to change. In addition to the fact that many landfills were becoming saturated, environmental problems began to plague landfill operators. Some landfills were emitting hazardous gases and fluids that were seeping into the air and water. Americans became more conscious of the need for safer and more attractive waste management. Federal initiatives that impacted the refuse industry included the Clean Air Act, the Clean Water Act, and the Safe Drinking Water Act. Recycling programs, such as the “one-bag” and “blue-bag” programs, emerged in several states. Consumers also became less receptive to landfill development, thus coining the acronym NIMBY (not in my backyard).

In the 1980s North American landfill capacity began to shrink. Public opposition to new landfills posed major barriers to refuse organizations. Furthermore, new federal and state environmental regulations made it increasingly difficult and expensive to operate existing landfills. During the 1980s, the number of landfills opened each year declined to between 50 and 200 while existing landfills closed at a high rate. The total number of dumpsites dropped from 14,000 in 1980 to 6,000 by 1990 and then to only 3,000 by 1996.

Despite society’s apparent concern over MSW and the environment in the 1970s and 1980s, both personal and commercial waste volumes continued to grow at a record pace. By 1992, the average American was producing four pounds of trash per day. Landfills were further stressed by curbside collection of yard waste, which was not commonly practiced until the mid-1980s. The total amount of U.S. trash had ballooned to over 280 million tons per year.

Waste companies responded to refuse growth and market demands for safer, less conspicuous disposal by stepping up recycling operations and by developing other disposal options, such as WTE. By the late 1980s, recycling programs processed 15 percent of all MSW, and about 125 WTE plants consumed nearly 15 percent of all refuse. The future importance of innovative waste management companies seemed clear to investors. Many refuse companies enjoyed skyrocketing stock prices and healthy profit growth.

Hazardous Waste. At the same time that the MSW industry was rapidly growing, government and industry began producing large amounts of toxic and radioactive waste that would eventually result in the proliferation of

an entire hazardous waste industry. New synthetic chemical products that were developed during the war, for instance, were offered to the public on a broad scale in the 1950s and 1960s. Industrial wastes that resulted from production of these chemicals were often carelessly dumped in waterways, landfills, and wells. Furthermore, the Department of Defense, which was busy creating a nuclear defense system, jettisoned mass amounts of highly radioactive materials.

By the 1970s, the refuse industry began to respond to societal concerns about the environment. Toxic substances, including some that had seeped into aquifers or had been used to produce children’s clothing, resulted in a new category of refuse called “hazardous waste.” Prompting the formation of the hazardous waste industry were federal mandates regarding toxic refuse. The Resource Conservation and Recovery Act (RCRA) of 1976, for instance, was implemented to control the creation and disposal of hazardous materials.

Laws that followed RCRA in the 1980s included the 1984 Hazardous and Solid Wastes Amendments (HSWA); the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund), which designated billions of federal dollars for clean up; the Toxic Substances Control Act; and the 1986 Superfund Amendments and Reauthorizations Act (SARA). CERCLA earmarked over \$9.6 billion for hazardous waste cleanup in the 1980s, much of which went to contractors in the refuse industry. In addition, the federal government required companies to spend additional billions to recover toxic waste sites.

Like MSW, the creation of hazardous waste continued to grow during the 1980s and early 1990s. By 1985 10 times more chemicals were in use than in 1970. In the early 1990s, synthetic chemical manufacturers were producing 220 million tons per year of about 58,000 different chemicals. In addition to growing amounts of hazardous waste produced in the United States in the early 1990s, refuse companies also benefited from ongoing CERCLA cleanups. By 1990, the Environmental Protection Agency had identified 1,224 priority cleanup sites, as well as over 31,000 sites that needed attention. In addition, the General Accounting Office estimated that 130,000 to 425,000 potentially hazardous sites existed. The average bill for a Superfund site cleanup in the early 1990s exceeded \$26 million.

Stock prices of refuse companies during the late 1980s and early 1990s reflected the surging demand for both MSW and hazardous waste services. The average earnings per share for the ten largest companies, for instance, jumped from 59 cents to over 70 cents in 1990 alone. Stock prices of those firms peaked in 1990 as well, rising from about \$22 to an average to almost \$30. In the

early 1990s, however, most refuse firms were stalled by an industry recession.

Several factors contributed to the slowdown in the early 1990s. MSW tonnage dropped to around 280 million tons per year by 1993. The amount of money spent on hazardous waste cleanup also declined in the weak economy. In addition, larger amounts of garbage were being collected for recycling. Because recycling is labor-intensive and there is relatively little demand for recycled products, it offers low profit margins. A weak economy also played a role in keeping prices down, as stagnant waste growth created a more competitive business environment.

Adding to the plight of the refuse industry in the early 1990s was a proliferation of the NIMBY attitude and increasingly stringent environmental regulations. These two factors were reducing the number of new landfills that were opening and were forcing many operators to close their fills or comply with expensive new regulations. In 1991 for example, an average of 63 landfills per state were shut down, while an average of only 10 new dump permits and six landfill expansion permits were allowed.

Regulations and public opposition also squelched the WTE market for waste in the early 1990s. Although the number of plants in operation grew from 30 in 1991 to 61 by 1993, the number of plants planned for future construction fell from 220 in 1988 to only 48 in 1993. Furthermore, by 1993, some 50 plants had been shut down for environmental reasons, up from 37 in 1991 and 27 in 1988. More WTE closings were expected as the cost of retrofitting existing plants for cleaner operation spiraled.

Privatization became more prevalent, with municipal ownership of solid waste landfills falling to 70 percent by 1996 and private firms picking up the formerly public operations. This shift was largely due to municipal budget cuts and increased regulatory compliance costs.

Overall, the waste management and disposal industry experienced less than five percent growth annually for the latter years of the decade. In early 1999, the industry reported annual revenue of \$40 billion, with private industry controlling approximately 67 percent. The industry also reported a 20 percent annual decline in disposal volume. However in 1997, the EPA increased the goal for recycling to 35 percent of total volume, and by 1999, several communities had reached or surpassed that goal. (The national average in 1999 was 28 percent.) Some states were taking more drastic measures. California had hoped to cut its overall refuse by 50 percent but missed that goal even though it did accomplish an impressive 33 percent. Minnesota was considering a law to ban *all* dumping in landfills.

But no state caught the attention of the industry more than New York, which planned to close its Staten Island landfill by the end of 2001. For 50 years, the landfill had been home to New York City's 13,000-ton *daily* trash load. Of concern to citizens of neighboring states, as well as to legislators, was the absence of laws preventing interstate dumping, and many Americans living in the East were wary of their states taking on New York's trash, even if they had the room and could use the money. For example, in 1997, Pennsylvania imported 6.3 million tons of trash from other states and buried it in its landfills for a fee. Virginia had also been a high-volume trash importer. However, in 1998, barges of trash traveling the historic James River on their way to landfills began spilling and leaking their loads into the river. At about the same time, New York papers featured Governor James Gilmore wearing latex gloves and showing the press items of medical and human waste that had been mixed with Brooklyn garbage. A shocked citizenry began to mobilize its political support, and as of early 2000, several state legislators had bills pending which addressed the potential ban of imported trash. Continuing negotiation of a proposed international hazardous waste treaty might result in bans on shipments of certain wastes to developing nations, which could otherwise become dumping grounds for other nations' unwanted and dangerous refuse.

On November 8, 1999, the EPA published its plan to implement emission guidelines for MSW landfills, focusing on the recovery of methane gases released into the atmosphere. Emissions from MSWs and industrial landfills had increased almost 20 percent between 1990 and 1997. EPA's stated goal was to reduce landfill methane emissions by 50 percent by 2000.

CURRENT CONDITIONS

According to survey research conducted by *Bicycle* as reported by *Journal of Soil and Water Conservation*, municipal solid waste totaled 26.4 million tons in 2001, up 7 percent from the previous year. Of the 41 states that replied to the survey, 10 had no change in their recycling rates, 14 showed an increase, and 17 reported a decrease. Landfill trends included nine states that reported no change in landfill rates, 20 states reported an increase, and 12 states reported a decrease. According to the *Bicycle* report, the United States had 132 incinerators located in 35 states. Nationally, 7 percent of the country's municipal solid waste was incinerated in 2001.

In the early twenty-first century, waste management firms are exploring and expanding ways to harness the power of landfill gases. Under EPA regulations, landfills are required to collect and burn landfill gases to be in regulatory compliance. Usually, landfill gases are burned off by flares installed in the landfill; however, the indus-

try is discovering that the gases, composed primarily of methane and carbon dioxide, can be used to produce a viable energy source. "Almost every community across America has a landfill, and that landfill is generating landfill gas," Brian Guzzone of the EPA's Landfill Methane Outreach Program told *American City and County*. "So, when feasible, why not do something with it?" Guzzone added. By capturing the gases and using them as a fuel source for such purposes as heating and motor fuel, greenhouse emissions are reduced and otherwise-wasted energy is used.

INDUSTRY LEADERS

The multinational waste management and environmental services firm Waste Management Inc. remains the largest in the industry. With \$11.1 billion in annual revenues in 2002, it serves 25 million residential and two million commercial companies and owns 319 landfills and 650 hauling operations across the country. After posting significant losses during the late 1990s, the company rebounded to record a net profit of \$822 million in 2002.

Allied Waste Industries is the nation's second largest waste management firm, with 10 million total customers in 39 states. Its nonhazardous solid waste operations include 340 collection companies, 175 transfer stations, 169 active landfills, and 66 recycling facilities. The company posted a net income of \$215 million on \$5.5 billion in revenues for 2002.

RESEARCH AND TECHNOLOGY

The industry is increasingly affected by new technologies related to packaging, waste transportation, and hazardous waste disposal. Recycling services are becoming a more important part of waste management services, even though residential recyclables recovers only a fraction of the cost necessary to collect and process them. Therefore, new recycling technologies, such as the development of papers and inks that are easier to process, could play a critical role in MSW profitability.

Additionally, great strides were made in the development and promotion of refuse-derived fuel under what has been referred to as waste-to-energy (WTE) technology. In 1999, the United States had 103 WTE facilities, which operated mostly as joint ownerships/partnerships with local governments.

National Environmental Technology Applications Corp. was one firm on the technological edge. This firm devised a mile-deep tube that could pressurize hazardous sludge for use as bricks, road base material, and structural fill. Importantly, advances in scrubber technology could revive the ailing WTE sector, allowing cleaner emissions at reasonable costs for energy plants. WMX had already developed new fabric filters and dust collectors that al-

lowed it to convert trash to energy more efficiently and cleanly.

SIC 4959**SANITARY SERVICES, NOT ELSEWHERE CLASSIFIED**

This category includes establishments primarily engaged in cleanup and maintenance activities that are not classified in other sanitary industries. Activities covered by this industry classification include beach maintenance and cleaning, malaria control, mosquito eradication, oil spill cleanup, snowplowing, street sweeping, and vacuuming airport runways.

NAICS CODE(S)

488119 (Other Airport Operations)

562910 (Remediation Services)

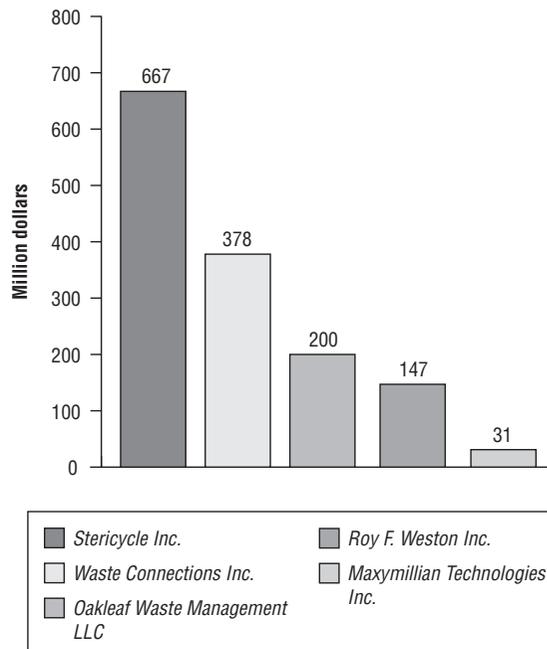

561710 (Exterminating and Pest Control Services)

562998 (All Other Miscellaneous Waste Management)

The 2001 industry leader was Stericycle Inc. of Lake Forest, Illinois. Stericycle boasted \$667 million in revenue and 2,600 employees. In second place was Waste Connections Inc. of Folsom, California, with \$378 million in revenue and 2,400 employees. Oakleaf Waste Management LLC of East Hartford, Connecticut, was third with \$200 million in revenue and 200 employees. Other notable companies in this industry were Roy F. Weston Inc. of West Chester, Pennsylvania, with \$147 million in revenue and 1,800 employees, and Maxymilian Technologies Inc. of Pittsfield, Massachusetts, with \$31 million in revenue and 200 employees.

Most establishments in the industry are small, local companies that operate on a contract basis, typically for business and municipal clients. For instance, many firms that offer commercial snowplowing, street cleaning, and runway clearing services are small, family-operated businesses. These companies typically act as subcontractors and bid on service contracts for property managers, government agencies, or institutions. The labor and capital intensive nature of sanitation services, combined with the competitive bidding process, results in characteristically low profit margins for industry participants. Furthermore, low barriers to entry create an extremely competitive pricing environment.

An example of an entrepreneurial company in this industry is the Greater Philadelphia Commercial Residential Services Co. (CORS). Started in 1996 as a graffiti-removal company, CORS could not turn a profit because business owners were unwilling to pay for services they believed should be paid for by local government or the graffiti wrongdoers. Since CORS' company assets already included vehicles with mounted pressure washers, the company broadened its market by offering industrial cleaning and environmental services. In 1999, services

2001 Industry Leaders

SOURCE: Ward's Business Directory of US Private and Public Companies

included pressurized surface cleaning, street cleaning, and interiors cleaning. Corporate revenues went from an \$11,000 loss in 1997 to nearly \$1.2 million in 1999.

Some 1,200 establishments performed miscellaneous sanitation services in the United States in the 1990s. They employed approximately 8,000 laborers and generated receipts of more than \$700 million. Such firms benefited from an emphasis by commercial property managers on increased maintenance to retain tenants. This, combined with moderate growth in government spending, was partially offsetting increased competition and stagnant prices among sanitary industry participants.

Environmental awareness of unhealthy conditions has helped the industry. In 1999, the U.S. Environmental Protection Agency (EPA) began publishing survey results of approximately 935 public beaches that regularly monitor water quality. The EPA's own review of 1,062 coastal beaches and the Great Lakes the previous year indicated that 350 had an advisory or closing. Beach maintenance often was contracted out to private companies, but remained a local responsibility. In Hollywood, Florida, for example, the public works division purchased a sanitizer that cleans the beach sand and redistributes it along its 5 miles of beaches. Each year, crews collect more than 500,000 pounds of litter, and 440 cubic yards of shoreline debris.

A bright spot in the industry has been oil spill cleanup services. This segment was benefiting from stringent new federal regulations enacted during the cleanup of the 11 million gallon Exxon Valdez spill in 1989. Notwithstanding, in that incident, less than 50 percent of the rescued wildlife had survived. Ten years and \$45 million later, 1999 populations for the bald eagle and river otter appeared to have recovered. Sea otters, harbor seals, harlequin ducks, herring, salmon, and one pod of killer whales were reported as “not recovering.” With respect to salmon, in 1999 patches of residual oil could still be found adjacent to some intertidal spawning habitats, having a continued negative impact on salmon embryos, according to the National Marine Fisheries Service (NMFS).

Many companies and city governments established oil spill readiness plans that provided for quick mobilization of spill cleanup contractors in the event of an emergency. Companies most likely to benefit in this sector are those that have access to the latest technology related to disaster cleanup equipment and chemicals. Major companies in the industry included Waste Management Inc. (formerly WMX Technologies) of Oak Brook, Illinois; and Handex Environmental Recovery Inc. of Morganville, New Jersey.

By the new millennium, increasing numbers of Americans were washing with antibacterial soaps, drinking bottled water, employing the latest electronic pest deterrents, and contributing to environmental charities in record amounts. According to a 1999 study released by the American Enterprise Institute, this was with good reason—it found that basic public health measures, including “drinkable water and sanitation services,” have the greatest effect on life expectancy.

Industry leader Stericycle handled waste management for nearly 300,000 medical clients, including hospitals and blood banks. The medical waste was treated in one of three ways: incineration, autoclaving, or electrothermal deactivation (ETD). Items considered medical waste range from blood and blood products themselves to single use items, such as needles or syringes, which work with blood or blood products. The company’s revenue continued to increase each year, more than 10 percent from 2003 to 2003 alone.

SIC 4961

STEAM AND AIR CONDITIONING SUPPLY

This industry comprises companies that produce and/or distribute steam and heated or cooled air for sale.

NAICS CODE(S)

221330 (Steam and Air-Conditioning Supply)

The steam and air conditioning supply industry consists mainly of a few big competitors that produce and sell steam and hot air. The industry also encompasses some miscellaneous activities, including production of geothermal steam and trailer-mounted air conditioning units used as back-up cooling systems. In the 2000s, the industry was dominated by Trigen Energy Corporation, which was formed by the merging of Cogeneration Development Corporation with ELYO in 1986. Trigen focused its business entirely on energy for buildings.

One growing segment of this industry is cogeneration. Cogeneration is a process that conserves fuel by improving energy efficiency in power plants. When power plants create energy using thermal processes, excess heat is produced. However, only 30 to 40 percent of that thermal energy is converted to usable electricity. Many power plants try to capture this excess heat and deliver it directly to a nearby consumer in the form of hot air or steam. These plants, by capturing the heat, are able to produce and sell both heat and power.

An electric utility plant, for example, might capture heat dissipated during steam production. It could then channel the heat through an underground pipe or vent to, for example, a nearby automobile factory for the factory’s heating needs. This is like a car’s heating system, which vents residual heat dissipated by the engine back to the car’s interior.

Plants using cogeneration typically operate at about 80 percent efficiency, meaning 80 percent of the energy source converts to usable power. Traditional power plants, by comparison, operate at closer to 40 percent efficiency. Although cogeneration has been understood for decades, it was not until the 1980s and 1990s that energy plants started cogeneration programs.

One of the largest cogeneration projects of the 1990s was done by Virginia Electric & Power Co. In 1993, this

utility asked state regulators to approve a company plan to build and own 10 “dispersed energy facilities” in its territory, to help industrial customers save money. Other utilities observed Virginia Power’s efforts, and some analysts predicted similar cogeneration efforts may end the construction of traditional centralized power plants.

A new wave of large cogeneration projects emerged toward the latter half of the decade and into the millennium, representing viable power sources. Most cogenerated power remains in the manufacturing sector, with the paper and chemical industries as leading users. The potential savings in energy remains tremendous. For example, in 1998 nearly 2.7 trillion cubic feet of natural gas, almost 60 million barrels of petroleum, and 56.8 million short tons of coal were all burned off in order to produce electricity.

With the continued deregulation of electricity and rising environmental concerns, the appeal of on-site electric generation continues to grow. One California study projected that on-site (distributed) generation would double by 2004. Power shortages and price hikes during the summer of 1998 stimulated further interests in the advantages of on-site generation.

The Federal government also had taken a renewed interest in cogenerated power because of the decrease in global carbon emissions. On December 10, 1998, the Department of Energy announced its goal to double the capacity of cogenerated power by 2010. Partially in anticipation of this expected growth, the Comprehensive Electricity Competition Act of 1999 contained provisions addressing required interconnections between cogenerative power producers and distribution utilities.

Trigen Energy Corporation, with 46 cogeneration and district energy facilities, produces steam hot water, electricity, and chilled water for 1,500 industrial and commercial customers in Canada, Mexico, and the United States. It also is a leader in converting biomass to energy. Its corporate offices were based in White Plains, New York. Trigen, which produces and sells electricity as a by-product of its heat and power generation, is considered the leading thermal science company in North America.

In 2001, there were 62 firms operating 84 establishments in this industry. There were about the same number of establishments employing fewer than 20 employees as there were employing more than 500. Overall, the industry employed 1,630 workers with an annual payroll of \$80.1 million. The average hourly wage was \$22.41.

SIC 4971

IRRIGATION SYSTEMS

This industry consists of establishments primarily engaged in operating water supply systems for the purpose of irrigation. Establishments primarily engaged in operating irrigation systems for others, but do not themselves provide water, are classified in **SIC 0721: Crop Planting, Cultivating, and Protecting**.

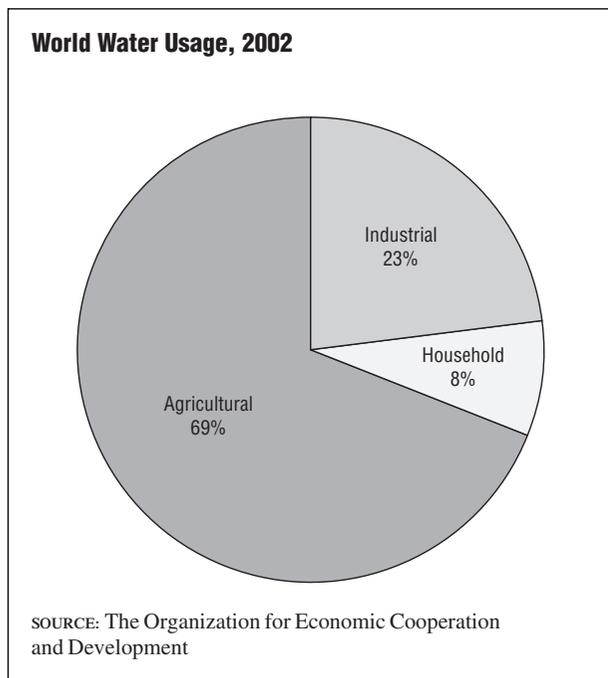

NAICS CODE(S)

221310 (Water Supply and Irrigation Systems)

INDUSTRY SNAPSHOT

As environmentalists, scientists, health officials, and policy analysts looked ahead to the most pressing problems facing the twenty-first century, the balance of demand and availability of fresh water was near the top of the list of concerns. With population figures booming through much of the world, particularly in developing countries, coupled with skyrocketing demand for clean water and delicate and imperiled ecosystems depending on ever more precarious water supplies, it was believed that innovative irrigation systems were required to stave off environmental and social catastrophe.

According to the United Nations Food & Agricultural Organization’s report, “Unlocking the Potential of Agriculture,” by 2030 world food production will need to increase about 60 percent to adequately feed the 2 billion more people expected to populate the planet. Agriculture consumes about 70 percent of all water withdrawals, according to *Appropriate Technology*, and the water required to yield an average person’s adequate diet

exceeds the quantity that person drinks by a factor of about one thousand. As a result, irrigation systems will require dramatic innovation to avoid potentially serious social conflict stemming from increased competition for scarce water resources.

In the United States, there were some 1,385 establishments engaged primarily in operating water irrigation systems in 2003, with total annual sales of \$783.3 million and employing nearly 11,000. The early and mid-2000s saw many of these establishments partnering with scientists to implement new technologies designed to boost irrigation efficiency.

ORGANIZATION AND STRUCTURE

The Center for Irrigation Technology at the California State University described irrigation as the artificial application of water to crops to ensure adequate moisture for growth. Irrigation systems ship water from its source to where it is needed. In the United States in the early 2000s, approximately 64.1 percent of withdrawn ground water was used for irrigation.

Water supply systems primarily utilized for irrigation purposes are in operation all over the world. Generally, water for irrigation falls under the responsibility of a water management district. These entities can be local, state, or federally operated public agencies or mutual associations, private agencies, or co-ops. Some are for-profit organizations, but most fall in the category of nonprofit.

Many technological advances during the twentieth century resulted in the expansion of irrigated agriculture

and of the construction of dams and reservoirs to regulate the distribution of water resources. There are actually four sources of water available for irrigation purposes: ground water, surface water, atmospheric water, and ocean water. The most widely used of these is surface water, which comes in the form of rivers, streams, lakes, and oceans. Ocean water is the least utilized of these for irrigation purposes, except in arid areas such as the Middle East where desalination projects brought new technology to agricultural development.

Irrigation water supply systems are structured differently in different parts of the United States. Large irrigation systems are prevalent mainly in the western United States, while other areas of the country generally experience enough rainfall to satisfy agricultural requirements. However, irrigation projects of some kind dot the whole country. Water supply systems in the western United States fell off in total surface irrigated acreage in the closing decades of the twentieth century, while the eastern areas of the country showed an increased use of irrigation systems, despite the rainfall advantages they enjoy. Nonetheless, approximately 75 percent or more of harvested cropland in several Western states is irrigated, and the greatest volume of irrigated water use remains in the western and southeastern states.

As of 2004, there were four basic irrigation systems in use. Those systems were: surface systems that employ wild flood, border, basin, and furrow methods; sprinkler systems that use hand-moved and mechanically-moved aluminum pipe, plastic hose, and solid set arrangements; drip systems that are placed above or below the ground; and sub-surface systems that encourage a high water table to rise in the root zone of the plant.

Attaining irrigation efficiency for the user is a top goal of the districts and water resource departments that monitor the water supply systems. Every effort is made to schedule the release of water to most effectively meet the crops' water needs. Water is expensive, so it benefits the supplier as well as the user to make optimum use of it.

Water pricing systems for irrigation vary throughout the country. Water from surface storage facilities is less expensive than water from state water projects (SWP). In California alone, there are approximately 385 water districts. These include commercial water service agencies and mutual associations that sell water at cost for agriculture within the district service area. Some of the organizations are nonprofit. Each water supplier provides the water within a structure that allows it to set the cost and objectives according to its own policies. The result is that there are many water pricing systems in use. In the early 2000s, the water price range for agricultural water varied from \$1 to \$300 per acre-foot, which often dictated the type of crops that a grower could afford to irrigate.

CURRENT CONDITIONS

The severity of the world water outlook was such that the Worldwatch Institute called for a so-called blue revolution to radically reduce water depletion. Such a wholesale restructuring of the world's handling of water supplies called for major technological overhauls alongside management policy changes. In the early 2000s, many analysts looked to desalination as the most hopeful avenue for addressing the world's impending water shortages. But as a means of providing water for agriculture, desalination was not yet realistic, given the huge quantities of energy consumed in the process.

One of the most promising efforts was in developing "drip irrigation" systems, which could decrease water use by as much as 70 percent. First developed in the 1960s, drip irrigation utilized low-cost plastic pipes that feed filtered water directly into the soil via tiny holes punctured in the tubing. This method conserves water, prevents run-off of nutrients from overly-flushed soil, and uses less energy than traditional irrigation techniques.

Micro irrigation was increasingly utilized by commercial farmers in arid regions of developed countries, particularly the United States, to supply water directly to the soil at intermittent intervals. Running through pipes along or just under the surface of arid soil, micro irrigation avoids the waste that accompanies channel irrigation and wild flooding irrigation, where large amounts of water run over the soil, only some of it actually absorbed into the soil. Micro irrigation systems were, in the early 2000s, fairly expensive, thus limiting their employment

primarily to large commercial farmers, whereas farmers and planners in water-scarce third world regions most in need of efficient irrigation systems were reluctant to introduce micro irrigation due to the hefty initial investment in the equipment involved.

On the management side of the equation, many U.S. communities began conducting regular water audits to ensure that the area's irrigation systems were running at optimal efficiency, judged in terms of water leakage, coverage area, and water pressure as measured against the community's historical water needs. Increasingly, water audits were a central component of community planning and an element in the determination of water permits for operators of irrigation systems. Digital orthophotographic technology, meanwhile, was developed for use in assessing a broad geographical area's landscape, plant types, and other measures to assure the land and residents allocated their water supply efficiently and sustainably.

WHOLESALE TRADE

SIC 5012

AUTOMOBILES AND OTHER MOTOR VEHICLES

This classification covers establishments primarily engaged in the wholesale distribution of new and used passenger automobiles, trucks, trailers, and other motor vehicles, including motorcycles, motor homes, and snowmobiles. Automotive distributors primarily engaged in selling at retail to individual consumers for personal use, and also selling a limited amount of new and used passenger automobiles and trucks at wholesale, are classified in **SIC 5511: Motor Vehicle Dealers (New and Used)**.

NAICS CODE(S)

421110 (Automobile and Other Motor Vehicle Wholesalers)

INDUSTRY SNAPSHOT

In 2001 seasonally adjusted sales for all U.S. merchant wholesalers amounted to about \$226.4 billion per month. With monthly average wholesale levels of approximately \$17 billion, motor vehicles and parts accounted for around 7.5 percent of this total. The auto industry plays an integral part in the American economy and everyday life. In 2001 it employed 923,570 workers. About 1.1 million individuals are employed indirectly as dealers at 22,150 franchised dealerships. If employment figures for the nation's 54,150 independent dealerships were available, this total would be much higher. In addition to auto dealerships, auto auctions employ an estimated 75,000 workers. The U.S. automobile industry is the number one U.S. manufacturing industry and contributes \$375 billion to the U.S. economy, or 3.7 percent of the nation's gross domes-

tic product (GDP). Indirectly, about one in every seven jobs in America relates to the manufacture, sale, operation, or maintenance of motor vehicles.

The automotive industry also forms the core of America's industrial strength. In a typical year, it generates one-sixth of all U.S. manufacturers' shipments of durable goods and consumes 30 percent of all the iron, 15 percent of all the steel, 25 percent of all the aluminum, and 75 percent of all the natural rubber bought by all industries in the nation. In 2001 personal consumption expenditures for new and used automobiles and trucks were approximately \$375 billion.

ORGANIZATION AND STRUCTURE

The *Census of Wholesale Trade* breaks down typical wholesaling activity into three categories based on business ownership, ownership of goods sold, and the character of typical transactions. Merchant wholesalers are independent or chain operations that take title to the goods they sell from a manufacturer and in turn sell to a variety of clients. Approximately 60 percent of all wholesale sales are made by these firms. Manufacturers' sales branches and offices are owned by the product manufacturer or producer and sell to retail outlets and franchised dealers. The majority of motor vehicle wholesale sales fall into this category. Finally, agents, brokers, and commission merchants are independent merchants who buy or sell products for others. Sales for this category usually relate to commissions and fees.

Generally, automobile manufacturers maintain a network of franchised retail dealers who sell to the public and provide customer support and service. To maintain a unified corporate presence, the manufacturers also establish separate wholesale sales offices that set and monitor dealer sales practices, advertising and marketing campaigns, and retail pricing ranges. Because these transactions are inter-

nal to the corporate entities and regarded as proprietary in nature, little specific information is available.

Many sales are made to franchised dealers, but the manufacturers' sales offices also sell to fleet purchaser and rental agencies with guaranteed buy-backs after three to six months.

Auctions. With dealers swamped with the growing volume of quality used cars, the manufacturers have increasingly shipped bought-back vehicles, known as program cars, to national auction chains, which have gained in size and popularity in recent years. Traditionally, the auto auction had been a small mom-and-pop operation designed mainly to redistribute used cars between differently branded dealerships or between regions of varying consumer market preference. Dealers of one type of car who took a competing make as a trade-in could wholesale the used car at an auction rather than display it on their own lots. In the late 1980s, however, some large players entered the auction arena and began consolidating many of the smaller operations into regional and national chains, transforming the industry into a high-tech "stock" market for motor vehicles.

BACKGROUND AND DEVELOPMENT

Henry Ford's concept of mass manufacturing on the assembly line meant that his fledgling auto industry needed a means of mass marketing its product. Ford intended to build as many copies as possible of a universal automobile that everyone would buy. To do so, he and his competitors set up a network of small dealers who would buy the product and promote it locally, freeing up the manufacturer to concentrate on the technical development of the product and the evolution of the manufacturing process. This was particularly important in those early days of the industry, when communications were slow and unreliable. Making local managers and independent entrepreneurs responsible for everyday business decisions created a flexible and responsive marketing system.

As the American consumer's appetite for various models of automobiles increased, other manufacturers entered the arena. To maintain market share, Ford dropped the price of his Model T to almost one-half its initial offering, but still erosion continued. Innovation and product improvement picked up speed in the 1920s, prompting Ford to close his plant in 1926 for nine months to design and retool for his Model A. When he reopened, he found he had a new competitor, Chrysler, which produced few of its own components but responded quickly to market demand by sourcing parts and systems from supplier firms.

During this heady period of product innovation, the dealer network played a less important role in gaining and maintaining corporate profits than did the actual product.

Those early years saw the complete domination of the world automotive market by American manufacturers, but the rapid acceleration of car production after World War II attracted global players. America's world share peaked at 82 percent in 1947, but declined since that time until the early 1990s, when domestic manufacturers once again increased their global market share. The American auto industry regained some of its market share between 1993 and 1996—particularly with pick-up trucks, minivans, and sport utility vehicles—but auto sales continued to fluctuate.

After 1948 the majority of technical development came to an end, and product lines within manufacturers became less differentiated. At that point, product loyalty and customer service at the dealer level became paramount. The entry of foreign firms into the market in the late 1950s again set up a measure of product differentiation that was eroded after the OPEC oil embargoes of 1973 and 1979. Those oil shocks made the primarily foreign-produced economy car more acceptable to the American public and strained the ties of product loyalty, when manufacturers in Detroit, the headquarters of the three major domestic carmakers, failed to respond. Dealers, threatened with bankruptcy, began to look to the foreign manufacturers for alternative vehicles to offer in their showrooms.

The wholesale arms of the manufacturers tried to impose discipline by forbidding franchisees from displaying competing models, but American law protected the dealers. Even so, the 50,000 U.S. automobile dealers who operated in the 1940s declined to about 18,000 in 1997.

Four segments defining particular niches for models had evolved—economy, sports, family, and luxury. Within those categories, the product became increasingly undifferentiated, as technological advances slowed. By the early 1990s, all the manufacturers were selling products with many similarities, which made the wholesale aspect of the business an especially important factor. As noted by the National Association of Wholesaler-Distributors, competition in the distribution of cars and trucks became particularly heated.

The 1980s saw a decline in the fortunes of the American automotive industry. Sales of all cars, motorcycles, and heavy trucks plummeted in the face of increasing competition from abroad. Only recreational vehicles and light trucks maintained their sales strength. This general downturn in the retail arena had a corresponding effect on the wholesale industry.

According to Federal Reserve Chairman Alan Greenspan, the seeds of that downturn could be seen in the drop in the number of vehicles per household that occurred between 1979 and 1983 and the rise in the

relative age of vehicles on the road. That resulted in a pent-up demand somewhere in the neighborhood of 10 million units, producing a selling boom between 1983 and 1987. However, those gains evaporated in the slow economic growth of the late 1980s and early 1990s. In 1990 total sales of all new cars in the United States dropped close to their 1982 level of 7.9 million units. From 1991 to 1994 auto sales climbed. Sales of U.S.-produced cars increased, while sales of imports decreased. In 1995 total import sales declined—from about 9 million sold in 1994 to 8.6 million sold in 1995—but total sales of U.S.-produced cars continued to climb.

Moreover, competition in the industry from manufacturers abroad had increased in strength. Sales of imported cars rose from 21.9 percent of all new sales in 1979 to 26.4 percent in 1990 according to *Monthly Labor Review*, and the output of transplants—foreign car manufacturing plants built in the United States—rose from nothing in 1982 to 14.4 percent of sales in 1990. At the same time the wholesale price of the vehicles was dropping. In *Applied Economics*, Edward Millner compared the average wholesale price of domestic cars in the period from 1954 to 1974, before the OPEC oil shocks, to the period from 1975 to 1986. He found prices in the later period to be lower than those of the earlier period, despite the fact that the costs of doing business had increased.

The sales of imports dropped steadily between 1991 and 1995, but foreign car manufacturers continued to build plants in the United States. Throughout the 1990s Japanese companies have invested \$12 billion in U.S. facilities and employ about 40,000 American workers. Toyota opened a \$700-million light truck plant in Indiana in 1998, creating 1,300 jobs. BMW opened a plant in 1994 in South Carolina, and by the end of 1995, production totaled 12,000 units. Mercedes Benz opened a \$300-million plant in Alabama in 1997, employing 1,500.

With foreign automobiles being manufactured in the United States by American workers, and American cars being built overseas by foreign workers, the distinction between domestic and import has become blurred. According to a 1996 poll by the Japan Automobile Manufacturers Association (JAMA), a majority of Americans believe that a car by any name is American if it was built in this country. Nearly three-quarters believe that a car made abroad is foreign, even if it is sold by Ford Motor Co., Chrysler Corp., or General Motors Corp.

Entering the mid-1990s, however, it appears that General Motors, Ford, and Chrysler—the “Big Three” of American car making—had arrested their long decline. In 1997 Ford’s trucks set all-time high sales records. According to their 1996 Annual Report, Chrysler Corporation increased their vehicle shipments by almost 300,000 from 1995 to 1996, and total revenues were \$8 billion higher in 1996 than in 1995. Indeed, the economic

fortunes of all three automakers improved dramatically in the early and mid-1990s, a welcome sight for the wholesaling divisions of those companies.

The Development of the Auto Auction. In 1995 approximately 20 percent of all U.S. new car sales were to rental companies. Often these vehicles return to the hands of the manufacturer. Handling such volumes of essentially used vehicles proved a headache for the wholesale divisions, even after they established factory-direct operations to move thousands of vehicles every week from rental agencies to dealer lots. In response, the wholesalers looked to another, more traditional used-car wholesaler already established in the industry. The auto auction provided an ideal distribution tool.

The traditional auto auction was a small operation that essentially exchanged vehicles between dealers, but the 1980s saw a revolution in the marketing device. Anglo American Auto Auctions Inc. and its British Car Auction Group (BCA) targeted the American lease and fleet operations, drawing on their extensive European experience to transform the American industry. Between 1979 and 1988 the number of vehicles sold by about 300 wholesale-dealer auctions doubled to 4.5 million units per year.

Growth slowed toward the end of the 1980s. The National Auto Auction Association (NAAA) expected sales of 10 million units by its 215 auction operators in 1990, but sales for the year only reached 7.7 million units. By 1996 the number of NAAA auction operators had increased to 252, and 14 million vehicles would be offered for sale in member auctions in the United States, Canada, Australia, Denmark, and Japan.

Like other wholesaling segments, this part of the industry has become increasingly concentrated. The three largest players competed with each other throughout the late 1980s by buying up smaller auctions across the nation. In 1987 the largest player, Manheim Auctions, Inc., moved 600,000 cars through 21 sites for a 13 percent market share. A new challenger, General Electric Capital Corp. (GECARS), responded with 450,000 vehicles at 17 locations. BCA followed with 415,000 through 20 facilities. In 1991 Manheim and GECARS merged under the Manheim name to form an auction giant with 46 locations and expectations to sell as many as two million cars annually. In 1995 Manheim was the world’s leading auto auction operation and sold four million cars that year. In 1996 Manheim, of Atlanta, Georgia, bought the Greater Auction Group, which has operations in five states. With its acquisition, Manheim operated 62 auctions in the United States and Canada, and employed 18,000 people. Dealers were their biggest customers.

According to the National Automobile Dealers Association (NADA), in 1998, some 31 percent of the used cars that dealers retailed were bought at auto auctions.

Dealers had increased their use of the auto auctions as a source for their inventory of used cars. The record 31 percent share reported in 1998 was a substantial increase from the 10 percent of dealer used car inventory reported in the early 1980s.

The growth in automotive leasing had a direct effect on the growth of auctions. Automakers used the auctions to dispose of their off-lease vehicles. The off-lease activity began at a time when fleet incentives and rental returns began to wane. As a result, auto auctions experienced more growth through the end of the twentieth century.

Dealers became more comfortable using the auction as a source when program cars, rental fleets bought by the manufacturers, were offered in the 1980s. In 1998 new car dealers retailed 12 million used vehicles and wholesaled another 7.3 million, according to NADA. They also reported the average price of a used vehicle sold by a new car dealer was \$12,500, up from \$12,100 the previous year.

According to data gathered from members of the National Auto Auction Association (NAAA), more than 8.6 million used cars and trucks were sold through their auctions in 1998. The value of the vehicles was reported to be \$66.7 billion. There was a total of 14.5 million vehicles handled. In 1999 the association had 204 members in the United States.

CURRENT CONDITIONS

By the early 2000s, auto auctions had made even greater inroads with dealers. NADA figures revealed that in 2001, some 35 percent of used cars sold by dealers were acquired at auction. This was part of an ongoing trend and represented an increase of 4 percent over 1998 levels.

Automotive leasing firms, the fleet vehicle industry, and rental car companies continued to be major drivers of auto auctions in particular and automotive wholesaling in general. However, by the mid-2000s off-lease vehicles likely will provide a smaller share of remarketed vehicles. Because of zero-percent financing, more consumers were buying in the early 2000s instead of leasing. This was a key reason that new vehicle leases declined 40 percent between 2000 and 2001, as reported by the Association of Consumer Vehicle Lessors. According to Manheim Auctions, in 2002 an estimated 4 million off-lease vehicles would be remarketed. In addition, 1.7 million rental vehicles and 13 million fleet vehicles were in operation during the early 2000s, many of which will be wholesaled by 2004.

In 2001 new car dealers retailed 13.3 million used vehicles and wholesaled another 8.1 million, according to NADA. The average price of a used vehicle sold by a new car dealer was \$13,930, up from \$13,648 the previous year.

The NAAA reports that, of 15.9 million vehicles handled, a record 9.4 million used cars and trucks were sold through its members' auctions in 2001. The value of

the vehicles was reported to be \$77.6 billion. That year, NAAA had 280 members in the United States and Canada.

Although traditional on-site auctions still represented the primary means of wholesaling vehicles, Internet auctions were emerging in the early 2000s. A January 2002 NAAA member survey revealed that 46,378 vehicles had been auctioned online, worth more than \$552.2 million. The average unit price of vehicles sold in this manner amounted to about \$11,900. Other reports indicate that online auctions may have an even greater economic value. Manheim, the world's largest operator of auto auctions, reported that its Manheim Online arm sold 134,000 vehicles via the Internet in 2001, with an estimated value of \$2 billion. This was a significant increase from levels in 1998 (\$275 million) and 1997 (\$58 million).

INDUSTRY LEADERS

Manheim, founded in 1945, was the world's largest operator of wholesale automobile auctions. Manheim had 115 locations in 2001, including facilities in North America, Europe, and Australia. Manheim achieved strong results in 2001, at which time it employed 32,500 people. The company's North American sales volume rose 23 percent from the previous year, exceeding five million vehicles with a sale value of \$54 billion. The company also sold some 400,000 vehicles abroad, leading to international sales of about \$100 million. Manheim is a subsidiary of Cox Enterprises, Inc.

Insurance Auto Auctions, Inc., a leading U.S. auto salvage company, was founded in 1982. The auction provided insurance companies with a cost-effective means to process and sell total loss and recovered-theft vehicles. The salvage industry was a \$3 billion industry at the turn of the century. Insurance Auto Auction reported 2001 sales of \$293 million. In January 2003 the company operated 62 auction sites across the United States.

WORKFORCE

The labor force in the wholesale trade segment of American industry has decreased, and many small firms have been forced out of business or consolidated into larger entities. However, in the automotive wholesale industry, employment experienced a slow but steady growth. As the volume of off-lease and dealer consignment vehicles grew, so did the need for personnel to handle the increased activity. The need to physically move large volumes of automobiles and trucks spurred growth in the employment of personnel to shuttle these vehicles. Many of these positions were filled by retirees on a part-time basis.

SIC 5013

MOTOR VEHICLE SUPPLIES AND NEW PARTS

This industry classification is comprised of establishments primarily engaged in the wholesale distribution of motor vehicle parts and supplies, such as accessories, tools, and equipment. Establishments primarily engaged in the distribution of used motor vehicle parts are classified in **SIC 5015: Motor Vehicle Parts, Used**.

NAICS CODE(S)

441310 (Automotive Parts and Accessories Stores)

421120 (Motor Vehicle Supplies and New Part Wholesalers)

INDUSTRY SNAPSHOT

In essence, the auto parts industry concentrates on two different markets. One side consists of several tiers of original equipment manufacturers (OEMs) that supply automobile manufacturers with parts for new automobiles. Entering the 2000s, weak economic conditions coupled with a decline in automobile production led to a period of difficult times for this portion of the industry.

However, things turned around in 2002, as automobile sales—and new vehicle production—increased. Value Line estimated that sales of original equipment in the auto parts industry would reach \$142.5 billion in 2002.

In addition to OEMs, other manufacturers and wholesalers serve the automotive aftermarket, providing replacement parts for used vehicles. This sector of the industry continues to experience consolidation. In addition, the introduction of high-quality parts has restricted aftermarket growth somewhat, as consumers do not need to replace parts as frequently. According to the Automotive Aftermarket Industry Association, total automotive aftermarket retail sales surpassed \$178 billion in 2001. However, this figure includes more than just parts and accessories. When service repair and tire sales are factored out, this figure is about \$35 billion.

BACKGROUND AND DEVELOPMENT

Traditionally, the distribution process for delivering motor vehicle supplies and parts to the marketplace took place in three steps. Manufacturers sold products to warehouse distributors, who then sold them to "jobbers" who, in turn, sold them to customers such as service stations. Jobbers offered benefits such as the extension of credit and wholesale discounts, and often sold items at retail price to the "do-it-yourself" market segment. Warehouse distributors provided other advantages, such as accessible inventory and a process for returning defective parts and stock that did not sell.

A variation of this process, termed "programmed distribution," emerged, as jobbers united to make purchasing decisions. The largest and one of the oldest organizations of this type was the North American Parts Association (NAPA), which provided services such as volume buying, private labeling, and advertising.

During the 1980s and early 1990s, the distribution process evolved: jobbers began to make purchases directly from manufacturers, bypassing the warehouse distributors. Some claimed it would reduce costs by streamlining the industry; others claimed it merely shifted the costs of maintaining an inventory and handling returns to the manufacturer.

CURRENT CONDITIONS

According to the Automotive Aftermarket Industry Association (AAIA), by 2002 consolidation had significantly scaled back the number of participants in the aftermarket portion of the industry. Much of this activity took place throughout the 1990s. Through consolidation, the number of establishments increased, while the number of owners decreased. For example, as illustrated in *Automotive Marketing Online*, in 1987 the top 100 chains owned 2,771 stores. By contrast, in 1999 the top four chains owned more than 6,000 stores.

Assimilation was another growing trend that became evident during the 1990s. With assimilation, the lines between the traditional and retail channels become blurred, and the use of the three-step distribution process has declined. As revealed in the November 2002 issue of *Aftermarket Business*, industry assimilation was still taking place in the early 2000s, and conditions were not expected to change in the near future.

Although growth in the automotive aftermarket as a whole has slowed down, the aging of the car population and the rise in miles driven bode well for industry's future, according to industry analysts and the AAIA. The Freedonia Group forecast North American aftermarket manufacturer-level sales would reach \$53 billion by 2006, and indicated that Mexico would outpace the United States and Canada in terms of retail aftermarket growth.

INDUSTRY LEADERS

In 2001 the top industry leader in motor vehicle supplies and new parts was Delphi Corp., based in Troy, Michigan. With about \$26.1 billion in sales and with 195,000 employees, Delphi (a spin-off of General Motors) was by far the biggest company in this industry. Next in line was Visteon Corp. (a spin-off of Ford Motor Co.) with 2001 sales of \$17.8 billion and 79,000 employees. The aftermarket side of the industry was led by Genuine Parts Co. Based in Atlanta, Georgia, in 2001 Genuine Parts recorded \$8.2 billion in sales and employed 31,000 workers.

SIC 5014

TIRES AND TUBES

This industry category includes companies that primarily wholesale new and used tires and tubes for passen-

ger and commercial vehicles. It also includes companies that wholesale tire and tube repair materials.

NAICS CODE(S)

441320 (Tire Dealers)

421130 (Tire and Tube Wholesalers)

INDUSTRY SNAPSHOT

Tire and tube wholesale establishments numbered 5,600 in 2003, according to Dun & Bradstreet, and employed some 47,400. This total included wholesale distributors of automobile, motorcycle, and truck tires and tubes; used tires and tubes; and tire and tube repair materials. The largest portion of players in this industry operated as merchant wholesalers, or companies who claim title to the goods they sell. Other companies were grouped as manufacturers' sales branches and offices, or as agents, brokers, and commission merchants.

Industry sales in 2003 totaled \$13.6 billion in 2003, while unit shipments fell by an estimated 1.5 percent, due largely to the slumping overall economy, according to the Washington, D.C.-based Rubber Manufacturers Association (RMA), though *Tire Business* reported strong showings among the major industry players. The RMA estimated total unit shipments of auto and truck new and replacement tires at 4.5 million in 2003.

The outlook for 2004 was brighter, with an expected sales increase of 3 percent, attributed to regenerated activity in commercial trucking, increased light vehicle production, and a recovering economy. Meanwhile, the high volume of car sales in the late 1990s was expected to help keep tire distributors in good stead through the mid-2000s. Moreover, the RMA predicted that level of growth would hold steady through 2008.

INDUSTRY LEADERS

The largest industry player was TBC Corporation, headquartered in Memphis, Tennessee. Founded in 1956, TBC was a diversified auto parts distribution firm until 1996, when a prolonged slump encouraged the company to strip down to focus on its tire operations. By the late 1990s, TBC's products included several private label tires under such brand names as Big O, Sigma, Cordovan, Grand Spirit, Turbo-Tech, Vanderbilt, and Multi-Mile. The company also sold aftermarket automotive supplies such as tubes, batteries, custom wheels, ride-control products, filters, brakes, chassis parts, and automotive service equipment.

In addition, TBC distributed through its 570 Big O Tires outlets throughout the western United States and Canada and its 360 Tire Kingdom retail stores in the east. In December 2003 TBC acquired National Tire & Battery from Sears, taking on 225 stores in 20 states. The firm had sales of \$1.11 billion in 2002, continuing a steady

rise in sales since its change in focus in 1996, while maintaining a payroll of 3,220 employees.

Other leaders in this category included companies selling new and retreaded tires, such as Bandag Inc. of Muscatine, Indiana. As of 2004 Bandag served independent dealers throughout America as well as dealers in Africa, Asia, Europe, and South America. Bandag employed 3,715 in 2003, while achieving revenues of \$816.4 million, representing annual growth of 9.3 percent. The firm served clients in the commercial and industrial sectors through its Tire Distribution Systems Inc. (TDS) subsidiary.

Based in Huntersville, North Carolina, American Tire Distributors Inc. maintained a payroll of 1,915 in 2002. That year, revenues inched upward 4.6 percent to \$1.06 billion. The largest independent distributor of tires in the United States, American Tire Distributors laid claims to such industry-leading brands as Michelin, Goodyear, and Bridgestone/Firestone. The company maintained 62 distribution centers in 35 states.

SIC 5015

MOTOR VEHICLE PARTS, USED

This industry classification is comprised of establishments primarily engaged in the distribution of used motor vehicle parts at both the wholesale and retail level. It also includes establishments primarily engaged in dismantling motor vehicles for the purpose of selling parts. Establishments engaged in dismantling motor vehicles for the purpose of selling scrap are classified in **SIC 5093: Scrap and Waste Materials**.

NAICS CODE(S)

421140 (Motor Vehicle Part (Used) Wholesalers)

According to D&B Sales & Marketing Solutions, there were 7,570 establishments engaged in the distribution of used vehicle parts at both the wholesale and retail level in 2002. Combined, they generated about \$3.7 billion in sales. The average establishment had sales of \$500,000.

The Alliance of Automobile Manufacturers reported that 95 percent of "retired cars from active use" are recycled. There were approximately 12,000 auto dismantler operations located throughout the United States. According to The National Independent Automobile Dealers Association (NIADA), there were more than 225 million vehicles in operation in 2003. The Automotive News Data Center, reported the average age of cars on the road were just over eight years old, and trucks with almost seven years in 2000.

States with the highest number of establishments in the used motor vehicle parts industry were Texas with 725, California with 639, and Florida with 457. Used automobile parts and supplies numbered 4,744 establishments, with revenues of \$2.5 billion. Together, they employed some 23,407 people. The second largest segment was used motor vehicle parts, with 1,868 establishments. Together, they shared sales of \$600.2 million.

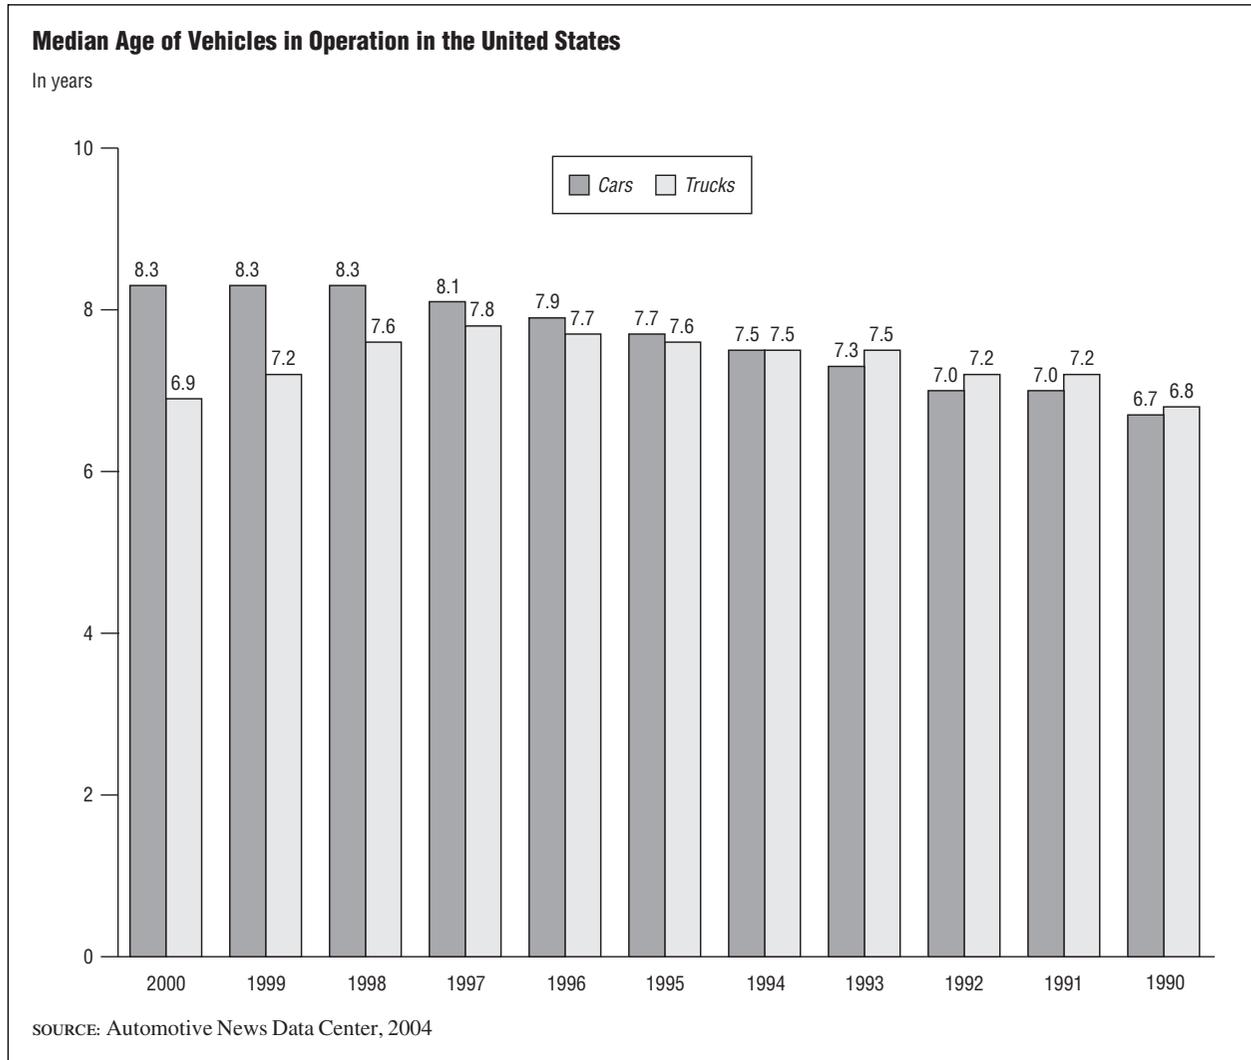

During the early years of the automotive industry, the need for replacement parts became apparent. Although manufacturers typically provided parts for their vehicles through franchised distributors, many car makers did not survive the early decades of the twentieth century, thus leaving "orphan" vehicles behind. These vehicles had a need for replacement parts that no manufacturer was producing.

Replacement parts became available through two channels. Some companies purchased tracings, drawings, and blueprints for parts from bankrupt manufacturers in order to fabricate replacement parts. Others obtained parts from broken-down vehicles and reconditioned them for resale. As the automotive industry matured and cars became a ubiquitous part of the American landscape, the need for replacement parts continued to grow.

The National Automotive Parts Association (NAPA) was founded in 1925 to meet America's growing need for an auto parts distribution system. This distribution system accommodated 200,000 part numbers in 1999. NAPA members supplied new and reconditioned products to repair shops, service stations, fleet operators, automobile dealers, and individual consumers.

The Automotive Recyclers Association (ARA) reported 1997 gross annual revenues of \$7.05 billion in the U.S. That same year 4.7 million vehicles were acquired for the purpose of recycling. There were more than 6,000 automotive recycling businesses in the United States employing more than 46,000 people. An estimated 86 percent of these establishments were full-service and employed ten or fewer people.

In 1998, a reported 205 million vehicles were in use in the United States with an average age of eight years. As the total number of motor vehicles increased, so did the market for used auto parts. A major channel for

obtaining these was through recyclers of scrapped or wrecked vehicles. Used parts often cost substantially less than new parts and could be located quickly through communications systems that linked auto recycling businesses, according to Brad Rose of the Automotive Recyclers of Michigan.

The leader in this market in 1998 was Genuine Parts Company (GPC), which operated the NAPA outlets. Genuine Parts Company was founded in 1928. It was a service organization that engaged in the distribution of automotive replacement parts. In 1998, its NAPA Auto Parts Group increased sales by six percent. In 1998, total sales for Genuine Parts Company were \$6.6 billion, an increase of ten percent over 1997 levels. In 2002, total sales were \$8,258.9 million. For 2003, sales increased to \$8,449.3 million, an increase of three percent. Blonders of Hartford, Lubacks and Co., Recycled Auto Parts of Brattleboro Inc., and Road Tested Recycled Auto Parts Inc. were also well known in the industry.

Ford Motor Company entered the recycling business in 1999, when it purchased “Kwik-Fit,” Europe’s largest independent “Fast-fit” repair chain, and a facility in Tampa, Florida, to disassemble cars and trucks. Customers included insurers and body shops and retail customers. Ford opened a Web site where customers could order parts online and the recycling unit would deliver it by express mail directly from its factories.

SIC 5021**FURNITURE**

This classification comprises establishments primarily engaged in the wholesale distribution of furniture, including bedsprings, mattresses, and other household furniture; office furniture; and furniture for public parks and buildings. Establishments primarily involved in the wholesale distribution of partitions, shelving, lockers, and other store fixtures are classified in **SIC 5046: Commercial Equipment, Not Elsewhere Classified**.

NAICS CODE(S)

442110 (Furniture Stores)

421210 (Furniture Wholesalers)

INDUSTRY SNAPSHOT

The wholesale distribution of furniture industry is subdivided into two categories: establishments engaged primarily in the sale of household and lawn furniture, and establishments primarily engaged in the sale of office and business furniture. According to statistics compiled by the U.S. Census Bureau, 29,920 establishments were listed in this classification in 2001. Combined sales totaled \$23.1 billion in 2003. There were 278,231 people employed within this industry, with an annual payroll of \$7.5 million. The average establishment generated \$2.7 million in sales. California, Florida, and New York controlled 32 percent of the market.

BACKGROUND AND DEVELOPMENT

This industry is affected by interest rates and the housing market. When these economic indicators are stable and strong, the furniture industry generally has higher retail sales. Barrons reported that the furniture industry experienced a slump from 1988 until mid-1992 when a "stop-and-start" recovery process began. Conditions within the furniture industry reflected the nation's general economy as consumers postponed purchases. As a result, when the economy began to improve, there was a pent-up demand for industry products, and the American Furniture Manufacturers Association (AFMA) predicted an increase in furniture shipments.

Following a slump in the early 1990s, the International Wholesale Furniture Association found more than 90 percent of survey respondents reported sales increases in 1993. Sales continued to climb in 1994 and 1995. Throughout 1995, monthly sales for furniture and home furnishings were between \$3.1 and \$3.4 million. AFMA also predicted an increase in the value of shipments of 7.6 percent in 1999, and a smaller increase of 2.1 percent for 2000. Consumer demand was expected to increase by 5.5 percent and 4.5 percent for 1999 and 2000, respectively.

Housing starts were forecast to increase by 2.9 percent in 1999, followed by only 0.3 percent in 2000. In the late 1990s, much of this industry's strength has come from the industrial (offices, hotels, restaurants) side of the market. The office furniture market estimated at \$12 billion, dropped to \$8 billion annually in. The office furniture market is estimated at \$12 billion. Some analysts predicted that 50 million families were to occupy a home office.

CURRENT CONDITIONS

The largest type of customer, furniture stores, represented 69.4 percent of sales. Other types of customers included rental dealers (19.2 percent of sales), manufactured homes (4.9 percent), specialty stores (2.5 percent), interior designers (1.4 percent) and institutional buyers (0.5 percent). The two largest product categories, living room/upholstered and bedroom, accounted for half of the sales.

Customary distribution channels within the industry, however, have changed. To reduce costs and improve efficiency, many manufacturers have increased their direct sales to retailers and rental dealers. As a result, wholesalers faced a shrinking number of traditional customers, and innovative wholesale concepts, such as warehouse clubs and electronic shopping networks, emerged. Wholesalers are also being threatened by large discount department stores such as Wal-Mart.

The Business and Institutional Furniture Manufacturers Association (BIFMA) International announced that furniture shipments would climb 5.6 percent for 2004, up from a 4.7 percent drop in 2003. Office furniture also declined 20 percent nationally in 2002. However, according to *Furniture Today*, furniture spending would increase 23 percent by 2011.

INDUSTRY LEADERS

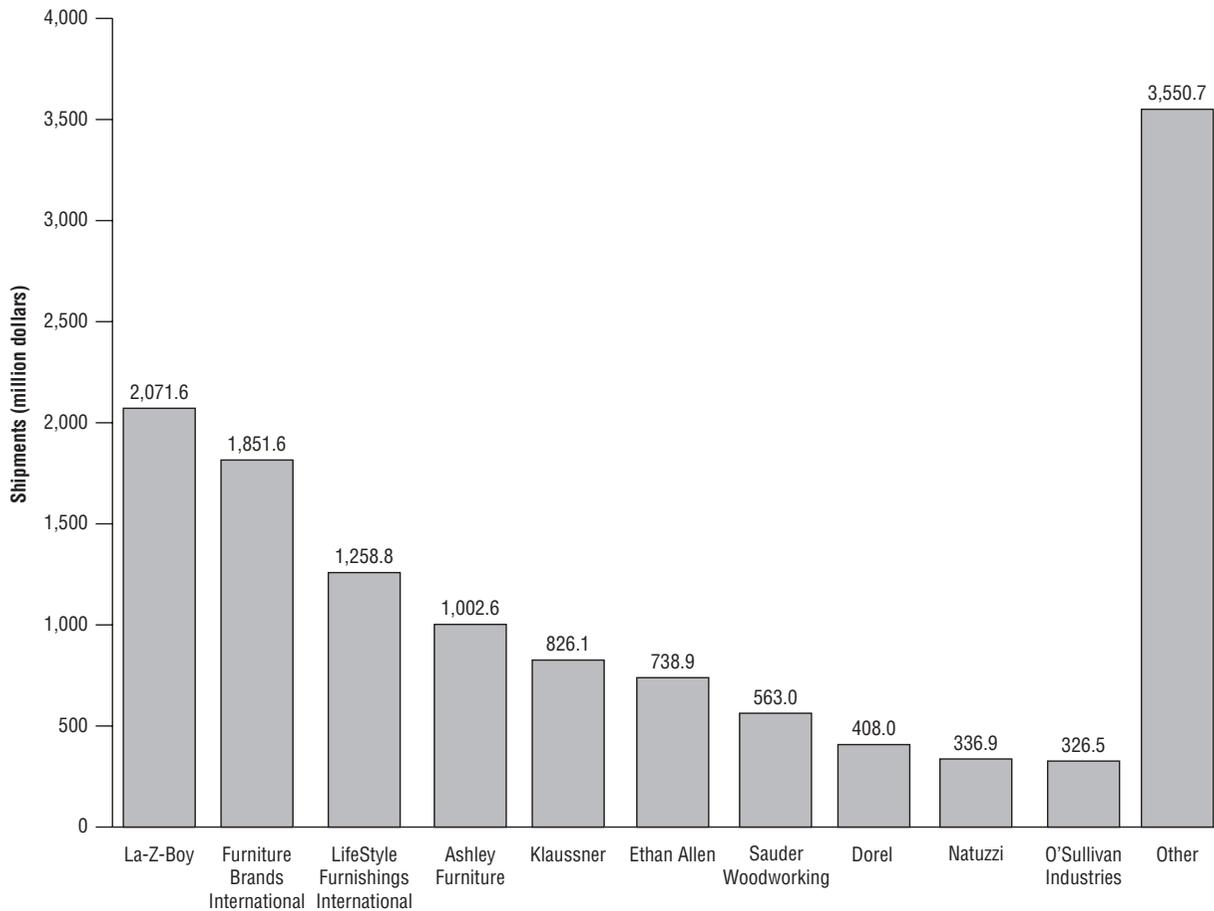

In the late 1990s, industry leaders included Value City Furniture Division of Ohio, Office Depot Incorporated Business Services Division of California, and TAB Products Company, also of California. In 2003, industry leaders were Furniture Brands International Inc. of St. Louis, Missouri, La—Z—Boy Inc. of Monroe, MI., and Hon Industries, Inc. In the second half of 2003, demand for commercial furniture began to stabilize and in December, both shipments and orders grew for the first time in three years.

WORKFORCE

The wholesale trade work force is expected to show an overall increase by 2005. Jobs with the highest increases are expected to be traffic, shipping, and receiving clerks, with 41 percent; general managers and top executives, with 36 percent; blue collar worker supervisors, with 28 percent; and truck drivers, with 28 percent.

Largest Furniture Makers by Value of Shipments, 2001

In millions of dollars

SOURCE: Market Share Reporter, 2004

AMERICA AND THE WORLD

Global competition has remained a key component for the decline of the domestic furniture industry. Imports were on the rise in 2003, with Brazil commanding 16 percent, Malaysia 12 percent, and China 28 percent. The United States imported about 48 percent of its furniture in 2003. AFMA predicted an increase in furniture shipments of 5.4 percent for 2004. AFMA also predicted an increase on the value of imports to generate some \$66.7 billion in sales, compared to \$67.6 billion in 2003.

SIC 5023

HOME FURNISHINGS

This industry classification contains establishments primarily engaged in the wholesale distribution of home furnishings and housewares. Products of the industry include antiques, china, glassware and earthenware, lamps (including electric), curtains and draperies, linens and towels, and carpets, linoleum, and all other types of hard and soft surface floor coverings.

Establishments primarily engaged in the wholesale distribution of electrical household goods are classified in **SIC 5064: Electrical Appliances, Television and Radio Sets**. Establishments primarily engaged in the wholesale distribution of precious metal flatware are classified in **SIC 5094: Jewelry, Watches, Precious Stones, and Precious Metals**.

NAICS CODE(S)

442210 (Floor Covering Stores)

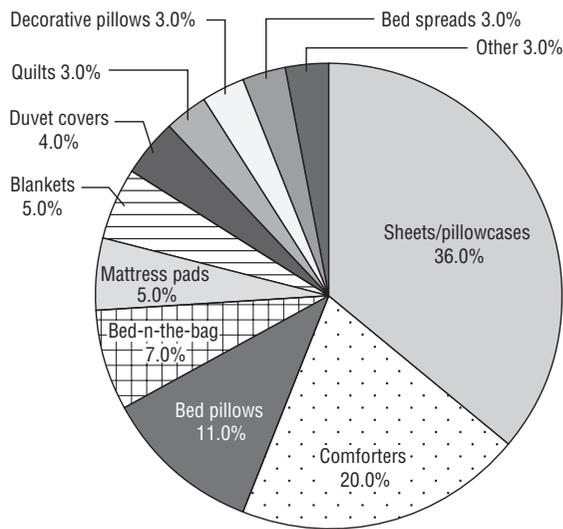

421220 (Home Furnishing Wholesalers)

The home furnishing wholesale industry is divided into four categories of establishment: sellers of china, glassware, and crockery; sellers of linens, domestics, draperies, and curtains; sellers of floor coverings; and sellers of other types of home furnishings. Home furnishings and floor covering equally shared 32 percent of the overall market. Decorative home furnishings and supplies represented ten percent.

The U.S. Census Bureau reported 8,024 establishments in 2001. There were 93,616 employees with a combined annual payroll of \$3.6 billion. In 2003, the number of establishments climbed to 14,838, valued at \$30.7 billion. The average wholesaler generated sales of \$2.4 million.

Industry watchers predicted industry expansion during the 1990s. *HFD* reported that demographic projections favored growth. The number of U.S. residents in the 35 to 55 age bracket was increasing, and that group typically included a higher percentage of home owners than older or younger segments of the population. The Furniture Buying Index showed a one point increase in January 2000 to 85—the first rise in five years. The index was at its highest point in a January since 1993, when it reached 102. The U.S. Commerce Department reported that home furnishing sales climbed 0.7 percent in April of 2004.

Bedding Market Sales, 2002

SOURCE: Market Share Reporter, 2004

Flooring distributors noted a shift in traditional distribution channels as more carpeting retailers turned to direct mill purchases. The number of retailers purchasing carpeting from distributors fell in the early 1990s. However at the beginning of 2000, Don Whitfield, division vice-president for Shaw Rugs, said that “continued economic growth will spur double-digit rug industry growth for the next 5-6 years.”

The market influence of wholesale warehouse stores also was growing. There were more distribution warehouses, conceived to cater to interior designers, builders, and decorators rather than retailers or the general public, and they were growing more popular.

Home fashions analysts identified three major design trends: casual and traditional; pure and simple; and crafted and contemporary. Casual and traditional combined classic and eclectic pieces with easy-care fabrics. Pure and simple styles were comparable to uncluttered country. Crafted and contemporary featured bright colors and patterns.

The states with the industry's highest number of establishments and dollar value of sales were California, Florida, New York, and Texas. In 2003 California's 2,410 establishments posted sales of \$5.4 billion, and New York's 1,362 recorded \$2.8 billion in sales.

SIC 5031

LUMBER, PLYWOOD, MILLWORK, AND WOOD PANELS

This classification is comprised of wholesale distributors of rough, dressed, and finished lumber (other than timber). Establishments operate with or without yards. Principal products include plywood, reconstituted wood fiber products, doors and doorframes, windows and window frames (all materials), wood fencing, and other wood or metal millwork.

NAICS CODE(S)

444190 (Other Building Material Dealers)

421310 (Lumber, Plywood, Millwork, and Wood Panel Wholesalers)

INDUSTRY SNAPSHOT

According to the U.S. Department of Commerce, 40 percent of U.S. consumption of “softwood lumber” represents the construction for new construction of homes, and 30 percent for their maintenance and refurbishing. In 2001, the U.S. Census Bureau reported 7,220 lumber, plywood, millwork, and wood panel wholesalers. That number had increased to 15,614 by 2003, and industry sales were valued at more than \$62 million. The industry employed roughly 204,070. The U.S. states with the highest sales volume included California, Florida, Texas, New York, Pennsylvania, Ohio, which together accounted for more than 36 percent of the industry’s output.

Lumber, plywood, and millwork represented the largest sector with 4,384 establishments. These controlled more than 28 percent of the market, with shared sales of more than \$19 million. Businesses in the rough dressed and finished lumber segment numbered 2,463, which was about 15 percent of the market. There were 1,890 businesses that were engaged in the wholesale distribution of kitchen cabinets. Combined, they represented approximately 12 percent of the market. Exterior building materials had 1,520 establishments and repre-

sented almost 10 percent of the market. The majority of lumber consumed in the U.S. was imported from Canada.

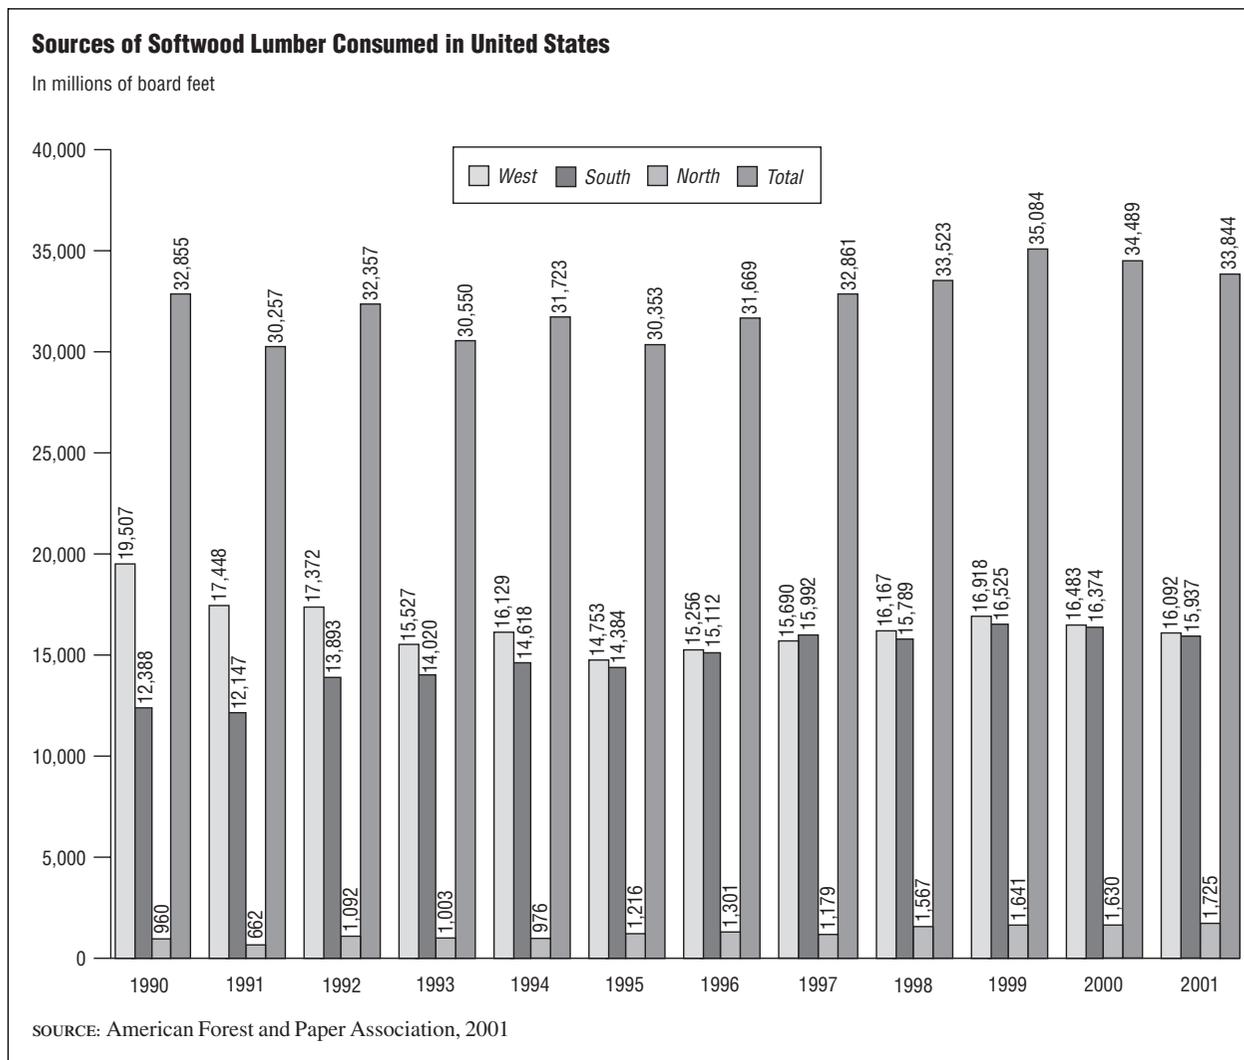

BACKGROUND AND DEVELOPMENT

During the early 1990s, establishments involved in the wholesale distribution of lumber and other wood products faced a number of challenges stemming from depressed economic conditions and an uncertain political climate. As the nation’s economy stagnated, many large retail outlets began bypassing wholesalers in favor of direct purchasing channels. Some smaller retail outlets were forced to close, leaving a diminished number of traditional customers for wholesalers. In addition, uncertainty about the nation’s timber policy led to fluctuating prices and concerns about product availability. In the late 1990s, however, the booming U.S. housing market led to an increase in new construction, reducing inventories and increasing the price of lumber.

According to figures compiled by the U.S. Department of Commerce, 8,364 establishments participated in this industry in 1992, having combined sales of more than \$56 billion. Sales of plywood, millwork, and wood panels represented \$28.9 billion of that amount. Lumber sales, totaling \$27 billion, were divided between establishments with yards, \$14.6 billion, and without yards, \$12.4 billion. By 1995, 8,584 firms were in operation, having 122,769 employees, a payroll of \$3,794,600 and estimated sales of almost \$70 billion. Of the firms reporting, 78 percent had less than 20 employees. Employment was expected to remain relatively flat through the close of the century, with total sales reaching almost \$76 billion.

The do-it-yourself (DIY) market represented approximately \$117 million in retail sales in 1993. Sales made by DIY retailers rose 12 percent between 1988 and 1993, and industry watchers anticipated that 150 new warehouse-style stores would begin operating in 1994. By 1995, however, the DIY market had flattened considerably and, in 1997, it was declining. In contrast, the professional builders’ market continued to increase, beefing up sales for building supply giants such as Home Depot—which controlled 42.8 percent of retail building supply sales in 1996—and the North Carolina-based Lowe’s Companies. In 2001, home improvement generated about \$190 billion. Some analysts predict home improvement total sales would reach \$200 billion in 2004. Together, Home Depot, and Lowe’s continued to dominate some 30 percent of the DIY market for 2001. Home Depot generated annual sales of \$38.4 billion.

According to Business Trend Analysts, manufacturers’ sales of millwork were forecast to increase 3.2 percent in 1999 from a 1998 market that totaled \$12 billion. Market segments that showed significant increases included flush-type, solid-core doors with hardboard faces (up 7.8 percent), hardwood stairwork (up

7.7 percent), and wood patio doors (up 6.7 percent). In 1999, the U.S. paneling market was dominated by furniture and molding/millwork at 44 and 21 percent, respectively. Doors and wall paneling each had nine percent.

CURRENT CONDITIONS

A standard “wood—framed home” demands some 15,000 board feet of lumber. North American lumber production totaled 41 billion board feet during the first seven months of 2003. The residential housing market was expected to continue to fuel the market. David Lereah, chief economist of the National Association of Realtors (NAR) agreed, and stated “new home sales this year should finish at around 1.05 million units,” more than an eight percent increase over 2002. Although lumber demand had been on the increase, it has been a “buyers&rsdquo; market in most lumber items, a market shaped by prevalent discounting and widespread declining prices,” according to the North American Wholesale Lumber Association (NAWLA).

According to *Wholesale and Retail Trade USA*, the top five companies in this industry by total annual sales were Nissho Iwai America Corp., later known as Solitz Corporation of America, with \$12 billion; HomeBase Inc. with \$4.4 billion, Universal Corp. with \$4.1 billion, Crane Co. with \$1.8 billion, and 84 Lumber Co. with \$1.6 billion. Other significant companies in the industry included Carter Lumber Co., North Pacific Group Inc., Hardware Wholesalers Inc., and Boise Cascade Corporation’s Building Materials Distribution Division.

Former home improvement wholesaler, HomeBase, opted to convert its existing warehouse stores into House2Homes, which would venture into the home decorating arena. Ginger Silverman of HomeBase, commented on the reasoning behind the newly formed company, and stated that “Home decorating, a \$125 billion industry with no one player commanding more than five percent share, is seen as a safe harbor compared to the cut—throat home—improvement category ruled by Home Depot and Lowe’s.”

According to the U.S. Bureau of Labor Statistics, the total employment within the industry will continue to decline because of the restraints placed on lumber harvests. There were about 207,000 producers of cabinets, trusses, and windows in 2001. The wholesale and retail dealers accounted for some 818,000 workers. The contractors and subcontractors of residential building represented more than 5 million workers. There are the self-employed contractors that account for an additional million that are construct homes as well.

SIC 5032

BRICK, STONE, AND RELATED CONSTRUCTION MATERIALS

This classification comprises establishments primarily engaged in the wholesale distribution of stone, cement, lime, construction sand, and gravel; brick (except refractory); asphalt and concrete mixtures; and concrete, stone, and structural clay products (other than refractories). Distributors of industrial sand and of refractory materials are classified in **SIC 5085: Industrial Supplies**. Establishments primarily engaged in producing

ready-mixed concrete are classified in **SIC 3273: Ready-Mixed Concrete**.

NAICS CODE(S)

444190 (Other Building Material Dealers)

421320 (Brick, Stone and Related Construction Material Wholesalers)

Typically, firms in this industry supply mineral-based building materials to building contractors and developers. Brick, stone, and related materials represented 3,159 firms, and about 27 percent of the overall market share in 2003. Sand, gravel and stone also represented 27 percent; ceramic wall and floor tile (not elsewhere classified) accounted for 10 percent; and cement, lime, and related products had more than 16 percent. In 2003, the total sales were approximately \$22,704 million, and the average sales per establishment was about \$2.70 million. The total number of establishments had increased from 3,351 in 2000 to 3,502 in 2001. Total payroll for 2001 was approximately \$1.3 million, and the total number of establishments climbed to 11,698 in 2003.

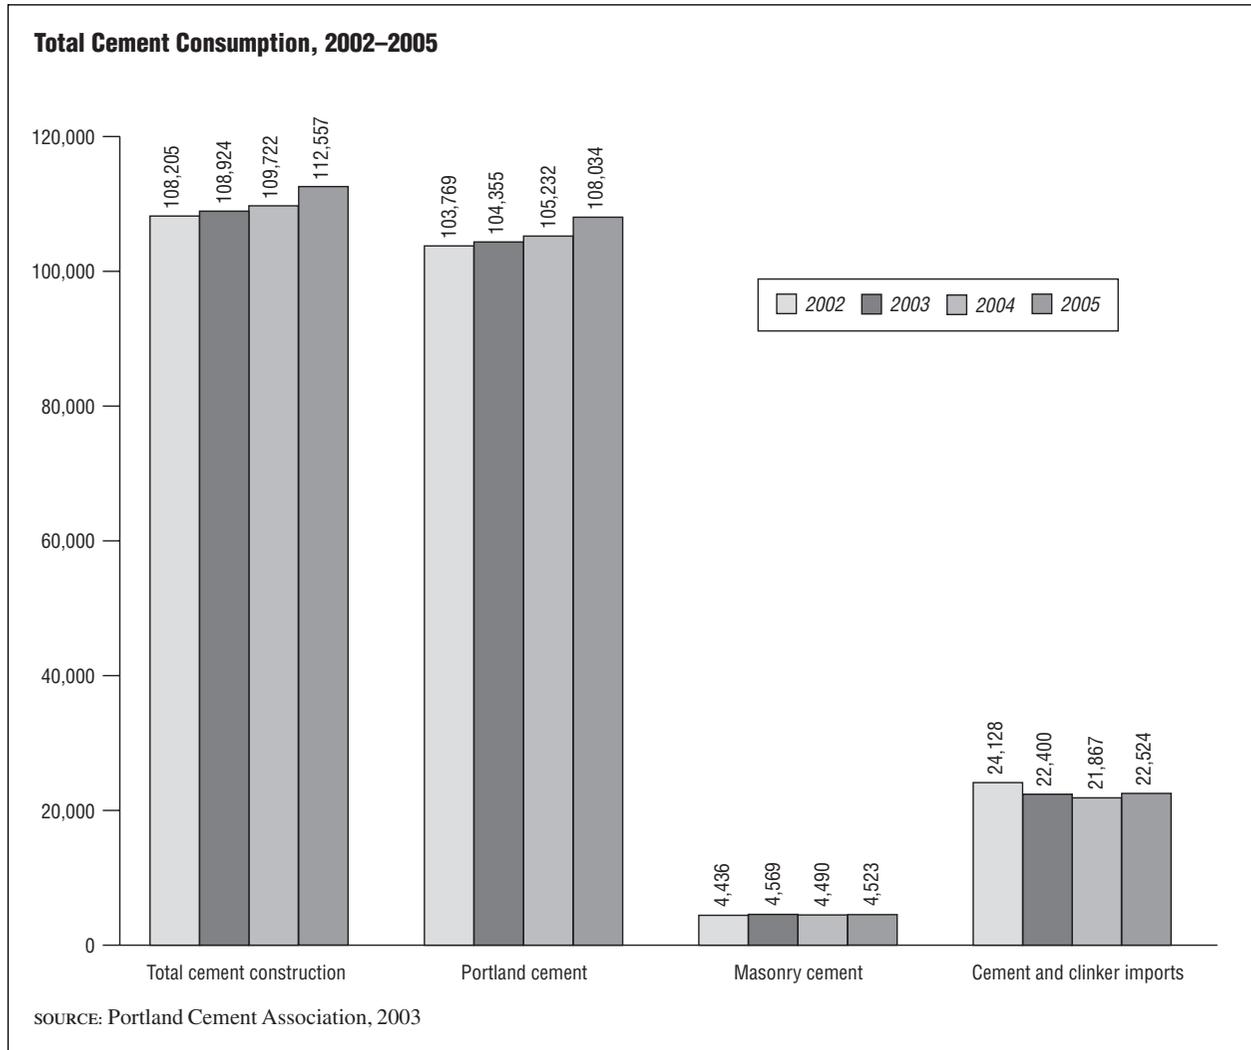

Merchant wholesalers—those who take title to the goods they sell—accounted for 79 percent of the industry’s establishments; 17 percent were manufacturers’ sales branches and offices; and the remaining 4 percent were agents, brokers, and commission merchants.

The industry was geographically distributed throughout the United States, with the Midwest, Southeast, and West having a slightly higher share of the industry’s establishments. California, Texas, and Florida led in the number of establishments and employees.

By products sold, the segment consisting of brick, block, tile, and sewer pipe commanded approximately 54 percent of industry sales in the 1990s. These were followed by cement, lime, and related products at 25 percent; and sand, gravel, and stone at 21 percent of industry product share. Sand and gravel production was expected to increase by 6.3 percent in 1999, but decrease slightly in 2000, according to the CIT Group. Although crushed stone production increased by 5.5 percent in 1999, it was projected to remain flat in 2000.

Combined, there were approximately 4,200 establishments in the industry in the mid-1990s, employing a labor force of roughly 32,000. The number of establishments were projected to increase to about 4,800 in 1998, with a total workforce of roughly 35,000.

Strong housing and commercial building markets in the mid- to late 1990s continued to provide slow but steady growth for industry sales. According to the CITGroup/Equipment Financing, residential construction increased by 5.6 percent in 1999, but was projected to decrease by 3.5 percent in 2000. Nonresidential construction was expected to flatten in 1999 and decrease slightly

in 2000. According to the U.S. Census Bureau, new construction increased by 6 percent during the first 10 months of 1999, compared to the same period in 1998.

Brick, stone, and related material represented the largest segment of the industry. This segment numbered 3,159 establishments, with combined sales totaling \$5,494.8 million. Ceramic wall and floor tile (not elsewhere classified) numbered 1,194 establishments, with \$1,630.4 million in sales. The concrete and cinder building products numbered 217 establishments, with \$2,776.6 million in sales. The U.S. industry was worth an estimated \$11.9 billion in 1995, a growth of approximately 18 percent since 1992. Sales were projected to be slightly lower at \$11.3 billion in 1998.

The National Association of Home Builders (NAHB), reported that there were 1.69 million homes built in 2002, an increase of 6 percent over 2001, and it was expected that 1.63 million homes would be constructed during 2003. The U.S. Department of Commerce confirmed this in a report released in March of 2004. According to the report, new

construction increased 7.9 percent during the first 3 months of 2004 over the first 3 months of 2003.

The Freedonia Group forecast that the consumption of asphalt would surpass 37 million tons by 2007. The traditional housing construction would drop slightly, but demand would shift to the commercial and industrial markets that were emerging from their 2002 downturn status.

According to the Portland Cement Association (PCA), the demand for cement was also expected to increase by 2 to 3 percent through to 2007. In addition, imported cement was also expected to increase 3 percent during that same time period. This would come after a 6.6 percent decrease in 2002, and 7.2 percent in 2003. It was projected that the increase would come not from residential construction, but from the industrial market. The total cement consumption is expected to increase throughout 2005 by 2.6 percent.

Industry leaders included Granite Rock Company of Watsonville, California; Walker and Zanger Inc. of

Mount Vernon, New York; and Livingston-Graham, Inc. of Irwindale, California.

The decrease in employees caused by the sluggish economy in 2001 and 2002 had caused the industry to lower its workforce. However, according to The Portland Cement Association, there was to be an increase of 30,000 to 60,000 construction related employees back in the workforce by December of 2003.

SIC 5033

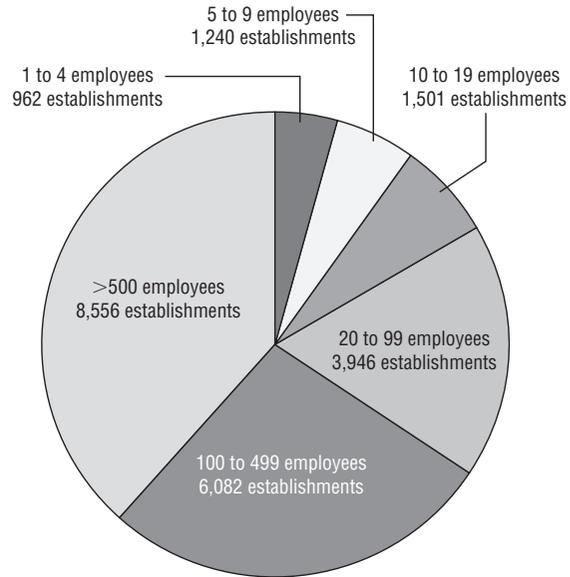

ROOFING, SIDING AND INSULATION MATERIALS

This industry consists of establishments engaged in the wholesale distribution of roofing and siding (except wood) and insulation materials. Such establishments include those engaged in wholesale distribution of asphalt felts and coatings; fiberglass insulation materials; roofing, asphalt, and sheet metal; shingles (except wood); and siding (except wood).

NAICS CODE(S)

421330 (Roofing, Siding, and Insulation Material Wholesalers)

Number of Employees per Establishment in the Roofing, Siding and Insulation Materials Industry

SOURCE: U.S. Census Bureau, 2001

In 2001, the U.S. Census Bureau reported 1,835 establishments engaged in the wholesale distribution of roofing and siding and insulation materials, except wood. There were approximately 22,287 employees who shared an annual payroll of \$1.3 billion. In 2003, the total number of establishments increased to 3,820 and the employee number climbed to 36,795. The industry shared about \$12.1 billion in annual sales, with the average sales per establishment at about \$5.6 million.

The various sectors included roofing, siding, and insulation with 1,339 establishments; roofing and siding materials with 879; roofing, asphalt and sheet metal with 437; insulation materials with 435; siding, except wood with 335; thermal insulation with 205; fiberglass building materials with 114; asphalt felts and coating with 56; mineral wool insulation materials with ten; and shingles, except wood with nine.

The wholesale roofing, siding, and insulation industry grew steadily in the early to mid-1990s, with sales rising from \$14.43 billion in 1992 to \$15.65 billion in 1996. At the same time, companies in the industry were consolidating—the number of establishments dropped from 2,848 in 1992 to 2,659 in 1996. Despite the decrease in establishments, employment remained relatively stable, dropping only slightly from 30,060 in 1992 to 29,523 in 1996. The industry’s payroll grew from \$921.9 million in 1992 to \$1.02 billion in 1996.

Inextricably tied to the larger construction industry, companies involved in wholesale distribution of roofing,

siding, and insulation materials keep a close eye on such key economic indicators as housing starts, which provide a particularly accurate barometer of trends in this support industry. In the mid-1990s, housing starts were very strong. After dropping to just 1.014 million in 1991, single family and multi-family housing starts in the United States rose every year to a peak of 1.457 million in 1994. While starts dropped back to 1.354 million in 1995, they rose again to 1.451 million in 1996. Though housing starts jumped to 1.66 million in 1999, the economy is expected to slow, resulting in housing starts to drop by an estimated 3.6 percent to 1.61 million in 2000.

U.S. demand for residential/commercial/light industrial siding material was expected to reach 9 billion square feet per year, valued at more than \$7 billion total. The market for specialty roofing was more than \$1 billion.

The wholesale roofing, siding, and insulation industry was dominated by large firms. The top five companies in the industry had revenues of \$500 million or more. The revenue leaders in this industry, according to *Wholesale and Retail Trade USA* and *Ward's Business Directory*, were T.J.T. Inc. of Emmett, Idaho, with \$2.5 billion; American Builders and Contractors Supply Company Inc., of Beloit, Wisconsin, with \$960 million; Boise Cascade Corp. of Boise, Idaho, with \$956 million; Cameron Ashley Building Products Inc. of Dallas, later known as Guardian Building Products Inc., with \$762 million; and Rugby USA Inc. of Deerfield, Illinois, with \$500 million). Other leaders included Patrick Industries Inc., Elkhart, Indiana, with \$404 million; Irex Corp., of Lancaster, Pennsylvania, with \$244 million; and Shook and Fletcher Insulation Co. with \$250 million.

While many of these establishments were solely concerned with the wholesale distribution of roofing, siding, and insulation materials, publicly held corporations such as Boise Cascade Corporation and Owens-Corning Fiberglass Corporation also had established their presence in the industry via subsidiary divisions.

SIC 5039

CONSTRUCTION MATERIALS, NOT ELSEWHERE CLASSIFIED

This industry comprises establishments engaged in the wholesale distribution of mobile homes and of construction materials that are not classified elsewhere. Some industry products are awnings, grain storage bins, and septic tanks. The industry also includes establishments primarily engaged in the wholesale distribution of mobile homes, prefabricated buildings, and glass. Establishments primarily engaged in selling construction materials to the general public are classified in **SIC 5211: Lumber and Other Building Materials Dealers**. Establishments primarily engaged in marketing heavy structural metal products are included in **SIC 5051: Metals Service Centers and Offices**.

NAICS CODE(S)

444190 (Other Building Material Dealers)

421390 (Other Construction Material Wholesalers)

According to the U.S. Census Bureau, there were 2,922 establishments engaged in the wholesale distribution of mobile homes and of construction materials not classified elsewhere, with combined sales of \$6.4 billion in 2003. The industry employed approximately 26,852 employees and they shared an annual income of \$1.1 billion. The average sales per establishment totaled \$1.6 million annually. California, Florida, and Texas led in the number of establishments, with 1,309 or almost 30 percent of the market. In addition, they employed some 6,715 people.

In 2003, the largest sector of the industry was construction materials, not elsewhere classified, with 911 establishments, representing more than 18 percent of the market, or \$364.2 million in combined sales. Prefabricated structures numbered 808 establishments and more than 16 percent of the market, with sales totaling \$656 million. Glass construction materials also controlled more than 16 percent of the market. Mobile homes accounted for about seven percent and \$171.6 million in sales, and septic tanks had six percent of market sales.

BACKGROUND AND DEVELOPMENT

Sales of the wholesale construction materials industry were dropping in early to mid-1990s, from \$9.22 billion in 1992 to \$6.9 billion in 1996. During the same period, the number of establishments in the industry dropped, from 4,049 in 1992 to 3,870 in 1996. Employment in the industry also declined from 36,978 in 1992 to 34,114 in 1996. The industry's payroll, however, grew slightly, from \$970.9 million in 1992 to \$1.02 billion in 1996.

As wholesalers of construction materials entered the 1990s, they faced economic challenges and changing industry conditions. Major retailers were growing in size and turning increasingly to direct purchasing and retail buying groups. Small building supply retailers were closing. This led to a diminished number of traditional wholesale customers, a situation reflected in the industry's dismal sales numbers in the mid-1990s.

A large portion of construction materials wholesalers' sales are generated by building supply retailers who operate a small number of stores. However, these are precisely the type of retailers who were being put out of business in the mid-1990s by building supply superstores such as Home Depot. Larger retailers—those with an annual sales volume of at least \$50 million—were more likely to purchase directly from manufacturers.

Surviving wholesalers in this industry grew larger and were able to operate on lower profit margins. Industry analysts predicted that only those wholesalers able to offer value-added services would survive. Typical value-added services included inventory management, financing, training, ad development, and merchandising assistance.

Manufactured housing represented one portion of the industry experiencing growth in the mid-1990s, a dramatic reversal of fortune from the 1980s. Manufactured housing units are shipped from plants, either single wide or as single sections of multi-wide housing units. Some manufactured housing is not used for dwellings, but for light commercial use, classrooms, or clinics.

Manufactured home sales declined each year between 1983 and 1991 and were down to about 170,000 units in 1991. However, sales rose dramatically to 210,800 in 1992 and about 265,000 in 1993, increases of 23 and 26 percent, respectively. In 1994 the industry grew another nine percent to 290,000 units, jumping to over 375,000 in 1998, according to the Manufactured Housing Institute. In 1999, one out of every three pre-sold single-family homes was manufactured, and there were about ten publicly traded manufactured housing companies. In the first 11 months of 1999, production was up 5.2 percent (around 346,000 homes), compared to the previous year's 329,000. Because of zoning restrictions in major cities, manufactured homeowners and developers have focused on moving to rural areas.

Builders of traditional homes began diversifying into creating developments of manufactured homes in the mid-1990s. For example, Centex Corp., the largest-volume U.S. home builder, agreed to acquire Cavco Industries, Phoenix, a major manufactured housing company, in December 1996. Also, Pulte Home Corporation, another high-volume homebuilder in the United States, developed six manufactured housing communities in 1995 and 1996 and had plans to build more. Centex

posted \$10.36 billion for 2003, while Pulte Home Corporation recorded \$9.0 billion. Other significant builders include D.R. Horton, KB Home, MDC Homes, Bowen Builders Group, and Ryland Homes

CURRENT CONDITIONS

The popularity of manufactured housing was spurred by the rising cost of traditional "stick" built homes and a dramatic improvement in manufactured housing quality, according to *Builder* magazine. A shortage of skilled trades people has made manufactured housing an attractive and cost effective means of developing lower-income communities, the magazine said. Today's manufactured houses are also larger and come with more features, resembling site-built houses but at a lower cost—50 to 60 percent less.

The Freedomia Group, Inc., an industrial market research firm, forecast the overall prefabricated and modular housing market to grow 1.7 percent annually into 2007. The findings were based on "cost advantages of factory production, such as bulk material purchasing and insulation from weather—related delays." Technology also played a significant role as the modular homes "closely resemble site—built houses." Further predictions included an annual 2.6 percent increase for multisection units until 2007.

INDUSTRY LEADERS

While sales in the wholesale building material industry were declining, the largest players in the industry remained very large. All of these companies, however, have extensive interests outside of the industry. According to *Builder*, the leading ten manufactured home builders for 2003 were Champion Enterprise of Auburn Hills, Michigan; Fleetwood Enterprises of Riverside, California; Clayton Homes of Maryville, Tennessee; Oakwood Homes of Greensboro, North Carolina; Palm Harbor Homes of Addison, Texas; Skyline Corp. of Elkhart, Indiana; Cavalier Homes of Addison, Alabama; Patriot Homes of Elkhart, Indiana; Horton Homes of Eatonton, Georgia; and SE Homes of Addison, Alabama. Together, they shipped 101,981 thousand manufactured homes in 2003.

The modular whole—house panel builder leaders for 2003 included Champian Enterprises, All American Homes, Muncy Homes, New Era Building Systems, Excel Homes, Horton Homes, Ritz—Craft Corp., Clayton Homes, Palm Harbor Homes, and R—Anell Housing Group. Combined, they shared \$3,722 million in sales.

SIC 5043

PHOTOGRAPHIC EQUIPMENT AND SUPPLIES

This industry classification comprises establishments primarily engaged in the wholesale distribution of photographic equipment and supplies, including cameras, darkroom apparatus, and photographic film. Establishments primarily engaged in the wholesale distribution of items such as photocopy, microfilm, and similar equipment are classified in **SIC 5044: Office Equipment**.

NAICS CODE(S)

421410 (Photographic Equipment and Supplies Wholesalers)

INDUSTRY SNAPSHOT

In 2001, there were an estimated 1,293 establishments in this industry, down from 1,350 the previous year. The number of establishments had been steadily dropping since a high of 1,556 in 1987, but had remained rather steady from 1993-96 with an estimated 0.3 percent change. States with the largest number of establishments in 2001 were California with 260 and New York with 174—combined, these states together accounted for just under a third of all establishments. In 2003, the number of establishments increased slightly to 1,382. The industry generated \$5 billion in sales for 2003, and the average sales per establishment were \$4.7 million. There were a total of 18,179 employees.

The largest industry segment was photographic equipment and supplies which controlled more than 48 percent of the industry. Average sales added up to approximately \$6.6 million. Cameras and photographic

equipment accounted for over ten percent of the market, with total sales of \$2.4 million. Photographic cameras, projectors, equipment and supplies dominated more than 14 percent of the market, with \$4.5 million in sales.

BACKGROUND AND DEVELOPMENT

In 1997, 32.4 percent of American households had film processed. Of these households, 28.3 percent processed 35mm film, 1.2 percent processed advanced photo system (APS) film, 5.8 percent processed disposable-camera film, and 2.9 percent processed other types of films. Of all rolls processed that year, 80 percent were 35mm print film, excluding disposable cameras. Also in 1997, 12.8 percent of American households obtained at least one camera or camcorder, and 11.5 percent bought at least one camera or camcorder.

Unit share was lost by the popular 35mm format in 1997 because of the growing popularity of APS and digital cameras. In 1998, the unit share by camera type purchases, according to Photo Marketing Association International (PMA), was: 35mm lens shutter with 46.5 percent; camcorder with 22.4 percent; APS with 8 percent; 110 with 7.6 percent; instant with 5.5 percent; 35mm SLR with 4.1 percent; digital still camera with 3 percent; and professional medium and large format with 2.9 percent. The 1997 unit shares by outlet type for camera and camcorder purchases were: discount stores with 39.8 percent; electronic/video stores with 15.1 percent; camera stores with 11.1 percent; unclassified types of stores with 8 percent; department stores (not discount) with 7.4 percent; mail order with 6 percent; catalog showroom with 5.4 percent; warehouse clubs with 3.8 percent; and drugstores with 3.3 percent.

Overall demand for photographic equipment and supplies was generally flat throughout the early 1990s. The 1999 value of shipments was expected to be \$24.7 billion. Photographic industry shipments through 2003 are expected to show modest growth reaching \$26.7 billion. The United States ranks as the world's second largest exporter of photographic equipment and supplies after Japan. In 1997, U.S. exports were worth \$4.7 billion, 4 percent more than 1996.

The 1990s saw the introduction of two products that continue to have a profound effect on the photographic equipment and supplies industry. APS, a new kind of camera and film and photo finishing option, first appeared in 1996. Using a 24mm format the APS film cassettes and cameras were developed by five major camera and imaging companies—Kodak, Fuji, Canon, Minolta, and Nikon.

One advantage of the APS format is its simple film loading procedure. Loading a standard 35mm film canister can be tedious since it has to be manually wound around a spool, the leader cannot be used for photographic images, and once in the camera it is not practical

to remove the film unless it is rewound into its canister. APS cassettes are dropped into the camera. The “smart” cassette then tells the camera to move the film to the first unused frame. The cassette can be removed at any time and reloaded. In this sequence the APS cassette will instruct the camera to advance the film to the next available frame. APS systems and their cameras also allow the user to choose from three formats for every frame shot. The “classic” format is similar to the standard 35mm format, the “HDTV” format is slightly wider, and the “panoramic” format approximates 3:10 ratio framing. In 1997, 11.2 percent of cameras bought in the United States were APS format, up from 6.4 percent in 1995.

Another innovation came in the late 1990s with the introduction of the film less digital camera. Generally selling for between \$200 and \$1,000 (prices vary depending on quality and options) in 1999, these cameras record and store images in a digital format. As soon as a picture is taken it can be viewed on a small screen on the back of the camera and the user has the option of storing the imaging or deleting it. The camera is then plugged into a personal computer via a cable and the digitized images can be brought up on the computer’s monitor and printed or stored for future use. *Kiplinger’s* predicts that 1999 will see the sale of 1.6 million digital cameras. In 1998, according to the PMA, 3 percent of all cameras and camcorders sold were digital.

In an article for *PTN* Lorraine DarConte interviewed industry insiders who saw changes in the way distributors relate to digital cameras which are “as close to the computer/electronic industry as to the photo industry,” according to Michael Hess, vice president of marketing for Tiffen/Saunders. Martin Lipton, national sales manager for Argraph Corp., also saw changes ahead for distributors of photo equipment and supplies. “Distributors that involve themselves in digital photography have to make themselves aware of a vast new body of information. They have to be the teachers and fonts-of-knowledge for many of their dealers.” Josh Blank of Mardel Photo Supply agreed. “Digital photography brings with it a new set of challenges for the traditional photographic distributor. Digital imaging and printing require product knowledge, new inventory stocking requirements for the showroom and constant updates on competitive products.” Bob Rose, vice president of Bogen saw electronic induced changes in the way dealers and distributors interact. “Probably one of the biggest changes for distributors,” Rose said, “is dealing with more computer-literate dealers. People are constantly asking us for more information via e-mail and fax machines.” Bogen’s sales representatives also access the Internet to check inventory and expedite orders while in the field. Liz Kleider, president of Kleider Inc. expected profound changes in consumers because of electronic innovations. Kleider

said, “I see two distinct camps emerging in our industry: those who believe in ‘pictures’ and those who call them ‘images.’” Kleider said. “The traditional photographic picture is to hold in your hand, to mail, to exhibit, and store. Besides, it can be produced cheaply. The electronic image is exciting in its versatility and mobility. But it is more fleeting, and capture into a more stable medium is still quite expensive.” Writing for *Photo Marketing* Alfred DeBrat suggested that retailers align themselves with photo equipment distributors who grew into digital imaging from the photographic rather than the electronic side of the business. Digital imaging products can thus be discussed using a ‘common language’ as opposed to distributors of electronic products “who may speak an unfamiliar language of bits, bytes, and megapixels.”

CURRENT CONDITIONS

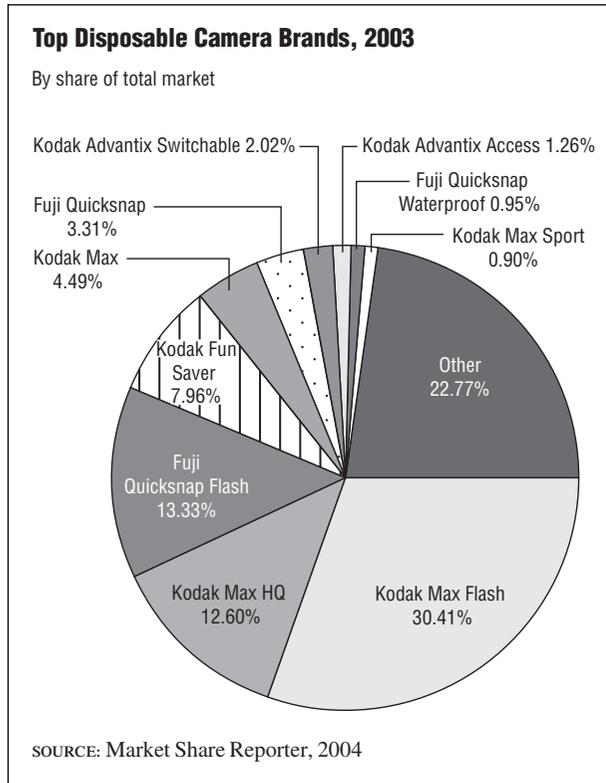

According to *Photo Marketing* magazine the total number of film rolls decreased by two percent over 2002. Film processing also declined about 6.2 percent, with 756 rolls being processed. The traditional method for consumers to develop their film decreased by 3.5 percent in 2002. Markets hit the hardest were mail—order and specialty retailers. These markets have seen double the decline in film processing over the past few years. The mass retailers were making a big hit with consumers because of their lower prices, and also convenience. The drug stores continued to thrive also, and did not experience the strain from the newest methods of film developing.

The market leader remained the onetime—use camera. Sales increased nine percent over 2001 to 197 million units sold. This was largely due to the continued advancement of technology. *Photo Marketing* reported that “10 percent to 11 percent of households use single—use cameras exclusively for their photo needs.” However, Fuji predicted the single—use camera to max out in 2006. The Kodak Max Flash single—use camera was the market leader for 2003, which represented 30.41 percent of the market. The Fuji Quicksnap accounted for 13.60 percent of the market. Combined, consumers purchased more than 306 million.

INDUSTRY LEADERS

One of the largest wholesale distributors of photographic equipment and supplies in the United States was Minolta Corporation, of Ramsey, New Jersey. Minolta was incorporated in 1959 to market products created by the Minolta Camera Co., Ltd., a Japanese manufacturer of cameras and accessories. Minolta offers products including cameras, and computer-based digital information and imaging systems. Minolta employed nearly 4,000 people in the United States and had 1998 sales of about \$1.1 billion.

Another major wholesale distributor was Olympus America, Inc., a subsidiary of Japan’s Olympus Optical

Co. Ltd. Olympus America was established in 1968 in Melville, New York, as a division of the Olympus Corporation. The company employed 1,500 people and had 1998 sales of about \$223 million. It distributed photographic supplies not only to retailers, but to hospitals and government organizations as well, and marketed Olympus scientific products.

The Tiffen Manufacturing Corp. of Hauppauge, New York, was a major manufacturer of photographic equipment and supplies, especially glass filters for still, video, and motion picture/television photography. Tiffen also offered filters and accessories for the digital camera market. In 1998, Tiffen had sales of \$27 million and employed 270 people. Tiffen has also entered into an agreement with photo giant Eastman Kodak, of Rochester, New York, to market, sell, and distribute Kodak filters, step tablets, control devices, and darkroom accessories. Tiffen planned to introduce consumer and professional photographic accessories to be sold as Kodak Gear and Kodak ProGear. Tiffen reported \$144.1 million in sales for 2003.

WORKFORCE

In 1996, the photographic equipment and supply industry employed 32,615 workers and had an annual payroll of \$1.3 billion. Photographic equipment wholesalers averaged 19 employees per establishment, while all of wholesaling averaged only 12. Payroll per em-

ployee was also higher in the photographic equipment wholesale trade when compared to the wholesale industry average. Photographic wholesalers' average payroll per employee was \$36,519, whereas the entire wholesale industry averaged \$29,919.

SIC 5044

OFFICE EQUIPMENT

This entry includes establishments primarily engaged in the wholesale distribution of office machines and related equipment, including photocopy and microfilm equipment; safes and vaults; accounting and adding machines; calculating machines; cash registers; duplicating machines; mailing machines; mimeograph equipment; typewriters; and addressing machines. These establishments also frequently sell office supplies, but establishments primarily engaged in wholesale distribution of office supplies are classified in **SIC 5111: Printing and Writing Paper**, **SIC 5112: Stationary and Office Supplies**, or **SIC 5113: Industrial and Personal Service Paper**. Establishments primarily engaged in wholesale distribution of office furniture are classified in **SIC 5021: Furniture**, and those involved primarily in wholesale distribution of computers and peripheral equipment are classified in **SIC 5045: Computers and Computer Peripheral Equipment and Software**.

NAICS CODE(S)

421420 (Office Equipment Wholesalers)

INDUSTRY SNAPSHOT

The office equipment industry is made up of establishments that distribute supplies and equipment from typewriters to safes to calculating machines. In 2003, photocopy machines, copying equipment, and cash registers dominated this industry, followed by vaults and safes, addressing and mailing machines, and duplicating machines.

The industry consisted of approximately 6,779 establishments in 2001, slightly down from 7,023 in 2000. By 2003, the number increased to 9,233 with more than \$25 million in annual sales. The average number of employees per establishment was 15, and the average sales per establishment was almost \$4 million. The majority of office equipment establishments were concentrated in California with 1,240 with sales of about \$1 million. Florida followed with approximately 700 establishments and about \$4 million in annual sales.

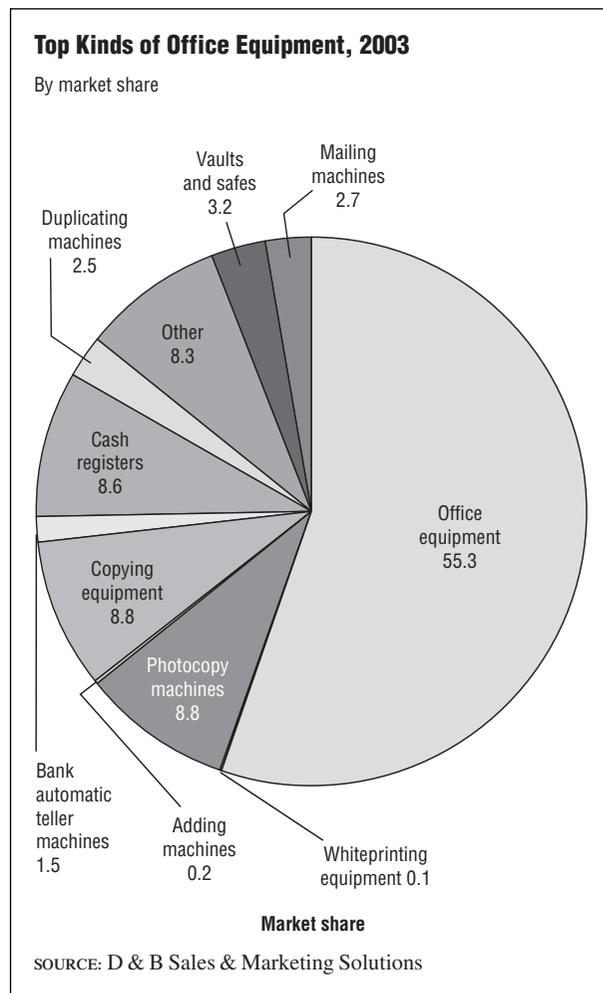

The wholesale distribution of office machines and related equipment employed about 147,160 people in 2001, up from 134,340 in 2000. The total number of employees continued to decline, and by 2003 the number dropped to 128,589.

BACKGROUND AND DEVELOPMENT

Xerox Corporation, the inventor of the copier in 1949, led the office equipment industry until the 1970s when Japanese rivals entered the market. Xerox sales representatives found themselves competing against local distributors of Minolta Camera Co. Ltd., Toshiba Corporation, and other companies. At the premium-priced end, Eastman Kodak Co. had become a powerful competitor as well. Xerox's quality-improvement strategy, however, helped the company regain much of its market share (about 38 percent in 1991). Xerox sells and rents machines and provides special financing to its largest accounts. Because Xerox machines are usually high-end product and small or new businesses do not qualify for Xerox's low interest financing, entrepreneurs often turn to the distributors of the lower-priced Japanese machines to buy or rent.

Wholesale distributors of office equipment have traditionally been part of a two-tier distribution system in which they bought merchandise from the manufacturers and sold it for profit to other retailers or industrial and commercial clients. They maintained deep inventories, often by taking loans against those inventories. To remain competitive, they needed to continually expand their services, expand geographically, and diversify their product markets.

The number of office equipment wholesalers decreased in the 1990s due to consolidation, forcing dealers to accept tighter profit margins. Like distributors in other industries, office equipment dealers found that the way to

maintain or increase their market share was to emphasize the service they provided that customers would not find in the superstores and other discount outlets. To broaden their appeal, many distributors also developed online catalogs for easy customer use.

The office machinery wholesale industry became intensely competitive as profit margins tightened. Many buyers of office equipment ordered through wholesale distributors rather than through retail outlets or direct from the manufacturer. Dealers selling low-end copiers and other equipment encountered tough competition from superstores and discounters, whose prices appeal to small and medium-sized businesses that do not qualify for the volume discounts given to large companies.

Distributors of office equipment, although not so vulnerable to the spending habits of individual consumers, had to contend with downsizing and layoffs at businesses across the country. Superstores have vied for the small to mid-sized business market and have been very successful in part because they offered smaller businesses discounts for which they had never qualified before. Smaller distributors, who could not profitably

compete with the superstores for their customer base, had thus been endangered.

Dealers, however, stressed the value-added service that they could provide to business customers of the retail outlets they supplied. Value-added service was one advantage that wholesalers stressed in their competition with superstores. Value-added services included on-call technical expertise; special financing arrangements; assistance in customer materials management costs; product lines tailored to specific customers; specially designed, labeled, or customized products or catalogs; next-day delivery; after-market products and service; just-in-time inventory controls; online reporting; and usage reports. Intense competition, though, often prevented dealers from charging fees for these services, which adversely affected their already tight profit margins.

Long-standing dealers of office equipment were angered by the generous discounting some manufacturers extended to office supply superstores. According to the National Office Machine Dealers Association (NOMDA), manufacturers were selling to the discounters at a better price than they sold to dealers. They noted that the superstores did not have to bear the expense of supporting repair, training, and technical service networks that the dealers maintained.

Although manufacturers, through the large retailers, realized the benefits of reaching out to the small business and home-office market they might not have reached through traditional distributor channels, superstores were a mixed blessing to them. The superstores offered minimal service, and the manufacturers assumed increased responsibility for handling repair and warranty problems. Dealers, on the other hand, carried a large inventory of parts, provided training with the equipment they sold, and provided same-day, on-site repair of the equipment.

The remaining larger distributors competed for the corporate dollars of national companies. To be competitive, however, they offered a wide range of products and services since customers often look to deal with one supplier rather than many.

Fueled by the strong U.S. economy and by the advent of digital copiers, the office equipment industry experienced bounding growth throughout the 1990s. Industry Analysts Inc., of Rochester, New York, conducted a 1999 survey of 135 office equipment dealerships, which were experiencing increased sales of 8 to 10 percent that year. Another market research firm, Dataquest, of San Jose, California, had projected U.S. placements of 180,000 digital copiers in 1998; actual placements more than doubled this projection, with 377,710 digital copier placements that year. Combined 1998 placements of analog and digital copiers numbered 1,927,600 units, an

increase of 9.9 percent compared to 1997 placements. Dataquest projections called for continued expansion of the total copier market over the three years after 1998 before decreasing to 2.1 million units by 2003. This would represent sales increases from \$425.8 million in 1998 to a projected \$36.1 billion in 2003.

Some industry analysts attributed the hot digital copier market to organizations replacing analog copiers with digital technology, which suggested finite growth once full digitalization was achieved. However, the trend toward digital networking encouraged the purchase of multiple copiers that could be interlinked, which could buoy sales once analog copiers are phased-out. Industry analysts also projected a shift in income for companies from hardware sales to technical support, as office equipment such as copiers were integrated into more complex systems requiring more sophisticated and knowledgeable users, and hence more support.

CURRENT CONDITIONS

According to 2003 data from D&B Sales & Marketing Solutions, photocopy machines, copying equipment, and cash registers dominated this industry, with 26 percent of the market. Combined, they accounted for more than \$11 million in sales. Vaults and safes followed with about 3 percent; addressing and mailing machines accounted for over 3 percent; and 2 percent of the market was contributed to duplicating machines.

As technology grew at an accelerated pace, corporate leaders began to rent, or lease some of their office equipment. This had proven to be cost effective for businesses whose office equipment became obsolete as new technology was introduced. According to Equipment Leasing Association of America (ELA), of Arlington, Virginia, expected a 5 percent increase in leasing in 2004. Key Equipment Finance, of Superior, Colorado noted that approximately 90 percent of its sales are derived from office equipment dealers and manufacturers. Xerox Corp. also added that about 85 percent of their customers lease their office equipment, such as multi—function copiers and fax machines.

INDUSTRY LEADERS

In the late 1990s, Alco Standard Corp. completed a long-contemplated consolidation by adopting IKON Office Solutions as its name for its office products division. IKON, which stands for I Know One Name, was previously one of the world's leading office machine companies. Alco spun off its paper distribution arm, Unisource Worldwide, the largest paper distributor in North America, to Alco's shareholders.

Another leading wholesale distributor was Lanier Worldwide Inc., a billion-dollar subsidiary of Harris Corporation. Lanier marketed copiers, fax machines and

dictation equipment, telephones, integrated computer software and networking systems, and other office equipment.

WORKFORCE

The wholesale distribution of office machines and related equipment employed about 147,160 people in 2001, up from 134,340 in 2000. The majority of companies in this industry were small—employing less than five persons. In 2001, 1,851 companies had less than 5 employees; 973 had between 5 and 9; 702 had between 10 and 19 employees; 652 had 20 to 49 employees; 84 had 50 to 99 employees; and about 63 establishments with 500 or more. The total number of employees continued to decline, and by 2003 the number dropped to 128,589.

RESEARCH AND TECHNOLOGY

Wholesale distributors have applied computer technology to improve profit margins. This has improved the productivity of many functions, including purchasing, delivery, storage, and shipping. It also improved inventory, credit, and information management.

SIC 5045

COMPUTERS AND COMPUTER PERIPHERAL EQUIPMENT AND SOFTWARE

This industry consists of establishments primarily engaged in the wholesale distribution of computers, computer peripheral equipment, and computer software. These establishments also sell related supplies, but establishments primarily engaged in wholesaling supplies are classified according to the individual product for exam-

ple, computer paper in **SIC 5112: Stationery and Office Supplies**. Establishments primarily engaged in the wholesale distribution of modems and other electronic communications equipment are classified in **SIC 5065: Electronic Parts and Equipment, Not Elsewhere Classified**. Establishments primarily engaged in selling computers and computer peripheral equipment and software for other than business or professional use are classified in **SIC 5734: Computer and Computer Software Stores**.

NAICS CODE(S)

421430 (Computer and Computer Peripheral Equipment and Software Wholesalers)

443120 (Computer and Software Stores)

ORGANIZATION AND STRUCTURE

Five distinct segments exist within the traditional electronics wholesale distribution arena: full-line distributors, technical and professional distributorships, regional and local distributorships, hardware distributors, and software distributors. The limited focus of the respective wholesaler segments distinguishes each from the mixed-sales distributor segments.

Full-line Distributors. Full-line distributors predominate the computer wholesale industry with the broadest product and customer base. Sales in this segment represent 35 percent of the total traditional distribution market and 23 percent of U.S. wholesale computer-distribution network revenue.

Hardware Distribution. Hardware distributors accounted for 22 percent of the nonsystems products. Regional and local distributors within the wholesale category account for 28 percent of the traditional distribution total and 18 percent of the U.S. wholesale computer distribution revenue. These distributors emphasize sales to independent dealers and fulfillment services.

Technical Distributors. Most of the wholesalers in this industry segment supply goods to corporations. Typical product lines include disk drivers, terminals, computers, keyboards, printers, and other computer equipment. Up to 20 percent of sales in the industry are commonly filtered to corporations via systems integrators and value-added reseller (VAR) channels. This segment is characterized by an overriding value-added focus consisting of integration and networking services. High-end product mixes involving complex hardware and software configurations predominate in this market.

Software-only distributors accounted for a scant 4 percent of traditional distribution sales. Their primary focus was on the sale of educational and entertainment software to the mass market. They also played an important role in bringing new software products to the market.

BACKGROUND AND DEVELOPMENT

A vital transformation occurred in the computers, computer peripheral equipment, and software industry during the late twentieth century. Industry standards evolved, markets solidified, and customer sophistication matured to new levels. Most significant among the changes was a dramatic shift toward complex network configurations, as a dramatic proliferation of new hardware technology emerged and expanded the functionality of desktop computers. The result was an expansion in the retail computer industry that spurred wholesale and manufacturing markets. Any doubt that the wholesale distribution segment of the industry was a powerhouse was erased in 1992, when IBM, Apple, and Compaq entered the industry. Concurrent with these developments, the larger national wholesalers formed new divisions to pursue such areas as retail sales, direct fulfillment, and emerging technologies.

Following the peak years between 1991 and 1993, there were 38,000 jobs lost in the wholesale sector. The business computer market segment became saturated at 90 percent by 1996, according to a report in *Monthly Labor Review*. In the face of a waning business market, distributors turned their attention to the new mass market of home consumers who were captivated by the power of the Internet. The market for home computers expanded dramatically at that time with the innovation of easy-to-use Internet software interfaces called browsers. The industry rebounded, employment increased by 4 percent, and the industry recovered 32 percent of the lost jobs. Additionally, the expansion of the home computer industry fueled a new market for prepackaged software. Advances in CD-ROM technology resulted in lower equipment prices for associated peripherals, such as optical drives and spurred sales of both hardware and software in the process.

In 1995 computer manufacturers began to encourage competition among wholesale distribution channels by opening the market to unhindered competition. The practice, called "open sourcing," absolved dealers from the requirement to contract exclusively with a specified wholesaler. "Second sourcing," a modified version of open sourcing, limits competition by permitting no more than two wholesalers to enter the channel. As a result of open sourcing policies, competition increased within the industry. Wholesalers were forced to compete and flourish or else to withdraw from the marketplace. Between 1992 and 1995 the number of wholesale distributors dropped nearly in half, from 300 to less than 180.

Likewise, software distributors encountered new challenges in the mid-1990s. In response to the burgeoning popularity of the Internet, some software manufacturers established online outlets and sold products directly to consumers over the World Wide Web. The new online

method of distribution enabled the \$30 billion software industry to distribute their product directly to a rapidly expanding Internet consumer market and bypass the wholesale industry entirely.

CURRENT CONDITIONS

In 2001 sales for all U.S. merchant wholesalers amounted to \$2.7 trillion. With sales of \$146.2 billion, computer and computer peripheral equipment and software accounted for around 5.4 percent of this total. Annual industry wholesale levels, which amounted to approximately \$142.1 billion in 1997, achieved healthy increases through 2000, reaching \$165.2 billion. However, sales fell in 2001, as economic conditions worsened.

The terrorist attacks against the United States on September 11, 2001, had a negative impact on already declining economic confidence levels. Widespread layoffs and the possibility of war with Iraq continued to affect the consumer and business outlook into 2003. Virtually every product segment within the computer industry was affected, in business and consumer sectors alike. On the corporate side, a temporary slowdown in technology spending occurred, as companies waited for better times. In addition to spending delays, some analysts cited other factors that attributed to the industry's slowdown. Among these were year 2000 "Y2K"-related new equipment purchases that took place at the end of the 1990s, as well as the availability of quality used equipment from bankrupt Internet companies in the early 2000s. A similar delay in discretionary technology purchases took place in the consumer sector.

Computer equipment distributors responded to these challenging economic conditions in a number of ways. By late 2002 industry leader Ingram Micro was in the process of laying off workers and implementing other measures to reduce expenses as its revenue slipped. It also evaluated credit lines with customers and made a series of adjustments. The largest distributors also began targeting small businesses in the early 2000s. As large corporations tightened their technology purses, small businesses—many of which were in the position to upgrade older equipment—presented distributors with other sales opportunities. Citing research from Roper NOP, *Computer Reseller News* revealed that in 2002 this market segment represented more than 80 percent of all U.S. businesses and was expected to spend \$243 billion on technology purchases.

Although the industry's distributors focus primarily on computers, computer peripheral equipment, and computer software, personal computer (PC) supplies represented yet another niche revenue source during challenging times. Although corporations were holding back with large capital purchases, such was not the case with supplies. Therefore, distributors looked to PC supplies as one

way to help offset losses in other product segments. In 2001 industry heavyweight Tech Data created a division devoted to marketing supplies. As of 2003, Ingram Micro also was concentrating in this area.

In addition to economic challenges, computer equipment distributors also struggled with “channel conflict” in the early 2000s, as manufacturers employed sales forces to directly reach end-users, bypassing the reseller or “solution provider” layer of the industry. To offset this competition, resellers were leveraging things like better pricing, the ability to bring end-users combinations of solutions from several different manufacturers, and more personalized service. In addition, distributors like Ingram Micro and Tech Data were investing in technology centers that their reseller customers could use for learning about the latest products, demonstrations, training, and more.

INDUSTRY LEADERS

Leading the wholesale industry in the early 2000s was Ingram Micro, Inc. of Santa Ana, California. A public company, Ingram ranked at number 75 on *Fortune*'s list of 500 leading public corporations in 2002. The corporation was the world's largest computer wholesaler, with 2001 sales of \$25.2 billion. With customers in more than 100 different countries, a sizable share of the company's business comes from international markets. The second largest company, Tech Data Corporation of Clearwater, Florida, reported \$17.2 billion in sales in 2002. Tech Data appeared at number 117 among the *Fortune* 500. Other significant businesses included Arrow Electronics, Inc.; Avnet, Inc.; and Co-mark, Inc.

SIC 5046

COMMERCIAL EQUIPMENT, NOT ELSEWHERE CLASSIFIED

This industry classification is comprised of establishments primarily engaged in the wholesale distribution of commercial machines and equipment, not elsewhere classified. Products of the industry include commercial cooking and food service equipment, partitions, shelving, lockers, store fixtures, electrical signs, balances and scales (except laboratory), mannequins, and vending machines.

NAICS CODE(S)

421440 (Other Commercial Equipment Wholesalers)

The commercial equipment, not elsewhere classified industry was valued at an estimated \$13 million in 2003. There were 9,516 establishments, with about 69,425 employees in 2003. This segment is part of the professional and commercial equipment and supplies market, which made up 23 percent of the entire wholesale distribution of durables in 2003, totaling \$1.9 million. Two key lines of business characterize the industry: restaurant and hotel equipment, and store machines and equipment. Restaurant and hotel suppliers produced about 54 percent of the industry's sales versus store machine wholesalers' about 22 percent share. Sales in the hospitality side of the industry have generally grown faster than those of the store equipment segment.

The industry employed approximately 53,002 workers in 2001, with an annual payroll totaling slightly more than \$2 million. According to the U.S. Census Bureau, the industry had approximately 5,071 establishments in 2001, down from 5,152 in 2000. Overall, the majority of the establishments were small. In 2001, 1,973 companies had fewer than 5 employees; 1,013 companies had between 5 and 9 employees; 743 had between 10 and 19; 640 had between 20 and 99; 198 had between 100 and 499; and 155 had 500 or more employees. The majority of establishments were in California and New York.

In the late 1990s, domestic restaurant chains and their suppliers increased their presence overseas. Unit openings in Europe and elsewhere by restaurant chains were expected to be twice that as in the United States. Since these restaurants prefer American equipment, this growth offered opportunities for both manufacturers and distributors. Distributors supporting overseas markets must be able to handle post-sales service requirements, local order fulfillment, and language barriers.

Sales of store fixtures increased dramatically during the 1970s and the 1980s, but stalled during the first years of the 1990s. Growth was attributed to the number of shopping malls under construction during the period. According to the report, the number of shopping malls in the United States had increased from 3,500 in the mid-1970s to about 35,000 in the early 1990s. As a result, the combined value of wood and nonwood store fixture shipments went from \$1.75 billion in 1975 to \$6.19 billion in 1990. As the construction of retail outlets slowed and overall economic growth lost momentum, demand for industry products leveled off.

During the mid-1990s, suppliers of store fixtures expected growth to come from three areas: renovations necessitated under the provisions of the Americans with Disabilities Act; government requirements; and vendor shops—distinctive spaces within retail establishments devoted to specific products. These three areas, however, were not expected to provide growth as dramatic as had been experienced during the previous two decades. By the late 1990s, wholesalers faced competition from manufacturers as they began selling via the Internet. For instance, St. Louis-based NU-ERA Group developed an online catalog and Newark, New Jersey-based HandyStore Fixtures, Inc. offered more than 2,000 store fixtures for sale on their Web site.

The majority of firms that distribute miscellaneous commercial equipment in the United States are typically quite small. Leading firms by revenues in the mid-2000s, most of which were restaurant and hotel suppliers, included Gordon Food Service Inc. of Grand Rapids, Michigan; Performance Food Group Co. of Richmond, Virginia; SYSCO Food Services of Walnut, California; International Dairy Queen Inc. of Minneapolis, Minnesota; Golden State Foods of Irvine, California; and Nobel (subsidiary of Sysco Food Services) of Denver, Colorado.

SIC 5047

MEDICAL, DENTAL, AND HOSPITAL EQUIPMENT AND SUPPLIES

This industry classification is comprised of establishments primarily engaged in the wholesale distribution of instruments, apparatus, and equipment to medical and dental practitioners, clinics, and hospitals. Products of the industry include surgical instruments, artificial limbs, operating room equipment, X-ray machines, hospital beds, medical and dental laboratory equipment, and professional supplies. The industry also includes wholesale distributors of industrial safety devices such as first-aid kits and face and eye masks.

NAICS CODE(S)

421450 (Medical, Dental and Hospital Equipment and Supplies Wholesalers)

446199 (All Other Health and Personal Care Stores)

According to the U.S. Census Bureau, there were a total of 9,212 establishments operating within this industry in 2001. The establishments were subdivided into two categories: wholesalers engaged primarily in the distribution of medical and hospital equipment and supplies, and wholesalers engaged primarily in the distribution of dental equipment and supplies. Medical and hospital wholesalers formed the largest segment of the industry, accounting for 14,262 establishments and sales of \$23,488.4 million. Dental wholesalers accounted for 1,314 establishments and sales of \$8,065.9 million. The total number of establishments climbed to 21,189 in 2003. Their combined sales totaled \$49,542.30.

During the early 1990s, rising health care costs led many hospitals to form alliances and make group purchasing decisions. Critics of the policy claimed that the situation created an adversarial relationship between the medical community and its suppliers because the purchasing groups left distributors with unprofitable margins.

In addition to concern over cost containment, the medical community faced increasing pressure to reduce its impact on the environment. Costs related to the disposal of medical waste, including toxic and hazardous materials, were mounting. Medical administrators called upon manufacturers and distributors to help provide products able to serve patients' needs and also reduce waste.

As the 1990s continued, suppliers engaged in cut-throat competition and managed care placed additional pressure on the industry. Hospitals began to complain about declining standards of service, even from the major national suppliers. As a result, suppliers found themselves competing to provide improved service at lowered

prices. “Activity-based costing,” in which prices are based on actual costs rather than a negotiated price plus a set shipping cost, became popular. Some hospitals turned to regional distributors and even took back some functions formerly performed for them by distributors.

Not surprisingly, many smaller companies folded or were acquired by larger companies. For instance, in 1994 Owens & Minor Inc. acquired third-ranking distributor Stuart Medical. Even the largest companies suffered a decline in profits. The average pretax profit margin for hospital distributors fell to 1.8 percent in 1994.

In the latter part of the 1990s, the remaining national medical-surgical distribution companies were struggling to maintain their standing, with regional distributors and drug distributors providing additional competition. In 1999 the industry leaders were Allegiance Corporation of McGaw Park, Illinois (a spinoff from Baxter International, which had broken up); Owens & Minor Inc. of Glen Allen, Virginia; Cardinal Medical Products and Services of McGaw Park, Illinois; and Fisher Scientific International Inc., of Hampton, New Hampshire, which completed its acquisition of privately owned Oxoid Group Holdings Limited in March of 2004. Oxoid is a manufacturer of microbiological culture media and other products that test for bacterial contamination. Fisher completed its acquisition of privately held Dharmacon, Inc. in April of 2004.

When ranked by sales, firms were more in the mid-size range, with 6,808 posting sales between \$250,000 and \$499,000. Of the remaining establishments, 2,882 firms had sales between \$100,000 and \$249,000, while there were almost an equal number above that mid-size range, with 2,443 companies with sales of \$500,000 to \$999,000.

A majority of companies in this business were small: 3,818 had fewer than 5 staff members. An additional 1,260 firms employed 5 to 9, and 848 employed 10 to 19 people. There were 651 that staffed between 20 and 99. States with the highest number of establishments were California with 3,066, Florida with 2,414, Texas with 2,071 and New York with 1,282.

One tool available to help medical supplies distributors locate specialized products was a CD-ROM database provided by MDI (Medical Data Institute) called EPIC Plus. The EPIC Plus system provided suppliers with an up-to-date database of more than 500,000 products produced by more than 2,000 manufacturers and wholesalers. The system was used by the Health Industry Distributors Association (HIDA) and recommended by the Independent Medical Distributors Association (IMDA), an organization formed to facilitate the exchange of ideas among medical suppliers and to meet the needs of firms involved in the distribution of specialized medical products.

SIC 5048

OPHTHALMIC GOODS

This category covers establishments primarily engaged in the wholesale distribution of professional equipment and goods used, prescribed, or sold by ophthalmologists, optometrists, and opticians, including ophthalmic frames, lenses, sunglass lenses, contact lenses, and optometric equipment and supplies.

NAICS CODE(S)

421460 (Ophthalmic Goods Wholesalers)

About 740 businesses were engaged in the wholesale distribution of ophthalmic goods in 2003, according to Dun & Bradstreet, representing annual sales of about \$1.8 billion and employing some 12,750 workers. The industry remained fairly fragmented in the mid-2000s. By far the largest number of these firms, 323, employed 4 or fewer people. There were 157 units with between 5 and 9 employees; 128 with 10 to 24 employees; and 56 with 25 to 50 employees. Only 25 establishments employed more than 100 workers. In the context of the overall U.S. wholesale market, ophthalmic goods distributors were registering strong performance, though the industry's employment growth remained modest. According to *ISO Market Profiler*, employment in the industry grew 1.9 percent in the five years ended June 2001.

BACKGROUND AND DEVELOPMENT

Some historians believe eyeglasses originated in Europe during the thirteenth and fourteenth centuries. Others attribute them to China, claiming Marco Polo introduced them to Europeans. Following the invention of Gutenberg's press and the ensuing availability of printed material, demand soared.

The subsequently common frame form—with side arms fitting over the ears—was introduced in 1746. Benjamin Franklin invented bifocals in 1752. Contact lenses were first offered in 1888. Other major innovations include the 1959 development of variable strength cor-

rective lenses, and the 1971 availability of “soft” contact lenses.

CURRENT CONDITIONS

The optical industry as a whole registered revenues of about \$16 billion in 2003 and was expanding continuously into new market segments in order to bolster an eroding customer base. For example, in the late 1990s and early 2000s, eyeglasses were increasingly consumed as fashion accessories, marking a much-needed relief in sales as consumers purchased new frames with greater regularity to keep pace with changing styles. The fashion market for glasses translated into new client bases for wholesale distributors, as manufacturers of such lenses increasingly included leading clothing designers who fashioned eyeglasses to complement their clothing lines.

With overall demand for eyeglasses slumping, eyeglass manufacturers and sellers were reaching out to new branches of consumers. On the one hand, the elderly found themselves increasingly in need of more specialized vision correction, not only for various vision ailments but also for specific tasks, such as reading and computer use. On the other hand, the market was targeting ever-younger consumers, breaking into the toddler market in the early 2000s.

Perhaps the fastest emerging challenge to the industry came from the booming popularity of laser eye surgery. Between 1995 and 2003, some 3.7 million pairs of eyes underwent these procedures in the United States, over 600,000 of them in 2003 alone, and this trend was expected to increase through the 2000s, encroaching upon the sales of the ophthalmic goods industry.

Contact lens makers, meanwhile, challenged laser eye surgery directly. In 2002, the Food & Drug Administration approved a new breed of contact lenses manufactured by Paragon Vision Sciences called Corneal Refractive Therapy that mold and flatten the user’s cornea and refocuses images farther away from the retina, thereby correcting nearsightedness while the user sleeps. Within a year of FDA approval, over 20,000 customers had opted for these vision-correcting contact lenses.

INDUSTRY LEADERS

Industry leaders included Bolle Inc., of Overland Park, Kansas, and Charmant Inc. USA, of San Ramon, California.

SIC 5049

PROFESSIONAL EQUIPMENT AND SUPPLIES, NOT ELSEWHERE CLASSIFIED

This industry classification covers establishments primarily engaged in the wholesale distribution of professional equipment and supplies that are not categorized elsewhere. It includes wholesale distributors of drafting instruments, laboratory equipment (other than medical and dental), and scientific instruments.

NAICS CODE(S)

421490 (Other Professional Equipment and Supplies Wholesalers)

453210 (Office Supplies and Stationery Stores)

Wholesale distributors of medical and dental laboratory equipment are classified in **SIC 5047: Medical, Dental, and Hospital Equipment and Supplies**.

INDUSTRY SNAPSHOT

The industry is divided into two general categories: wholesalers primarily engaged in the distribution of religious and school supplies, which represented 20 percent of the market, and wholesalers primarily engaged in the distribution of other professional equipment and supplies, which controlled about 75 percent of the market.

According to the U.S. Census Bureau, some 2,615 establishments composed this industry in the 2001, and employed an estimated 38,536 people in the United States. Their combined sales were estimated at approximately \$15 million in 2003. The industry accounts for a small portion of the broader professional and commercial equipment category, which sold an estimated \$85 million in products in 2003. In 2003, there were a total of approximately 5,291 establishments. Average sales per establishment were about \$3.4 million. States with the largest number of establishments were California with 734, Florida with 407, Texas with 392, and New York with 372.

BACKGROUND AND DEVELOPMENT

In the 1990s, one of the most promising product segments was laboratory equipment. Some industry analysts predicted that provisions of the Clean Air Act of 1990 would bring steady growth in U.S. sales of instruments and apparatus used to measure and control pollutants. Pollution abatement programs undertaken in other

countries around the world were expected to create similar increases in other markets.

Sales of school equipment, however, were uncertain. One industry participant stated that the school market was “characterized by tight funding and restricted budgets.” Typically, such conditions tend to stifle market growth.

This industry consisted of just over 7,000 establishments in 1997, according to *Dun’s Census of American Business*. The largest group, comprising 2,076 units, reported sales between \$250,000 and \$499,000 in 1997. The next biggest category included slightly smaller operations with gross revenues between \$100,000 and \$249,000 in 1997: 1,143 wholesalers fell into this group. Interestingly, the next largest group was at the higher end of the scale, with gross revenues of \$1 million to \$5 million, with 1,104 establishments. More than 842 units had sales between \$500,000 and \$1 million; about 319 distributors had an annual sales volume between \$50,000 and \$99,000. Only 82 sold between \$1,000 and \$50,000 worth of stock in 1997, while 339 units reported more than \$5 million in annual sales.

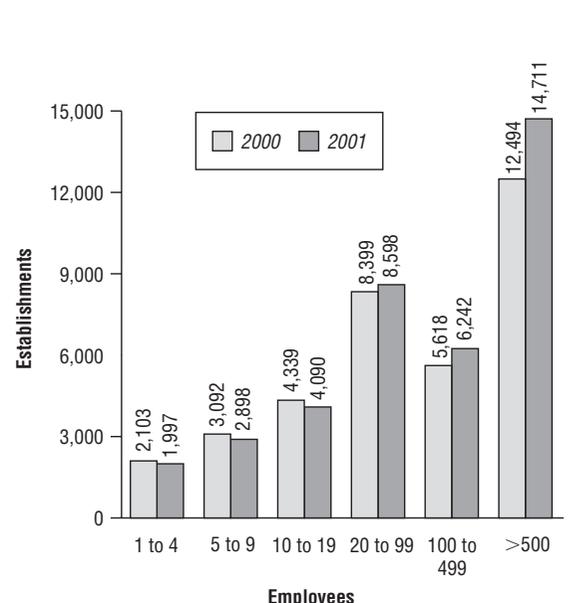

Almost half of the distributors in this category, for a total of 4,399 firms, employed fewer than five workers in 1997. 1,311 businesses had between five and nine employees; 517 staffed between 10 and 14 workers; and 214 employed from 15 to 19. A slightly larger number of establishments, 412, employed between 20 and 49 workers. There were 127 with between 50 and 99 employees, and just 82 with over 100.

INDUSTRY LEADERS

One of the nation’s leading distributors of professional equipment and supplies in the late 1990s was the VWR Scientific Products Corporation. Founded in 1852, VWR provided laboratory equipment, chemicals, and supplies to customers around the world. VWR also offered value-added services such as warehouse management systems, electronic order entry, electronic data interchange, and bar coding for more efficient inventory control. The company posted sales of \$1.3 billion in 1998, nearly tripling its revenues within five years. VWR Scientific Products was acquired by Germany-based Merck Kga, in 1999. Merck Kga then changed the name to VWR International, and planned to sell the company to Clayton, Dubilier & Rice, a private equity investment firm based in New York. Both VWR and Dubilier & Rice were expecting final approvals in 2004. Walter W. Zywoitek, CEO of VWR, would operate as an independent company, and also continue to distribute Merck’s product line.

Other leaders were Carl Zeiss, Inc. of Thornwood, New York, Mitutoyo America Corp./MTI Corp. of Aurora, Illinois, and Crocker Fels Co. of Cincinnati, Ohio.

Number of Employees per Establishment in the Professional Equipment and Supplies Industry, 2000–2001

SIC 5051

METALS SERVICE CENTERS AND OFFICES

This industry comprises establishments primarily engaged in marketing semi finished metal products (except precious metals). Products of the industry include aluminum and copper (sold in bars, rods, sheets, pipes, plates, etc.), iron and steel products (such as rough castings, bearing piles, flat products, and semi finished products), lead, mercury, tin and tin base metals, and zinc. The industry also includes establishments engaged in the wholesale distribution of wire products (such as screening

and bale ties), metal bars, nails, and metal tubing. Establishments primarily involved in the wholesale distribution of metallic ores (including precious metal ores) are classified in this industry. Establishments primarily involved in distributing semi finished precious metals are classified in **SIC 5094: Jewelry, Watches, Precious Stones.**

NAICS CODE(S)

421510 (Metals Service Centers and Offices)

The U.S. Census Bureau reported a total of 11,250 establishments within this industry in 2001, which were subdivided into three classifications: ferrous metals service centers (those operating with a warehouse), ferrous metals sales offices (those operating without a warehouse), and nonferrous metals service centers and offices. Ferrous metals contain iron; nonferrous metals do not contain iron.

In 2001 the U.S. Census Bureau reported that this industry employed 162,222 workers. Establishments within the industry posted a combined annual payroll of \$7 million for that year. In 2000 approximately 168,576 individuals were employed by metals service centers and offices, while total industry sales were in excess of \$7.3 million. In 2003, the number of establishments stood at approximately 11,975. Total annual sales for this industry were about \$111,985 million in 2003. The average sales per establishment were about \$13 million.

Ferrous metals service centers represented the largest segment of the industry, numbering 5,840 establishments, with combined sales totaling \$47.8 billion. Ferrous metals sales offices numbered 2,388, with \$28.5 billion in sales. The 2,053 nonferrous metals service centers and offices had combined sales of \$24.8 billion.

According to *Purchasing*, service centers supply a third of all the metal fabricated by manufacturing. These service centers shipped an estimated 32.8 million tons in 1998, an increase of 4.1 percent compared to the previous year, out of the 128 million tons of ferrous and nonferrous metals consumed in North America. Since the demand for total metals was expected to drop by 2 to 3 percent in 1999, metals service center shipments were expected to decline by about the same amount. *Purchasing*'s Metals Distribution Index was thus expected to drop from 148.8 to 142.6. Other industry analysts predicted that market share of service centers would grow, reaching 40 to 45 percent within a decade or so.

Metals service centers received shipments from mills and prepared products for manufacturers and other end users. Both aluminum and steel service centers suffered from a nationwide economic downturn during the early years of the 1990s. As the economy recovered, so did shipments. Steel service shipments increased from about 27 million tons in 1994 to around 30 million tons in 1998,

according to *Purchasing*. However, shipments were expected to drop to about 30 million tons in 1999. Aluminum center shipments increased from a little more than 2 billion pounds in 1994 to nearly 2.4 billion pounds in 1998. These shipments were expected to increase slightly in 1999. Copper center shipments peaked in 1994 at more than 500 million pounds, then declined in 1998 to around 460 million pounds.

According to statistics offered by the Steel Service Center Institute (SSCI), almost 45 percent of domestically produced stainless steel and 30 percent of carbon industrial steel was purchased and distributed through steel service centers. SSCI also said that shipments reached a record of 28.8 million tons in 1997, compared to 27.1 million tons in 1995. Average daily shipments increased by eight percent in 1997 compared to the previous year. Statistics offered by the American Iron and Steel Institute (AISI) reported that the U.S. steel mills shipped 9,038,000 net tons, up from 7,577,000 net tons, or 19.3 percent in 2003. The U.S. aluminum shipments were also expected to increase by two to three percent.

Also in 2003, AISI reported that within the major metal markets service centers and distributors were up 6.3 percent in 2003; automotive was down 5 percent; construction and contractors' decreased 8.4 percent; oil and gas was up 8.6 percent; machinery, industrial equipment and tools were down 2.5 percent; appliances, utensils and cutlery climbed nine percent; containers, packaging and shipping apparatus dropped 9.3 percent; and electrical equipment fell 10.2 percent.

The overall market was in a slow period and dropped 2.3 percent in 2003, followed by a 2.4 decline in 2002. The iron, copper and steel market was expected to increase 544,000 tons, which would make it the highest shipment in history. The nonferrous metals had increased in 2003 to 1.05 million tons. This was the first time since 1999 that the nonferrous metals had seen this kind of demand. Some analysts believe the overall demand will increase in 2005.

Following the general trend in the wholesale industry, there was significant consolidation through mergers of metals service centers in the late 1990s, with 1997 and 1998 being peak years. One of the biggest during 1997 was the merger of Tubesales and Williams & Co. to form TW Metals of Exton, Pennsylvania. In the first quarter of 1999 there were seven acquisitions involving steel and aluminum centers.

The consolidation of the industry continued in 2003 when MacSteel Service Centers USA, a leader in the industry, acquired most of the assets of Baldwin Steel Co., located in Lawrence Harbor, New Jersey, from the Duferco Group. Rolled Alloys, a service center in Temperance, Michigan, acquired the Metals Aerospace Inter-

national, a subsidiary of Metals USA, located in Santa Monica, California. The newly formed service center was to be renamed Harvy Titanium. In addition, according to *Business Week*, there were also a number of steelmakers that had to resort to Chapter 11 bankruptcy protection by 2003.

Customers also began putting more challenging demands on metals service centers during the same period. These included meeting promised delivery dates and consistently providing high-quality goods at competitive prices, according to *Purchasing*. New areas of customer service were also being added, including supply of finished parts and management of logistics. These developments were blurring the lines between service centers and independent processors.

The majority of service center companies were small; nearly 90 percent of the 975 North American centers listed by *Purchasing* magazine had annual sales under \$100 million. 39 percent had their corporate offices headquartered in the Midwest, while 72 percent operated service centers where most manufacturing is located. Construction was the largest market.

The top 10 companies according to *Supply Chain* magazine, in terms of 2000 annual sales, were Ryerson Tull Inc. of Chicago, Illinois, with \$2.86 billion; Thyssen Inc. of Detroit, Michigan, with \$2.3 billion; Metals USA Inc. with \$2.1 billion; Reliance Steel & Aluminum Co. of Los Angeles, California, with \$1.73 billion; MacSteel Service Centers USA of Torrance, California, with \$1.4 billion; Worthington Steel Co. of Columbus, Ohio, with \$1.2 billion; Samuel Son & Co. of Mississauga, Ontario, with \$1.19 billion; Rio Algom Metals Distribution Group of Minneapolis, Minnesota, with \$1.15 billion; EMJ (Earle M. Jorgenson Co.) of Brea, California, with \$1.07 billion; and Russel Metals Inc. of Mississauga, Ontario, with \$1.03 billion. Ward's Business Directory 2000 also listed two Japanese subsidiaries: Marubeni America Corp. and Mitsui and Company, both of New York City, among the top leaders. Marubeni America Corp.'s total sales for 2003 were \$3.5 billion.

SIC 5052

COAL AND OTHER MINERALS AND ORES

This industry comprises establishments primarily engaged in the wholesale distribution of coal and coke, metallic ores (such as copper, iron, and lead), and nonmetallic minerals (except crude petroleum). It also includes establishments engaged in the wholesale distribution of precious metal ores (such as gold ore and silver ore).

Establishments primarily engaged in the wholesale distribution of semifinished precious metals are classified under **SIC 5094: Jewelry, Watches, Precious Stones, and Precious Metals**. Establishments primarily engaged in the wholesale distribution of nonmetallic minerals used as construction materials are classified under **SIC 5032: Brick, Stone, and Related Construction Materials**. Establishments primarily engaged in the wholesale distribution of crude petroleum and petroleum products are classified under **SIC 5171: Petroleum Bulk Stations and Terminals**.

NAICS CODE(S)

421520 (Coal and Other Mineral and Ore Wholesalers)

According to the U.S. Census Bureau, 649 establishments were classified in this industry in 2001; this figure has declined consistently since the 1980s. They were subdivided into establishments primarily engaged in wholesaling coal, which accounted for approximately 50 percent of establishments, and those primarily engaged in wholesaling other minerals and ores, which made up the remaining 50 percent. Coal sales were around \$660.3 million, and sales of other minerals and ores topped \$429 million. Total sales for this industry reached \$7.7 million in 2003.

U.S. Coal Production, 2001–2002

By region, in millions of Short Tons

	2001	2002
Appalachian	431.2	396.2
Interior	146.9	146.6
Western	547.9	550.4
Refuse Recovery	1.8	1.0
Total	1,127.7	1,094.3

SOURCE: Energy Information Administration—Annual Coal Report 2002

The majority of industry establishments are merchant wholesalers. Sales by merchant wholesalers, however, typically represent only a third of industry sales. The establishments classified as manufacturer sales branches and offices represent approximately 48 percent of industry sales. Agents, brokers, and commission merchants make up the remainder of industry sales. The states with the most establishments were Ohio, Pennsylvania, Kentucky, and West Virginia.

According to the *Annual Coal Report*, total U.S. coal production declined 3 percent in 2002. The downturn of the economy, as well as a mild winter, impacted the overall consumption. In addition, coal prices increased across the board in all sectors of coal production in both 2001 and 2002. As a result of the decline, five major coal companies filed for bankruptcy in 2002, with an additional four more in progress. Some filed for Chapter 11 while others sold their interests to other coal companies. As natural gas prices rise so does the demand for coal. U.S. coal production is expected to increase 1.5 percent annually through 2025.

Some of the leading companies in this industry, according to Ward's Business Directory 2000, include Arch Coal Sales Company Inc. of St. Louis, Missouri, with annual sales around \$1 billion; Electric Fuels Corp. of St. Petersburg, Florida, with estimated sales over \$600 million; and Hickman Williams and Co. of Livonia, Michigan, with annual sales around \$290 million. The top ten coal producers in 2002 were Peabody Energy Corp.; Kennecott Energy & Coal Co.; Arch Coal Inc.; RAG American Coal Holding Inc.; Consol Energy Inc.; Massey Energy Co.; Vulcan Partners L.P.; Horizon Natural Resources Inc.; North American Coal Corp.; and TXU Corp. According to the Energy Information Administration, these top ten companies accounted for 62 percent of the total market.

SIC 5063**ELECTRICAL APPARATUS AND EQUIPMENT, WIRING SUPPLIES, AND CONSTRUCTION MATERIALS**

This category covers establishments primarily engaged in the wholesale distribution of electrical power equipment for the generation, transmission, distribution, or control of electric energy; electrical construction materials for outside power transmission lines and for electrical systems; and electric light fixtures and bulbs. Construction contractors primarily engaged in installing electrical systems and equipment from their own stock are classified in **SIC 1731: Electrical Work**.

NAICS CODE(S)

444190 (Other Building Material Dealers)

421610 (Electrical Apparatus and Equipment, Wiring Supplies and Construction Material Wholesalers)

INDUSTRY SNAPSHOT

Electrical equipment wholesale companies, or merchant wholesalers, purchase or take title to goods produced by manufacturers and resell the goods to retailers, or other wholesalers, at a profit. They help to lubricate the U.S. economy by providing retailers with goods to sell, and by finding and cultivating markets for manufacturers' products.

In 2001, the U.S. Census Bureau reported that there were 13,878 establishments in the electrical apparatus and equipment, wiring supplies, and construction material industry. There were approximately 168,091 employees with an annual payroll of about \$8 million. In 2003, there were 24,048 establishments reported and over \$75 million in sales.

Electrical apparatus and equipment represented the largest sector of the industry, with 7,888 businesses and about 32 percent of the overall market share. Electrical supplies had 3,799 establishments and controlled over 15 percent of the market. Lighting fixtures had 2,287 establishments and accounted for nine percent of the market. Burglar alarm systems had 1,869 locations and about eight percent of market share. Electric motors had 1,019 establishments and accounted for about four percent of the market. Combined, these industry sectors contributed more than \$35 million to the overall sales. States with the highest number of establishments were California with 2,860, Texas with 1,863, Florida with 1,791, New York with 1,451, Illinois with 1,007, and Pennsylvania with 1,002.

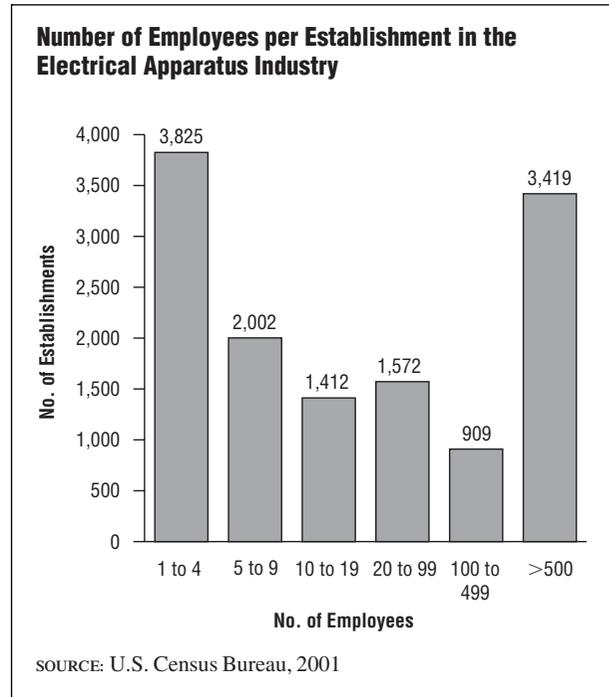

ORGANIZATION AND STRUCTURE

Historically, this industry has been fragmented, with establishments focusing on local markets and specializing in particular items. For instance, California alone had more than 1,600 electrical equipment wholesale establishments in 1997. Still, throughout the 1990s, a few large wholesalers acquired smaller, regional outlets in order to gain efficiency of scale for their operations.

Transactions by merchant wholesalers account for a majority of equipment sales. In addition to merchant wholesaling, some transactions involve agents and brokers. Although the agents and brokers work as middlemen between producers and retailers, they are usually compensated directly by the manufacturer in the form of fees and commissions. The third type of wholesale establishments are manufacturers' sales offices and branches, which sell their equipment directly to retailers.

In addition to buying, selling, and shipping products between producers and retailers, wholesale companies have recently begun to provide more value-added services to their customers. In the case of industrial electrical equipment, wholesalers often provide engineering and technical consulting. They might also arrange to have products customized or repaired. Wholesalers of contractor and consumer electrical supplies might arrange special financing plans, help retailers develop just-in-time inventory systems, or provide overnight delivery services for specialty items. Many wholesalers also incorporate a shifting price scale that favors customers who purchase the most.

Products. The wholesale market for electrical supplies is divided into industrial and consumer products. Wholesalers deliver industrial electrical equipment primarily to utility companies and to firms engaged in heavy industries. The four primary types of equipment are transformers, switchgears, motors and generators, and relays and controls. Transformers are used by utilities to regulate and deliver power to their customers and by indus-

tries to change voltage for varying equipment needs. Smaller transformers are used in a variety of products from doorbells to low-voltage lighting and security systems. Switchgear products include panel boards, circuit breakers, fuses, and other devices used to generate, transmit, and distribute electricity. Motors and generators are used by utilities, industry, and residential consumers alike. Industrial relays and controls are used to start, regulate, stop, and protect electric motors. With the expansion of the Internet and company intranets, an increasing amount of electrical wholesale companies are expanding into the data and communications market, offering a wide range of structured cables and systems.

The total market for industrial electrical equipment in 1998, a large part of which was served by wholesalers, was almost \$37 billion. Transformers accounted for 15 percent of the market, while switchgear and complementary apparatus represented about 21 percent. Motors and generators made up about 32 percent of sales, as did relay and control devices. While the market for these items increased by 5 percent between 1996 and 1997, the next two years saw slower growth of only about 1 percent annually.

Products offered by wholesalers for residential, commercial, and construction markets were numerous. Major retailers of such equipment included hardware stores, home centers, discount stores, and construction supply centers. Major product categories were: lighting fixtures, current-carrying wiring devices for residential homes, and non-current-carrying devices for commercial applications. These categories encompassed such items as

light bulbs, lugs and connectors, insulators, hangers and fasteners, flashlights, conduits, circuit breakers and panels, coaxial cable, capacitors, alarm systems, batteries, wire, and other related supplies.

The market for electric lighting and wiring equipment, most of which was served by wholesalers, rose significantly in the mid-1990s, and in 1996, the total value of shipments exceeded \$24.5 billion. This figure represented an increase of 24 percent over four years. Wiring devices and lighting fixtures represented nearly equal shares of that figure. In 1997 sales of lighting fixtures for commercial and industrial uses reached \$4 billion, almost double the \$2.3 billion in sales for residential use. In addition, sales of miscellaneous items, like batteries and flashlights, added significantly to non-industrial wholesale revenues.

BACKGROUND AND DEVELOPMENT

Although Benjamin Franklin conducted some of the first experiments related to electricity in the mid-1700s, public supplies of electricity were not a reality in most advanced countries until the late 1800s. Not until after the turn of the century, moreover, did identifiable industries arise to meet the demand for industrial and residential electrical equipment. Indeed, rapid U.S. industrialization between 1900 and 1929 spurred demand growth for all types of electrical equipment, as well as for wholesale and retail distributors that could bring products to the market.

The U.S. economic expansion after World War II proved to be a boon for electrical equipment wholesalers. As the population expanded, particularly in the 1960s, sales of industrial equipment to utilities and factories ballooned. Sales of electrical supplies and lighting fixtures to residential markets also accelerated, as housing starts soared past 1 million per year in the 1960s, and fluctuated as high as 1.4 million annually during the 1970s.

Wholesalers became an integral factor in the distribution of electrical equipment and supplies to all markets. Hardware stores sprang up across the United States from the 1950s through the 1970s to serve burgeoning suburbia. These outlets looked to wholesalers for help in finding and supplying products, managing inventory, and marketing their goods to consumers. Likewise, agents and brokers, as well as manufacturers' branches, helped to supply and advise industrial and utility customers that sought heavy-duty electrical equipment. Wholesalers also devised catalogs and distribution facilities to help them efficiently supply contractors, property managers, and other commercial customers.

Although sales growth began to slow in the late 1970s, partially as a result of the energy crunch, wholesalers continued to realize steady growth in demand throughout the early 1980s. The reduction in sales growth

for new industrial and utility installations was partially offset by an increase in sales of replacement equipment and retrofits. Furthermore, strong commercial and residential construction markets were boosted by a rise in sales of electrical supplies for home remodeling and repair.

By the mid-1980s, wholesalers supplied the lion's share of a \$23 billion market for industrial and utility equipment, and a \$12 billion market for lighting and wiring supplies. Total merchant wholesale sales of electrical goods, which included many products sold by other industries, approached \$90 billion. Revenue and profit growth remained relatively steady through 1988, as sales of all electrical wholesale goods climbed to \$110 billion and lighting and wiring sales jumped to about \$14 billion.

The electrical apparatus and equipment wholesale industry began to experience difficulty in the late 1980s and early 1990s. A U.S. economic recession compounded problems that had begun in the early 1980s. Demand for electric energy equipment, for instance, stagnated at about \$21 billion (in constant 1987 dollars), and sales of electric wiring and lighting devices fell more than 1 percent per year between 1989 and 1992. Plummeting housing starts contributed substantially to declines in both market segments. The subsequent economic recovery boosted both residential and commercial construction, which in turn brought growth in the sales of electrical apparatus. The total \$91 billion market for these goods in 1996 marked an increase of nearly 22 percent from 1992.

Following a relatively stagnant period in the early 1990s, sales of electrical equipment picked up significantly. By 1997, sales had grown by 5.2 percent over the previous year. However, 1998 marked a slow down in sales, a trend that was expected to continue in subsequent years. Wholesalers of electrical equipment had already responded to the industry's slump of the late 1980s and early 1990s by consolidating with competitors and improving customer service, trends that continued even after the market for these goods began to improve. These steps were made necessary by increased competition from non-traditional outlets for electrical equipment. Still, wholesalers remained the largest category of distributors for these items, sales of which reached \$91 billion dollars in 1997. Like other wholesalers, those who deal in electrical apparatus and equipment benefited from the sustained growth of the U. S. economy in the second half of the 1990s.

With the growth in the market for electrical apparatus and wiring throughout the middle and end of the 1990s, major wholesalers became able to use their resources to acquire smaller regional distributors. Besides increasing the larger wholesalers' market share, these acquisitions also created more locations for them throughout the United States. Some large companies also

increased their market share by landing exclusive contracts as suppliers for government agencies.

Electrical apparatus and wiring wholesalers also sought ways to improve customer service as a means of improving sales. Like wholesalers of other kinds of goods, electrical supply distributors turned to the Internet as a potentially powerful and convenient tool. However, by the late 1990s the percentage of their business done on the Internet remained insignificant. W.W. Grainger, Inc., for instance, received less than 1 percent of its revenue from Internet sales. Explanations for why the customers for these products were slow to make use of the new technology ranged from their lack of computers with Internet capability to their insistence on negotiating prices instead of ordering online.

Another method by which wholesalers attempted to increase customer convenience was through cooperation with non-competing wholesalers. In these arrangements, a wholesaler of electrical equipment would agree to pool their catalogs with distributors of other kinds of items that might be of interest to their customers. Such arrangements offered customers one-stop shopping.

Competition. Even as their market grew, wholesalers had to deal with new sources of competition. Giant hardware supply warehouses, such as The Home Depot, Inc., and Lowe's Companies, Inc., continued to expand, encroaching on markets traditionally dominated by hardware and lighting stores. These organizations often sidestepped the traditional wholesale industry by going straight to the manufacturer for their products, often ordering products in bulk at a lower price. Many wholesalers feared that their markets could wane while profit margins withered. Do-it-yourself homeowners, as well as construction and maintenance contractors, discovered that they could obtain lighting, wiring, and other electrical supplies at significant discounts at the larger supply warehouses, compared to electrical wholesalers and specialty distributors. Supply warehouses were not able to compete as easily in the commercial and industrial product markets. Since opening their first stores in the early 1980s, some warehouse chains realized stunning growth rates. By 1999, Home Depot alone had more than 900 stores. In the late 1990s a new form of competition emerged both for traditional wholesalers and large superstores. Manufacturers began offering their wares directly to their customers on the Internet. Direct Internet sales offered manufacturers the opportunity to sell their products directly to the end customer, eliminating the middle man and increasing their profits. This development created agreement among competitors on the same side of the issue, as some traditional wholesalers expressed support for Home Depot's threat not to deal with manufacturers who competed with their stores.

CURRENT CONDITIONS

Due to the economic downturn in the early 2000s, the electrical distributor market fell \$12 billion from its all time high of \$76 billion in sales. According to some analysts, this drop had been something the electrical distributors had not experienced in over 25 years. DISC Corp., projected a drop of 3.5 percent for 2003, followed by an increase of 2.8 percent in 2004. The electrical wholesalers expected to see a total turnaround in 2005.

Overall, the electrical wholesaling industry remained fragmented. There were about 250 distributors who controlled 50 percent of the market. Some analysts noted that it would be years before the industry would begin to consolidate. Graybar Electric Co., WESCO Inc., Consolidated Electrical Distributors, Inc., and GE Supply Inc. control 16 percent of industry sales. Electrical wholesalers were expanding their presence through the opening of new locations, while continuing to share the market with home centers and discounters.

INDUSTRY LEADERS

While some *Fortune* 500 firms participated in the electrical apparatus and equipment, wiring supplies, and construction materials wholesale industry, many local and regional firms did business around the country. None of the largest companies exclusively sold items that fall into this category.

Graybar Electric Company, Inc., an employee-owned company based in St. Louis, Missouri, generated \$3.7 billion in sales in 1998, most of that amount coming from electrical apparatus and equipment. About 40 percent of its sales went to electrical contractors. Forced to downsize and reorganize during the construction slump of the late 1980s and early 1990s, the company diversified once the economy improved. After buying a minority interest in a Canadian computer networking firm in 1994, Graybar divided its operations between its electrical products and its data and communications line of goods. Graybar continued to expand internationally in 1998, opening a subsidiary in Chile.

WESCO International, Inc., was the second largest wholesaler of electrical apparatus and equipment behind Graybar, earning more than \$3 billion in sales in 1998. Originally a part of Westinghouse, WESCO became an entity unto itself in 1994. The company embarked on a series of acquisitions, including Industrial Electric Supply Company and Statewide Electrical Supply in 1999. WESCO expanded from 250 branches in 1994 to more than 330 in 1998, with locations in Europe and Asia as well as North America.

Besides selling electrical equipment, W.W. Grainger, Inc., of Lincolnshire, Illinois, provided a wide variety of industrial supplies and equipment to its customers.

Its total sales for 1998 reached \$4.3 billion, a significant portion of which came from electric motors and lighting equipment. Grainger was one of the first electrical wholesalers to use the Internet as a sales tool. Its catalog went online in 1995, and in 1999 Grainger opened the online store OrderZone.com.

WORKFORCE

Employment in the overall wholesaling industry grew slightly along with the U.S. economy in the middle and late 1990s, even though the economic slump, accompanied by increased automation, in the preceding years had led to workforce reduction. In 1997 6.6 million people were employed in wholesaling, up from six million in 1992. In the field of durable goods wholesaling, which includes electrical apparatus and equipment, nearly four million people were employed in 1997, which was 500,000 more than five years earlier. The Bureau of Labor Statistics projected small growth in the wholesale workforce in the twenty-first century.

RESEARCH AND TECHNOLOGY

Technological advances in the electrical supplies wholesale industry were limited primarily due to automation and information systems, namely the incorporation of the Internet into business operations. Major distributors put their catalogs online to allow customers to place orders conveniently. Some wholesalers joined with other companies that distributed different kinds of goods that their customers were likely to need, providing one-stop online shopping by making multiple catalogs available at one Web site.

These arrangements were expected to appeal to large customers who negotiated prices for bulk purchase in advance. Such firms could use secured Internet connections to conduct their dealings with the wholesalers with whom they had contracts. Some occasional buyers would also find the Internet convenient for quickly filling one-time orders. Many purchasers from wholesalers, though, might still prefer in-person negotiation for their orders. Hardware stores, for instance, need to keep just the right amount of inventory in stock. WESCO developed a way to help such customers in remote areas by sending out trucks stocked with supplies, which the customer could then purchase as needed when the truck arrived. This method cut out the delay between order and delivery that even the Internet couldn't remove.

SIC 5064

ELECTRICAL APPLIANCES, TELEVISION, AND RADIO SETS

This industry is comprised of establishments engaged in the wholesale distribution of household electrical appliances (such as refrigerators, freezers, dishwashers, and laundry equipment), household and motor vehicle electronic sound or video equipment, and radio and television sets. The industry also includes establishments primarily engaged in the wholesale distribution of household nonelectric appliances (such as gas clothes dryers and gas refrigerators).

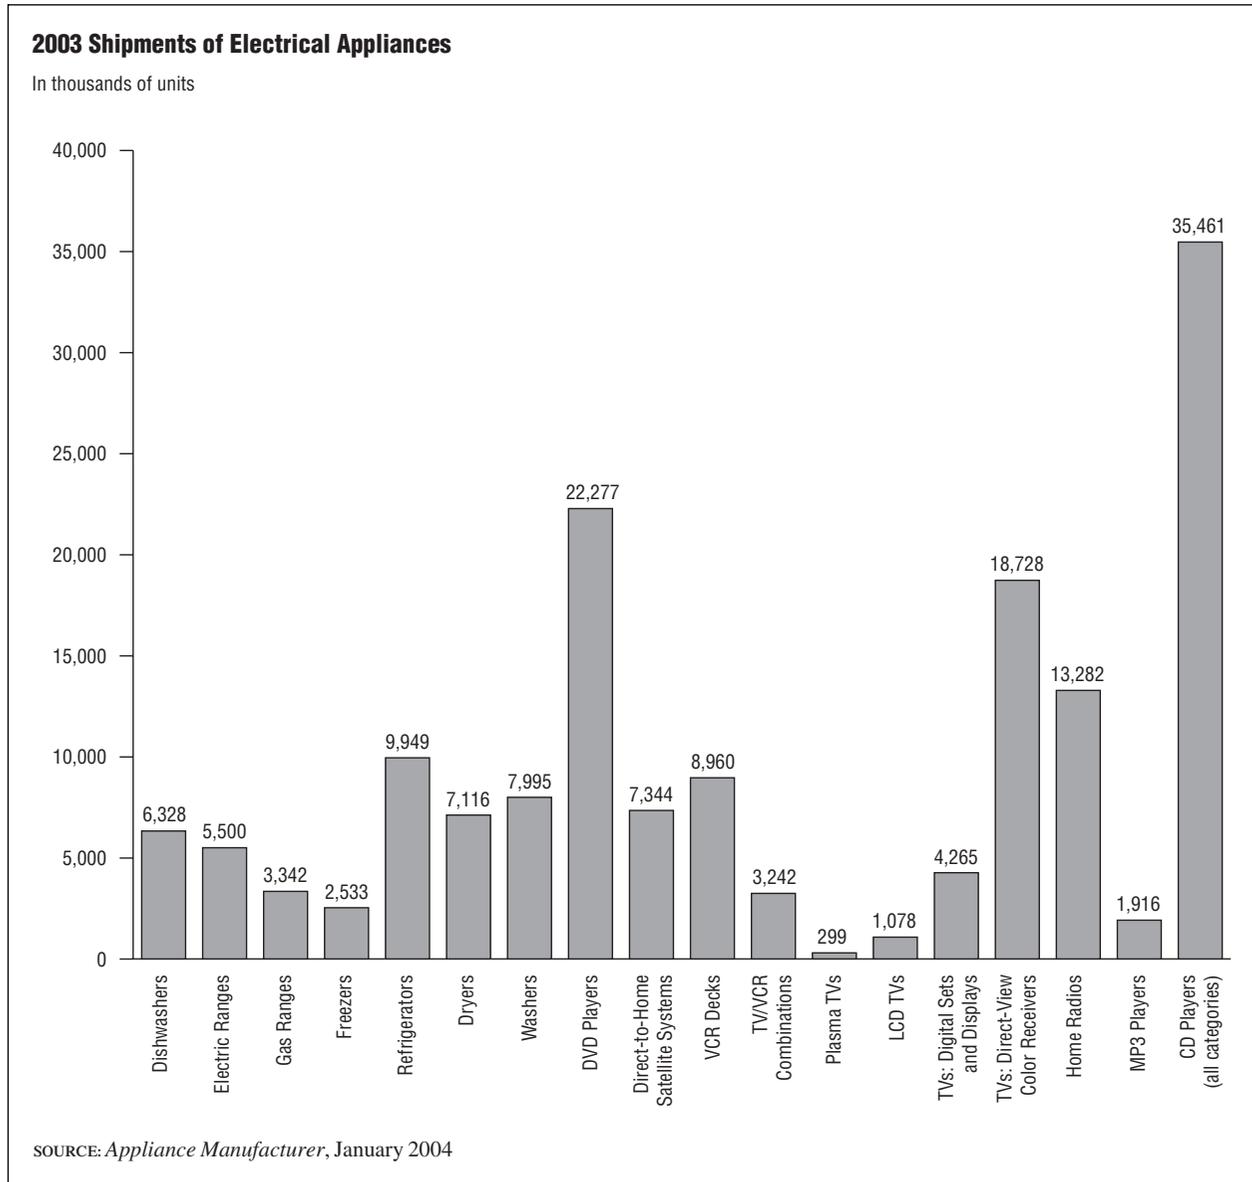

NAICS CODE(S)

421620 (Electrical Appliance, Television, and Radio Set Wholesalers)

INDUSTRY SNAPSHOT

Wholesale distributors of electrical appliances, televisions, and radio sets served an industry enjoying constant innovation and new product demand. By the 2000s, the market for these products was dominated by a major shift to digital technology. While this development clearly presented vast new market openings, it also posed tough challenges. Convincing a market highly saturated with its products to upgrade to the latest technology called for aggressive marketing strategies and value-added services. Wholesalers were expected to aid these strategies with services and technological sophistication of their own in order to most adeptly meet their manufacturers' and retailers' needs in the quick-paced marketplace.

About 4,900 establishments operated in this industry by the mid-2000s, generating revenues of \$34.7 billion. The market remained relatively unconsolidated; according to estimates by Dun & Bradstreet, over half of all electrical appliance, television, and radio wholesale distributors employed fewer than five people, while the industry as a whole employed 56,500.

CURRENT CONDITIONS

The advent of digital television broadcasts on 1 November 1998 was good for the consumer electronics industry. The Consumer Electronics Association (CEA) estimated that 30 percent of American households would have digital television sets by 2006, an outcome that was expected to fuel sales in the consumer electronics industry. In 2003, sales of flat-panel televisions skyrocketed, registering triple-digit growth in the first half of that year. Liquid-crystal display (LCD) and plasma TVs emitted less radiation and reflected less glare than traditional cathode ray tube (CRT) TVs. By late 2003, flat-panel TVs represented 20 percent of all digital television sales.

One of the trends that was expected to help the continued increase in television and related product sales

was the growing interest in direct-to-home satellite systems. The early 2000s saw continued growth in this fast-emerging sector. According to *Appliance Manufacturer*, unit shipments of direct-to-home satellite systems grew from 6.9 million in 2002 to a predicted 7.8 million in 2004.

In fact, the transition to digital was even considered to be too important to relegate solely to market forces. The Federal Communications Commission (FCC) considered regulations requiring manufacturers of analog television sets to install tuners capable of receiving DTV signals, thereby making them digital-ready, in an effort to speed the digital conversion. The Council of Economic Advisors (CEA) sued the FCC, arguing that the cost to manufacturers and consumers outweighed the benefits of an across-the-board digital conversion. But clearly, by

the mid-2000s, the writing for analog TV was on the wall. In 2002, the FCC ruled that half of all 36-inch analog televisions must be DTV-compatible by July 2004, and all such units must include DTV tuners a year later; smaller analog televisions must be DTV-ready by mid-2007.

Industry insiders worried that the advent of digital technology would adversely affect sales in categories that had not fully transformed from analog technology. While these fears were borne out in many cases, some analog industry categories were hanging on into the mid-2000s. The CEA reported combination television/video cassette recorder sales increased to 4.87 million units in 2002, up from 4.63 million units the year before, though falling prices led to a drop in total sales from \$790 million to \$737 million. Sales of projection televisions, on the other hand, continued to fall from their peak of 1.22 million units and \$1.48 billion in sales in 2000 to 681 million units and \$733 million in sales in 2002. Videocassette recorders registered one of the most severe declines, from 23.1 million units in 2001 to 13.57 million in 2002.

In the audio segment, overall unit shipments fell 19 percent in 2002, and an additional 4.3 percent in 2003. Industry observers attributed this slide to the lackluster economy and to the encroachment of new forms of audio consumption, particularly via the Internet and computer-based audio listening. The tide was stemmed somewhat by the rise of MP3 players, which enjoyed double-digit growth in the early 2000s, but shipments of CD players fell from nearly 43 million in 2002 to a predicted 34 million in 2004.

Shipments of major household appliances such as refrigerators, ovens, and laundry equipment tend to track the performance of the overall U.S. economy. In particular, new housing starts were a key indicator for performance in this category. As such, growth was extremely modest in the early 2000s, but most major categories continued to grow slightly in the early 2000s. Between 2002 and 2004, according to *Appliance Manufacturer*, all the major categories in the major-appliance sector—dishwashers, disposers, electric and gas ranges, freezers, refrigerators, washers, and dryers—saw their shipments grow around 2 percent annually.

SIC 5065

ELECTRONIC PARTS AND EQUIPMENT, NOT ELSEWHERE CLASSIFIED

This industry consists of companies that wholesale electronic parts and electronic communications equipment not classified elsewhere. Industry products include semiconductors, modems, telephone equipment, amateur radio communications equipment, recording, cassettes, diskettes, and public address equipment.

NAICS CODE(S)

421690 (Other Electronic Parts and Equipment Wholesalers)

According to the U.S. Census Bureau, there were nearly 20,397 establishments employing approximately 338,488 in the electronic parts and equipment industry in 2001. By 2003, the total number of establishments increased to 23,601, with about 276,822 employees. The industry generated \$119.2 billion in annual sales. The average sales per establishment was about \$6.70 million. States with the highest number of establishments were California with 4,673, Florida with 1,975, Texas with 1,956, and New York with 1,811.

The electronic parts and equipment industry began in the late nineteenth century, when it primarily served the telegraph industry. After Alexander Graham Bell invented the telephone (1875), and Thomas Edison invented the light bulb (1879), the United States used more electricity. And, as manufacturers offered new electric inventions, wholesale distribution systems were developed to deliver these products to market.

The industry fell into a recession during the 1980s but rebounded by 1987, only to experience a second setback in industry growth—to less than 2 percent—in 1991. Conditions improved slightly in late 1992, as delivery lead times increased; the number of electronic parts distribution companies totaled 15,329 by the end of that year, and combined industry sales totaled \$106 billion. Yet, just as industry forecasters predicted that U.S. exporters would sell more to developing markets in Asia, Western Europe, Canada, and Mexico, the industry suffered a recurrence of depressed conditions. A renewed slump in the distribution industry began in 1995 and lasted for three years.

During the remainder of the 1990s, industry players moved toward consolidation; and, due in part to instability in Latin America and an economic crisis in the Far East, U.S. exports slowed dramatically. Distributors rushed to synchronize supply with demand during this decline, which, unfortunately, lasted into the third quarter of 1998. Finally, near the end of the fiscal year, stock

prices in the industry hit bottom—a four-year low that was broken by a subtle climb in prices at the beginning of 1999. Distribution margins, however, remained low, as key consumers such as computer manufacturers continued to drive prices down with bulk purchases. Observers reiterated that success in the distribution channels hinged on the ability to sustain growth in the existing high-volume transaction environment.

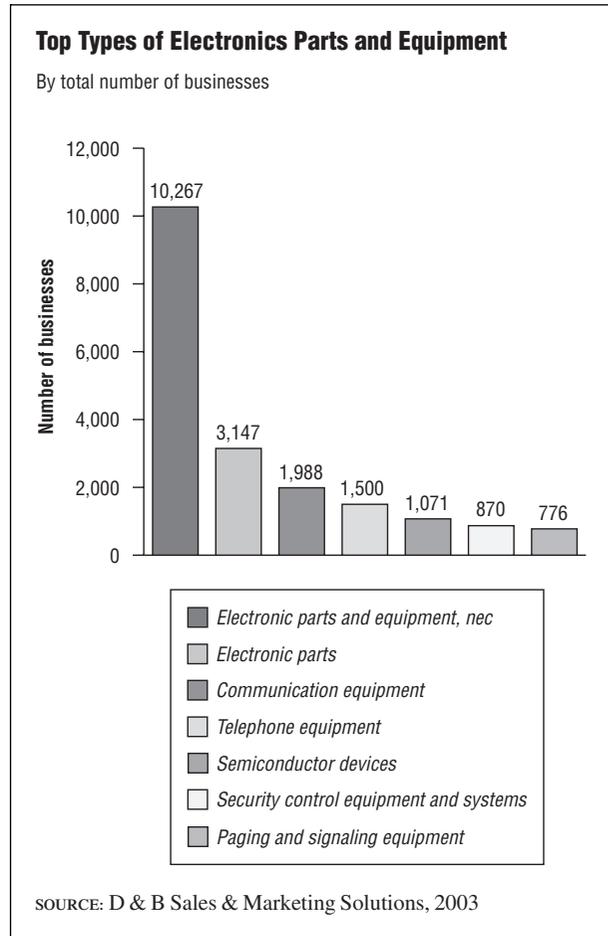

In early 1999, guardedly optimistic forecasters predicted a turnaround for the electronic component distribution industry, and analysts pressed firms to merge and consolidate in apprehension of a continually temperamental economic climate. Analysts further concluded that the continued growth of distribution channels necessitated the conscientious implementation of dynamic efficiency controls to coordinate supply with demand within a fluctuating marketplace.

Due to the sluggish economy that followed the September 11, 2001 attacks on the World Trade Center, the financial impact was felt throughout the industry. Annual sales of electrical distributors dropped 24 percent in 2001 and 22 percent in 2002. According to the *Electrical Wholesalers*, the “top 250” electrical distributors, based on annual sales, fell by 8.4 percent to about \$36.9 billion in 2001. As a result, there was a decrease of 78,781 employees during that same time period.

Consolidation continued throughout 2001 and 2002 with approximately forty companies reported to have been acquired. For example, Graybar Electric Co. acquired Commonwealth Controls Corp., located in Richmond, Virginia; and WESCO International Corp. acquired both Control Corporation of America, located in Richmond, Virginia, and Heming Enterprises Inc., located in Hayward, California. Some former leaders in the industry were acquired over the past year, which include Kennedy Electrical Supply Corp., Missouri Valley Electric Co., Warren Electric, Eoff Electric, and Fromm Electric. In 2003, sales continued to decline as reported in *Purchasing* magazine. In fact, for the leading 75 electrical distributors, sales had fallen some seven percent. Nevertheless, Pembroke Consulting Firm, located in Philadelphia, predicted wholesalers and distributors would rebound in technology spending and surpass \$80 billion in 2008.

During the early 1990s, the nation’s largest independent electrical and telecommunications distributor was Graybar Electric Company, Incorporated. The diversified Graybar, headquartered in St. Louis, Missouri, operated 275 U.S. locations throughout North and Central America, and the Pacific Rim.

Dominance of the industry shifted to Arrow Electronics, Inc. of Melville, New York, in the mid-1990s, although Graybar continued its activity. Arrow, primarily a supplier of passive components, inter connect products,

and computer peripherals, boasted key clients including Intel and Texas Instruments. Arrow moved to acquire a number of smaller distributors throughout the remainder of the decade, and by 1998 the distributor employed 9,700 workers. Arrow reported \$8.345 billion in annual sales that year, of which an estimated 65 percent were from semiconductors.

Second to Arrow in the distribution industry, Avnet, Inc. of Phoenix, Arizona, derived approximately 50 percent of its business from the distribution of semiconductors to major producers including National Semiconductor, Intel, and Advanced Micro Devices. Avnet reported \$6.35 billion annual sales during fiscal 1999 and increased its employee count by 5.7 percent to achieve a workforce of 8,200. In January of 1999, when Arrow announced a merger with Bell Industries’ Electronics Distribution Group, Avnet rebounded with the acquisition of Marshall Industries in mid-year. Arrow Electronics and Avnet thereby commanded over 45 percent of the market, according to a report in *Electronic Buyer News*. Forecasters predicted continued single-digit growth as the industry moved into the third millennium.

In 2003, Arrow, Avnet, and Grabar remained the leaders in the industry. That year, Arrow posted annual

sales of \$8.68 billion, while Avnet surpassed Graybar with \$9.05 billion to Grabar's \$3.97 billion.

SIC 5072

HARDWARE

This industry comprises establishments primarily engaged in the wholesale distribution of general hardware items and cutlery. Products include bolts, nuts, washers, rivets, screws, brads, locks (and related materials), and hand tools (including power hand tools). Establishments primarily engaged in the wholesale distribution of nails, non-insulated wire, and screening, however, are included in **SIC 5051: Metals Service Centers and Offices**.

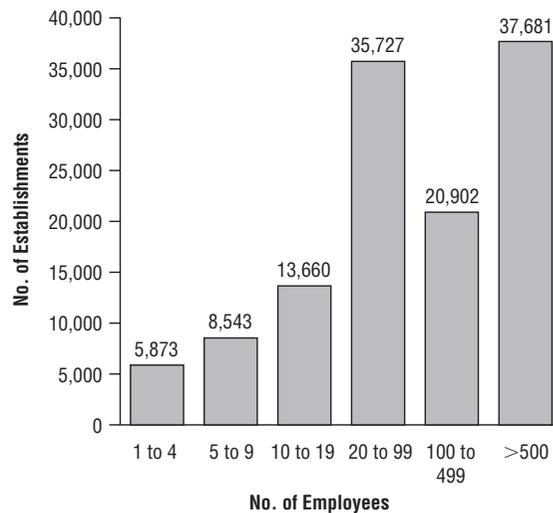

NAICS CODE(S)

421710 (Hardware Wholesalers)

In 2001, there were an estimated 9,387 establishments engaged in the wholesale distribution of hardware, a dramatic increase from 1996's total of 8,000. In 2001, hardware wholesalers employed more than 122,386 people and posted an annual payroll in excess of \$5 million. By 2003, wholesale sales reached more than \$23 billion, with the top four co-op companies claiming almost 50 percent of that total. Cotter & Company (True Value) had \$2 million in sales, ACE Hardware generated \$3 million, ServiStar claimed \$2 million, and Do It Best Corp. (formerly Hardware Wholesalers Inc.) had \$2.3 million.

General hardware establishments represented the largest segment of the industry. They numbered 3,298 establishments, and their combined sales totaled \$14.4

Number of Employees per Establishment in the Hardware Industry

SOURCE: U.S. Census Bureau, 2001

billion. Hand tools totaled 613 establishments, and \$1.01 billion in sales. Miscellaneous fasteners totaled 680 establishments, and their combined sales totaled about \$1.02 billion. The 713 builders' hardware establishments had combined sales of \$2.03 billion. States with the highest market presence were California, Texas, New York, and Florida.

During the 1990s, the hardware industry began to change. The combined effects of consolidation and the growth of the "Do-It-Yourself" (DIY) industry squashed the small, independent hardware stores, the industry's traditional customers, and simultaneously expanded the dominance of the large, warehouse-style retailers, such as Home Depot, which made purchases directly from manufacturers. In 1999, Home Depot expected to at least double its chain of 800 stores by 2003. Lowe's followed the lead of Home Depot and, after it acquired Eagle Hardware's 36-store chain in 1999, the company planned to add between 80 and 85 stores to its base of 484. Home Depot and Lowe's were expected to generate sales of more than \$50 billion the same year, which was 25 percent of the DIY market.

In early 1997, the DIY industry had a value of \$140 billion. The top 100 retailers held about one-half of the market share. One response to this challenge was the 1997 merger of Cotter & Company with ServiStar Coast to Coast Corporation. This venture helped its members by reducing costs and improving efficiency, and it was expected to benefit customers in terms of lower prices. The new company, TruServ Corporation, had annual sales of more than \$3 billion and employed almost 6,000.

Cotter & Company was the largest full-line hardware distributor in the United States, as measured by sales volume. Cotter, a privately held dealer cooperative with headquarters in Chicago, Illinois, operated 15 distribution centers and employed more than 4,000 people. The company supplied nearly 6,000 True Value members across the United States and in 50 countries.

Another industry leader was Do it Best Corp., formerly Hardware Wholesalers Inc., which acquired Our Own Hardware. Hardware Wholesalers had 1997 sales around \$1 billion and employed more than 1,000. In 1999, Do It Best Corporation beat both Home Depot and Lowe's to Web prominence and became the largest hardware store on the Internet, with more than 70,000 items for sale.

ACE Hardware Corporation, based in Oak Brook, Illinois was second in sales volume. ACE, another dealer-owned cooperative, supplied products to more than 5,000 stores through its 18 distribution centers. In 2002, the company reported sales of \$3 million, and employed more than 5,268 people.

SIC 5074

PLUMBING AND HEATING EQUIPMENT AND SUPPLIES (HYDRONICS)

This industry consists of companies that primarily wholesale hydronic plumbing and heating equipment and supplies. Industry products include: steam and hot water boilers, prefabricated fireplaces, oil burners, plumbing fixtures, solar heating panels, and water softeners. Companies that primarily install plumbing and heating equipment from their own stock are in **SIC 1711: Plumbing, Heating and Air Conditioning**.

NAICS CODE(S)

444190 (Other Building Material Dealers)

421720 (Plumbing and Heating Equipment and Supplies (Hydronics) Wholesalers)

According to the U.S. Census Bureau, the plumbing and heating equipment and supplies (hydronics) wholesalers consisted of about 4,756 establishments in 2001, employing approximately 52,669, with an annual payroll of about \$2.1 million. There were approximately 1,504 establishments with fewer than five employees. By 2003, the number of establishments increased to 11,874, with annual sales of about \$44 million. The average sales per establishment was approximately \$5 million. The total number of employees climbed to 108,853.

Plumbing and hydronic heating supplies dominated the industry. This segment totaled 5,387 offices and controlled about 45 percent of the overall market. Plumbing fittings and supplies numbered 2,269 offices and controlled about 19 percent of the market. Water purification equipment numbered 1,370 and held about 11 percent of the market. Combined, they accounted for more than \$35 million of the overall annual sales. States with the largest presence were California with 1,264, Texas with 857, New York with 814, Florida with 710, Pennsylvania with 610.

The British conglomerate Wolseley plc, the largest distributor of heating and plumbing products worldwide, owned two of the top three industry leaders in this category: Ferguson Enterprises, Inc. (purchased in 1982 and based in Newport News, Virginia) and Familian Corp. (purchased in 1987 and based in Los Angeles, California). On June 18, 1998, Wolseley announced its integration of Familian into Ferguson with the new, single entity headed by Ferguson president Charles A. Banks. The companies generated approximately \$2.3 billion in combined sales for 1997. The merger brought the employee count of the combined company to almost 7,000 and the number of locations to 391 in 41 states, the District of Columbia, and Puerto Rico. In 2003, Ferguson Enterprises extended its market presence and acquired Triangle Supply, Inc. of Dallas, Texas.

According to trade publications, Ferguson ranked as the largest distributor of plumbing supplies in the United States; the third largest for pipe, valves, and fittings (PVF); and the fifth largest for heating and cooling (HVAC) equipment. Ferguson achieved its market dominance through integrated inventory strategies: first, local market needs determined branch inventory; second, Ferguson located its distribution centers strategically to maximize accessibility; and third, Ferguson offered just-in-time inventory delivery for products not in stock. Primus, Inc., of Dayton, Ohio, represented the other of the top three industry leaders before the consolidation of Ferguson and Familian. Primus garnered sales of \$829 million with 2,962 employees in 1998, \$780 million in 1997 sales with 2,175 employees, and \$700 million in 1996 sales with 2,150 employees.

In 1994, according to the U.S. Department of Commerce, 9,341 establishments did business in this industry,

compared to 8,931 in 1987. Of this total, 7,930 were merchant wholesalers (wholesalers who take title to the goods they sell); 1,118 were agents, brokers, and commission merchants. The remaining 278 were manufacturers' sales branches and offices. Combined sales for all establishments topped \$27.8 billion in 1992, compared to \$23.2 billion in 1987.

According to the *Annual Benchmark Report for Wholesale Trade*, wholesalers of hardware, plumbing and heating equipment, and supplies saw April 1999 sales (seasonally adjusted) of \$68.7 billion. This amount was projected to increase into the 2000s.

SIC 5075

WARM AIR HEATING AND AIR CONDITIONING EQUIPMENT AND SUPPLIES

This industry includes companies that wholesale warm air heating and air conditioning equipment and supplies. Industry products include air conditioning equipment (except room units), air pollution control equipment, electric heating furnaces, humidifiers and dehumidifiers (except portable units), and ventilating equipment.

NAICS CODE(S)

421730 (Warm Air Heating and Air-Conditioning Equipment and Supplies Wholesalers)

According to the U.S. Census Bureau, there were 5,579 establishments involved in the wholesale warm air and heating, and air conditioning equipment and supplies industry. The number of employees totaled 57,478, and the annual payroll was about \$2.7 million. The combined industry totaled \$15,371.40 million in 2003. The total number of establishments increased to 7,701, and the average sales per establishment totaled some \$3.10 million. The industry is geographically distributed throughout the United States, with the Midwest, Southeast, and West having a slightly higher share than elsewhere of the industry's establishments. The largest concentrations of

facilities in this classification were in Texas, California, New York, Illinois, and Florida.

In 1997 the U.S. Census Bureau reported that there were 799 establishments manufacturing equipment for air conditioning, warm air heating, and commercial and industrial refrigeration. These operations shipped \$22.9 billion worth of merchandise, spent \$12.5 billion on materials, and invested \$569 million in buildings and other structures, machinery, and equipment. About 63 percent of these establishments employed at least 20 people, and 33 percent employed at least 100 people.

In the early 2000s, growth was predicted for this industry from selling through nontraditional channels such as the Internet. Changing Environmental Protection Agency (EPA) regulations were also expected to increase sales, since the phasing out of older refrigerants would create a demand for replacement units. Supermarkets, restaurants, and high-rise buildings were among those converting to new refrigeration and air conditioning systems through the year 2000.

The U.S. Census Bureau estimated that the main product of 133 of these establishments was mechanically refrigerated, self-contained heat transfer equipment. These operations shipped \$5.4 billion worth of merchandise and employed 29,110 people. Products in this category accounted for about 19 percent of total industry shipments in 1997. The largest value of shipments in this segment originated in New York, Georgia, Tennessee, Texas, and Kentucky. This industry employed 120,002 people, including 91,566 production workers who earned an average hourly wage of \$12.65. Total payroll was \$3.7 billion.

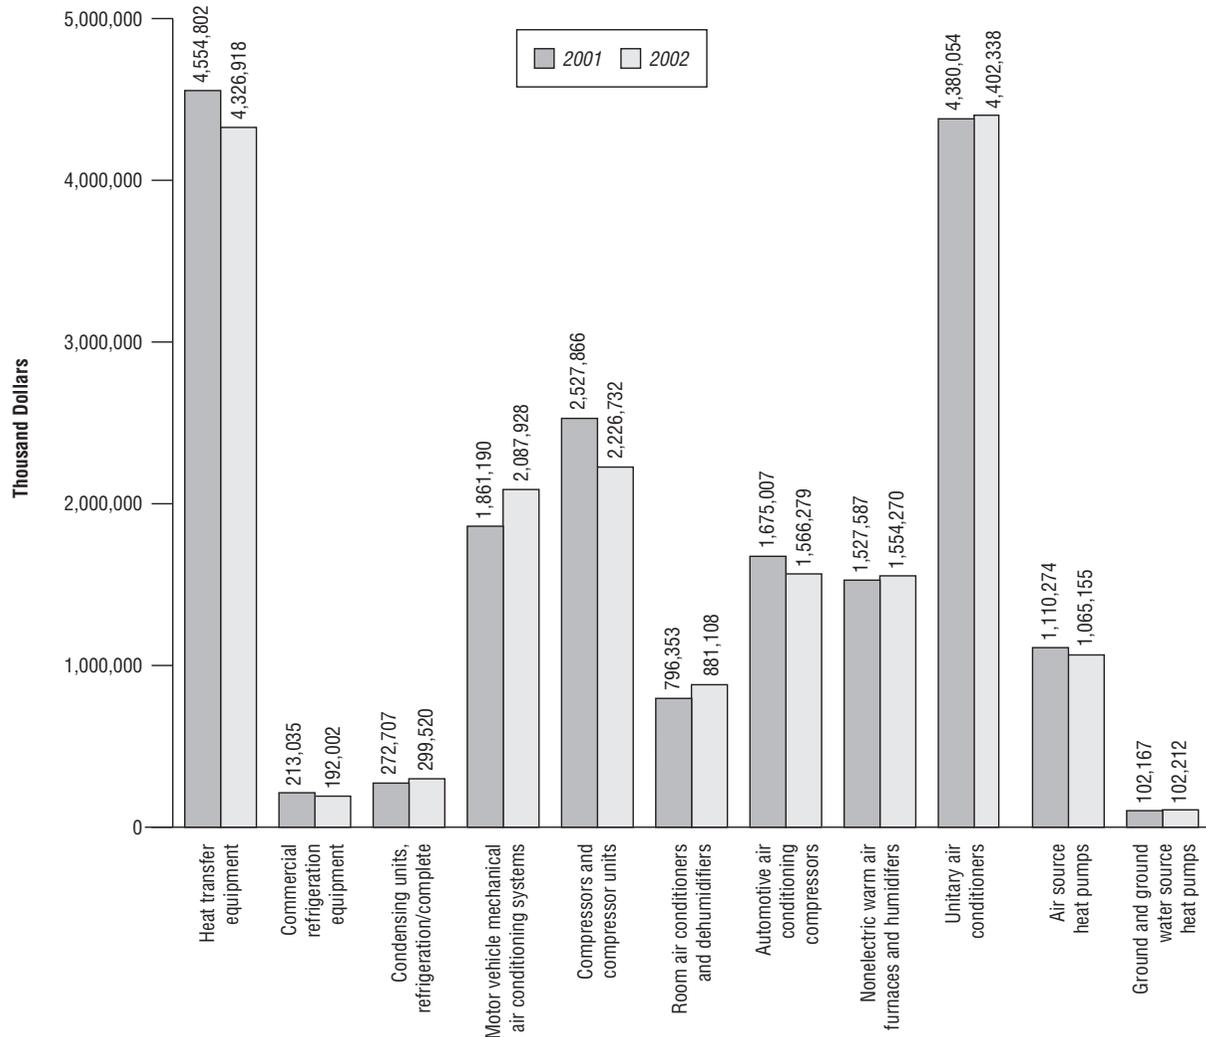

Unitary air-conditioners, not including air source heat pumps, were the main product at 55 facilities. These operations shipped \$6.0 billion worth of merchandise and employed 24,194 people. Products in this category accounted for 20 percent of total industry shipments. The largest value of shipments in this segment originated in Pennsylvania, Texas, and Ohio. Room air conditioners and dehumidifiers, except portable units, accounted for four percent of shipments.

Warm air furnaces (including duct furnaces and humidifiers) and electric comfort heating equipment were the main products at 33 establishments. These operations shipped \$1.7 billion worth of merchandise and employed 7,234 people. Products in this category accounted for nine percent of total industry shipments. The largest value of shipments in this segment originated in Tennessee and Ohio.

Air source heat pumps, not including room air-conditioners, accounted for four percent of the industry's shipments; and ground and ground water source heat pumps accounted for less than one percent. Parts and

Value of Shipments of Refrigeration, Air Conditioning, and Warm Air Heating Equipment, 2001–2002

Value of shipments, in thousands of dollars.

SOURCE: U.S. Census Bureau, 2003

accessories for air-conditioning and heat transfer equipment accounted for nine percent. The largest value of shipments in this segment originated in Tennessee, New York, Missouri, and Ohio.

By 2002, warm air heating and air conditioning dominated more than 45 percent of the industry with \$5.5 billion in sales. Heat transfer equipment had total sales of \$4.3 billion, condensing units sales totaled \$300 million, room air conditioners generated \$881 million in sales, motor vehicle mechanical air conditioning systems accounted for sales of \$2.1 million, compressors and compressor units sales totaled \$2.22 million, automotive air conditioning compressors generated \$1.6 million in sales, nonelectric warm furnaces and humidifiers contributed

sales of \$1.53 million, unitary air conditioners totaled \$5 million in sales, and air source heat pumps had \$1.07 million in sales.

Among companies whose primary products fell into this classification, ACR Group Inc. of Philadelphia, Pennsylvania, had 450 employees and sales of \$155.5 million in 2002. Previously known as Time Energy Systems Inc., this firm manufactured various climate control products. Another company, Gensco Inc. of Houston, Texas, had 500 employees and estimated sales of \$117 million. Gensco manufactured furnace duct pipe, elbows and fittings, and custom-cut flexible ducting.

Of other diversified companies that made products in this category, W.W. Grainger Inc. of Lake Forest, Illi-

nois, was one of the largest with 14,701 employees and sales of \$4.67 billion in 2003. The company's Grainger Division, a nationwide distributor of air compressors, air conditioning and refrigeration equipment and components, and other tools and equipment, served more than one million customers and had several hundred branches located nationwide.

Other industry leaders included Primus Inc. of Dayton, Ohio, with 3,195 employees and sales of \$1.1 billion in 2003; and United Refrigeration Inc. of Philadelphia, Pennsylvania, with 1,175 employees and estimated sales of \$384 million.

W.W. Grainger, Inc., 2004. Available from <http://www.grainger.com>.

wholesale refrigeration equipment and supplies. There were approximately 13,670 employees, with an annual payroll of \$583,358. In 2003, the total number of establishments increased to 3,088, with annual sales of \$4.9 billion. The average sales per establishment was \$2.3 million. The workforce increased to 20,862 employees.

The largest value of shipments in this industry originated in Pennsylvania, California, New York, and Texas. Refrigeration equipment and supplies dominated the market, with 45 percent of industry sales. Total value of shipments was \$4.6 million, with 1,390 establishments employing 10,269 workers.

In 1999, the industry experienced an acute shortage of R-134a, a key refrigerant for production, due to increased demand for use in flat-tire inflators, increased exports to fill the European demand, a scarcity of raw materials to manufacture R-134a, and the shutdown of three Japanese producers of the refrigerant. R-134a prices rose more than 70 percent in February and March 1999. Refron, Inc. of Long Island City, New York, one of the market leaders, took advantage of this shortage to advertise its inventory of rare CFC refrigerants. The company's sales grew in 1998 by 2,389 new customers.

August 1999 shipments of unitary air-conditioners and heat pumps, as tracked by the Air Conditioning and Refrigeration Institute, fell compared to 1998 shipments. In January 1998 sales dropped to about 350,000 from almost 400,000 in January 1997. However, shipments rose by 10.4 percent in September 1999 over the previous year, making the August drop seem like an anomaly.

Also in 1999, the Environmental Protection Agency flexed its muscle by enforcing its 1992 Refrigerants Recycling regulations. First, the EPA fined the City of New York \$50 million for venting refrigerants into the atmosphere by not removing them before crushing refrigerators and air conditioners for disposal. The EPA also enforced its anti-leakage regulations by fining GTE in California \$85,000 for insufficient repair work on its refrigeration system. The agency simultaneously proposed lower allowable leakage rates, dropping the acceptable level from 35 percent to as low as 5 percent, depending on the type of system.

In September 1995, the EPA enacted its Clean Air Act Amendment, tightening leak repair requirements for owners and operators. Still, as the economy improved and interest rates went down, refrigeration equipment and supplies sales rose during the mid-1990s.

A poor economy during the early 1990s lowered refrigeration equipment sales. Large refrigeration equipment buyers, such as supermarkets, had trouble obtaining credit, and slim profit margins affected industry expansion. Mobile vehicle refrigeration systems sales fell from 60,070 units in 1989 to 50,800 in 1990. Sales of drinking

SIC 5078

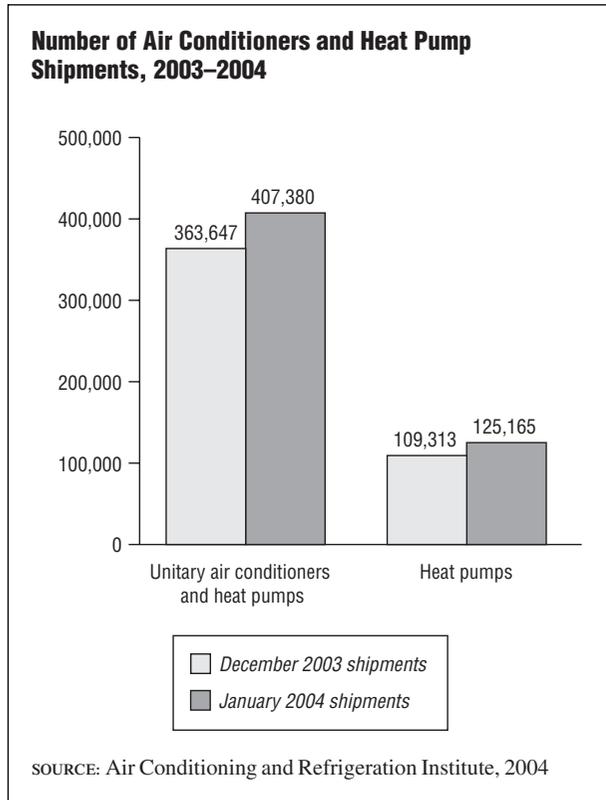

REFRIGERATION EQUIPMENT AND SUPPLIES

This industry consists of companies that primarily wholesale refrigeration equipment and supplies. Industry products include beverage coolers, refrigerated display cases, drinking water coolers, ice cream cabinets, ice-making machines, walk-in and reach-in commercial refrigerators, and refrigerated soda fountain fixtures. Companies that primarily install refrigeration equipment from their own stock are in **SIC 1711: Plumbing, Heating and Air-Conditioning**.

NAICS CODE(S)

421740 (Refrigeration Equipment and Supplies Wholesalers)

According to the U.S. Census Bureau, there were 1,501 establishments involved within the industry of

water coolers also dropped from 984,061 units in 1989 to 886,175 in 1990.

Ice-making machines sales rose, from 195,959 units in 1989 to 200,818 in 1990, but stayed below the 243,771 units sold in 1988. Among other factors, lower sales were blamed on slow growth in the fast food restaurant industry. According to one account, about 70 percent of ice machine shipments during the early 1990s were replacements rather than new purchases. In addition to the fast food industry, who use ice machines for soft drinks, other ice machine buyers include hospital emergency rooms, food processors, and pre-cast concrete pourers.

According to government statistics, there were 1,421 establishments in this industry in 1994, down from 1,513 in 1987. Combined sales totaled approximately \$3.7 billion in 1996, up from \$2.68 billion in 1987. Merchant wholesalers—wholesalers who take title to goods they sell—made up the largest number of these companies, with 1,252 establishments. The industry employed 10,373 people, with an annual payroll of \$303 million in 1992, compared to 12,281 people paid a total of \$303 million in 1987. The employment rate was also expected to fall to 11,561. California had the most establishments, with 191, and generated 12.4 percent of U.S. sales. Texas had 108 establishments and generated 7.9 percent of U.S. sales.

According to the Air Conditioning and Refrigerating Institute, the total number of central air conditioners and

air—source heat pumps shipped in 2003 increased one percent over 2002 to 6,807,262. Total heat pump shipments of 1,625,365 had also increased 10 percent. However, shipments of both unitary air conditioners and heat pumps dropped three percent to 363,647 units. Total distributor shipments were up eight percent overall in 2003. The trend seemed to continue when January 2004 shipments increased by six percent. In fact, total distributor shipments climbed eight percent from January 2003.

The majority of the establishments in this industry were small. In 2003, there were 1,962 establishments that had fewer than five employees; 571 had between five and nine employees; 318 had between 10 and 24 employees; 101 had between 25 and 49 employees; 28 had between 50 and 99 employees; and about 7 establishments with 100 or more employees.

SOURCE: U.S. Department of Commerce, Bureau of Census, 2003

As a whole, this industry consisted of an estimated 5,050 establishments that employed more than 93,168 workers. Industry sales were valued at more than \$32 million in 2003. The U.S. states with the highest sales volume included Texas, North Carolina, California, Illinois, and Louisiana, which together accounted for more than 57 percent of the industry's output in that decade.

Demand for construction equipment fluctuated in accordance with spending in the construction industry. The industry managed to weather the global recession of the early 1990s with little more than a slowdown in sales growth. Fairly dramatic growth characterized the industry during the mid- to late 1990s, despite a nationwide trend toward business consolidation in most other sectors. Within this industry, sharp increases were seen in both the number of establishments and the size of their workforces.

As the industry entered the new millennium, it faced increased competition from such nontraditional participants as equipment rental services and large-format warehouse retailing. Industry analysts advised distributors dealing with contractors to focus on niche products and full-service offerings in order to keep their customers from turning to do-it-yourself retail outlets. Moreover,

information technologies like the Internet provided new marketing challenges to the industry by allowing potential customers to easily reach outside of their local area to obtain equipment. As a result, numerous participants in the industry, as well as their trade associations, established Internet sites to reach the newly widened market.

Mining and mineral processing equipment was valued at \$1.1 billion for 2003. The construction machinery sector, including surface mining equipment, was valued at \$15 billion. The Association of Equipment Manufacturers (AEM) predicted the overall construction equipment industry within the United States would experience a loss of 0.4 percent for 2003. However, more than 87 percent of dealers were expecting revenue growth.

Two major players in the wholesaling of construction and mining machinery in the late 1990s were Caterpillar Inc. of Peoria, Illinois, and CNH Global N.V., which is headquartered in the Netherlands but operates in more than 15 countries, including the United States. Both companies manufactured this equipment and marketed it through their own networks of distributors. Furthermore, both companies loomed large in the production of agricultural equipment, which is not covered by this industry. Caterpillar's 2003 sales totaled \$22.8 billion, while CNH Global reported 2003 sales were \$10.1 billion. Deere & Company of Moline, Illinois was also an industry leader; in fact, Deere's construction and forestry division reported a 67 percent increase for the second quarter of 2004.

SIC 5083

FARM AND GARDEN MACHINERY AND EQUIPMENT

This industry is primarily engaged in the wholesale distribution of agricultural machinery and equipment, including devices used to prepare and maintain soil and to plant, protect, irrigate, and harvest crops. The industry also supplies equipment and machinery to dairy and livestock operations.

NAICS CODE(S)

421820 (Farm and Garden Machinery and Equipment Wholesalers)

444210 (Outdoor Power Equipment Stores)

INDUSTRY SNAPSHOT

In 2001, according to the U.S. Census Bureau, the farm and garden machinery and equipment industry totaled 9,086 establishments. Combined sales totaled slightly more than \$12 billion in 2002. In 2003, the annual sales had grown to more than \$24 billion. Subcategories include farm dealers, wholesale distributors to nonfarm accounts, including exports, and lawn and garden machinery and equipment.

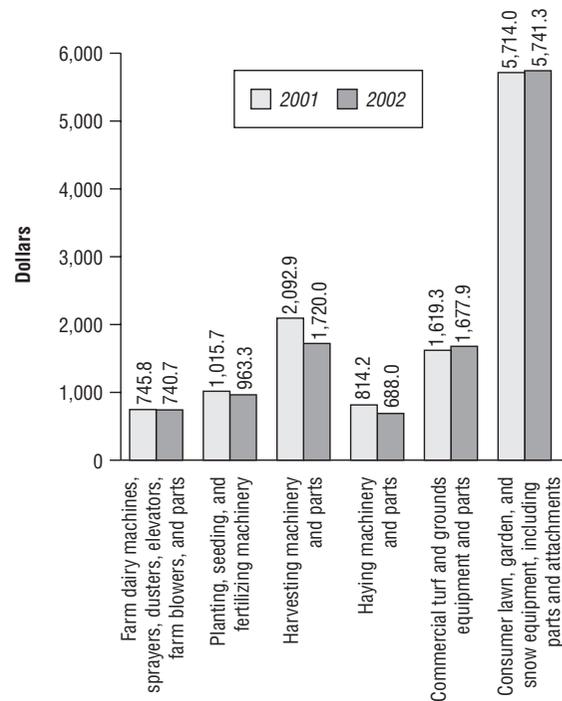

BACKGROUND AND DEVELOPMENT

The trade journal *Appliance Manufacturer* projected growth in the market for consumer lawn and garden products in 1998 of 2.9 percent to almost 8 million units. The Outdoor Power Equipment Institute (OPEI) predicted increases in shipments of walk-behind power mowers in 1998 of 2.5 percent; decreases in riding mowers of 10 percent; growth for lawn and garden tractors of 6.3 percent; and increases in tiller shipments of 3.6 percent. Overall, shipments rose 5 percent to 7.7 million units for 1998.

Sales of tractors and combines were up significantly in 1996, according to the Equipment Manufacturers Institute. The strength of the farm economy, rising net farm income and a decline in the ratio of debt to assets, contributed to farmers' willingness to buy agricultural equipment. However, depressed grain and livestock prices led to a decrease in North American retail demand for farm equipment in 1999. Hans Becherer, chairman and CEO of Deere & Co. expected a reduction of 25 percent or more. Since the early 1970s, the number of

Value of Shipments in the Farm and Garden Machinery Equipment Industry, 2001–2002

In millions of dollars

SOURCE: U.S. Census Bureau, 2003

U.S. farms has decreased by one-third, from 3 million to 2 million.

CURRENT CONDITIONS

According to the Freedonia Group, sales of U.S. power lawn and garden equipment were expected to rise 4.2 percent per year through 2002 to nearly \$9 billion. This market included lawn mowers, turf and grounds equipment, garden tractors and tillers, trimmers and edgers, and snow throwers. U.S. exports of lawn and garden equipment are two-thirds the value of imports, according to the U.S. Department of Commerce. The biggest markets for exports were Canada, France, Germany, the United Kingdom and Australia.

Farm and garden machinery represented the largest segment of the industry, with 2,396 establishments, and their combined sales totaled about \$2.7 billion. Agricultural machinery and equipment numbered 2,206 establishments, with more than \$8 million in sales, and lawn and garden machinery and equipment numbered 1,237 establishments with combined sales of \$254.4 million. Farm dairy machines, as well as sprayers, dusters, elevators, farm blowers, and parts generated \$740.7 million; planting, seeding, and fertilizing machinery totaled

\$963.3 million; harvesting machinery and parts contributed \$1.72 million; and haying machinery and parts generated \$688 million. Average sales per establishment totaled approximately \$2.4 million.

INDUSTRY LEADERS

AGCO Corp., Deere & Co., Caterpillar Inc., and Case Corp. were important agricultural machinery manufacturers with extensive distribution networks. Consolidation continued as companies acquired other equipment makers. In 1998, Case Corp. bought Tyler Industries, a manufacturer of agricultural sprayers. Major wholesalers included RDO Equipment Co., IIC Industries Inc. Former industry leader, Richton International Corp., was acquired by Deere & Co. in 2001.

WORKFORCE

The industry employed approximately 87,642 people in 2003. Its annual payroll was about \$3.3 million. The average number of employees per establishment totaled about 7. States with the highest number of establishments were Texas with 1,016, California with 812, Minnesota with 576, Florida with 567, Iowa with 542, and Nebraska with 415.

packing machinery, industrial paint spray equipment, wood pulp manufacturing machinery, industrial pumps and pumping equipment, industrial sewing machines, shoe manufacturing and repairing machinery, smelting machinery, welding machinery, and winches.

NAICS CODE(S)

421830 (Industrial Machinery and Equipment Wholesalers)

According to the U.S. Census Bureau, there were nearly 34,000 establishments employing approximately 352,561 people in the industrial machinery and equipment industry in 2001. These were subdivided into six groupings: food-processing machinery, equipment, and parts made up approximately 2 percent of sales; general-purpose industrial machinery, equipment, and parts accounted for about 33 percent; metalworking machinery, equipment, and parts accounted for 12 percent; materials handling equipment and parts accounted for 15 percent; oil well, oil refinery, and pipeline machinery, equipment, and supplies garnered 4 percent; and other industrial machinery and equipment made up the remaining 34 percent. Industry payroll in 2001 exceeded \$16.4 million. Sales were expected to only increase slightly during the late 2000s, while employment was expected to remain relatively flat.

The top states, based on number of establishments and sales volume, largely mirrored the concentration of the U.S. population. These were California, Texas, Florida, Illinois, Ohio, New York, Pennsylvania, and Michigan. Together, these eight states generated more than half of all industry sales. North Carolina, Indiana, and New Jersey were also leaders in number of establishments.

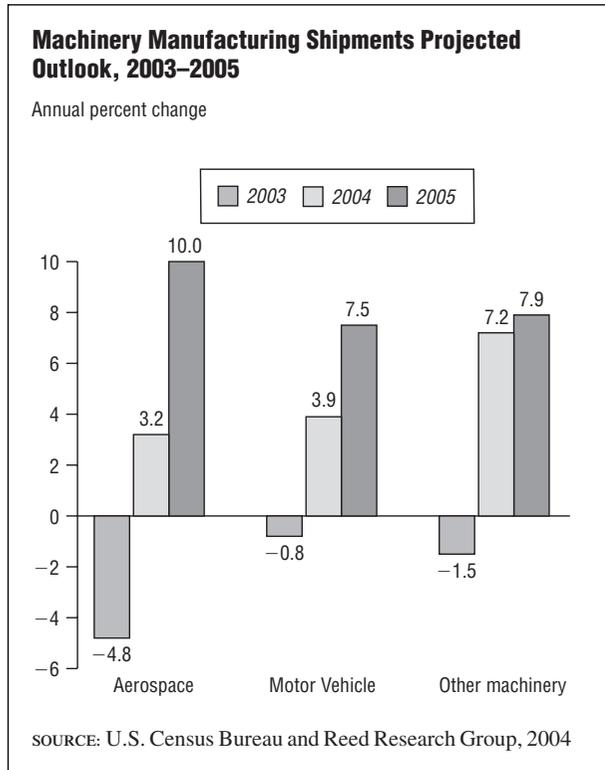

Industrial equipment sales suffered downturns during the early 1990s as lean fiscal performances stalled new plant investment in many sectors served by this industry. Recovery began in 1993, and the industry posted healthy sales' growth and modest profits in the mid-1990s. The wholesale distribution of all machinery, equipment and supplies—which includes this category—made up 15 percent of the durable goods market for 1997, which totaled \$193 billion. Trying to post higher returns, many in the industry reconfigured the way their companies distributed industrial machinery. Other industry strategies aimed at further increasing market strength included reducing costs, outsourcing distribution-related services, and seeking out new business, especially through the exploration of foreign markets. Strong prospects for export growth included Canada, Mexico, South America, the United Kingdom, France, Germany, Australia, Japan, China, and Africa.

Reed Research Group, in conjunction with the U.S. Census Bureau, predicted the machinery and components manufacturing market was positioned for growth in 2004

SIC 5084

INDUSTRIAL MACHINERY AND EQUIPMENT

This industry is comprised of establishments involved in the wholesale distribution of industrial machinery and equipment, not elsewhere classified. Products of the industry include chainsaws, citrus processing machinery, conveyor systems, industrial cranes, derricks, industrial diesel engines, elevators, ladders, lift trucks, machine and machinists' tools, oil refining machines,

that would continue into 2005. Fueled with an overall 8.5 percent increase in sales, the industry had emerged from its downturn trend of more than three years. The value of machinery shipments was projected to climb to about \$72,000 in the first quarter of 2004, and reach almost \$76,000 by the year's end, up from \$70,000 at the end of 2003.

The industrial distribution industry underwent extensive consolidation, but merger and acquisition activity was down 41 percent in 2002. The pace picked back up in 2003 with a number of mergers and acquisitions. A leader in the industry, Airgass Inc., acquired a total of 14 branches of Union Gas Group.

One of the leading industrial distribution firms in the United States was Dresser Industries Inc. of Dallas, Texas, with annual sales of more than \$7.4 billion and 31,000 employees. Other top companies included Unisource Worldwide Inc. of Berwyn, Pennsylvania, with sales of \$4.76 billion and 10,000 employees; Applied Industrial Technologies, Inc. of Cleveland, Ohio, with sales of \$1.46 billion and 4,355 employees; and W.W. Grainger Inc. of Lincolnshire, Illinois, with sales of \$4.66 billion and 14,701 employees. Following the integrated supply trend in the wholesaling industry, W.W. Grainger established an alliance with VWR Scientific Products in 1997 to service consolidated customer orders. By 2002, W.W. Grainger announced its plans for a huge expansion over the course of five years.

Other leading companies include WESCO Distribution Inc. of Pittsburgh, Pennsylvania; Duferco Energy Group, Inc. of Houston, Texas; Stewart and Stevenson Services of Houston, Texas; Airgas Inc. of Radnor, Pennsylvania; and National-Oilwell Inc. of Houston, Texas.

The manufacturing sector shed two million jobs throughout the downturn, and unfortunately many of these jobs were expected to be moved overseas. Some companies were relocating their facilities to China, the Pacific Rim, and some are even looking into Africa, where labor costs are lower.

SIC 5085

INDUSTRIAL SUPPLIES

This industry comprises establishments engaged in the wholesale distribution of industrial supplies that are not included in another classification. Products of the industry include abrasives, bearings, industrial diamonds, printers' ink, refractory materials, rope (except wire), valves and fittings (except plumbers' valves and fittings) and non-paper containers such as bottles, crates, drums, and metal pails.

Plumbers' valves and fittings are included in **SIC 5074: Plumbing and Heating Equipment and Supplies**

(Hydronics). Wire rope is included in **SIC 5051: Metals Service Centers and Offices.**

NAICS CODE(S)

421830 (Industrial Machinery and Equipment Wholesalers)

421840 (Industrial Supplies Wholesalers)

The 23,463 establishments in this industry employed some 204,573 workers in 2003, according to the D&B Sales & Marketing Solutions. These establishments were subdivided into nine specialties: general-line industrial supplies, approximately 40 percent of establishments; fasteners and fastening equipment, 12 percent of establishments; industrial tools, six percent; mechanical power transmission supplies, three percent; hydraulic and pneumatic supplies, seven percent; industrial valves and fittings, eight percent; welding supplies, four percent; industrial containers and supplies, four percent; and other industrial supplies such as abrasives, mechanical rubber

tools, ropes, cordage, and industrial diamonds, 16 percent. Estimated industry-wide sales totaled more than \$45 million in 2003.

During the early 1990s, the Industrial Distribution Association (IDA) reported that conditions within the industry were changing. The institutional market for industrial supplies, including governments, schools, and hospitals, had fallen considerably from its mid-1980s high. The IDA ranked metals fabrication supply as the leading national market for industrial suppliers. Other industries representing major clients included chemical, automotive, aircraft, and construction establishments.

The abrasives market also suffered from the general economic downturn. Noting variations by geographic region, however, abrasives sales rebounded in the more robust mid-and late 1990s global economy. Abrasive distributors had strong sales in 1997 and many companies expected their 1998 sales to top 1997 levels. Certain niche markets were forecast to increase significantly.

The role of bearing distributors began changing in the late 1990s. Manufacturers began demanding that distributors form partnerships with customers, to both deliver product and to participate in the design and selection processes. This demand was in response to increasing overseas competition. The distributor is expected to bring extra value to the customer, including an integrated supply contract, just-in-time delivery and 24-hour product availability.

The integrated supply trend was expected to continue, as were acquisitions, making companies become even larger. Companies like FedEx and UPS were entering the industrial distribution market and therefore conventional distributors will have to focus on providing technical services and customer support to increase revenue. Industry experts estimated that approximately 25 percent of all large company purchases were linked to an integrated supply program at the turn of the century.

The wholesale distribution of industrial supplies was considered fragmented, with the largest 250 businesses controlling less than 15 percent of the overall market. Up until the economic recession that began in 2001, the industrial industry underwent numerous mergers and acquisitions. Once the economy turns around some analysts believe mergers and acquisition would significantly resume.

Industry leaders included W.W. Grainger, Inc. of Lake Forest, Illinois, with sales of \$4.6 million; Motion Industries Inc. of Birmingham, Alabama, with sales of more than \$2 million; Applied Industrial Technologies of Cleveland, Ohio, with annual sales of more than \$1.4 million; McJunkin Corp. of Charleston, West Virginia, with sales of more than \$800 million; and Kaman Industrial Technologies of Windsor, Connecticut, with sales of more than \$400 million. Other leaders included Lawson Products Inc. of Des Plaines, Illinois; Fairmont Supply Co. of Washington, Pennsylvania; and Industrial Distributors Group Inc. of Tucker, Georgia. Some companies were acquired by others, including King Bearing Inc. (a subsidiary of Applied Industrial Technologies) and Berry Bearing Co. (a subsidiary of Motion Industries Inc.).

SIC 5087

SERVICE ESTABLISHMENT EQUIPMENT AND SUPPLIES

This industry comprises establishments primarily engaged in the wholesale distribution of equipment and supplies for barber shops, beauty parlors, power laundries, dry cleaning plants, upholsterers, undertakers, and related personal service establishments. Other products of the industry include carnival and amusement park equipment, firefighting equipment, janitors' supplies, and voting machines.

Service establishment equipment and supplies wholesalers specialize in one of four areas: beauty and barber equipment and supplies, custodial equipment and supplies, laundry and dry cleaning equipment and supplies, and other service establishment equipment and supplies.

NAICS CODE(S)

421850 (Service Establishment Equipment and Supplies Wholesaler)

446120 (Cosmetics, Beauty Supplies, and Perfume Stores)

In 2003, according to D&B Sales & Marketing Solutions, there were nearly 21,338 establishments generating more than \$15 million in sales. The industrial machinery and equipment industry was subdivided into four groupings: beauty and barber equipment made up approximately 36.2 percent of sales; custodial equipment and supplies accounted for about 23.3 percent of sales; laundry and dry cleaning equipment accounted for about 5.5 percent of sales; and other equipment and supplies made up about 21.4 percent of the sales. California, Florida, New York, and Texas controlled almost 36 percent of the establishments. Combined, they generated more than \$5 million in sales.

The National Association of Wholesalers (NAW) issued a report in 1992 titled *Facing the Forces of Change 2000: The New Realities in Wholesale Distribution*. The report, based on the findings of a commissioned study undertaken by Arthur Andersen Company, included equipment and supply distributors among the examples of types of companies encountering competition from innovative market channels. Traditional merchant wholesalers, who represented 93.5 percent of industry establishments in the government's census, were expected to face the stiffest competition. Alternate channels included manufacturer direct sales, retail formats such as

buying clubs and warehouse clubs, and inventory service providers such as subcontractors offering product assembly or transportation coordination. Merchant wholesalers were not expected to increase their market share in the overall national economy, however.

Unisource Worldwide Inc. of Berwyn, Pennsylvania led the industry with sales of more than \$4.8 million for its fiscal year ended September 30, 2002. Sally Beauty Company Inc., headquartered in Denton, Texas, followed with sales of almost \$1.8 million in 2002. Fastenal Co. of Winona, Minnesota placed third in the industry with 2003 sales of \$994.9 million. Reinhart Institutional Foods Inc. of La Crosse, Wisconsin generated \$415 million in 1997, the most recent year available. Clark Foodservice Inc. of Elk Grove Village, Illinois rounded out the top five industry leaders with 2001 sales of \$320 million. In addition, Reinhart acquired Weis Foodservice of Sanbury, Pennsylvania and established the Reinhart Sunbury Distribution Center in 2002.

Unisource employed 10,000 workers who together generated total revenues of \$553,530. Reinhart, although it placed fourth in total sales, was second in sales-to-worker ratio, with 750 employees producing \$553,333 in revenue—just under \$200 per employee less than the leader Unisource. Of the top five sales leaders, Clark placed third in this category with \$413,333 sales for its 750 employees, exactly \$140,000 less than Reinhart. Fastenal placed fourth with \$201,388 sales for its 3,025 employees, and Sally Beauty placed fifth with \$161,375 in sales for its 8,000 employees.

The industry employed 61,497 workers in 2001 with a payroll of \$2.1 billion. The majority of companies in this industry were small—employing less than five employees. In 2001, 2,298 companies had less than 5 employees; 1,207 had between 5 and 9 employees; 812 had between 10 and 19 employees; 849 had between 20 and 99 employees; 412 had between 100 and 499 employees; and about 605 establishments with 500 or more employees. In 2003, the employee total had increased to about 119,526.

SIC 5088

TRANSPORTATION EQUIPMENT AND SUPPLIES, EXCEPT MOTOR VEHICLES

This industry is comprised of establishments engaged in the wholesale distribution of transportation equipment and related supplies, excluding motor vehicles. Ships (except pleasure craft), combat vehicles, guided missiles, and space vehicles are included in the industry. Self-propelled golf carts, railroad equipment, and aircraft parts and supplies are also included. Establishments primarily engaged in the wholesale distribution of motor vehicles are included in Industry Group 501 (motor vehicles and motor vehicle parts and supplies). Establishments primarily engaged in the wholesale distribution of pleasure boats are included in **SIC 5091: Sporting and Recreational Goods and Supplies**.

NAICS CODE(S)

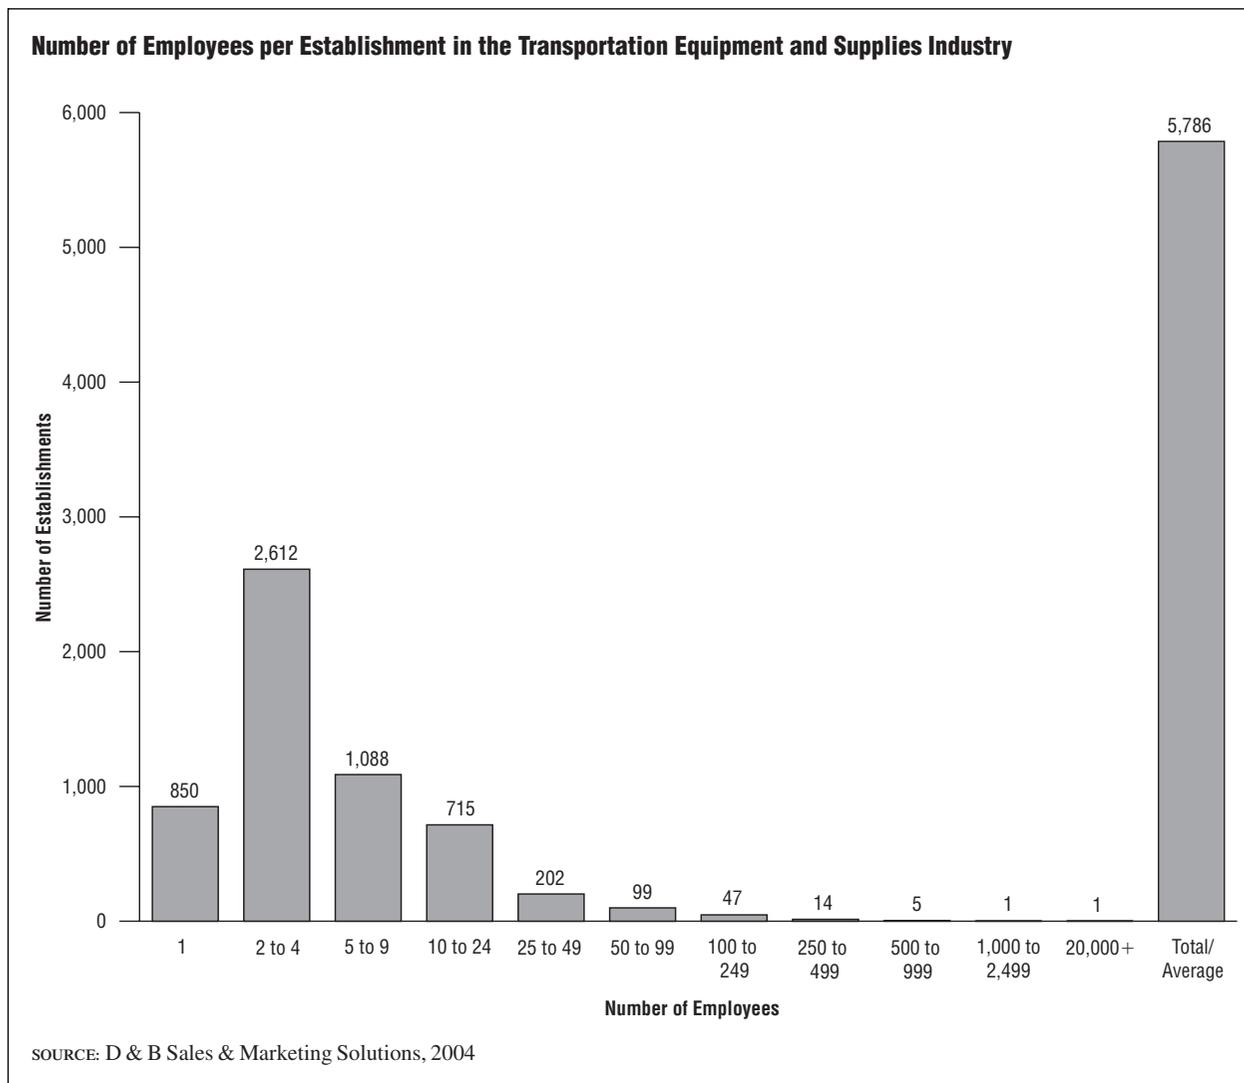

421860 (Transportation Equipment and Supplies (Except Motor Vehicles) Wholesalers)

In 2001, according to the U.S. Census Bureau, there were 3,730 establishments engaged in the transportation equipment and supplies wholesalers industry. These employed approximately 45,520 people, with an annual payroll of \$2.1 billion. The total number of establishments increased to 5,786 in 2003. Together, they shared \$22.4 billion in revenue. The average sales of individual establishments was about \$4.6 million. The three states with the highest number of establishments were Florida, California, and Texas. Combined, they generated some \$16.4 billion in sales. Maryland with only 103 establishments had sales of \$23.2 billion.

Three separate specialties constitute this fragmented category. By number of establishments, the largest classification is aircraft and aeronautical equipment and supplies; followed by marine machinery, equipment, and supplies wholesalers; and other transportation equipment and supplies wholesalers—including sellers of equipment and supplies used by railroads, streetcars, buses, tramways, aerial hoists, and horse-drawn vehicles.

Aircraft and parts numbered 1,263 establishments, or more than 21 percent of the market. Aircraft equipment and supplies by themselves numbered 689 establishments, and shared almost 12 percent of the market. Marine supplies represented 678 establishments and also shared roughly 12 percent of the market.

During the early 1990s, the aerospace industry experienced declines in both the defense and civil segments. Although industry analysts anticipated recovery in the commercial segment of the industry during the second half of the decade, continuing stagnation in the defense

market was expected because of continued U.S. government downsizing. The best growth opportunities were for niche segments such as business and commuter jets, spare parts, and maintenance and overhaul in the commercial sector. Small commercial aircraft running regional services were a growing trend in the late 1990s. Industry performance as a whole continued to be mixed as the industry supplanted its defense-based revenues with commercial and industrial sales. The industry grossed an estimated \$23 billion in 1996 and employed approximately 37,000 workers.

U.S. Airways Group Inc. of Arlington, Virginia, led the industry with 1999 sales of almost \$8.6 billion. Two New York City-based firms—Mitsubishi International Corp. and Sea Containers America Inc.—followed with 1998 sales of more than \$7.1 billion and almost \$1.3 billion respectively. Houston-based Stewart and Stevenson Services Inc. generated sales of more than \$1.2 billion for its fiscal year ended January 31, 1999. AAR

Corp., headquartered in Elk Grove Village, Illinois, rounded out the top five industry leaders with sales of \$918 million for its fiscal year ended May 31, 1999.

Stewart and Stevenson Services Inc. (SSSS) was awarded a \$5 million Systems Technical Support (STS) service contract in early 2000 from the United States Army for support of its Family of Medium Tactical Vehicles (FMTV). The contract, administered by the Army's Tank, Automotive, and Armaments Command (TACOM), added up to \$47 million in total revenue over four years. The company was extremely familiar with the equipment it would maintain, as SSSS manufactured 11,400 FMTVs from 1992 through 1998 for the Army.

U.S. Airways Group posted sales of \$5.3 billion for 2003, a decrease from \$7.0 billion for 2002. The company had been under bankruptcy protection, and successfully reorganized in 2003. That may change, however, according to a U.S. Airways spokesperson in a press release issued on May 7, 2004. The company has undergone cost

cuts in an effort to situate itself for the scheduled arrival of new jets in 2005. Since the corporate credit rating had been downgraded, the company had been trying to cut back by about 25 percent. Unfortunately, if the company cannot get the financing needed it just may have to undergo "another bankruptcy filing if it is unable to do so." U.S. Airways Group employs approximately 31,700 people. Sea Containers America Inc. recorded sales of \$1.6 billion for 2003. Mitsubishi International Corp. generated sales of \$105.7 million for 2002, while Stewart and Stevenson Services Inc. posted sales of \$1.2 billion for 2004. On April 15, 2004, Stewart and Stevenson landed an extended contract worth some \$63.4 million for additional deliveries of their FMTVs from the U.S. Army TACM. This contract had been extended from an earlier contract in April of 2003. The total number of FMTV vehicles delivered to the U.S. TACM stood at more than 23,000.

SIC 5091

SPORTING AND RECREATIONAL GOODS AND SUPPLIES

Establishments in this entry are primarily engaged in the wholesale distribution of sporting goods and accessories; billiard and pool supplies; sporting firearms and ammunition; and marine pleasure craft, equipment, and supplies. Establishments primarily engaged in the wholesale distribution of motor vehicles and trailers are classified in **SIC 5012: Automobiles & Other Motor Vehicles**. Those distributing self-propelled golf carts are classified in **SIC 5088: Transportation Equipment &**

Supplies, and those distributing athletic apparel and footwear are classified in Industry Group 513: Apparel, Piece Goods, and Notions.

NAICS CODE(S)

421910 (Sporting and Recreational Goods and Suppliers Wholesalers)

INDUSTRY SNAPSHOT

The wholesale sporting goods industry, including apparel and footwear, enjoyed revenues of nearly \$50 billion in 2003 up from \$45.6 billion in 1998, despite the sluggish economy of the early 2000s. The Sporting Goods Manufacturers Association International (SGMA) expected modest growth of only 1.3 percent in 2004, but that included the lagging sales of sports apparel, which is separate from the this industry category. Still, that meager growth, according to the SGMA, was rooted in excess retail capacity and a decline in selling prices, along with consumers' growing tendency to buy on sale.

The late 1990s and early 2000s were marked by rapid consolidation. Like many wholesale industries, wholesalers of sporting and recreational goods were in a relatively weakened position compared to manufacturers, so instead of competing with their prices, wholesale distributors opted to emphasize value-added services not offered by manufacturers, in an effort to regain a larger portion of the market. Distributors were quickly forced to streamline their operations, most typically using sophisticated information technology, to implement comprehensive brand- and inventory-management and customer-data services for their clients.

Though it drove many smaller players out of the market, this consolidation carried many advantages for the industry. The remaining competitors boasted greater efficiency and the economies of scale and flexibility to adjust to manufacturers' and retailers' heightened demands. These firms served their clients with volume discounts, better financing options, and larger warehouses to accommodate a variety of product lines.

ORGANIZATION AND STRUCTURE

The sporting and recreational goods market is largely seasonal, requiring manufacturers to deliver product lines in a timely fashion in order to take advantage of the limited period of demand for many products. According to a 1997 survey of sporting goods buyers by *Sporting Goods Business* magazine, almost 75 percent of the buyers surveyed were buying closer to the selling season, rather than overstocking products during the off-season.

Because of the wide range of sports and other activities served by this industry, many retailers specialized in providing equipment for certain activities, such as fishing, hunting, boating, and so on. Other distributors spe-

cialized by market, dealing primarily with team equipment for schools and other institutions. Still others directed their business toward equipment popular in specific regions of the country, for example, providing fishing and hunting gear in rural areas. The latter strategy, in particular, gave smaller dealers or distributors an advantage over the superstores and chains, in that such operations could specialize in providing specific regional information, advice, and products.

CURRENT CONDITIONS

Wholesalers spent the early 2000s recovering from a glut of products in the marketplace, over-saturating the industry with large inventories of high-priced but weak-selling products, particularly in-line skates, ski equipment, metal golf clubs, and equipment for team sports, in which participation remained flat.

According to a SGMA International forecast report, the vast majority of sporting goods executives expected consolidation to be a major growth factor through the end of the first decade of the new millennium. Indeed, mergers and acquisitions continued at a brisk pace into the mid-2000s, with Gart Sports merging with Sports Authority to create the nation's largest sports retailer chain. Moreover, analysts predicted that the industry would grow increasingly diversified, with the development of sporting goods tailored to ever-more specific lifestyles. Of particular concern to wholesalers, however, was the anticipated growth in the retailers' strength in the industry, which will likely afford retailers greater leverage in demanding services and concessions.

The wholesale of sporting goods and recreational equipment was estimated at \$18.27 billion in 2003. The exercise equipment sector was among the industry's saving graces, with sales of nearly \$4 billion in 2003. Sales in this area continued to surf the wave of increased gym membership, which doubled between 1987 and 2003. Clubs, universities, and other institutional settings constantly upgrade equipment, ensuring a steady market for fitness equipment. Moreover, some fitness products, led by treadmills and stair machines, were particularly popular among individual consumers for use in the home.

Women's participation and interest in sports reached an all-time high during the 1990s and early 2000s. Women's sports enjoyed increasing high-profile media coverage during this period, slowly overcoming years of being relegated to the margins of the sporting world. Team sports, soccer and basketball in particular, saw robust growth in the numbers of female participants. Female basketball players who participated frequently rose from 2 million in 1990 to 2.4 million in 2002. Other sports and related equipment that experienced significant growth due to women's participation were tennis, free weights, step machines, treadmills, step aerobics, station-

ary bikes, and camping with tents. The SGMA projected that products for women would be among the few industry growth sectors while manufacturers, wholesalers, and retailers faced down an over-saturated market.

Basketball participation remained the most popular team sport in the United States, with the number of frequent players up 14 percent since the mid-1990s, while bowling was the most popular U.S. sports activity, with 53.2 million participants. Meanwhile, the rise in popularity of both gentler forms of exercise such as yoga and water workouts and extreme sports such as skateboarding and skydiving opened new market niches driving overall industry growth.

Yoga and Pilates enjoyed skyrocketing mainstream acceptance in the early and mid-2000s. The SGMA reported yoga participation jumped 31 percent to 9.1 million in 2001, with the trend expected to continue. Meanwhile, Pilates participation leapt 41 percent to 2.4 million. Yoga and Pilates classes were increasingly offered as part of overall fitness programs at health clubs, greatly accelerating participation.

Extreme or action sports were also on the rise in the mid-2000s. Skateboarding, surfing, snowboarding, skydiving, and wakeboarding were a few of the leading segments of this emerging niche. Primarily youth-oriented, extreme sports derived their appeal largely from marketing campaigns advertising a general lifestyle, rather than health or sportsmanship. Skateboarding exploded in popularity, due in large part to increased television coverage and its being marketed as a trendy extreme sport. The SGMA reported 11.6 million skateboarders in 2001, up a full 49 percent from the previous year.

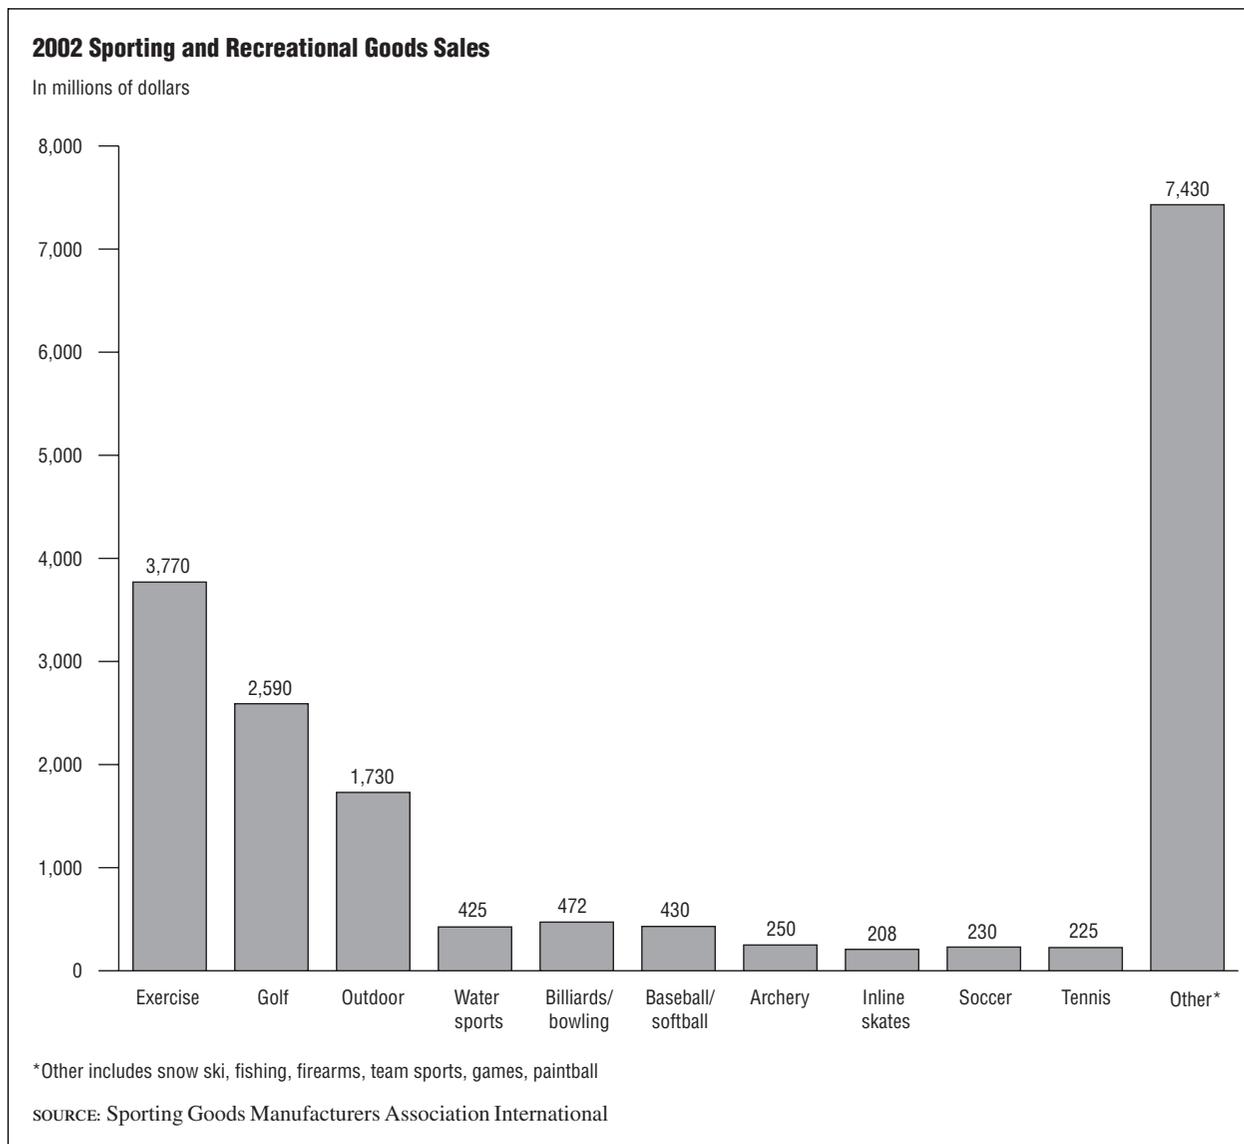

INDUSTRY LEADERS

SCP Pool Corporation, based in Covington, Louisiana, brought in revenues of \$1.16 billion in 2003, up 17.6 percent over 2002. The firm was the world's largest wholesale distributor of swimming pool supplies and related equipment, with 161 service centers in 35 states and another 40 centers in Europe. SCP spent the late 1990s and early 2000s acquiring smaller, regional distributors and building its network.

Ellett Brothers Inc. was a leading wholesaler of outdoor equipment, based in Chapin, South Carolina. Its network included 800 manufacturers and suppliers as well as 30,000 customers, to which it distributed some 50,000 products for camping, hunting, and marine sports. Other leading industry firms included Gander Mountain Inc. of Bloomington, Minnesota, with revenues of \$297.8 million in 2003, and Dayton, Ohio-based Outdoor Sports Headquarters Incorporated (OSHI).

RESEARCH AND TECHNOLOGY

In the mid-1980s, OSHI and other distributors introduced the opportunity for customers to purchase power-

ful new computer systems that could track, report, and forecast inventory needs and quickly compute sales and profits. The systems offered customers several unique advantages. Programs could update inventory, track sales taxes, and create mailing lists. Given a certain amount of information regarding individual sales, the system might recommend additional products for the retailer to promote. The OSHI system provided firearms records required by the Bureau of Alcohol, Tobacco, and Firearms, as well as fishing and hunting license records. Furthermore, some programs allowed dealers to access the wholesaler's mainframe to obtain information on the status of the wholesaler's inventory. Other options included allowing the retailer to place an order directly to the wholesaler's computer and quickly learn whether the order qualified for any incentive programs. Some computer programs could also update prices in the dealers' computers, forecast seasonal sales based on the sales in

previous years, track special orders, and generate daily sales reports.

Distributors were also increasingly relying on computerized distribution centers to improve service and profits. Easton Aluminum, the official supplier of equipment to the U.S. Olympic Archery Team, built a 100,000 square foot, state-of-the-art distribution center that served as a model for distributors and manufacturers. Located in Salt Lake City, Utah, this distribution center replaced four warehouses, one for each division of the company, providing a more stable distribution of merchandise in an industry that experienced severe peaks and valleys due to the seasonal nature of sporting goods. The system also allowed Easton to maintain extremely accurate inventory records.

Recognizing that the market is consumer-driven, both manufacturers and retailers used computer technology to gather market and consumer information. Retailers can

track customer preferences from point-of-sale (POS) information and use it to manage inventory accurately. Manufacturers can use this same information to react to top-selling products or discontinue shipments of slow-sellers. Both the retailer and manufacturer benefit by reducing the need for inventory build up and markdown.

The Internet became an integral part of business in the late 1990s, changing how and where consumers shop. The Internet allows retailers to store data regarding customer purchases, birthdays, and demographics. Retailers can use the information to suggest gifts, cross-promote products, and refer users to partner sites. In addition to offering products to consumers, many companies used the Internet to facilitate business-to-business e-commerce such as automating their inventory, offering customer service, distributing products, and utilizing order fulfillment functions. By the mid-2000s, however, industry-specific online stores faced encroachment from mass e-retailers. Amazon.com, for instance, launched a sporting goods store in 2003, partnering with a number of online sporting goods companies, including Golfballs.com, SportsLine.com, altrec.com, and others. Amazon.com aimed to compete directly with the major sporting goods retailers, offering brand names in over 50 sporting activities.

SIC 5092

TOYS AND HOBBY GOODS AND SUPPLIES

This category includes establishments primarily engaged in the wholesale distribution of games, toys, hobby

goods and supplies, dolls, craft kits, model kits, children's vehicles, fireworks, and playing cards.

NAICS CODE(S)

421920 (Toy and Hobby Goods and Supplies)

INDUSTRY SNAPSHOT

On June 1, 2001, the International Council of Toy Conferences announced that toy sales worldwide reached \$69.5 billion. In 2001, the American toys and hobby goods wholesaling industry was composed of 3,025 establishments. The industry employed about 36,890 workers. In 2003, there were a total of 31,100 establishments that generated about \$27,883.60 million. The toy and hobby goods and supplies represented 27 percent of the total market, or 8,380 establishments. The majority of the industry was located in California, Florida, Illinois, Michigan, New York, Ohio, Pennsylvania, Texas, and Washington.

BACKGROUND AND DEVELOPMENT

Wholesale distributors of toys experienced a shrinking customer base in the early 1990s, as national toy store chains and discount stores began to buy directly from manufacturers. Sales in the mid-1990s continued to grow, up by 20 percent from 1992 to \$20 billion. However, since 1992 expenses have been rising faster than sales. While toy distributors were once the most important customers at toy fairs, Toys 'R' Us became the leading toy retailer in the mid-1990s and had the most purchasing clout with toy manufacturers, accounting for 20 percent of U.S. toy sales in 1996. Sydney Ladensohn Stern and Ted Schoenhaus, authors of *Toyland: The High Stakes Game of the Toy Industry*, wrote that toy manufacturers referred to the wholesale distributors as "dinosaurs because they used to be the toy company's most powerful customers, and today they are almost extinct." However, wholesale distributors of toys continue to supply smaller, independent toy stores and department stores, and still regarded their industry as playing a pivotal role in the toy marketplace.

Even toy specialty retailers were not immune to a shifting market, however. By 1998, Toys 'R' Us had been surpassed by Wal-Mart as leading toy retailer. Wal-Mart commanded 17.4 percent of the market, while Toys 'R' Us dropped to 16.8 percent of the market.

Acknowledging changes in the marketplace, the Toy Wholesalers Association changed its name to the Toy and Hobby Wholesalers Association in 1989. Like wholesalers in other industries, toy and hobby wholesalers refocused their business to provide value-added services generally not offered by manufacturers.

Value-added Services and the Role of the Distributor
Consolidation of toy manufacturers and retailers meant

massive changes for the distribution network of the toy industry. Eliminating the added expense of distributorships, major toymakers were able to offer volume discounts to toy stores and other retailers of toys. Furthermore, toy store chains such as Toys 'R' Us established their own distribution centers from which to supply their stores. In 1995, the pressure on distributors increased as more manufacturers went to direct distribution of their products, an effort led by Marvel comic books and Citadel Miniatures. This second wave in the direct distributorship drive proved even more vexing for the wholesalers because the manufacturers involved introduced the licensing of retail outlets. These licensed dealers received delivery of new product releases before non-licensed dealers and wholesalers, which further tightened the market for distributors.

Consequently, toy and hobby wholesale distributors targeted smaller retail stores and chains, offering merchandise from the smaller manufacturers. They also expanded their industry to include the distribution of hobby and craft items. Distributors recognized that service was vital to their survival in a tough market.

William L. MacMillan, executive director of the Toy and Hobby Wholesalers Association in 1991, noted in a 1991 article in *Playthings* magazine that the distributor could still offer many unique services to both retailers and manufacturers. For instance, the distributor, having associations with thousands of products and retailers, was able to provide valuable information to toymakers and toy sellers. MacMillan suggested that the wholesaler could act as a consultant to new retailers, advising them about such issues as the proper quantities to keep in stock and the benefits of certain promotional techniques. Furthermore, MacMillan observed, the distributor could provide valuable services to manufacturers by offering information on how various products were selling in specific markets, providing advertising aid through distributor-sponsored promotions and in-store displays, and providing sales training to store personnel.

The distributors' volume buying power meant they could offer retailers lower prices than the manufacturer, and by maintaining fully stocked warehouses, distributors also helped save retailers and manufacturers inventory space. In addition, a computer network for ordering, sales, and inventory became perhaps the most important value-added service. Through such a network, distributors provided an efficient means of sharing information with both manufacturers and retail clients.

According to a survey of the entire wholesale distribution industry, consolidation of the distribution industry led to fewer but stronger competitors able to offer a wide range of services including volume discounts, improved financing options, and adoption of state-of-the-art warehouse technology.

Although consolidation of the retail toy industry forced many distributors out of business, those that remained were more efficient and were able to explore smaller manufacturers and retail accounts, including independent drug and specialty stores.

Craft and Hobby Boom The crafts and hobby industry experienced a renewed popularity in the early 1990s, probably due to a return to homemade gifts and decorations prompted by economic recession. A 1994 survey by the trade group Hobby Industries of America found that participation in crafts or hobbies had increased, with 81 percent of U.S. households participating in a particular craft or hobby, compared to 77 percent four years earlier.

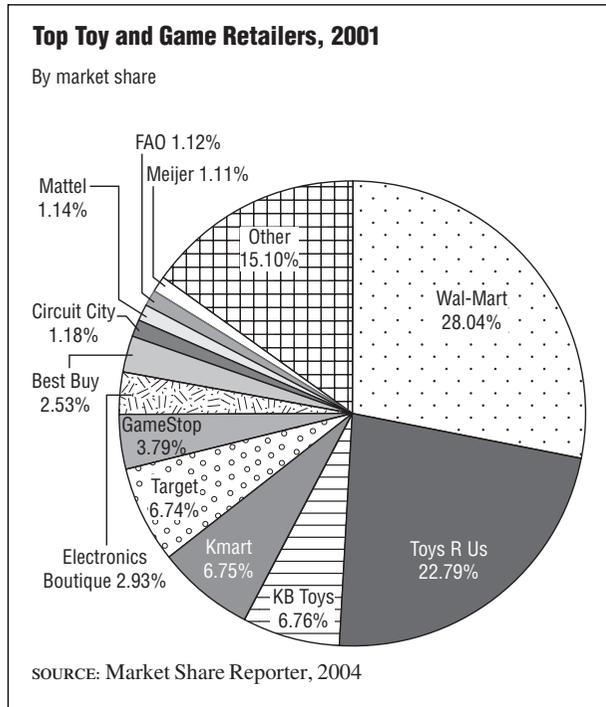

New Technology's Impact Probably the most intriguing change in the toy industry was the birth of the Internet. Companies such as eToys, founded in 1996, gained considerably publicity during the 1999 Christmas season. eToys offered buyers the opportunity to shop at home for hard-to-find toys rather than braving crowded stores and frenzied shoppers. The company's sales in 1999 were \$30 million, but that represented a 4,267 percent jump from the previous year. There are numerous concerns and challenges surrounding the concept of e-trade, but there is no question that as the technology improves, online toy shopping will become an important element of the sales structure.

CURRENT CONDITIONS

According to *Playthings* magazine, the toy industry has had to go 'back to the drawing board.' Joe Diaz, president of the Learning Express since 1987, agreed in an interview that if independent retailers 'cannot find a way to cooperate, they will not survive.' Long time toy retailers KB Toys, FAO Schwarz, Inc., Zany Brainy, and The Right Start filed for Chapter 11 bankruptcy protection following the 2003 Christmas season.

The five top leaders in the toy industry controlled almost 60 percent of the overall market share. According to the *Market Share Reporter*, Wal-Mart accounted for 20 percent of the market, Toys 'R' Us claimed 17 percent, Target generated 8 percent, while Kmart had 6 percent, and KB Toys had 5 percent. In addition, Wal-Mart dominated as the top toy and game retailer in 2001 with 28.04 percent. Toys 'R'Us followed with 22.79 percent, KB Toys with 6.76 percent, Kmart with 6.75 percent, and Target with 6.74 percent.

Craft items continued to be a favorite among consumers. According to the *Market Share Reporter*, "Americans were spending more time at home." Michaels Stores were the leaders with \$2.5 billion, followed by Jo Ann Stores with \$1.6 billion, Hobby Lobby had \$1 billion, followed by a distant fourth, Frank's Nursery & Crafts with \$371 million.

INDUSTRY LEADERS

Among the leaders in this industry at the end of the 1990s were Ben Franklin Crafts Inc., with more than \$350 million in annual sales and more than 200 workers, and Applause, LLC (formally Applause Enterprises Inc.)—makers of the popular Beanie Babies—with \$300 million in sales and more than 1,700 employees in 1999.

Ben Franklin Retail Stores Inc. had franchised variety and crafts stores throughout the U.S. by the end of the 1990s. The company also owned and operated a chain of Ben Franklin superstores. The parent company was the wholesale distributor for both the variety and craft franchises.

Applause, LLC is best known for its plush toys, including characters from Sesame Street and Disney. It was created in 1995 when Dakin, a plush toy manufacturer, merged with a company founded by Wallace Berrie, brother of rival novelty manufacturer Russ Berrie. In addition to plush toys it produces items such as magnets, keychains, and tableware decorated with its licensed characters (such as Looney Tunes and the Muppets).

WORKFORCE

According to the U.S. Census Bureau, there were a total of 36,890 employees in 2001, a decrease from 38,325 in 2000. The majority of companies in this classification were small; in 2001, 1,399 companies had fewer than five employees; 502 had between five and nine employees; 310 had between 10 and 19; 338 had between

20 and 99; 127 had between 100 and 499; and 37 had 500 or more employees. The total annual payroll totaled \$1.5 million in 2001. In 2003, the total workforce totaled 159,480 workers.

SIC 5093

SCRAP AND WASTE MATERIALS

This industry category includes establishments primarily engaged in assembling, breaking up, sorting and distributing scrap and waste materials. The industry also includes auto wreckers engaged in dismantling automobiles for scrap. Those establishments engaged in dismantling cars for the purpose of selling secondhand parts are classified under **SIC 5015: Motor Vehicle Parts—Used**.

NAICS CODE(S)

421930 (Recyclable Material Wholesalers)

INDUSTRY SNAPSHOT

The United States generates more than 229 million tons of municipal waste annually, distributed as follows: paper and cardboard, 36 percent; yard trimmings, 12 percent; metals and plastics, 19 percent; and other waste, 33 percent. In addition to collection, the scrap and waste materials industry operates the sorting and recycling services that help to reduce the amount of waste sent to landfills. To that end, it also processes for wholesale distribution a wide variety of materials including bags and bottles, fur cuttings and scraps, nonferrous metal wastes and scraps, and rubber scraps. The industry's primary output, however, has been wastepaper and ferrous scrap metals such as iron and steel.

In 2001, the United States Environmental Protection Agency (EPA) reported that the total municipal solid waste generation of 229 million tons before recycling consisted of yard trimmings 12.2 percent; wood 5.7 percent; rubber, leather and textiles 7.1 percent; plastics 11.1 percent; metals 7.9 percent; glass 5.5 percent; food scraps 11.4 percent; paper 35.7 percent; and other was 3.4 percent.

There were a total of 8,133 establishments engaged in the scrap and waste materials industry in 2003. Combined they generated approximately \$20.1 billion. There were about 75,853 workers with approximately nine employees per establishment. The average sales were about \$2.90 million per establishment. States with the highest number of businesses in this industry were California with 1,053 establishments, Texas with 563, New York with 505, Pennsylvania with 459, and Ohio numbered 437.

ORGANIZATION AND STRUCTURE

Scrap Wastepaper. Wastepaper processors use large balers to bundle compressed wastepaper—such as newsprint, cardboard, or office paper—for shipment to paper mills for recycling. Recycling efforts by the scrap industry increased substantially during the final decades of the twentieth century, recovering 45 percent—45 million tons—of all paper and paperboard used nationally in 1997; recycled office paper alone increased to 48 percent, up from just 15 percent in 1990. The industry set a goal to recycle 50 percent of all paper, and 65 percent of office paper by the year 2000.

Export markets increased by 285 percent from the mid-1980s and the mid-1990s, and prices for recycled paper products soared in 1995, but fell again in 1996. A subsequent no-growth forecast for the entire paper industry late in 1998 led producers to forestall plans to increase plant capacity for recycling of paper products as the 1990s drew to a close. At that time the American Forest & Paper Association projected a continued 2.1 percent annual growth for recovered fiber, which reflected a 75 percent decline from previous growth. Revised projections called for recycled paper to flatten and stabilize at 36 percent of total product, with printing and writing paper down at 10 percent. The lower projections stemmed from an ongoing pattern of lack of demand. Meanwhile, paper recovery in Japan and Europe remained above 50 percent.

To help bolster the market, companies developed chemicals and techniques for improving the marketability of recycled paper products. Ponderosa Fibers of Baltimore, Maryland, developed a method for removing fluorescence from office wastepaper, and Cytec Industries Inc. of West Paterson, New Jersey, introduced a chemical that reduced bleeding of ink in recycled paper products. A growing trend among producers in 1998 was to move aggressively toward lowering the chlorine content through substitution, with a goal of achieving elemental chlorine-free (ECF) pulp. There were a total of 412 establishments handling the waste paper in the United States. There were about 6,231 workers contributing to \$8.8 million in sales in the mid—2000s.

Scrap Iron and Steel. Scrap iron and steel companies collect junked cars, steel from buildings, and scrap from metalworking industries, then process it for use by steel mills. Processors are required to remove and properly dispose of many hazardous wastes before shredding any metal scraps. Of particular concern is the disposal of shredder fluff—the waste left after processing metals—which often contains high levels of oils, PCBs, lead, and cadmium. At least 75 percent of shredder waste is recoverable. Ways to recycle this waste are being studied by government and industry researchers alike.

In the mid-1990s, U.S. steelmakers were using more than 70 million tons of scrap metal annually to produce new steel. Globally, the use of scrap metals reached 400 million tons. Some analysts predicted that this demand on a global scale would keep prices high throughout the 1990s. However, demand leveled off by 1996, and prices for ferrous scrap metals dropped. A 1997 rebound in prices, offset by a monetary crisis in Asia, led to an industry slump at the close of the decade. The industry recycled 1.9 million tons of steel in 1998, or 72.1 percent of eligible steel—a decline of 8.9 percent from the 1997 recycling level of 81 percent. The decrease resulted from excessively low steel prices brought about by the economic crisis in Asia and by “steel dumping” (excessive cheap exports) by foreign nations. Analysts detected some improvement early in 2000 as Asian recovery progressed, and secondary producers fought to maintain an effective price differential between primary and secondary product. There were approximately 1,050 establishments that were engaged within the metal scrap and waste materials industry sector employing about 15,847 workers. Combined, they generated \$8.3 million in sales in the mid-2000s.

Scrap Plastic. The United States used more than 30 billion pounds of plastics annually in the 1990s, of which the recycling rate was nearly 20 percent. By the late 1990s, more than 15,500 U.S. communities—representing nearly 50 percent of the U.S. population—had access to some form of plastics recycling.

In response to the growth in plastics recycling, research and development departments sought ways to use various types of recycled plastics. One industry association listed more than 1,300 uses for recycled plastics, including products such as PCV pipes, lawn furniture, and auto dashboards. A technique called pyrolysis can convert plastics from shredder fluff into fuel oil. This process is being tested by the Illinois-based Argonne National Laboratory. There were a total of 1,009 workers throughout 137 businesses specifically handling scrap plastic in 2003.

CURRENT CONDITIONS

According to the EPA, there was a 1.2 percent decrease from 2000 until 2001 of municipal solid waste due to the slowed economy. The main industry segment affected was paper and paperboard, a segment which dropped 5.7 percent. During that same time period, according to *Waste Age Magazine*, the slowed economy led to consumers buying less, leading to lower consumption. Overall, there was a decrease of 2.8 million tons in 2001, or 0.11 pounds per day of individual consumption. There were also less operational landfills located throughout the United States in 2001. This had been an ongoing trend for the industry that wanted to operate larger facilities that

were easily accessible. The total number of landfills had dropped to 1,858 in 2001 from 2,216 in 1999.

INDUSTRY LEADERS

The largest company in the solid waste handling industry in 1999 was Waste Management Inc. of Houston, Texas—formerly USA Waste Services. Waste Management took its new name following a 1998 acquisition of the former Waste Management Corp. A *Fortune* 500 company, Waste Management reported \$12.7 billion in sales. Waste Management maintains operations worldwide through Waste Management International. In 2003, Waste Management’s annual sales were \$11.6 billion. Allied Waste Industries Inc., with \$1.7 billion in holdings, assumed the rank of second largest waste handler, following its acquisition of BFI. Allied Waste reported \$1.6 billion in sales for 1998, and \$5.2 billion for 2003.

Among recycling firms, IMCO Recycling Inc. of Irving, Texas, is the world’s largest recycler of aluminum, with 20 plants in the United States, and overseas operations in Wales and Germany. IMCO sells to General Motors, Alcoa, and Kaiser Aluminum among others. IMCO’s 1999 sales totaled \$765 million and \$892 million reported for 2003.

Junk Conglomerates. In 1999 two major corporations entered the salvage arena. Prior to that time, according to the Automotive Recyclers Association in 1997, that industry involved 5,500 independent firms engaged primarily in parts recycling, for estimated collective revenues of \$7.05 billion annually. A survey conducted by the association and reported in *Automotive News* revealed that 86 percent of U.S. junkyards maintained a staff of 10 or fewer employees in 1997. The scenario shifted course between April of 1999 and January of 2000, as the giant automaker, Ford Motor Co., entered the marketplace through a wholly owned subsidiary called Greenleaf Acquisitions. The incorporation of Greenleaf was a critical move in a new diversification strategy underway at Ford, and by January of 2000 Greenleaf had expanded into 6 of the United States and had acquired a total of 20 previously independent junkyards. At that time the company indicated plans for international expansion into Canada, Mexico, and Europe. Management projections held that Greenleaf’s annual sales might surpass \$1 billion at an undetermined time in the future, primarily through the salvage car parts market. Ford’s entry into the salvage market followed an earlier move by LKQ Corp. to diversify into junkyards in 1999.

RESEARCH AND TECHNOLOGY

Power of Plastic. A \$20 million plant for gasification of recycled plastic—the world’s first facility of its kind—was under construction at Varkaus, Finland, in 1999. The plant, designed to recycle aluminum and plastic packag-

ing, promised to convert the waste into gas energy. Common types of refuse included in this category include paper cartons designed to contain liquid, as such cartons typically contain 30 percent plastic and aluminum foil. The new plant, designed to support recovery of aluminum, can operate at 95 percent energy savings over aluminum ore processing. Prior to the Varkaus plant, aluminum recovery from cartons was considered unfeasible. Corenso United Oy, Foster Wheeler, and VTT Energy undertook the construction of the plant as a joint venture. VTT Energy is a research organization that pioneered the gasification technology in the early 1980s. The plant, according to projections, will produce more than 2 million kilograms of aluminum every year, for export to Sweden. Also in Europe, in 1999 German researchers reported initial success with near-infrared spectroscopy (NIR) as a method for determining the paper content of plastic for recycling. NIR can be implemented more cheaply and faster than current chemical processes in use.

Automation. A process that automated the sorting of waste was designed by National Recovery Technologies Inc. of Nashville, Tennessee, in conjunction with the U.S. Department of Energy's Office of Industrial Technologies. Not only did this new technology allow for sorting according to material, but also according to more specific characteristics such as color, or particular type of plastic. With these new advances, up to 1,500 tons of municipal solid waste can be processed in one day. The EddySort system, manufactured by Wendt Corp. of New York, can recover virtually all nonferrous metal from automobile shredder fluff. Overall, automating the recycling process improves both the speed and efficiency of the recovery of hazardous wastes. Technologies also are being introduced to improve or provide additional applications for recycled paper and plastics, which ultimately will strengthen the market for industry products.

SIC 5094

JEWELRY, WATCHES, PRECIOUS STONES, AND PRECIOUS METALS

This industry classification comprises establishments involved in the wholesale distribution of jewelry, watches, precious stones, and precious metals. Products of the industry include clocks, coins, gem stones, pearls, precious metals bullion, silverware, and trophies. Establishments primarily engaged in the wholesale distribution of precious metal ores are included in **SIC 5052: Coal and Other Minerals and Ores**.

NAICS CODE(S)

421940 (Jewelry, Watch, Precious Stone, and Precious Metal Wholesalers)

INDUSTRY SNAPSHOT

According to the U.S. Census Bureau, the jewelry, watch, precious stone, and precious metal wholesalers represented approximately 8,215 establishments. Combined, these employed some 54,408 people with an annual payroll of \$2 billion. In 2003, the total number of establishments climbed to 12,936. The industry generated approximately \$13.8 billion in annual sales. The total number of employees reached 61,411. The average sales per establishment were \$1.10 million. The majority of the establishments were small—employing fewer than five people. There were a total of 9,939 establishments with fewer than five employees.

Jewelry, the largest sector of the industry, numbered 4,872 establishments and dominated more than 37 percent of the market. Together, this group accounted for \$4.8 billion in sales. The jewelry and precious stones sector numbered 3,435 establishments and controlled more than 26 percent of the market. Combined, this group generated \$2.5 billion in sales. Diamonds represented 1,327 establishments and controlled about ten percent of

the market, with \$1.7 billion in sales. States with the majority of establishments include New York with 2,981, California with 2,685, and Texas with 1,143.

BACKGROUND AND DEVELOPMENT

Jewelry is as universal and ancient a form of adornment as clothing. It has been made of a variety of materials from human hair to precious metals and gems, and has been used to signify social status, wealth, official or political rank, holidays and celebrations, and fad and fashion. Its forms have included items for the head (hairpins, headbands, crowns, earrings, and lip and nose rings); neck (pendants and necklaces); chest (brooches, cloak clasps, buttons); waist (belts and girdles); and arms and legs (bracelets, anklets, and rings). As an industry, jewelry has been represented in all the major civilizations by goldsmiths, metalworkers, gem cutters, and many others. The Byzantine Empire (approximately the 6th to 13th centuries) with its profusion of gold and enamel and the European Renaissance (the 15th to 17th centuries) characterized by the use of gemstone-embellished fabrics and chains, ropes, pendants, and girdles were perhaps the greatest moments in the history of jewelry.

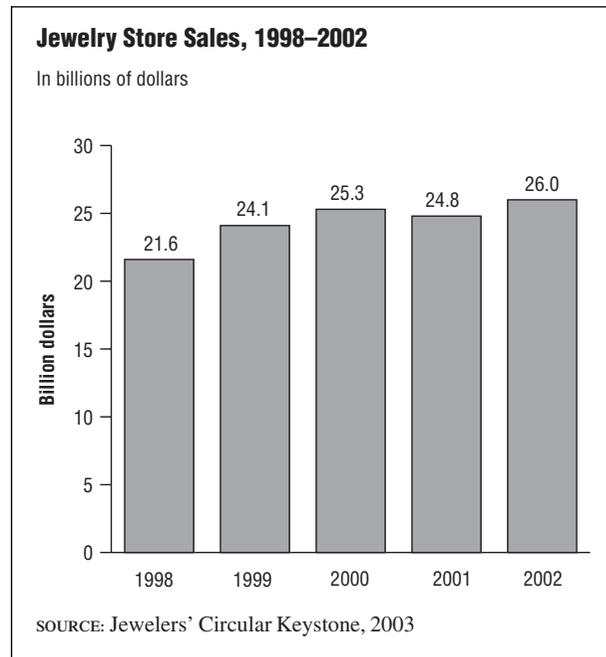

Watches were developed around 1450-1500 when the coiled spring made the invention of the pocket watch possible. By the 17th century, crystal faces to protect the workings, bearings, hairsprings, and balance wheels were standard. Watches were handcrafted by skilled artisans until about 1800 when machine-made parts led to mass production. Electric and electronic watches were introduced in the 1950s and 1960s.

During the first few years of the 1990s, conditions within the jewelry, watches, precious stones, and precious metals industry were unstable. In 1993, the number of establishments was about 6,800 and sales were about \$45 billion, which was up from a 1990-91 low of about 6,000 establishments and \$40 billion in sales. High numbers of retailer bankruptcies, fluctuations in international currency exchange rates, and the recession in the United States and abroad led to reduced profitability for wholesale dealers.

In January 1994, however, *Jewelers' Circular-Keystone* reported that conditions appeared to be improving. Some diamond dealers attributed the turn-around to the repeal of the federal luxury tax in 1993. During 1994, the heaviest projected demand was for diamond jewelry, loose diamonds, and karat gold jewelry.

Gem stones were also experiencing an upswing. Industry forecasters expected growth in ruby, sapphire, emerald, tourmaline, and tanzanite sales. The highest projected demand was for stones in earth tones, such as orange and peach.

Pearl dealers also anticipated improving conditions. Although high-quality Japanese pearls remained expen-

sive and in short supply, forecasters predicted that increased supplies of Chinese freshwater pearls and South Sea pearls would help bring prices down in the lower-quality sector of the pearl market. This, coupled with increased demand, was expected to yield higher net profits.

Watch suppliers also expected sales to increase slightly during 1994. Annual U.S. watch sales were pegged at 65 million units with women's and jewelry watches, sport watches, upscale watches, two-tone watches, stainless steel watches, and watches with lighted dials remaining popular.

In the mid-1990s, jewelers were trying to lower their business costs, increase productivity, and tighten their customer base to increase profitability. The diamond trade was having especially low confidence due to foreign competition.

The industry employed more than 50,000 and generated sales of about \$44 billion in 1998. Sales in jewelry stores increased about 8.5 percent from 1997 to 1998 to \$22 billion, and about 40 percent of sales occurred in the fourth quarter of 1998, in keeping with traditional holiday sales trends. Other than jewelry stores, gemstones, jewelry, precious metals, and watches are sold by department stores, warehouse stores, home shopping television, catalogs and showrooms, and over the Internet.

Over 28,000 jewelry stores across America accounted for approximately half of the nation's jewelry sales in 1998. Consolidation occurred as large chains purchased others, and growth took place as these same chains expanded their number of outlets in shopping malls. Zale Corporation acquired Peoples Jewelers of

Canada in June 1999, but Service Merchandise (a major catalog showroom) filed for bankruptcy, also in 1999; these events show that this industry is both highly competitive and risky. Retailers have sought new ways of improving product value. As a result, jewelry imports have increased from 26 percent in 1983 to 52 percent in 1997. With economic declines in Asia, Asian wholesalers have turned to the United States and Europe with increased volumes of exports.

Jewelers improved their prospects substantially in the late 1990s by better marketing and improved tracking of supplies, demand, and sales; they also were able to capitalize on simple demographics as the United States emerged from the recession earlier in the decade with baby boomers reaching their maximum earnings years and investing their income in jewelry. The large jewelry chains were continuing to consolidate into the 2000s, and retailers were optimistic about trends and fashions in jewelry and watches and growth of markets at a range of income levels.

CURRENT CONDITIONS

Jewelers credit the bridal business with 30 to 50 percent of their revenue. Holidays and gift-giving opportunities, are also major factors in sales of watches and jewelry. Year-round spending and the growth of purchases among women of jewelry for themselves have made jewelers less dependent on December holiday sales, despite cyclic sales related to the economy and, to a lesser degree, the seasons.

Jewelry sales also depend heavily on fashion trends. Colored gemstones, designs from natures, diamonds in virtually any form, yellow gold, white metals, princess-cut gemstones, Tahitian pearls, and invisible necklaces are expected to be among the most popular.

In precious metals, gold commodity prices have continued to drop, but jewelry manufacturers and retailers have yet to pass savings along in lower prices because, given the metal's volatile price, they are protecting their ability to pay higher prices for gold over the coming years. Forecasters expected sales of silver jewelry and other white metals to remain strong, with platinum is the strongest of the precious metals in sales. China and Japan lead the world in consumption of platinum jewelry.

INDUSTRY LEADERS

The top 20 firms in jewelry sales consisted of about 50 percent jewelry specialists. Tiffany & Co., Whitehall Jewelers, and the Piercing Pagoda were the only three companies with both unit growth and sales that exceeded 20 percent. For the industry as a whole, 1998 sales growth was 7 percent (compared to 8.7 percent in 1997) and unit growth was 2.3 percent (3.8 percent in 1997). The two major television shopping networks generated about 3 per-

cent of industry-wide sales in 1996 through 1998. Of the three corporate leaders, Tiffany & Co. epitomized quality and name recognition worldwide; in the second quarter of 1999, Tiffany's earnings increased 63 percent. Whitehall Jewelers, Inc., has 276 stores in 31 states and has projected earnings growth rates of 30 percent and 22 percent for fiscal 1999 and 2000, respectively. Following a massive reorganization in the late 1980s, Zale Corporation is the largest specialty retailer (per 1999 statistics) with 1,300 stores in the United States, Canada, and Puerto Rico under several firm names; they also have considerable direct mail and online sales. The specialty jewelry market posted positive results from 1998 through 2002, according to *Jewelers' Circular Keystone*. Overall sales increased about 20 percent over the five year period, falling only in 2001 to 2.2 percent.

Internet sales of jewelry and watches are anticipated to rise to \$56 million in 2000 and \$140 million by 2001. Polygon Network, Inc., maintains Web sites for approximately 3,000 retailers and suppliers on six continents as well as providing online information resources. The Network experiences daily transactions of about \$3 million and, as of 2000, holds a loose diamond inventory valued at about \$100 million.

RESEARCH AND TECHNOLOGY

Sellers of diamonds are increasingly threatened by sales of cubic zirconium and other, less expensive "diamond look-alikes". The largest diamond marketer worldwide, De Beers, is experimenting with "diamond branding" to mark the firm's name and identification numbers on diamonds. Development of this technique includes reader machines to detect the tiny, laser-cut inscriptions. Production of synthetic gemstones continues to be a strong research field.

De Beer's who had been in control of the synthetic diamond market, had new rivals. Newly formed Apollo Diamond Inc. located in Boston, Massachusetts, and Gemesis Corp. of Sarasota, Florida had come up with a new technology for producing manufactured synthetic diamonds within a lab. De Beer's never dreamed the Russian technology would ever be mastered. The actual manmade diamonds are created in only a few days versus the natural diamonds that are mined from under the earth. Appollo used a process known as Chemical Vapor Deposition (CVD), while Gemesis used a high—pressure, high temperature technique that imitates the geologic conditions under which natural diamonds are formed. The diamonds were expected to be sold about 30 percent less than the price of a natural diamond. Gemesis had sold its yellow synthetic diamonds through retail jewelers at about 10 to 50 percent less than the manmade diamonds. Gemesis was working on producing various other colors, specifically blue, by late 2004.

SIC 5099

DURABLE GOODS, NOT ELSEWHERE CLASSIFIED

This industry classification includes wholesale distributors of durable goods that are not categorized elsewhere. It includes distributors of prerecorded audio cassettes, compact discs, and phonograph records; fire extinguishers; firearms and ammunition, except sporting; coin-operated game machines; luggage; monuments and grave markers; musical instruments; nonelectric signs; and forest products, except lumber, such as cordwood, hewn logs, and wood chips.

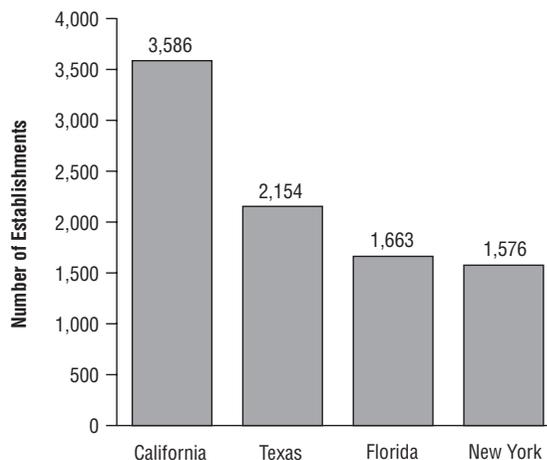

NAICS CODE(S)

421990 (Other Miscellaneous Durable Goods Wholesalers)

According to the U.S. Census Bureau the durable goods industry consisted of 14,285 establishments in 2001, employing about 99,261 workers. In 2003, the number increased to 22,521 establishments with total annual sales estimated at \$24,665.80 million. The average sales generated per establishment totaled about \$1 million. States with the highest number of establishments were California with 3,586, Texas with 2,154, Florida with 1,663, and New York with 1,576.

In 1997 Dun and Bradstreet listed 22,521 establishments in the durable goods industry, which generated \$659 billion in sales, up from \$617 billion in 1996. The industry also generated profits of approximately \$107 billion dollars, up \$15 billion from the previous year. In

States with the Largest Number of Establishments in the Durable Goods Industry

SOURCE: D & B Sales & Marketing Solutions

1998 profits dropped to roughly \$100 billion, due in large part to struggling overseas economies, especially in Asia. Orders for durable goods rose again in 1999, to a record \$186 billion dollars in August. But over the next two months the U.S. Department of Commerce reported that orders for durable goods had fallen 1.3 percent.

General merchandise such as luggage, non-sporting firearms, and non-electronic signs accounted for approximately 32 percent of sales in the durable goods industry during the 1990s; musical recordings made up 26 percent; forest products excluding lumber were 24 percent; musical instruments and supplies accounted for 4 percent; fire extinguishers and safety equipment totaled 2 percent; and other durable goods filled out the remaining 12 percent.

Dun and Bradstreet listed 158 U.S. dealers of non-sporting firearms in 1999. Most such dealers had less than 10 employees and reported sales between \$50,000 and \$500,000, with more successful dealers commonly being located in higher crime areas like Los Angeles, California.

In 2003, products from this industry segment dominated the durable goods market. The segment accounted for 7,941 total establishments within the industry. Safety equipment and supplies generated 9.6 percent; video and audio equipment accounted for 9.3 percent; wood and wood by-products made up 7.9 percent; musical instruments made up 2.8 percent; firearms and ammunition (except sporting) accounted for about 2.5 percent.

Samsonite was the world's largest manufacturer of luggage in the 1990s. The maker of American Tourister,

Lark, and Samsonite brand names reported more than \$175 million in U.S. sales during 1997, and employed 7,300 workers.

There were more than 1,100 U.S. nonelectronic sign makers in 1997, but only a fraction reported annual sales in excess of a \$1 million. Display Technologies, Inc., of Orlando, Florida, was one of the leading sign makers in the country during the late 1990s, posting sales of approximately \$66 million in 1997, and employing 525 workers. In 1999 Display Technologies bought Lockwood Group Inc., a commercial sign manufacturer in Atlanta, Georgia. Revenue for Lockwood totaled more than \$10 million in 1998.

Warner-Elektra-Atlantic Corp., a subsidiary of multimedia conglomerate Time Warner Entertainment Co., L.P., was one of the nation's leading distributors of prerecorded music over the past 10 years. It had sales of more than \$222 million in 1997 and employed approximately 1,200 people. Yamaha Corporation of America was one of the leading U.S. distributors of musical instruments, posting \$185 million in sales during 1997 and employed approximately 1,000 workers.

The durable goods industry employed 72,000 workers in the mid-1990s, and had an annual payroll exceeding \$2 billion. The average industry worker brought home approximately \$588 dollars per week in pay in 1997. A 1999 survey of leading U.S. employers indicated that the biggest demand for workers in 2000 would come from durable goods manufacturers, 30 percent of which reported plans to hire employees.

In 2003, the workforce had increased to 114,615 workers. The majority of establishments employed under five people. There were a total of 18,153 establishments with five or fewer employees. There were 2,196 that employed between 5 and 9; 1,331 employed between 10 and 24; 391 employed between 25 and 49; 165 employed between 50 and 99; 80 employed between 100 and 499; and 23 establishments employed more than 500.

SIC 5111

PRINTING AND WRITING PAPER

This industry classification includes wholesale distributors of printing and writing paper. Products of the industry include fine paper, envelope paper, and ground wood paper. Wholesale distributors of computer paper and stationery are classified in **SIC 5112: Stationery and Office Supplies**.

NAICS CODE(S)

422110 (Printing and Writing Paper Wholesalers)

INDUSTRY SNAPSHOT

In 2003, there were about 1,860 printing and writing paper wholesale distributors in the United States, generating revenues in excess of \$7.8 billion. The industry employed almost 29,000 workers, the vast majority of whom worked in firms employing fewer than ten people overall. But this trend was changing by the mid-2000s as a result of difficult industry conditions. As the industry fell on hard times in the late 1990s and the early 2000s, paper producers and paper wholesalers alike underwent a wave of consolidation.

Resource Information Systems Inc. (RISI), in its 2003 *North American Graphic Paper Forecast*, reported that printing and writing paper was falling behind the pace of the U.S. economy. Notoriously chained to the performance of the overall economy, the paper industry as a whole tended to patiently weather downturns as a lapse in the broader market. In the early 2000s, however, that connection was beginning to slip, as demand for printing and writing paper lagged behind even the sluggish U.S. economy.

Overcapacity through the late 1990s and early 2000s was largely to blame for the decline in prices the plagued the industry. But the American Forest & Paper Association (AF&PA) found that the sustained downturn that marked the paper industry through the late 1990s and early 2000s had begun to level off by 2003. As the industry stabilized, prices were expected to creep upwards again. Still, while demand and prices were expected to rebound with the improving economy through the mid-2000s, analysts expected the pace to lag a bit behind the overall economy. To make matters worse, the U.S. industry also faced fierce foreign competition, as overseas firms delivered quality improvements at a brisk pace and sold them at aggressive prices, helping exacerbate the downturn in U.S. paper prices.

ORGANIZATION AND STRUCTURE

Printing and writing paper is grouped in four large categories: uncoated groundwood, coated groundwood,

uncoated freesheet, and coated freesheet. “Groundwood” refers to paper made from mechanical pulp, and “freesheet” refers to paper made from chemical pulp (see **SIC 2611: Pulp Mills**). “Coated” refers to paper that has been treated to improve printability and/or appearance. Printing and writing papers range from the lower-quality paper used to print advertising circulars to the high-quality coated paper used to print upscale magazines. These categories do not include newsprint, which is considered to be a low-quality paper.

Through the 1990s, distributors and wholesalers of printing and writing paper focused on forming strategic alliances with major commercial printers and with other high-volume end users. In some cases, distributors became sole suppliers to certain printers. On the “imaging” side of the business, the growth of desktop computers, software graphics programs, and new output devices challenged paper distributors to more closely match paper requirements to their customers’ imaging needs. To do this, distributors had to provide more technical assistance to customers.

BACKGROUND AND DEVELOPMENT

In the 1980s and 1990s, printing and writing paper distributors had to deal with wide price swings brought about by the volatile market for paper products. For example, after several years of below average pricing in the early to mid-1990s, the average price for all pulp, paper, and paperboard products rose 34 percent in 1995, with some printing and writing grades rising as much as 75 percent. However, the next year prices dropped as much as 30 percent in some grades. This volatility was brought about by a complex cycle of mill capacity additions, changes in inventory, and paper usage. For example, as the cost of printing and writing paper soared in 1995, publishers and printers increased their inventories dramatically in anticipation of future price increases. When publishers and printers began using this inventory, they stopped buying new supplies and prices for printing and writing paper tumbled.

For distributors and wholesalers, this pattern made business planning difficult. When demand and prices were high, they could make incremental profits, but down cycles were difficult since they were carrying the double burden of excess inventory and low unit prices.

The growing popularity of electronic modes of communication such as the Internet, electronic mail, and voice mail certainly contributed to the slowdown in demand for printing and writing paper in the late 1990s. These means of communication were still in their infantile phases in the early and mid-1990s and did not impact the industry. In fact, wholesalers of printing and writing paper showed consistent sales growth in the early to mid-1990s, moving from \$32.3 billion in 1990 to \$37.9

billion in 1993 and \$43.2 billion in 1996, sustaining average growth of 5.6 percent, well ahead of inflation.

CURRENT CONDITIONS

While the sluggish U.S. economy certainly played its part, many analysts attributed a share of the paper industry’s woes to the accumulated effects of the shift toward electronic media. While these effects were predicted—often to dramatic extremes—in the 1980s and 1990s, only around 2000 did the combined shift to electronic media play out across fields and sectors—from electronic plane tickets to online advertising, for example—to rear up and create a major and lasting dent throughout the paper industry. However, optimists had something to cheer about in the mid-2000s, as advertisers, many of them licking wounds from the disappointments of Web-based banner advertising, slowly returned to the printing fold.

The early 2000s represented a period of recovery from the chronic aggregate paper production overcapacity in the United States and of adjustment to rising foreign competition and to continued weak demand. After capacity growth leveled off in the late 1990s, paper production capacity fell 1.9 percent in 2001 and an additional 1.3 percent in 2002 to reach a total of 100.5 million tons, down from 101.3 million in 1999, according to the forty-third annual capacity survey conducted in 2002 by American Forest & Paper Association (AF&PA). Projections for aggregate production capacity remained very slow, predicting increases of 1.1 percent in 2000, 0.7 percent in 2001, and 0.4 percent in 2002. The AF&PA estimated that capacity declined about 0.5 percent in 2003, with projections of modest increases of 0.8 percent in 2004 and 0.4 percent in 2005.

After experiencing annual capacity growth of 2.2 percent in the 1990s, printing and writing paper capacity dropped dramatically beginning in 1999. This trend continued into the 2000s, falling by 2.1 million tons between 2000 and 2002 to reach 27.3 million. While holding steady in 2003, capacity was expected to begin rising again in the mid-2000s, by 1.6 percent in 2004 and 0.5 percent in 2005 as prices rose and the industry shook off the effects of its late 1990s overcapacity.

The growth rate for uncoated groundwood capacity reached an astonishing 10.3 percent in 2002, with estimates of another 5.4 percent in 2003 and 3.4 percent in 2004 as total capacity inched back towards its 1996 peak of 2.3 million tons. Uncoated groundwood, meanwhile, achieved capacity growth of 2 percent in 2003 to reach 5.04 million tons. With an estimated decline of 2.4 percent in 2003, capacity for coated freesheet had fallen about 12.6 percent below its 2000 peak, due primarily to a string of mill closings, according to AF&PA. Uncoated freesheet capacity fell to its 10-year low of 13.6 million

Demand for U.S. Printing and Writing Paper

By percent change per year

Type of paper	2000	2001	2002	2003
Uncoated freesheet	-1.4	-7.4	-1.2	1.4
Coated freesheet	1.7	-11.5	6.4	3.9
Uncoated groundwood	6.0	-2.8	5.1	2.7
Coated groundwood	5.0	-6.9	0.7	3.8

SOURCE: Resource Information Systems Inc.

tons in 2002, though it was expected to rise and level off at 14 million in the mid-2000s.

INDUSTRY LEADERS

As in other industries, diversification, acquisitions, and mergers dominated the business plans of the leading companies. In 1999 market leader Unisource was acquired by Georgia-Pacific Corporation, the world's second-largest forest products company, but Georgia-Pacific sold 60 percent of its share of Unisource's distribution segment in 2002 to Bain Capital.

Unisource Worldwide Inc. of Berwyn, Pennsylvania, was the largest independent marketer and distributor of printing and imaging paper in North America, though it thinned its workforce in the early 2000s from 13,400 in 1998 to 11,800 in 2003. Sales took a similar dip over that period, from \$7.42 billion to \$4.76 billion. The firm operated about 100 distribution centers throughout North America and claimed Xerox among its clients.

Georgia-Pacific Corporation, based in Atlanta, Georgia, was a paper-industry behemoth, with 61,000 employees spread across its diverse operations. Georgia-Pacific's distribution operations raked in revenues of \$4.8 billion in 2002.

International Paper Co. of Purchase, New York, the other major player in this industry, relied on diversification to balance its business. The firm, which employed 72,500 workers in 2002, spent the early 2000s selling off many of its fringe operations to concentrate on its core paper and forest-product businesses. In 1998 International Paper purchased industry giant Mead's distribution business. Distribution revenues amounted to \$6.52 billion in 2002, though that accounted for the distribution of all its diversified products, from printing and writing paper to industrial and consumer packaging.

SIC 5112**STATIONERY AND OFFICE SUPPLIES**

This entry includes establishments primarily engaged in the wholesale distribution of stationery and office supplies, including computer and photocopy supplies, envelopes, typewriter paper, file cards and folders, pens, pencils, social stationery, greeting cards, carbon paper, business forms, loose leaf binders, and inked ribbons.

NAICS CODE(S)

453210 (Office Supplies and Stationery Stores)

422120 (Stationery and Office Supplies Wholesalers)

INDUSTRY SNAPSHOT

In 2003, D&B Sales & Marketing Solutions reported 10,262 establishments primarily engaged in the wholesale distribution of stationery and office supplies. Their combined sales were approximately \$52.2 billion, with the average business generating \$6.40 million in sales. The industry employed some 109,745 employees. However, these figures were down from just two years before when the U.S. Census Bureau reported 7,323 establishments, as well as 123,458 employees. The majority of establishments were small employing less than five people. California, Florida, Illinois, New Jersey, New York, Ohio, Pennsylvania, and Texas controlled more than half of the overall market.

Although the stationery and school supplies wholesalers have seen an increase in demand, the demand for business office paper had been in a slump for the past couple of years. With the softened economy followed by the September 11, 2001 attacks on the World Trade Center, businesses were scaling back. The stationery and school supplies wholesalers shared 60.3 percent of the market for 2002, or \$13.5 billion in 2002. The industry remained highly fragmented with five of the leading suppliers controlling 31.3 percent of the overall market.

ORGANIZATION AND STRUCTURE

Traditionally, wholesalers buy merchandise from a manufacturer and resell it at a profit to other wholesalers, retailers, or industrial and commercial customers. To compete with wholesalers, superstores such as Office-Max, Staples and Office Depot provide small businesses, and the distributors who supply those dealers, with similar merchandise for lower prices. As competition for smaller businesses intensified, larger distributors began focusing more on commercial accounts. For example, United Stationers targets commercial accounts with \$5 million or more in annual revenue, servicing industry office complexes of 50 or more employees. Unisource Worldwide also reports success in attracting and retaining regional and national accounts. In fiscal 1995, these key customers contributed more than \$600 million to Unisource revenues.

Wholesale distributors have also tried coordinating their efforts with the superstores rather than trying to compete with them. United Stationers began testing a distribution system with the largest office supplies superstore, Office Depot. United received products from 10 different manufacturers at its Atlanta distribution center, and then within 24 to 36 hours shipped the merchandise to 31 Office Depot stores in the southern United States. United also performed this service for smaller dealers and for some manufacturers by delivering products to the manufacturers' key accounts.

Many retailers and their commercial customers began operating on "just-in-time" delivery, requiring their distributors or manufacturers to ship supplies as quickly as possible. With just-in-time buying, dealers or their customers place smaller orders more often, saving them space and inventory time and avoiding tying up their money in supplies that might sit on the shelves for months. For commercial and industrial accounts, just-in-time also reduced the theft that often occurs in business.

Just-in-time ordering prompted retailers to more fully computerize their sales and inventory information, making it readily available to their distributors, or manufacturers if they dealt directly. With state-of-the-art computer equipment, suppliers could perform some of the inventory management tasks and determine what items needed to be restocked. Because dealers were keeping less inventory on hand, however, they had to ensure that the distributor could get merchandise to them quickly, often for next-day delivery.

The office supply wholesale industry also had to compete with the convenience of catalog and direct mail marketers with whom customers could place orders by calling a toll-free number or using a fax machine. These suppliers also operated on slim profit margins and dealt directly with the manufacturers.

BACKGROUND AND DEVELOPMENT

Distributors of stationery and office supplies saw steadily growing sales in the 1990s. Total sales for this industry grew from \$27.8 billion in 1990 to \$33.5 billion in 1993 and \$39.3 billion in 1996. Average annual growth for that six-year period was 6.9 percent, well ahead of inflation. In 1994 and 1995, larger distributors posted strong earnings growth. One particularly strong growth area was contract business forms management.

The 1997 BPIA Leadership Council Meeting identified four major trends affecting the industry: vendor consolidation, globalization, internal competition within the industry, and liquidizations of family-owned businesses. Whereas the office supply and stationery wholesale industry had a large number of establishments operating in the mid-1990s, just over 11,450, and this number diminished in the late 1990s.

As part of the consolidation trend within the industry, larger national distributors established networks of distribution centers to serve targeted regions. National distributors also turned to technology to help make them competitive with the many regional distributors. To enhance service to customers and ensure quick delivery, many distributors converted their ordering, billing, and warehouse operations to sophisticated computer hardware and software systems so inventory could be tracked easily and orders filled within 24 hours.

Meanwhile, large retailers and warehouse clubs such as OfficeMax, Staples and Office Depot were usurping the role of distributors and buying directly from the manufacturer, their large size and vast networks facilitating the volume buying power of wholesalers. These retailers grew quickly by targeting corporate purchasers and expanding their service capabilities.

Smaller distributors were operating on increasingly narrower margins and serving a shrinking market of retail stores, and many went out of business due to a poor economy and fierce competition. Those that did survive did so by reevaluating their pricing and service policies, finding that while they often could not beat the discounters' prices, they could provide value-added services as part of the traditional two-tier distribution system. Wholesale distributors then focused on ways to better serve retail clients and to help those clients provide better customer service.

As for globalization, Paine Webber analyst Aram Rubinson pointed out at the BPIA Leadership Council Meeting that international expansion did not succeed as well for Staples as it had for Viking, a contract stationer, because Viking didn't have to invest in brick-and-mortar infrastructure as Staples did. United efforts within the industry also promoted globalization. For example, in February 1997 the National Purchasing Association

(NPA) formed a marketing alliance with Basic Office Products Canada and Integra of the U.K. These three groups represent a total of 600 individual dealer locations with combined sales volume of about \$2 billion in office product consumables.

In October 1999 the Business Products Industry Association (BPIA) reported on a new study conducted by the National School Supply and Equipment Association (NSSEA) suggesting that the education segment represented a growing outlet for the industry. The 1999 State of the School Market Report noted the increase in annual expenditure per pupil—to \$7,000 from \$5,000 a decade earlier—as well as record enrollment increases three years in a row, with projected record-breaking enrollment every year through the early 2000s. National spending on K-12 education increased by 51 percent in inflation-adjusted dollars since the 1970s. This growth in education ensured business for the industry, as most of its products catered to students or school administrators.

CURRENT CONDITIONS

By 2003, the stationery wholesalers of business forms seemed to be gaining some ground with 3,365 establishments and more than 32 percent of the market. Stationery and office supplies had 2,618 establishments, or more than 25 percent of the market. Combined, they shared \$27.7 million in sales. Greeting cards represented more than five percent of the market, with \$2.3 million in sales. Computer and photocopying supplies wholesalers shared \$5.6 million annually, while computer paper wholesalers shared \$1.4 million.

According to Transworld Information Corp., the school and office stationery sector climbed to \$324 billion alone for 2002. The back—to—school sales attributed to the bottom line figure. In fact, the average consumer spends about \$123.37 for their back—to—school stationery and office supply needs. Further projections placed the stationery and school supplies in the forefront for 2007, with anticipated market share of 72.4 percent valued at \$28.8 billion.

INDUSTRY LEADERS

United Stationers Inc., of Des Plaines, Illinois, was the nation's largest wholesale distributor of business products in North America, with a distribution network of 66 Regional Distribution Centers serving more than 20,000 resellers. United Stationers had record net sales of \$878 million in the third quarter of 1999, up 10.4 percent from its net sales in the third quarter of 1998 at \$795 million. Third quarter 1999 net income similarly rose to \$22.3 million, up from \$19.9 million in the third quarter of 1998. Net sales over the first nine months of 1999 amounted to \$2.5 billion, up 10.7 percent compared

to the same nine-month period in 1998, when net sales reached \$2.3 billion.

In 1992, United Stationers acquired Stationers Distributing, the fourth largest distributor in the industry at half the size of United. The acquisition strengthened United's position in Texas and the western United States, since United was dominant in the Midwest and Northeast. United Stationers Inc. posted \$3.8 billion for 2003, up from \$3.7 billion in 2002.

U.S. Office Products claimed to be "one of North America's leading providers of office supplies" and other professional needs. The company performed poorly in the second quarter of 1999, with revenues falling 1.6 percent from the same quarter of 1998 because of diminished North American sales, particularly in the Office Supplies Division. Overall revenues for the company for the third quarter 1999 were \$642.5 million as compared to \$677.2 million during the same period of 1998. Half-year results showed a more dramatic decline: \$1.27 billion for 1999, compared to \$1.33 billion, a difference of \$60 million.

Other major competitors in the industry include Unisource Worldwide, of Wayne, Pennsylvania; ResourceNet, of International Paper, in Purchase, New York; Genuine Parts Co., of Atlanta, Georgia; Boise Cascade Office Products, of Itasca, Illinois; S.P. Richards Co., of Smyrna, Georgia; and Corporate Express Inc., of Broomfield, Colorado. In May 1999, Georgia-Pacific Corp., of Atlanta, Georgia, merged with Unisource.

RESEARCH AND TECHNOLOGY

Wholesalers have applied advanced computer technology to improve their slim profit margins. This technology improved productivity of all functions, including purchasing, delivery, storage, picking, and shipping. It also improved inventory as well as credit and information management. Using electronic document interface (EDI) technology wholesale distributors, superstores, warehouse clubs, mail order houses and dealers can input an order and trigger the shipping and billing, resulting in faster turnaround, less paperwork, and savings on handling.

SIC 5113

INDUSTRIAL AND PERSONAL SERVICE PAPER

This category includes establishments primarily engaged in the wholesale distribution of wrapping and other coarse paper and paperboard, as well as converted paper and related disposable plastics products, such as bags, boxes, dishes, eating utensils, napkins, and shipping supplies. It includes wholesale distribution of corrugated and solid fiber boxes, fiber cans and drums, pressed and molded pulp goods, pressure sensitive tape, sanitary food containers, and paper towels.

NAICS CODE(S)

422130 (Industrial and Personal Service Paper Wholesalers)

INDUSTRY SNAPSHOT

Judging from the paper production capacity in the United States, the late 1990s represented a time of "ultra slow" capacity growth, according to the 40th Annual Capacity Survey conducted in 1999 by the American Forest & Paper Association (AF&PA). The 1998 Capacity Survey was the first to identify a leveling of growth in aggregate paper production capacity in the United States, with an expansion rate of 0.6 percent. Capacity remained to 101.3 million tons. Projections for aggregate production capacity remained very slow, predicting increases of 1.1 percent in 2000, 0.7 percent in 2001, and 0.4 percent in 2002. According to the 42nd Annual Capacity Survey conducted in 2001, AF&PA reported a capacity growth to remain at 0.4 percent through 2004.

Wholesale distributors of industrial and personal service paper posted more than \$25 million in sales in 2003. There were about 5,982 establishments, up from 5,089 in 2001, according to D&B Sales & Marketing Solutions figures. Most of these establishments averaged about 13 employees, and average sales per establishment were about \$5.5 million. There were about 71,412 employees

in 2001 with an annual payroll of about \$3.3 million. The employee total had increased to 74,458 in 2003.

BACKGROUND AND DEVELOPMENT

Whereas the production capacity for most grades of industrial and personal service paper ran flat or grew slightly, one component of the industry represented sustainable growth. The annual rate of using recovered paper to make industrial papers was projected to rise 1.8 percent from 2000 to 2002, bringing recovered paper's share of total consumption from 36.1 percent in 1998 to 37.1 percent in 2002. The production capacity for tissue paper grew to 7.1 million tons in 1999. However, projections called for slower capacity growth through the next three years, with rates descending from 2.8 percent in 2000 to 1.7 percent in 2001 and 0.2 percent in 2002.

Containerboard and boxboard capacities were slated to run fairly flat, with the former only growing 0.5 percent annually from 2000 to 2002 and growth of the latter falling from 1.2 percent in 2000 to 0.6 percent in 2001 before bottoming out at 0.3 percent in 2002. Milk carton and food service board capacity grew by 2.5 percent in 1999, but was expected to level off during the first three years of the millennium. The production capacity of kraft paper, used to line corrugation, fell to 2.1 million tons in 1999. However, its capacity levels were expected to level as well, dropping only 1.1 percent in 2000 and then leveling off by 2002.

Wholesale distributors of industrial and personal service paper saw a steadily increasing market in the 1990s, with sales growing from \$37.0 billion in 1990 to \$46.7 billion in 1996. This represented average annual growth of 4.4 percent, keeping the industry growing moderately in real (inflation adjusted) dollars. The industry was also growing in terms of employment in the 1990s, with 69,700 employees in 1990 increasing to 75,300 in 1996. There were 5,668 establishments involved in wholesale distribution of industrial and service paper in 1996, up from 4,667 in 1990, according to U.S. Department of Commerce figures. Most of these were small operations, however, averaging 12 employees per establishment.

CURRENT CONDITIONS

Establishments in this industry are concentrated in the most densely populated areas to be close to their customers. About half of all industrial and personal service paper is distributed by paper merchants and the other half is marketed and distributed by the paper manufacturers' own sales representatives and distribution services. Many of the largest manufacturers of industrial and personal service paper distribute their goods from distribution centers near their plants and mills.

Given the small size and large number of distributors in this industry, the market is considered to be highly

fragmented. Market share is spread among the thousands of local and regional U.S. distributors, with only a few operations being considered national in scope. However, larger firms such as International Paper and Unisource Worldwide have been consolidating the distribution system in recent years by buying up smaller competitors to provide single-source purchasing for a range of industry products. These distributors are taking advantage of a trend in which their major customers establish company-wide supply contracts, eliminating some of the buying autonomy of their local units.

In addition to single-sourcing, a major strategy for paper distributors has been to offer several services to clients, including: on-call technical expertise; overnight delivery; just-in-time inventory controls; and electronic data interchange (EDI), which allows suppliers, distributors, and customers to write electronic purchase orders, track inventory and sales, and collect other information as part of the distribution process.

According to W. Henson Moore, president and CEO of the American Forest & Paper Association, unfair trading practices have resulted in 72 paper mill closures over a five year period, and the elimination of more than 32,000 jobs in 2002. He further noted, "Unless exchange rates are fixed pretty soon, and equilibrium is restored, the U.S. paper industry will not have the capacity to challenge our competitors and retake these lost markets."

INDUSTRY LEADERS

Leading companies included International Paper Co., of Purchase, New York, and Unisource Worldwide, of Berwyn, Pennsylvania. Other major players in the industrial and personal service paper distribution industry included units of the following paper manufacturing firms: Champion International Corp., of Stamford, Connecticut, (through its Nationwide Papers Division); Mead Corp., of Dayton, Ohio, and Georgia-Pacific. Leading independent operations included McCarty-Holman Co., of Jackson, Mississippi, Martin-Brower Co., of Downers Grove, Illinois, Central National-Gottesman, of Purchase, New York, and Bunzl Distribution, of St. Louis, Missouri.

SIC 5122

DRUGS, DRUG PROPRIETARIES, AND DRUGGISTS' SUNDRIES

This industry classification includes establishments engaged in the wholesale distribution of items such as prescription drugs, proprietary drugs, druggists' sundries, and toiletries. Products handled by industry participants include antiseptics, bandages, blood plasma, cosmetics, hair preparations, perfumes, pharmaceuticals, nonelectric razors and razor blades, toothbrushes, and vitamins. Establishments primarily involved in the wholesale distribution of surgical, dental, and hospital equipment are included in **SIC 5047: Medical, Dental, and Hospital Equipment and Supplies**.

NAICS CODE(S)

422210 (Drugs, Drug Proprietaries, and Druggists' Sundries Wholesalers)

In 2003 the total number of establishments was 10,209. Combined, these companies posted combined sales of approximately \$287.4 billion in 2003. The industry employed approximately 234,917 workers in 2001, with an annual payroll totaling slightly more than \$13.7 million. The average sales per establishment was about \$34.7 million. States with the highest establishments were California with 1,677, New York with 1,035, and Florida with 955.

Establishments within the industry were subdivided into two categories. The largest—specialty-line pharmaceuticals, cosmetics, and toiletries—was comprised of 69.8 percent of the industry's total number. Their sales, totaling \$42.17 billion in the mid-1990s, accounted for 65.6 percent of the industry's sales. The other category—general-line drugs—was comprised of wholesalers who were distinguished from specialty-line sellers on the basis of their commodity-line mix.

According to U.S. government predictions, demand for pharmaceuticals was "insensitive" to the national economy, meaning that fluctuations in the country's overall business climate had little impact on demand for the industry's products. National concern over rapidly rising costs, however, was mounting and bringing change to traditional distribution patterns. Price increases, which marked the early to mid-1990s, were beginning to slow during the final years of the decade.

The total number of establishments in the drugs, proprietaries, and sundries industry steadily decreased throughout the decade, from approximately 5,200 in 1990 to more than 6,000 by 1996. In 1997 the number had reached 8,053. By 2000, the number of establishments had decreased to 7,418, and declined further to 7,189 in 2001.

The Federal Food and Drug Administration (FDA) mandated drug manufacturers to place bar codes on all drugs dispensed in hospitals as a means of reducing medication errors. The FDA required manufacturers to put bar codes on individual doses as early as 2006. The labels are expected to prevent 413,000 medication errors over the next twenty years.

Drug merchants maintain their own websites where they offer pharmaceutical and laboratory products, as well as health related information services. The U.S. Department of Commerce reported that drugs and sundries wholesalers' online sales rose 24 percent, or \$19 billion and their overall sales rose 20 percent, or \$33 billion. In fact, according to the U.S. Department of Commerce, more than half of the Internet sales generated are from drugs and sundries. Overall online sales for the industry were \$14 billion versus their total sales of \$32 billion.

One industry leader was McKesson HBOC, based in San Francisco and formed when McKesson, distributor of pharmaceuticals, bought HBO and Company, health-care information systems and technology. The company posted 2003 sales of \$50.4 billion and 24,500 employees. That year, McKesson acquired Sky Pharmaceuticals Packaging Inc., a supplier of unit dose bar coded packaging to better meet the government's regulations on standard bar coding.

Other leaders were Cardinal Health, Inc., of Dublin, Ohio, with 2003 sales of \$50.5 billion and 50,000 employees; Amerisource Bergen Corporation of Chesterbrook, Pennsylvania, with 2003 sales of \$49.6 billion and 14,800 employees; and Owens and Minor, Inc., of Glen Allen, Virginia, with 2003 sales of \$4.2 billion and 3,245 employees.

The majority of the establishments in this classification were small—employing fewer than five people. In 2001, 2,559 companies had fewer than five employees; 953 companies had between five and nine employees; 620 had between 10 and 19; 755 had between 20 and 99; 289 had between 100 and 499; and 1,424 had 500 or more employees. In 2003, the total number of employees increased to 155,928.

SIC 5131

PIECE GOODS, NOTIONS, AND OTHER DRY GOODS

This industry comprises wholesale distributors of piece goods, yarn goods (made from natural or manmade fibers), notions (including sewing accessories and hair accessories), and other dry goods. Products of the industry include belt and buckle assembly kits, buttons, shoulder pads, textiles, thread, apparel trimmings, and zippers. The industry also includes converters who buy fabric goods (except knit goods) in the grey market, contract to have them finished, and sell the finished product at wholesale. Converters of knit goods, however, are included in Industry Group 225. Establishments engaged primarily in the wholesale distribution of items considered home furnishings are classified under **SIC 5023: Homefurnishings**.

NAICS CODE(S)

313311 (Broadwoven Fabric Finishing Mills)

313312 (Textile and Fabric Finishing (except Broadwoven Fabric) Mills)

422310 (Piece Goods, Notions, and Other Dry Goods Wholesalers)

In 2001, there were approximately 5,668 establishments in the piece goods and notions industry. The states with the largest number of establishments in the industry were New York with 24 percent and California with about 21 percent. In 2003, the industry increased to 6,887 establishments with 58,057 employees. The average

number of employees per establishment was nine, and average sales per establishment was about \$4 million. Sales for the industry totaled approximately \$25 million. States with the most textile mills were still New York with 1,653, and California with 1,467.

Piece goods and notions represented 1,196 establishments, or more than 17 percent of the market. Average sales were about \$2.4 million. Following were piece goods and other fabrics with 1,120 establishments representing more than 16 percent of the market, and averaging about \$2.8 million in sales.

Sellers of fabric goods and craft items to retailers experienced an upswing during the early to mid-1990s. As Americans began spending more time at home, sales for sewing and craft shops increased. Fabric wholesalers supplying the apparel industry, however, saw their customers dwindle in size and numbers. Industry employment decreased in the apparel industry during the first half of the 1990s. Thread sellers were unaffected because apparel cut in the United States and shipped abroad for assembly was ordinarily sewn with American-produced threads. Additionally, non-apparel uses for industry goods were steadily increasing into the 2000s.

For 2003, the American Textile Manufacturers Institute (ATMI) reported that approximately 50 textile mills went out of business in the United States. As a result, the textile industry's employment rate declined by ten percent, or 428,000 workers. As the mills were shut down the average work week also fell one hour and 36 minutes over 2002. In addition to the shortened work week there were also pay cuts. There were a total of 50,000 thousand jobs lost by the end of 2002 in the United States. Fabric, yarn, and thread also declined about 8 percent down to \$39 billion. Imports from China, however, had an estimated 40 percent price gain in regards to their currency over the United States. China's imports stood at 85 percent, with China controlling about 19 percent of the U.S. textile market.

One of the largest organizations involved in this industry was Marubeni America Corporation. Marubeni America, a wholly owned subsidiary of Marubeni Corporation (a Japanese general trading company), was incorporated in 1951. Its headquarters were located in New York City, and the company operated 14 other branches and offices throughout the United States.

Marubeni America's Textile Division offered an assortment of products in the international marketplace. According to a published company statement, although fabrics represented the "backbone of the division's success," the company was expanding its interest in natural and synthetic fibers, yarns, and raw American cotton.

Marubeni America operated other product divisions in addition to its Textile Division. These included metal

and mineral, machinery, chemical, plastics and inorganic chemicals, agri-commodity, and general merchandise.

Other industry leaders include ITOCHU International Inc. (ITOCHU Cotton Inc.) and China Industrial Group, both located in New York City.

SIC 5136

MEN'S AND BOY'S CLOTHING AND FURNISHINGS

This industry classification is comprised of wholesale distributors of men's and boys' apparel and furnishings. Products of the industry include shirts, trousers, sportswear, suits, ties, work clothing, hosiery, underwear, nightwear, outerwear and overcoats, gloves, hats, scarves, and umbrellas. Wholesale distributors of men's and boy's shoes, however, are included in **SIC 5139: Footwear**.

NAICS CODE(S)

422320 (Men's and Boys' Clothing and Furnishings Wholesalers)

Approximately 4,465 establishments were primarily engaged in the wholesale distribution of men's and boys' apparel and furnishings in 2001. The industry's sales were estimated to total in excess of \$801.8 million, an increase from the \$768.2 million reported by the U.S. Census Bureau. There were approximately 559,912 employees in 2001, a number which continued to grow throughout 2003. There were a total of 6,972 establishments in 2003, with sales of \$15,704.70 million. The average sales per establishment was \$2.6 million. The men's and boy's sector dominated the industry with 3,312 businesses and more than 47 percent of the market. In 2003, New York led the nation with 1,467 establish-

ments and the \$3.8 billion in sales. California was second with 1,457 establishments and sales of \$3.5 billion.

In fall 1996, *Occupational Outlook Quarterly* provided a solemn forecast for employees in the apparel industry. During the later part of the twentieth century, increasing globalization and new technological developments played a role in the continuous decline in the industry. From 1970 to 1996, employment in the overall apparel industry declined by about 33 percent to around 915,000 workers by the mid-1990s.

Following the aftermath of the attack on the World Trade Center on September 11, 2001, the U.S. apparel industry shifted about 96 percent of its 2002 production overseas. The slowed economic retail sales downturn that followed contributed to the overall concern in regards to the price of production.

One industry leader was Polo/Ralph Lauren L.P. Ralph Lauren began his career in 1967 when he designed wide ties and started the Polo label. The following year, he established the Polo by Ralph Lauren menswear company. Throughout the following decades he also established successful womenswear, fragrance, accessories, and home furnishing lines.

The *Daily News Record* reported in late 1996 that Polo/Ralph Lauren generated more than \$500 million in retail sales of men's furnishings in the United States and internationally; this number remained virtually unchanged in 1999. In 1996, the company had 2,700 employees; this number increased to 6,800 in 1999. Polo/Ralph Lauren had licenses throughout the United States and in more than 30 countries. It sold the resulting products through independently licensed and company-owned Polo stores and through upscale department stores. In 2003, Polo/Ralph Lauren's total sales were \$2.4 billion, with a total of 10,800 employees.

The demand for menswear edged up from 30 percent to 32.5 percent in 2003. Various men's stores have reported the same results. As reported in *Retail Traffic*, JoS A. Bank Clothiers Inc.'s year to year growth jumped to 15.2 percent from a decline of 3.7 percent in 2002. Men's Warehouse, a famous maker of suits reported the same results.

Other important companies were Tommy Hilfiger Corporation; L.L. Bean, Inc.; J. Crew Group Inc.; Abercrombie and Fitch; American Eagle Outfitters; and Gap Inc.

SIC 5137

WOMEN'S, CHILDREN'S, AND INFANTS' CLOTHING AND ACCESSORIES

This industry comprises wholesale distributors of women's, children's, and infants' clothing and accessories. Products of the industry include blouses, dresses, skirts, sportswear, unisex clothing, underwear, lingerie, hosiery, outerwear, hats, handbags, ladies' handkerchiefs, gloves, and mittens. Wholesale distributors of baby goods and diapers and distributors of hospital gowns are also included. Wholesalers engaged in the distribution of women's, children's, and infants' footwear, however, are classified under **SIC 5139: Footwear**.

NAICS CODE(S)

422330 (Women's, Children's and Infants' Clothing and Accessories Wholesalers)

Approximately 7,583 establishments were engaged in this industry in 2001. Their estimated combined sales totaled \$13.8 billion, down from nearly \$16.2 billion from 2000 U.S. Census Bureau data. Additionally, this industry employed more than 79,595 workers in the mid 2000s. In 2003, there were 9,751 establishments, with total annual sales of \$21.3 billion. The average sales per establishment was \$2.5 million. The highest number of establishments were concentrated in California, which had 2,774, and New York, with 2,549.

Much of the industry's activity was centered in New York and California. Combined, these two states accounted for 54.5 percent of the number of industry establishments and employed some 44,720 people.

According to several U.S. business publications including *Forbes*, the North American Free Trade Agreement (NAFTA) was the impetus behind a massive shift of U.S. garment production from Asia to Mexico. Half of the apparel sold in the United States was imported from other countries and, after the 1994 NAFTA agreement, apparel exports from Mexico grew to \$3.3 billion. In early 1997, Mexico was the highest U.S. source of imported apparel. Sent to Mexico mainly in the form of cut pieces to be sewn, U.S. apparel exports almost dou-

bled to about \$2.5 billion a year after NAFTA. The change in production from Asia to Mexico helped lower U.S. clothing costs between 1994 and 1997.

The retail industry remained focused on The World Trade Organization deadline when quotas on almost all textiles and apparel would be eliminated in January of 2005. With ongoing price pressure and demands to reduce operating costs it may be likely that more U.S. clothing would be outsourced to China.

One of the largest industry establishments was Nitches, Inc., formerly known as Beeba's, Inc. The company began operation as a women's sportswear wholesaler in 1973 and imported finished garments, primarily all-cotton and cotton-blend items, from approximately 20 countries and resold them to retailers such as Wal-Mart Stores, Inc.; Mervyn's; The Limited Stores, Inc.; J.C. Penney Company, Inc.; and Target Stores, Inc. In 1996, Nitches reported that it competed "on a basis of price, quality, reliability of service and fashion focus," with experience in handling a variety of women's, children's, maternity, and plus-size apparel.

In 1996, the California-based Nitches imported finished garments from 15 foreign countries and continued a policy of seeking national diversity in its arrangements with manufacturers. Nitches reported sales of \$31.5 million in 1999. The company had 40 full-time employees during 1999, which was down approximately 50 percent from the mid-1990s. This decline in the number of employees followed a trend that *Occupational Outlook Quarterly* predicted would continue in the apparel industry beyond the year 2000. Nitches reported sales of \$28.4 million for fiscal 2003, down slightly from \$29.5 million in 2002.

SIC 5139

FOOTWEAR WHOLESALERS

This industry consists of establishments that engage in the wholesale distribution of athletic and other footwear of leather, rubber, and other materials.

NAICS CODE(S)

422340 (Footwear Wholesalers)

INDUSTRY SNAPSHOT

In 2003, according to the U.S. Census Bureau, the total number of establishments in the footwear wholesalers industry was 23,925, with total annual sales of \$12.5 billion. The average sales per establishment was \$7.2 million. States with the highest number of establishments were California with 504, New York with 294, Florida with 225, and Texas 115. Shoes accounted for 1,107 establishments, and controlled 54 percent of the market. Total sales in this sector were \$6.7 million. Footwear accounted for 629 establishments, and controlled more than 30 percent of the market, and generated \$6.7 million in sales.

The Commerce Department divides footwear wholesalers into three categories: merchant wholesalers, who take title to the goods they sell; manufacturers' sales branches and offices, which are kept apart from manufacturing plants for marketing purposes; and agents, brokers, and commission merchants, who buy and sell products owned by others on a commission or agency basis. Additionally, the footwear market is divided into several sections: women's and misses' footwear; men's, youths' and boys' nonrubber footwear; children's, infants', and babies' nonrubber footwear; leather athletic footwear; sneakers, rubber and plastic protective footwear; and house slippers. By way of imports, wholesalers play a major role in each of these markets and dominate several.

BACKGROUND AND DEVELOPMENT

According to the *1992 Census of Wholesale Trade*, almost 80 percent of the total establishments in the industry were merchant wholesalers, which accounted for nearly 75 percent of all sales. Manufacturers' sales branches and offices comprised 1.5 percent of the total establishments and tallied less than 9 percent of sales. Over 19 percent of the establishments and 16 percent of the sales were attributed to agents, brokers and commission merchants.

Footwear wholesalers benefited greatly during the 1980s and 1990s from the booming popularity of athletic and other sport-oriented casual shoes. Nearly 180,000 employees at domestic manufacturers lost their jobs be-

tween 1968 and 1995, according to the Footwear Industries of America (FIA) trade group, but footwear wholesalers flourished by importing inexpensive models. Nike, Inc. and Reebok International Ltd. fueled the industry by making casual footwear a fashion staple.

The distinction between domestic manufacturers, wholesalers, and retailers had grown fuzzier due to the domination of imports in the U.S. footwear market. Traditionally, footwear wholesalers served as the middlemen between footwear manufacturers and footwear retailers. In the 1990s, however, more and more of these manufacturers were based outside the U.S. In addition, with many domestic manufacturers seeking to replace lost sales by boosting their own foreign production, and powerful domestic retailers sourcing directly from factories abroad in an attempt to reduce costs, smaller wholesalers began facing stiff competition from firms that were once their partners.

Nike and Reebok, along with other U.S. firms that produce footwear in the factories of foreign shoe firms, can take advantage of the extremely low wages paid abroad and solidify their positions. South Korean manufacturers, who dominated the high-quality U.S. import market in the early 1990s, fell from favor in recent years as wages increased. Major U.S. companies like Nike and Reebok gradually moved their higher-level production to other countries in Southeast Asia causing employment in South Korea's footwear industry to drop 40 percent between 1990 and 1993. Chinese manufacturers, on the other hand, continued to dominate the low-priced footwear market because their wages remained extremely low. Footwear continues to represent over 15 percent of China's entire light industry sector's exports.

Industry sales for footwear wholesalers was \$19.9 billion in 1996, more than 22 percent higher than 1990 and almost 52 percent greater than 1987. More than 21,800 people were employed by 1,534 footwear wholesalers in 1996, drawing an annual payroll of \$1 billion. Millions of other workers around the world also found employment as a result of the American demand for footwear and imports from their production—mostly from China, Brazil and Indonesia—now account for almost 89 percent of all U.S. shoe sales.

The payrolls of footwear wholesalers grew substantially in the 1990s, largely mirroring the increased activity as domestic production declined and imports rose. Annual payrolls at all footwear wholesaling establishments jumped 13.7 percent between 1992 and 1996, and the sales per establishment increased 43.9 percent. By 1995, average annual pay for agents, brokers and commission merchants was \$61,015; employees in manufacturers' sales branches and offices received \$50,557; and merchant wholesalers were paid \$37,825.

CURRENT CONDITIONS

The primary function of independent footwear wholesalers operating in the United States is to stock the shelves of shoe retailers with a wide variety of brands and products. The operations of these companies, however, were dwarfed by those of the wholesale divisions of America's two leading athletic footwear manufacturers, Nike and Reebok. These two firms have established themselves as major consumer brands of footwear and other related athletic apparel products with the power to act as their own wholesale importers.

At the turn of the century, predictions called for continuing flat sales for footwear wholesalers, remaining at about \$35 billion per year with a mere one percent rate of annual growth. Industry insiders attributed this stagnancy to oversupplied inventories, especially in athletic footwear (which makes up about 40 percent of the overall market) and to poor sales for women's nonathletic shoes (which account for over 35 percent of market).

According to the *Market Share Reporter*, Nike continued to control the market, with 39.1 percent, followed by Reebok with 12 percent. Others were New Balance with 11.6 percent and Adidas with 9.6 percent. In 2003, Nike acquired the popular Converse brand that was to be incorporated into the rest of the lineup, which include Cole Haan and Hurley brands.

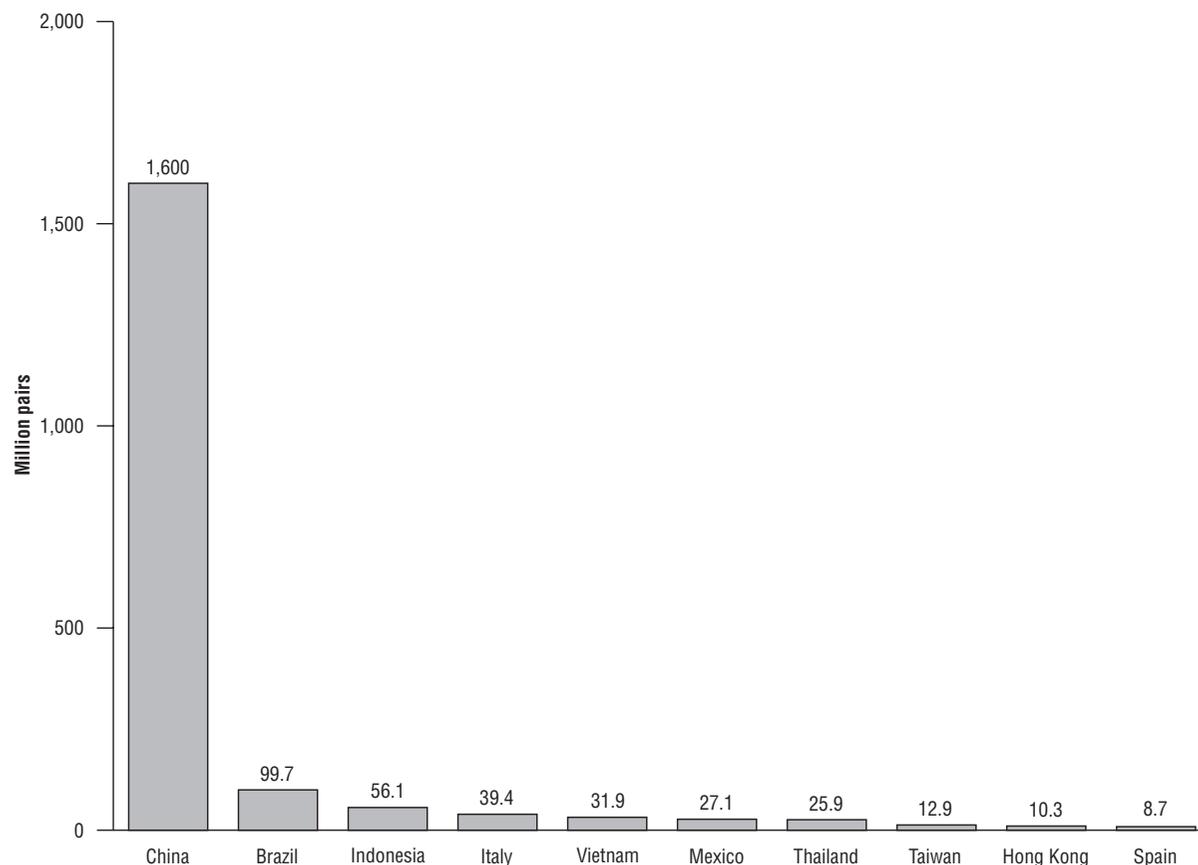

INDUSTRY LEADERS

Besides Reebok and Nike, the big names in the Footwear wholesale industry were the St. Louis-based Brown Shoe Co., with \$1.8 billion in fiscal 1998 sales; Spalding Holdings Corp., with \$800 million in 1998 sales; and Items International Airwalk Inc., with \$236 million in fiscal 1997. Brown's sales increased 4.2 percent to \$429.1 million in the third quarter of 1999, with wholesale sales slipping from \$119.2 million to \$116.7 million. Airwalk took advantage of the cash infusion resulting from the 1998 buyout by Sunrise Capital Partners to diversify into apparel, buying into the brand's appeal internationally, where it was not as well known as a shoe company as in the United States.

WORKFORCE

The changes in the industry all but eliminated the role of so-called jobbers, or middlemen who resold close-out, seconds and overrun shoes to retailers, as manufacturers sold directly to merchants and computerized their inventories. Estimates pegged the number of jobbers in 1997 at half the number of a decade earlier.

In 1992, according to the Commerce Department, there were 21,826 employees in the footwear wholesaling industry. Of those, 18,710 worked for merchant wholesalers; 1,689 for manufacturers' sales branches and of-

Sources of Top Footwear Imports to the United States, 2004

SOURCE: American Apparel & Footwear Association, 2004

fices; and 1,427 for agents, brokers and commission merchants.

According to the U.S. Census Bureau, there were a total of 26,170 employees in 2001, a slight decrease from 26,592 in 2000. The majority of companies were small in this classification were small—employing less than five persons. In 2001, 802 companies had less than 5 employees; 235 had between 5 and 9 employees; 146 had between 10 and 19; 173 had between 20 and 99; 102 had between 100 and 499; and 73 had 500 or more employees. The total annual payroll was \$1.5 million in 2001. In 2003, the total number of employees increased to 23,925.

AMERICA AND THE WORLD

By the mid-1990s, once successful foreign producers in regions like Taiwan and South Korea were suffering losses similar to those experienced by domestic manufacturers during the 1970s and 1980s. An increased standard of living in these countries led to rapidly rising wages, which made it increasingly difficult for them to compete

with other lower wage countries such as China, Indonesia, and Mexico. As a result, Taiwan and South Korea dropped from being the fourth- and fifth-largest importers of shoes to America in 1992 to the seventh- and eighth-largest in 1995.

The overall value of U.S. imported footwear continued to climb at \$15.3 billion in 2004. The largest importer was China who contributed 1.6 billion pairs. Other top importers included Brazil, 99.7 million pairs; Indonesia, 56.1 million pairs; Italy, 39.4 million pairs; Vietnam, 31.9 million pairs; Mexico, 27.1 million pairs; Thailand, 25.9 million pairs; Taiwan, 12.9 million pairs; Hong Kong, 10.3 million pairs; and Spain contributed 8.7 million pairs. The heated foreign competition, though, is good news for American footwear wholesalers and, ultimately, the U.S. consumer.

SIC 5141

GROCERIES, GENERAL LINE

This category covers establishments primarily engaged in the wholesale distribution of general lines of groceries. Specialty establishments—those involved in such activities as roasting coffee, blending tea, or grinding and packaging spices—are not included in this classification. Wholesalers responsible for the distribution of specific grocery classes are classified under specific wholesale distribution areas such as **SIC 5142: Packaged Frozen Foods**; **SIC 5143: Dairy Products, Except Dried or Canned**; and **SIC 5145: Confectionery**.

NAICS CODE(S)

422410 (General Line Grocery Wholesalers)

INDUSTRY SNAPSHOT

Wholesale food distributors provide food and related products (health and beauty aids, cleaning products, and other general grocery items) to retail grocery stores, convenience stores, and other retailers that sell food products. Food distributors can provide other services to their retail customers as well—advertising, merchandising, accounting, real estate site location, and financing. Their infrastructure usually includes warehouse facilities, truck fleets, and related information technology systems. According to the U.S. Census Bureau’s *Statistical Abstract of the United States*, wholesale grocers generated revenues of \$402.9 billion in 2001, compared to \$274.8 billion in 1992 and \$344.4 billion in 1998. There were 39,700 wholesale grocers in 2000, down from 40,600 in 1999.

The U.S. wholesale food distribution industry reflects the ups and downs of the retail food industry, which was subject to slow or even negative growth during the late 1980s and 1990s. Historic low levels of food inflation, weak consumer spending, and the rapidly changing face of the retail grocery industry (including the growth of so-called “wholesale club” stores and the decreasing influence of the independent grocer) have all taken their toll on the retail and wholesale food industries.

Retail grocers—and the wholesalers that depend upon them—have also seen a growing portion of their sales being taken away by restaurants. In the 1990s, restaurants emphasized value and convenience to lure new customers, and an increasingly time-stressed public has responded in increasing numbers by eating out or buying takeout food. In 1955 consumers spent approximately 25 percent of their food money at restaurants. By the turn of the century, in a single day an average of 4 out of every 10 people frequented eating establishments, and the total portion of the American food dollar spent eating out had grown to 45 percent. To counter this trend, as early as the mid-1980s, a number of retail grocers began offering prepared food. They began with salad bars and soon were offering sandwiches, microwaveable dinners, pizza, and soups. In 2002 over 80 percent of supermarkets offered some sort of prepared foods, and providing a selection of prepared foods was listed among the top 10 trends, according to the *Progress Grocer*.

Another factor contributing to the decline of the food wholesaler was the trend toward self-distribution. Grocery chains are increasingly moving in this direction, causing wholesalers to expand their client base in order to take on more (and often smaller) independent grocers. With the number of independents shrinking annually, this pool was becoming limited, forcing some wholesalers to look to mergers as their only way of surviving.

ORGANIZATION AND STRUCTURE

To be profitable, wholesale distribution must operate on a local or regional level. The most successful distributors, therefore, have either located their warehouse near a targeted metropolitan area or have set up a system of branch warehouses to limit the distance their truck fleets must travel to deliver goods to retailers.

As of 2003, there was a variety of wholesale distributors in the United States. The specialty wholesaler provides a limited range of products—gourmet foods, spices, candy, or greeting cards. These wholesalers usually provide a range of services that include point-of-sale merchandising material, display suggestions, and product servicing such as stock rotation and monitoring of product displays. Rack jobbers provide a limited line of products—usually health and beauty aids, house wares, toys, and other types of non-food merchandise with dis-

tinctive marketing requirements different from those needed for food items—for which they assume complete responsibility on the in-store level.

Full-service wholesalers offer complete lines of grocery and non-grocery products; they also often provide lines of general merchandise, dairy, bakery, frozen foods, fresh meat, and fresh produce. Besides the food products themselves, full-service wholesalers provide help to the retailer in advertising, merchandising, and procuring products they may not warehouse. For example, a wholesaler may not actually stock fresh meat in its own warehouse, yet it may help retailers in obtaining and marketing fresh meat products. Among the range of merchandising services a full-service wholesaler may provide its retail customers are retail accounting, site selection, store design and interior layout, personnel training, display, promotion, advertising, suggested retail selling prices, and advisory help in projecting and controlling sales, gross margin, expenses, and net profit. In some instances, a full-service wholesaler may make private or controlled brands available to its retail customers.

The retailer-owned wholesaler reflects the efforts of a number of retailers to join forces (sometimes under a common name) to operate their own warehouses and shipping lines. The cooperative effort makes it possible for retailers to obtain merchandise at the lowest possible cost. In addition to providing lines of food products, the retailer-owned wholesaler also supplies group advertising, merchandising, and other services. Among the largest retailer-owned wholesalers are the Wakefern Food Corporation of New Jersey and Certified Grocers of California, Ltd.

BACKGROUND AND DEVELOPMENT

In the early history of American food merchandising, retailing, wholesaling, and importing were often carried out by the same organization. It was not until the 1850s that the three activities began to distinguish themselves. Between 1850 and 1900 specialized wholesaling became common as service wholesalers provided a complete line of grocery products, including non-food items and perishables, to independent retail food stores.

During the early twentieth century, the number of service wholesalers grew rapidly. As chain stores developed and flourished, beginning with the founding of the Great Atlantic & Pacific Tea Company in 1912, wholesalers and retailers formed voluntary and retailer-owned groups. As supermarkets flourished between 1930 and 1965, marketing strategies on the retail and the wholesale level began to evolve, and major changes in food distribution took place. Retailer-owned and voluntary group wholesalers grew in number; at the same time, food wholesalers began to streamline and automate their distribution processes to cut costs and boost efficiency.

Among the earliest wholesaling leaders were the Independent Grocers Alliance (IGA Stores), founded in 1926, and Nation-Wide Stores, founded in 1928. These early wholesalers saw themselves as having two roles, stocking retailers' shelves and serving as merchandising experts to help increase profits.

Intense competition marked the 1970s and 1980s. The high inflation rates of the 1970s, coupled with the energy crisis, contributed to a general downturn in the industry. The industry profile was also in flux during this period because of changes in the retail food industry. Small retailers began expansion into multiple stores, sometimes also increasing their geographical dispersion. As chains spread out, the costs of moving goods to them from warehouses increased; some of the multiple-store owners turned to new distributors closer to their branch stores, while others began their own warehouse operations. The 1980s saw the consolidation of many food chains and the subsequent closing of warehouses that proved to be redundant.

CURRENT CONDITIONS

According to *Progressive Grocer*, wholesalers continue to serve as the primary supply source for more than 15,000 supermarkets. Ninety-eight percent of independents (those with fewer than 11 stores) and 18 percent of chain supermarkets depend on wholesalers to stock their shelves. In total, wholesalers provide goods for nearly one-third of the national supermarket sales.

However, the trend toward self-distribution, which began in the 1980s, continues to be one of the most serious threats facing the wholesale grocery industry. Wholesalers have historically made their biggest profits from servicing small regional independents, many of which were non-unionized and therefore able to save in labor costs. As the small independents consolidated into regional chains, the few remaining independents lost their labor cost advantage, since the chains gained labor concessions from their unions.

The strength of regional chains allowed them to negotiate price concessions from wholesalers and reduce their use of the supplementary services for which the wholesalers previously charged. Many of the remaining small independents were unable to compete against new formats such as combination stores and wholesale clubs. Consequently, competition for the wholesalers increased as did margin pressure, and wholesalers have had to deal with the growing clout of surviving customers and the threat of self-distribution.

With the move to self-distribution, wholesalers must either acquire new accounts or take over other wholesalers to maintain sales volume. As of 2003, the bulk of wholesaler business is derived from small-volume independents and relatively small chains. Regional chains and

such nontraditional food retailers as “deep discount” drug stores and “club” stores have forced wholesalers to invest more heavily in the weaker companies they supply to maintain their volume.

The largest wholesalers—most notably Supervalu and Fleming Companies, Inc.—have responded to these pressures not only by acquiring other wholesalers but also by significantly increasing their presence on the retail side of the grocery industry. By 1998, Fleming derived 31 percent of its revenue from retail operations. Supervalu, meanwhile, had reached as high as sixteenth place among U.S. food retailers in 1998. Essentially, these wholesalers were creating their own self-distributing chains through their acquisitions of retail chains and encroaching on retail territory, just as retailers have been encroaching on wholesaler turf. However, poor sales prompted Fleming to announce its withdrawal from retail operations in 2002, and the company placed up for sale its 110-store retail division, operating under the banners Food 4 Less and Rainbow Foods. Unable to stabilize its books, the company filed for Chapter 11 bankruptcy in April 2003.

Another major source of competition for the industry is the proliferation of alternative format stores, including warehouse clubs, deep discount drugstores, mass merchandisers, and supercenters. Analysts expected these alternatives to capture a greater market share from traditional retail outlets as alternative outlets offer more food and food-related products. By 2002 Wal-Mart had become the nation’s largest grocer, holding a 12 percent market share. Other discounters, including Costco and Target, were gaining ground in the grocery business.

A new wrinkle in the grocery industry is the online grocer business, which allows people to shop for groceries on the Internet. Touted as the future of grocery shopping, several online wholesale/retailer appeared on the scene, equipped with big investment backing and high expectations. Founded in 1999, Webvan, considered a “pure player” because the company focused specifically on grocery items, delivered nationwide and expected to have distribution centers in 10 U.S. cities by the turn of the century. However, by early 2001, the company was struggling with a cash flow shortage, and in July the Webvan was forced to file Chapter 11 bankruptcy. Others soon followed suit, including another pure player, Homeruns.com. By the early 2000s online grocery shopping was being revisited, but this time online operations were being aligned with existing brick-and-mortar stores, thus creating hybrid “brick-and-click” businesses.

The wholesale food industry has been forced to consolidate to remain profitable. In the past, voluntary wholesalers—firms that derive the majority of their revenues from independent stores operating under voluntary group banners—were the primary source of acquisition

and growth for wholesalers. A growing number of other types of small wholesalers are also being acquired by their larger counterparts.

Wholesalers will need to know that the price of services they provide for their independent customers will not be affected by costs related to distribution inefficiencies. They will also need to secure favorable terms from manufacturers and pass along these savings to their customers, thus leveling out price differences among all types of retailers. Cutting down on excess inventory is also seen as a key to future grocery wholesalers’ success.

A shrinking client base is one of the major reasons for the high consolidation rate in the wholesale food industry. The fate of the independent supermarket is a good illustration: According to *Progressive Grocer*, independents accounted for 65 percent of supermarket sales in 1952, 42 percent in 1972, 29 percent in 1992, and 16 percent in 1998. Large chains, convenience stores, and alternative-format stores have all taken market share from independents. Another factor is the capital-intensive nature of the wholesale grocery industry, which requires constant investment in systems, technology, and warehouse enhancements. Smaller wholesalers may have difficulty financing these commitments.

INDUSTRY LEADERS

The largest food wholesaler in the United States in 2001 was also a food retailer and manufacturer of food products. Supervalu Inc. (formerly known as Super Valu Stores, Inc.), with headquarters in Eden Prairie, Minnesota, reported 2002 revenues of \$19.1 billion, resulting in a net income of \$257 million. A wholesaler of groceries, drugs, sundries, and toiletries, Supervalu supplied 4,000 stores (down from 4,600 stores in 1998). It also supplied nearly 1,400 self-owned retail grocery stores in 14 states and made peanut butter, nuts, and candies. Supervalu grew rapidly in the late 1990s through acquisitions, for example, signing an acquisition agreement with Richfood, Inc. of Richmond, Virginia, in June 1999 (Richfood, the ninth largest wholesaler, had 1998 sales of \$3.01 billion.) As of 2003 Richfood does business as Supervalu, Eastern Region.

The second largest food wholesaler was Fleming Companies Inc., of Oklahoma City, Oklahoma, which had sales of \$15.5 billion in 2002, resulting in a net loss of \$200 million. After announcing the sale of its 110-store retail operations in 2002, the company did not sufficiently cover its debts and filed for Chapter 11 bankruptcy in April 2003. A publicly held company founded in 1916, Fleming supplied more than 3,100 stores in 46 states and exported food products as well. In the 1990s, Fleming solidified its wholesaling and retailing operations through several acquisitions.

SIC 5142

WHOLESALE PACKAGED FROZEN FOODS

Included in this category are establishments primarily engaged in the wholesale distribution of packaged quick-frozen vegetables, juices, meats, fish, poultry, pastries, and other “deep freeze” products. Establishments primarily engaged in the wholesale distribution of frozen dairy products are classified in **SIC 5143: Dairy Products, Except Dried or Canned**, and those distributing frozen poultry, fish, and meat that are not packaged are classified in **SIC 5144: Poultry and Poultry Products**, **SIC 5146: Fish and Seafoods**, and **SIC 5147: Meats and Meat Products**, respectively.

NAICS CODE(S)

422420 (Packaged Frozen Food Wholesalers)

INDUSTRY SNAPSHOT

Total frozen foods sales exceeded \$30 billion in 2001, according to *Frozen Food Age*, up from \$24 billion in 1997. The category remained healthy due to robust product innovation and lifestyle demographics favoring convenience foods, particularly those with a healthy image. Still, like wholesalers in general, those distributing frozen packaged foods were increasingly squeezed by the intensifying demands of manufacturers and retailers alike. Wholesalers in this environment faced increasing pressure to bolster their operations with value-added services.

ORGANIZATION AND STRUCTURE

Some packaged frozen food wholesalers are specialty wholesalers offering just a few products—premium frozen novelties or frozen diet foods, for example. Besides selling frozen food, these wholesalers generally provide point-of-sale merchandising material, display suggestions, and offer product servicing such as stock rotation and product display monitoring.

For the most part, however, frozen foods were provided to retailers by full-service wholesalers, businesses that offer complete lines of grocery and non-grocery products and help the retailers with advertising, merchandising, and getting products they did not warehouse. Competition increased in this sector during the 1990s, and many large companies introduced sophisticated computer programs to track orders and deliveries.

Some frozen foods are distributed through the wholesale/retail chain by retailer-owned wholesalers, retailers who operate their own warehouses and shipping lines. The cooperative effort makes it possible for retailers to obtain merchandise at the lowest possible cost. The retailer-owned wholesaler also supplies group advertising, merchandising, and other services.

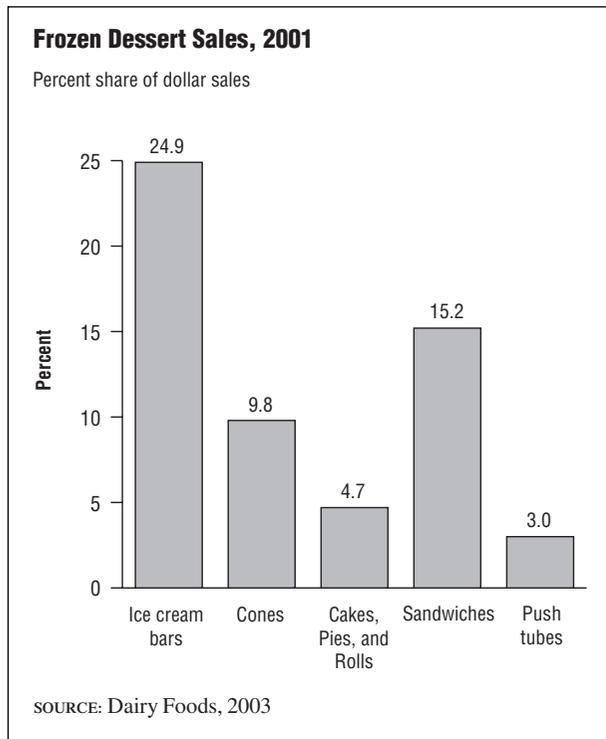

BACKGROUND AND DEVELOPMENT

The father of the frozen food industry, Clarence Birdseye, began experimenting with frozen food products in 1915; by 1930, General Foods Corp. began marketing a line of frozen poultry, meat, fish, fruit, and vegetables in retail grocery stores under the Birdseye name.

After World War II, the industry began to reach a mass market and quickly began to diversify and segment to boost profits. By the 1950s, frozen foods were the fastest-growing sector of the food business, according to *Business History Review*. The distribution network caught up with the mass market’s pace in the mid-1950s, as technology was developed to mechanically keep rail car contents frozen across long distances, linked together with strategically located centralized automated cold-storage warehouses.

In the industry’s infancy, frozen food processors marketed their wares through company-owned branches or regional wholesale distributors. This distribution pattern was expanded in 1945 when the Snow Crop Marketers Co. (New York City) introduced a direct sales program to chain stores, voluntary groups, and retail cooperatives. Frozen food products were then distributed through public warehouses or private distribution centers.

Frozen foods were profitable for both manufacturers and wholesalers. They became the primary players in a category supermarket industry analysts call “meal replacement”—that is, food for people who are too busy to cook. From 1996 to 1997, frozen food sales increased 3.2

percent. According to a 1997 survey conducted by *Frozen Food Age*, a family with teenagers spent an average \$58 a week on frozen foods. The Great Lakes and the Plains had the greatest growth in frozen food sales for the time period covered by the survey.

CURRENT CONDITIONS

Dun & Bradstreet reported about 1,590 establishments operating in this industry in 2003, employing over 41,100 workers and generating revenues of \$24 billion. An increasingly health-conscious yet extremely time-pressed U.S. public looked to frozen foods to provide quickly prepared yet delicious and wholesome meals. Though boasting convenience, the industry was traditionally beset by a reputation for product that was generally of lower quality than fresh alternatives. By the late 1990s and early 2000s, the industry spawned a niche specializing in gourmet, restaurant-quality foods that could be prepared quickly at home. Leading brands such as Con-Agra's Healthy Choice and Stouffer's Lean Cuisine marked the trend by pouring money into major marketing campaigns positioning their products to capitalize on the growing consumer hunger for nutritious, and even exotic, frozen foods. This trend bled into the rise of ethnic categories, including French, Italian, and Asian. Asian-style packaged frozen foods, riding the wave of health-conscious consuming, led the segment, increasing 7.8 percent in 2002, according to ACNielsen.

However, the industry faced marketing problems in its very display, as shoppers routinely rated the frozen-

food aisle the most uninviting section of the supermarket, forcing retailers to use price promotions as a primary means by which to draw customers, thus impeding profit margins. Meanwhile, frozen packaged foods faced emerging competition from refrigerated foods, especially meat and produce, that copy frozen foods in their claims to convenience. While the refrigerated segment remained a minor threat to frozen foods in 2004, the industry was growing rapidly, with sales expected to hit \$12.2 billion by 2005, according to the New Jersey market-research firm Food Spectrum.

INDUSTRY LEADERS

SYSCO Corp. continued its reign as the largest food-service marketer and distributor in North America in the mid-2000s. Based in Houston, Texas, SYSCO was chiefly a supplier to the food service industry, specializing in the wholesale distribution of more than 275,000 types of prepared frozen meals, condiments, and deli meats. SYSCO employed about 26,200 workers in more than 160 facilities throughout North America in 2003 and distributed to over 420,000 foodservice customers, including restaurants, hospitals, schools, and other business and industry foodservice operations. Value-added services SYSCO regularly supplies to customers include product usage reports and other data, menu-planning advice, food safety training, and inventory-management assistance. The firm expanded rapidly via strategic acquisitions through the late 1990s and early 2000s, edging into the market for frozen Asian cuisine with its purchase of Asian Foods Inc., North America's largest Asian food service distribution company. SYSCO's revenues jumped from \$21.8 billion in 2001 to \$26.1 billion in 2003.

Trailing SYSCO was U.S. Foodservice Inc., the second-leading food service distributor. With a customer base of over 300,000 and particular strength among schools, the Columbia, Maryland-based firm was a subsidiary of the world's largest food distributor, Royal Ahold, which purchased the company in 2000 and placed it under its Ahold USA operation. Like SYSCO, U.S. Foodservice was on an acquisition spree after being acquired itself, purchasing a number of regional distributors in addition to market rival Alliant Exchange.

The number-three distributor was Performance Food Group Company, of Richmond, Virginia. The firm employed 1,250 in 2003 and distributed to a client base of some 48,000 schools, healthcare facilities, restaurants, and fast-food chains. Like was the case with its rivals, the acquisition of key regional players was among Performance Food Group's key growth strategies in the early 2000s, leading to a jump in sales from \$3.24 billion in 2001 to \$5.52 billion in 2003.

Ben E. Keith Company, based in Fort Worth, Texas, employed 2,618 and garnered revenues of \$1.34 billion in

2003, up 12.7 percent from the year before. In addition to frozen food, Ben E. Keith distributed produce, dry groceries, and beer to restaurants, hospitals, schools, and other institutions.

SIC 5143

DAIRY PRODUCTS, EXCEPT DRIED OR CANNED

This classification covers establishments primarily engaged in the wholesale distribution of dairy products such as butter, cheese, ice cream and ices, and fluid milk and cream. This industry does not include establishments primarily engaged in pasteurizing and bottling milk. Establishments primarily engaged in the wholesale distribution of dried or canned dairy products are classified in **SIC 5149: Groceries and Related Products, Not Elsewhere Classified**.

NAICS CODE(S)

422430 (Dairy Products (except Dried or Canned) Wholesalers)

INDUSTRY SNAPSHOT

By 2003 there were 2,767 firms engaged in the wholesale of dairy products, employing some 45,450 workers and generating total sales of \$17.2 billion. The late 1990s and early 2000s were marked by brisk consolidation, with the bulk of the dairy industry's distribution and wholesaling activities closely associated with the major dairy cooperatives.

ORGANIZATION AND STRUCTURE

The structure of the wholesale milk industry is somewhat different from that of other wholesale food product operations. In most metropolitan areas, local milk producers make it unnecessary for wholesalers, either chain

store or affiliate, to operate their own fluid milk facilities. Instead, distributors arrange with one of the local milk companies for their fluid milk sales. These local producers are responsible for supply and delivery to stores. They also are in charge of producing private-label milk and milk products, which they distribute directly to the retailer.

In rural areas, when local sources are not available, wholesalers usually handle fluid milk through their own distribution centers. These wholesalers may be full-service wholesalers, providing dairy products and complete lines of grocery and non-grocery products. Besides the food products themselves, full-service wholesalers provide assistance to the retailer in advertising, merchandising, and procuring products they may not warehouse.

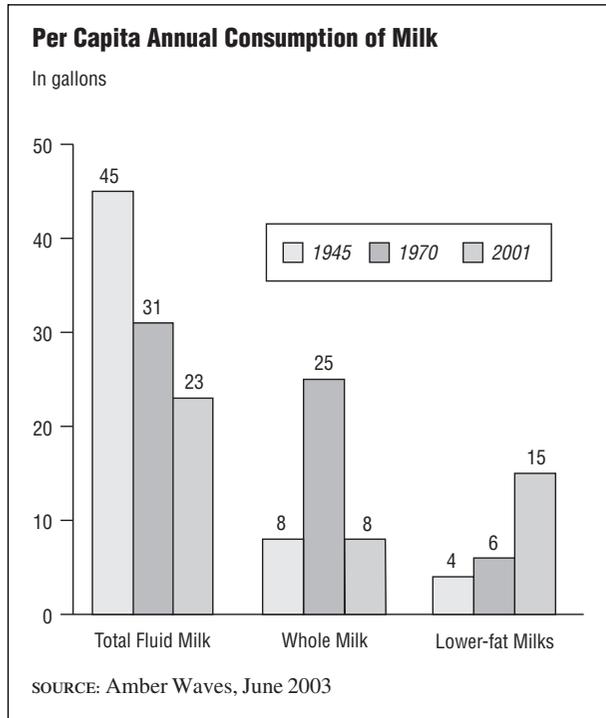

The retailer-owned wholesaler may also provide fluid milk to a number of outlets. This type of wholesaler represents the efforts of a number of retailers to join forces (sometimes under a common name) to operate their own warehouses and shipping lines. The cooperative effort makes it possible for retailers to obtain merchandise at the lowest possible cost. In addition to providing lines of food products, the retailer-owned wholesaler also supplies group advertising, merchandising, and other services.

Ice cream, butter, and cheese may be handled by retailer-wholesalers, full-service wholesalers, or, in the case of some premium products, by specialty wholesalers. This type of wholesaler provides a limited range of products and a variety of services, including point-of-sale merchandising material, display suggestions, and product servicing such as stock rotation and monitoring.

BACKGROUND AND DEVELOPMENT

The industry developed in tandem with the country's changing social demographics and organization. Through the twentieth century, the importance of distribution skyrocketed in the dairy industry. In 1909, according to *Amber Waves*, over half of all milk consumption took place on the very farms where the milk was produced. By 1960 that figure had plummeted to only 10 percent, and by 2001 it was only 0.3 percent. With the average U.S. consumer growing more and more remote from the farm, distribution became a significant issue.

Fluid milk consumption stood at 34 gallons per person in 1945; by 2001, the average person in the U.S. drank only 23 gallons per person. Part of the decrease was associated with health concerns as a cholesterol- and calorie-conscious public became aware of whole milk's high fat content. Many consumers tended to cut milk from their diet completely, believing, erroneously, that lower fat milks were also lower in nutrients. Further research proved otherwise, and consumption of lower fat milks increased. In the period between 1970 and 1974,

about 78 percent of all beverage milk consumption was of whole milk. By the mid-1990s, reduced-fat milk accounted for 50 percent of all beverage milk consumed. Skim milk consumption increased from 5 percent in the early 1970s to 13 percent in 1994. In addition, promoting the health benefits of lowfat milk, the industry embarked on a \$52 million ad campaign in the mid-1990s featuring popular celebrities.

Cheese consumption, on the other hand, made up the difference for the decline in milk consumption. Per capita cheese consumption reached 30 pounds in 2001, more than twice as much as in 1975. Much of the cheese was consumed on pizzas and in convenience foods. Ice cream consumption held steady from the end of World War II until the late 1980s, when fitness-consciousness forced ice cream consumption down slightly but steadily, often replaced by yogurt. Consumption of fluid cream products such as half-and-half, light cream, heavy cream, and sour cream increased in the 20 years from 1974 to 1994 with per capita consumption rising from 10 half-pints in 1974 to 15 half-pints in 1994.

Farm milk prices began plummeting in November 1996, causing many dairy farmers to lose up to a third of their income. The industry was quick to react: within a half year, four of the industry-leading cooperatives entered merger discussions, and within a year the cooperatives had inked an agreement pending approval by the Department of Justice antitrust division. Even as the justice department approved it, industry insiders questioned whether it sacrificed competition for the sake of

increased efficiencies. Merger proponents pointed out that dairy co-ops have been consolidating since long before economic techno-globalization ushered in the late 1990s consolidation craze.

CURRENT CONDITIONS

While farmers were getting the lowest prices for their milk and dairy products in a quarter century, there was no appreciable corresponding decline in retail prices, translating to healthy profits for wholesalers and retailers alike, leading to calls for industry regulations stipulating that cost savings be passed along to the consumer. The main factor behind the discrepancy between farm and retail prices was increased consolidation, which afforded wholesalers and retailers greater leverage in pricing decisions.

The fastest-growing dairy product in the United States was yogurt, which continued in the 1990s its rise to reach approximately \$2.8 billion in sales in 2002, according to ACNielsen, an increase of 13.6 percent over the previous year. Much of this increase was owed to the booming popularity of new drinkable yogurt products, which exploded in 2002 to \$136.2 million, up 36.6 percent over 2001. Consumers tended to view yogurt as a healthy alternative to ice cream, and yogurts were frequently marketed as diet food to an increasingly health-conscious public.

In addition to concerns over evolving attitudes and understanding regarding the health of dairy products, the late 1990s and early 2000s witnessed a surge in concern and protest over the use of hormone injections designed to stimulate milk production in cows. Part of the broader controversy involving genetically modified (GM) foods, the injection of recombinant bovine somatotropin (RBST) led to calls for labeling of dairy products so produced.

In what some industry observers viewed as a sign of things to come, Maine introduced an official Quality seal, awarded only to milk from RBST-free cows, which spurred reaction from wholesalers and retailers throughout New England, many of whom marketed such dairy products as healthier and safer than hormone-injected products. Agrochemical behemoth Monsanto Corporation challenged the program, contesting that, since research was thus far inconclusive regarding the health risks associated with RBST, such marketing claims amounted to false advertising and potentially slandered hormone-injected products.

Proponents of RBST argue that it makes for cheaper products, given that cows injected with the hormone produce up to 15 percent more milk. Activists working against GM foods, however, contend that the safety of such products has yet to be scientifically established and point to Canada and Europe, where RBST has been banned entirely, as an indication that policy should veer on the side of caution. The outcome of these debates had

profound implications for dairy wholesalers, as about one-third of U.S. dairy herds used RBST in 2003.

In tandem with evolving health concerns and the RBST controversy, the organic dairy segment was among the fastest-growing sectors of the dairy industry. With more shelf space at groceries being devoted specifically to organic dairy products, wholesalers quickly capitalized on this emerging niche. The leading segment of the organic foods movement, Datamonitor estimated organic dairy sales would increase 25 percent per year through 2005, with organic milk leading the way.

INDUSTRY LEADERS

Dairy Farmers of America (DFA) was as of 2004 the world's largest dairy cooperative, bringing together 24,000 members across the country. Based in Kansas City, Missouri, the super-cooperative was born in 1997 with the merger of some of the country's largest dairy cooperatives, including Mid-America Dairymen of Springfield, Missouri; Milk Marketing of Strongsville, Ohio; and Western Dairymen Cooperative of Thornton, Colorado. In 2002 DFA garnered sales of \$6.45 billion with 4,000 employees.

Associated Milk Producers Inc. (AMPI) of New Ulm, Minnesota, chose to forego the merger talks that produced DFA and remained one of the industry's leaders even after its Southern Region unit was absorbed into DFA in 1997. Sales held steady at \$1 billion in 2003, while the company employed 1,700 and brought together 4,600 farms throughout the north central Midwest. AMPI was the result of the merger of about 100 dairy cooperatives throughout the South and Midwest in 1969, which banded together in order to stabilize prices and to take advantage of government deregulation, which left the industry to regulate itself.

Minneapolis-based Michael Foods Inc. generated 2002 sales of nearly \$1.17 billion, employing about 4,370. The company specialized in egg products but decided to sell its dairy operations to Dean Foods. Other major players included Multifoods Specialty Distribution of Englewood, Colorado, a subsidiary of International Multifoods, and Holberg Industries Inc. of Greenwich, Connecticut, a diversified services company that distributed food through its AmeriServe arm.

SIC 5144

POULTRY AND POULTRY PRODUCTS

This category encompasses establishments primarily engaged in the wholesale distribution of poultry and poultry products, except canned and packaged frozen foods. Not included are establishments primarily engaged in the killing and dressing of poultry, which are classified in **SIC 2015: Poultry Slaughtering and Processing**. Establishments primarily engaged in the wholesale distribution of packaged frozen poultry are classified in **SIC 5142: Packaged Frozen Goods**, and those distributing canned poultry are classified in **SIC 5149: Groceries and Related Products, Not Elsewhere Classified**.

NAICS CODE(S)

422440 (Poultry and Poultry Product Wholesalers)

INDUSTRY SNAPSHOT

Between 1989 and 2001, U.S. consumer demand for chicken jumped 60 percent, which *Supermarket Business* attributed in large part to the industry's aggressive development and marketing of value-added, case-ready products, such as boneless breast strips, shredded chicken in a tub, grilled filets, and diced and shredded breast meat, often pre-seasoned and packaged with flavor-enhancing sauces. U.S. Department of Agriculture statistics revealed that U.S. consumers ate 70 percent more chicken in 2001 than 20 years earlier, amounting to about 57 pounds of chicken per capita.

By 2003, the industry employed 23,550 workers in its 1,133 establishments, according to analysts at Dun & Bradstreet. Nearly half of these businesses employed fewer than five people; however, like much of the U.S. wholesale industry, poultry distribution was rapidly consolidating in the early and mid-2000s, shifting focus to value-added services such as inventory and display management. Poultry wholesalers raked in revenues estimated at about \$6.45 billion in 2003.

Different kinds of poultry meat command vastly different prices. The wholesale price of chicken breasts, for example, was generally twice that of dark leg meat. While purchasing whole chickens was generally the cheapest option per pound, consumer trends were driving

away from this option, as demand skyrocketed for more easily prepared and more controlled meat types, such as ready-to-eat boneless breast fillets.

BACKGROUND AND DEVELOPMENT

The U.S. poultry industry started on small farms, where chickens and eggs provided family income. Hatcheries, feed stores, and poultry processing facilities sprang up in grain-producing regions of the Midwest, connected to markets by collection and distribution centers. Integration developed as feed dealers and manufacturers merged with hatcheries and processors. Large wholesalers began to dominate the market in the mid-1940s in response to consumer demand and the ability to preserve and ship fresh products.

CURRENT CONDITIONS

In the late 1990s and early 2000s, the industry was beset by a series of disease-related health concerns, including salmonella and bird flu. In 2003, Asia was hit with a widespread case of bird flu—originating, according to experts, among ducks and other waterfowl—and migratory birds were in danger of spreading the virus to the United States' poultry farms, beginning in Alaska. After a series of salmonella cases in the late 1990s, the industry was panicky about potential for the problem to intensify, and so it focused on ways in which such outbreaks could be quickly contained before they had a chance to spread through an increasingly centralized food industry.

The U.S. government challenged food industries, including poultry wholesalers, to develop methods of detecting salmonella and other food-borne pathogens, some of which had developed resistance to antibiotics. Industries were asked to design controls for all production phases—including transportation, shipping, tracking, and shelving—focusing on temperature, prior cargoes, and sanitation. Methods either in use or under study included sturdier machine-assembled reusable shipping containers doubling as retail shelves, computerized order placement, and tracking and bar coding. Pathogen eradication and tracking technology included food

irradiation and genetic ‘‘fingerprinting.’’ Control points could monitor temperatures and times with package sensors both en route and during loading and storage. Pathogen source control might involve such ideas as coating chicken feed with red pepper to repel rodents.

The poultry industry also came under fire from medical and regulatory authorities who argued that the industry's alleged overuse of antibiotics to maintain healthy stocks had given rise to evolving food-borne germs that could resist high-strength medicines, thus running the risk that major diseases could rip through the food chain. In response to such concerns, the largest U.S. poultry product producer, Tyson Foods Inc., announced in 2002 its intentions to wean its chicken populations of antibiotics.

INDUSTRY LEADERS

Industry leader Zacky Farms, LLC of El Monte, California, shuttered its chicken operations, leaving its rival Foster Farms as a leading player in the industry. Foster Farms, the largest poultry country in the western United States, operated its own hatcheries, grow-out ranches, feed mills, and processing plants in addition to its distribution operations. Other industry players included Norbest Incorporated of Midvale, Utah; Troyer Foods of Goshen, Indiana; and Crystal Farms Refrigerated Distribution of Minneapolis, Minnesota.

AMERICA AND THE WORLD

The United States was a major exporter of poultry and poultry products. Russia was the industry's biggest foreign customer, purchasing \$586 million in chickens in 2001. That relationship soured briefly when Russia, ostensibly to force U.S. poultry producers to erect a barrier between the slaughter and processing segments of the industry, slapped an embargo on U.S. poultry imports in 2002. Russia later backed off, but the embargo caused a decline of U.S. exports to Russia to \$494 million.

Another key trading partner was Mexico, to which U.S. poultry producers exported chicken legs and thighs in exchange for the breast meat favored by U.S. consumers. In the early 2000s, the two countries scored a series of deals to regulate tariffs through the middle of the decade under the rules of the North American Free Trade Agreement (NAFTA). These deals allowed both countries to protect their domestic industries with 99 percent tariffs in 2003, which would then decline about 20 percent per year for five years until the tariffs were phased out entirely.

SIC 5145

CONFECTIONERY

This industry classification includes wholesale distributors of confectionery and related products such as candy, chewing gum, salted or roasted nuts, popcorn, soda fountain syrups and toppings, and potato and corn chips.

NAICS CODE(S)

422450 (Confectionery Wholesalers)

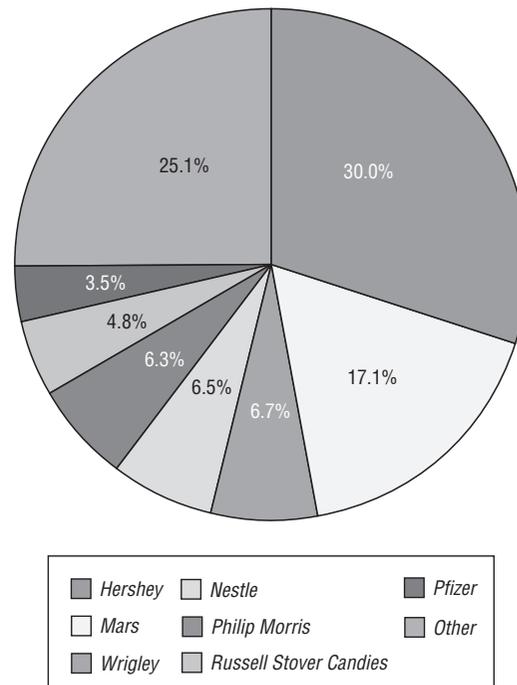

In 2001, according to the U.S. Census Bureau, there were a total of 2,381 confectionery wholesalers. That same year, the industry employed 46,929 workers and posted an annual payroll of \$1.7 million. In 2003, there were approximately 4,130 confectionery wholesalers, and about 47,630 workers. The industry generated about \$10.4 billion in sales. The average sales per establishment were \$3.2 million. The states controlling most of the confectionery market were California, Florida, New York, Pennsylvania, and Texas. Combined, they represented more than 36 percent of the total market.

According to a market study on confectionery sales conducted in the mid-2000s, supermarkets generated 40 percent of total sales in this industry. Mass merchandisers and convenience stores accounted for 15 and 14 percent, respectively. Small retailers, drug stores, vending machines, wholesale clubs, fundraising, and the military accounted for the remaining sales, each generating less than ten percent. The trend continued into 2003, where supermarket sales for confectionery products increased by three percent. Mass merchandisers, not counting Wal-Mart, declined 3.1 percent.

Candy consumption continued to increase throughout the decade. Up from 16.0 pounds per capita in 1986, it stood at 20.7 pounds in 1990, and, according to the National Confectioners Association (NCA), reached 23.4 pounds by 1995. Candy trade products were classified in two categories: chocolate and non-chocolate. In 1995, chocolate, the top-selling category, accounted for more

Top Candy Makers, 2002

By market share

SOURCE: Market Share Reporter, 2004

than 50 percent of the nation's candy sales. The U.S. Census Bureau reported candy consumption increased to 5.8 billion pounds by 2002. According to *Direct* magazine, the United States held the fifth position in the world for candy consumption.

Gum consumption and chewing gum sales also experienced tremendous growth in the U.S. market during the 1990s. According to statistics released by the National Association of Chewing Gum Manufacturers, total domestic factory sales increased from \$716.0 million in 1980 to \$1.3 billion in 1990, and sales passed \$1.4 billion in 1994. A decade later, sugarless gum was gaining popularity with a 13 percent increase.

Even vending distributors, which saw a substantial loss of sales in the early 1990s, were experiencing an upward swing by the mid- to late 1990s. In 1997 total confectionery sales, excluding chewing and bubble gum, destined for vending machines increased by 14.4 percent. Vending machines of confectionery products had declined three percent to \$239 million by 2000.

The largest number of firms, however, were in the mid-range of sales—1,618 firms had sales between \$250,000 and \$499,000, while another 1,255 firms had sales between \$1 million and \$4.9 million. Only 78 firms had sales below \$49,000.

The leading candy makers in 2002 reported in the *Market Share Reporter*, were Hershey with 30 percent, Mars with 17.1 percent, Wrigley with 6.7 percent, Nestle with 6.5 percent, Philip Morris with 6.3 percent, Russell Stover Candies with 4.8 percent, Pfizer with 3.5 percent, and other companies with 25.1 percent shared. The leading gum makers in 2002 reported in the *Market Share Reporter*, were William Wrigley Jr. Co. with 54.8 percent, Adams with 26.5 percent, Hershey's Foods Corp. with 16 percent, Topps Co. with 0.9 percent, Concord Confections Inc. with 0.5 percent, Philadelphia Chewing Gum with 0.4 percent, and other companies with 1.8 percent shared.

According to the Food Institute, the confectionery industry underwent more consolidation in 2003 than it had since 1992, with nine consolidations reported. There were a total of 11 mergers and acquisitions in 2003. A few were Farley & Sathers Candy Co., which purchased gum brands from Hershey's Foods Corp., and Just Born Inc., of Bethlehem, Pennsylvania which acquired Goldenberg Candy Company in April of 2003. Another, Alpine Confections Inc. of Alpine, Utah, was awaiting a pending transaction to acquire brands Fannie May and Fanny Farmer Candy from Archibald Candy Corp.

In 2003, most of the businesses in this industry had a small number of employees—1,212 establishments had one to four employees, while an additional 412 establishments had five to nine employees. Only 97 firms had more than 100 staff members.

According to the National Confectioners Association (NCA), the Asian markets had imported close to \$700 million in confectionery products into the United States in 2002. Combined, China and Hong Kong accounted for \$175 million in imports. The United States manufacturers represented \$90 million in exports during the same period. In 2003, the United States represented \$665 million in exports, which made the United States the third largest exporter of confectionery products. This trend was expected to continue as the Asian economy intensified.

SIC 5146

FISH AND SEAFOODS

Establishments classified in this industry are engaged in the wholesale distribution of fresh, cured, or frozen (but not canned or packaged frozen) fish and seafood products.

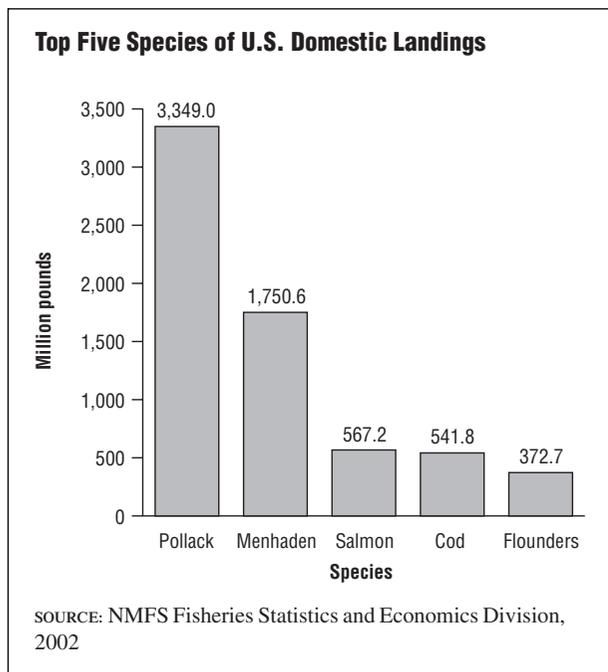

Establishments engaged in the preparation of fresh or frozen fish and other seafood, and the shucking and packing of fresh oysters in non sealed containers, are classified in **SIC 2092: Prepared Fresh or Frozen Fish and Seafoods**. Establishments primarily engaged in the wholesale distribution of canned seafood are classified in **SIC 5149: Groceries and Related Products, Not Elsewhere Classified**, and those distributing packaged frozen foods are classified in **SIC 5142: Packaged Frozen Foods**.

NAICS CODE(S)

422460 (Fish and Seafood Wholesalers)

INDUSTRY SNAPSHOT

In 2001 there were 2,980 wholesale plants in this industry, down slightly from the 2,992 plants operating in 2000. Employment stood at 28,405. California, Louisiana, New York, Massachusetts, Louisiana, and Florida had the highest number of operations, with 2,275 establishments employing 22,199 in 2003. Per capita U.S. consumption stood at 15.6 pounds per person in 2002. Of the 15.6 pounds that were consumed fresh, frozen, or

shellfish represented 11.0 pounds. The total for cured products stood at 0.3 pounds. That same year, frozen fishery products in cold storage stood at a high of 379,464 thousand pounds in January, reaching a low of 311,485 pounds in June.

According to statistics compiled by the National Oceanic and Atmospheric Administration (NOAA), consumers spent some \$55.1 billion for fishery products in 2002. Food service establishments accounted for \$38.4 billion; retail sales for individual consumption was \$16.4 billion; and \$283.1 million was spent for the manufacturing of fish products. This in turn contributed \$28.4 billion towards the U.S. Gross National Product. The U.S. Department of Commerce, in conjunction with the Food and Agricultural Organization of the United Nations, reported that the U.S. was the world's third largest consumer of fishery products. By the end of 2004, according to the *Food Institute*, fish consumption was expected to increase two to three percent. This projected forecast is the direct result of the mandatory country of origin labeling rules.

One of the major issues facing seafood distributors during the 1990's was product safety. Some consumer groups were calling for increased FDA oversight of fish products and advocated the adoption of more stringent safety standards. Another issue was product availability. Climate changes, environmental degradation, and over-fishing of stocks were being blamed for reducing the supplies of some traditional fisheries, particularly in the North Atlantic.

According to statistics compiled by *Supermarket Business*, supermarkets purchased 66 percent of their sea-

food from specialty fish and seafood wholesalers. Another nine percent was purchased from other suppliers including grocery wholesalers. Fish sales accounted for 42 percent of supermarket fish and seafood sales. The second largest category was shrimp, representing 33 percent of sales. One of the most popular individual products was salmon.

The leading five species in the United States were pollock, menhaden, salmon, cod, flounders, shrimp, crab, lobsters, and scallops. Polluck ranked first in volume at 3.3 billion pounds, or 37 percent, and menhaden followed in volume at 1.8 billion, or 19 percent. Shrimp ranked first in value at \$460.9 million, or 15 percent. Crab was second in value with \$397.7 million or 13 percent.

The total exports of fishery products was 2.2 billion pounds in 2001, valued at \$3 billion. The U.S. imported four billion pounds of seafood valued at \$10.1 billion. The World Trade Organization (WTO), was working with member countries to abolish the current seafood tariffs that have restricted U.S. trade. As of 2003, the United States recorded a \$7 billion seafood trade deficit. The final results were not expected until January 1, 2005.

Two of the nation's largest seafood distributors were Fishery Products International USA and Trident Seafoods Corporation. Fishery Products International USA, located in Danvers, Massachusetts, was a subsidiary of Fishery Products International. Fishery Products International, headquartered in St. John's, Newfoundland, Canada, harvested and marketed products, including shrimp, snow crab, sole, cod, redfish and haddock from the coast of Newfoundland and Labrador. Scallops were harvested off Nova Scotia's coast. The company generates most of its sales from the service industry sector. FPI recorded sales of \$759 million for 2003, up from \$720 million reported for 2002. Trident Seafoods Corp., with headquarters in Seattle, Washington, brings in salmon, crab, and various finfish from Alaska and the Pacific Northwest. Trident is in the process of acquiring NorQuest Seafoods. Trident generated \$650 million for 2002.

Other leading distributors include Dulcich, Inc., located in Clackamas, Oregon, and the fourth largest, Red Chamber Co. headquartered in Vernon, California, with sales of \$680 million for 2002. There were about 85,000 people that worked in the fishery seafood processing and wholesaling segments in 2001.

SIC 5147

MEATS AND MEAT PRODUCTS

This industry consists of wholesale distributors of fresh, cured, and processed (but not canned or frozen) meats and lard. Establishments engaged in the wholesale distribution of frozen packaged meats are classified under **SIC 5142: Packaged Frozen Foods**. Establishments engaged in the wholesale distribution of canned meats are classified in **SIC 5149: Groceries and Related Products, Not Elsewhere Classified**.

NAICS CODE(S)

311612 (Meat Processed from Carcasses)

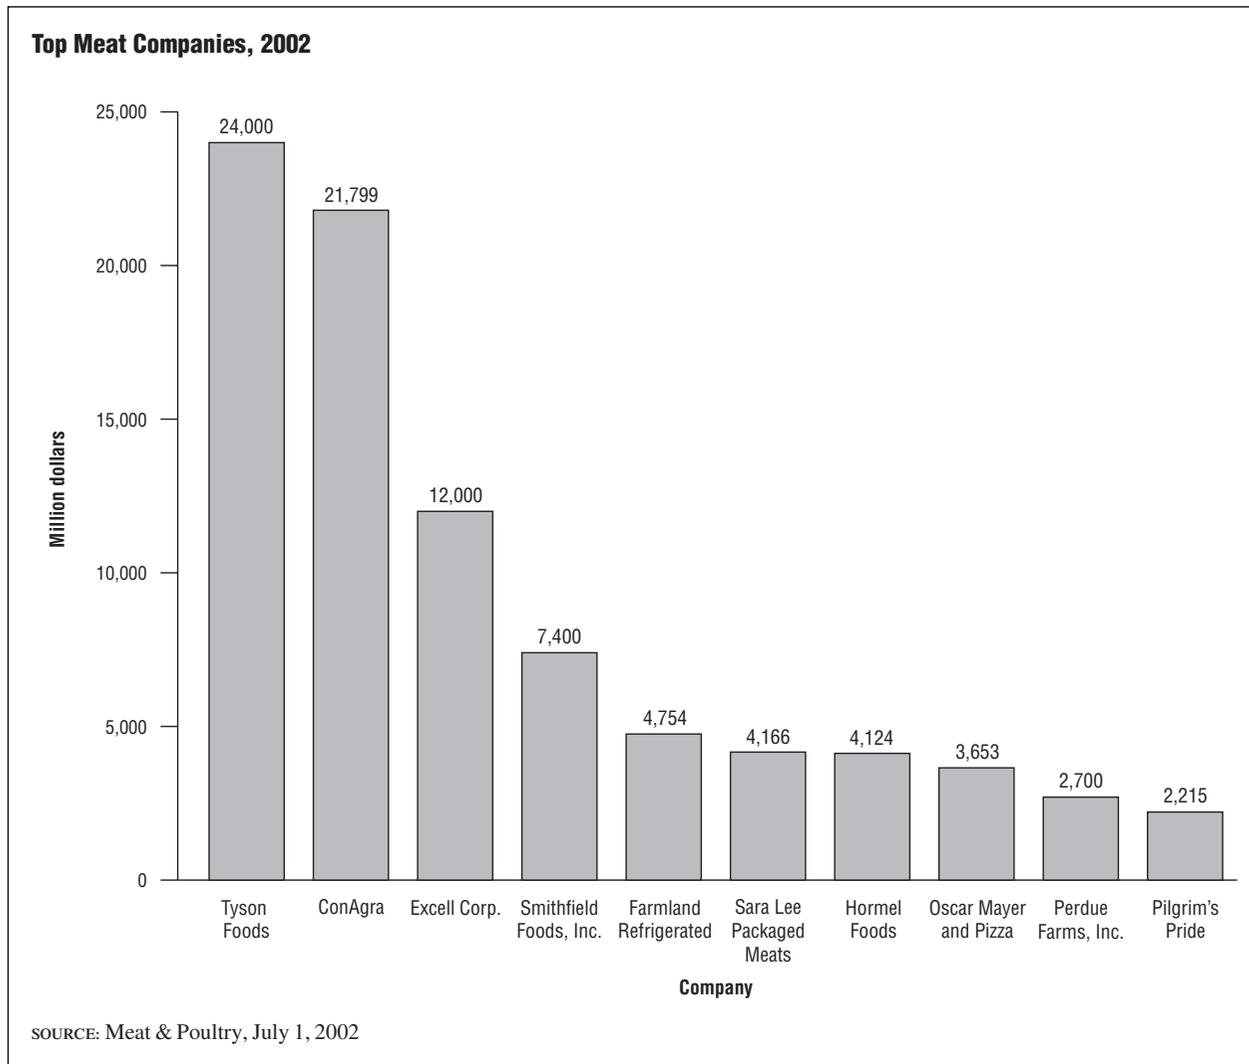

422470 (Meat and Meat Product Wholesalers)

According to the U.S. Census Bureau, 3,305 establishments were engaged in the wholesale distribution of meats and meat products in 2001. The total number of establishments climbed to 4,118 in 2003. Combined, they generated approximately \$29,955.50 million in sales. The average sales per establishment was about \$7.50 million. The workforce climbed to 66,619 people and the average number of people per establishment totaled 16. Most establishments employed under five workers. There were 1,958 businesses that employed five or fewer people. States with the highest number of wholesale distributors were California with 507, New York with 463, Texas with 288, and Illinois with 265. Together, they dominated

almost 40 percent of the market. Meats and meat products represented 2,375 establishments, which was more than 57 percent of the market. Fresh meats followed with 1,194 establishments and controlled 29 percent of the overall market. Meat brokers numbered 365 businesses or 8.9 percent of the market.

The Cryovac Division of Sealed Air Corporation, in conjunction with the National Cattleman’s Beef Association underwent an assessment of “supermarket fresh meat departments.” Their focus was in the areas of “packaging, point of sale materials, and the presence of non—meat items in the meat case.” There were a total of 25 leading U.S. markets that took part in this audit. Some findings revealed that beef, poultry, and pork were the leaders in the retail marketplace in 2002. About 65 percent of the average retail meat cases contained beef. Poultry followed with 22 percent, and pork at 14 percent. Consumers demand for leaner, and boneless cuts remained prevalent with 82 percent of steak, and 93 percent of roasts retailed as boneless. Their findings also concluded that consumers shop for convenience, and 98 percent of the meat markets accommodated them with a section devoted specifically for that purpose. However, less than half used a “point—of—sale to attract consumers to the section.” A major finding was in regards to conflicting labeling, specifically on ground beef, and that less than half of the packages lacked cooking instructions. Non—meat items totaled 60 percent, such as vegetables, potatoes, and condiments. In almost 94 percent of the fresh meat markets their cases contained processed meats, as well. The “fresh meat case may be moving toward providing whole meal solutions rather than providing only fresh meat.” In conclusion, the average beef consumption had increased by five percent, and the average price had also increased by two percent. This finding concluded the shift in consumer demand. Since 1993, there has been a dramatic shift in the way consumers shop for meat. Even though the price is higher for premium cuts, some consumers tend to prefer the premium labeled meats.

According to Steve Kay, editor and publisher of *Cattle Buyers Weekly*, 2001 was a year for “Merger Madness,” or as the “year of mergers,” some of which were between former leaders within the industry. Some include IBP, Inc.; Packerland Packing; Taylor Packing; Emmpak Foods; Moyer Packing; Rocco Enterprises; and B.C. Rogers Poultry. The merger activity had slowed down in 2002 and the industry did not expect to see the continued consolidation. The U.S. Department of Agriculture’s Foreign Agricultural Service reported that meat exports would decline in 2003, which had not occurred since 1985. The experts attributed the decline in poultry exports of 11 percent to be the main cause of the expected decline. The safety of meat and meat products continued to be an issue since the bovine spongiform encephalopa-

thy, commonly referred to as “mad cow disease,” was discovered in a single cow from Canada.

According to the *Food Institute*, U.S. red meat and poultry was forecast to increase 0.7 percent in 2004. Overall beef production had dropped 3.2 percent in 2003, however, poultry was up 1.3 percent, while pork was up 0.8 percent. According to reports, prices were expected to remain the same, or drop slightly for 2004.

One of the largest meat and meat products wholesalers in the United States was Monfort, Inc., a major company in ConAgra Beef Companies. Monfort began in the 1930s near Greeley, Colorado, as a family-owned cattle feeding operation and became an international, multibillion dollar company. By the late 1990s it employed 19,000 people in the United States and, by 1999, it had an annual sales revenue of \$7.1 billion. In 2003, a few of ConAgra’s customers included Wal—Mart, Sysco Corporation, and Wendy’s Hamburgers. ConAgra’s sales were \$19.8 billion for 2003.

Monfort, Inc. was the only major meat producing company with cattle feeding, beef, pork, and lamb processing operations, national distribution and transportation, a by-products and pet foods division, and a construction company. An innovator in the industry, Monfort introduced quarter-inch trim specifications, which started an industry-wide trend toward lean cuts. In response to retailer demand for even leaner cuts of meat, the company began offering *Super Lite* cuts, trimmed to one eighth of an inch. Company officials expected demand for their products to grow as innovative packaging, value-added products, and exports helped boost sales.

Other industry leaders were Tyson Foods; Cargill, Inc.; Smithfield Foods, Inc.; Farmland Refrigerated; Sara Lee Packaged Meats; Hormel Foods; Oscar Mayer; Perdue Farms, Inc.; and Pilgrim’sPride Corp.

SIC 5148

FRESH FRUITS AND VEGETABLES

This industry is comprised of wholesale distributors of fresh fruits and vegetables. It also includes establishments involved in banana ripening for the trade.

NAICS CODE(S)

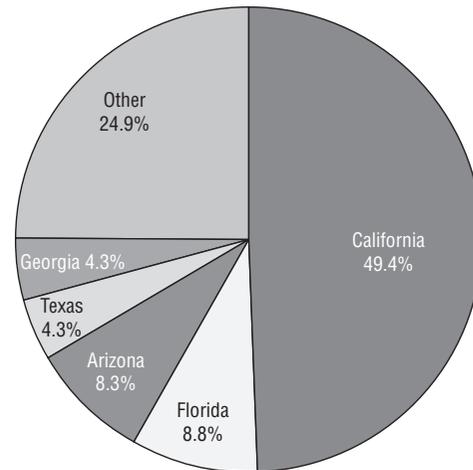

422480 (Fresh Fruit and Vegetable Wholesalers)

In 2001, the U.S. Census Bureau reported a total of 5,753 establishments engaged in the wholesale distribution of fresh fruits and vegetables. In 2003 there were a total of 6,988 establishments and a total of 100,125 employees. The total sales generated were approximately \$35.8 billion, with the average sales per establishment totaling about \$5.7 million. California led the nation in both number of establishments, with 1,419, and value of sales, with \$8.4 billion. Florida ranked second with 793 establishments and sales totaling \$10.2 million, followed by New York, Texas, and New Jersey. Most industry establishments were classified as merchant wholesalers, those who take title to the goods they sell. The remaining businesses in the classification are agents, brokers, and commission merchants.

The fresh fruits segment had 1,136 establishments and employed 28,103 people. It accounted for more than 16 percent of the market, with total sales of \$10.2 million. Banana ripening numbered 528 establishments, and fresh vegetables had 396 establishments and generated \$6.3 million.

Sales of fresh vegetables and fruits in the United States have increased significantly since 1987, due in great part to nutritional awareness and promotions by national dietary-health programs such as “5 A Day—For Better Health.” Increased interest in adopting a meatless lifestyle also propelled vegetable sales. By the end of the

States Producing the Most Fresh Vegetables, 2003

SOURCE: National Agricultural Statistics Service

century, more than 12 million Americans considered themselves to be vegetarians.

Vegetable production in 1993 declined one percent, attributable to tomato crop damage in Florida and lower sweet potato production, both of which were down eight percent. Grower receipts in 1995 were \$14.8 billion—the fifth consecutive increase in receipts and a record high. Strong prices for lettuces, potatoes, carrots and melons supported the higher receipts as did broccoli and watermelon consumption. Production had increased by the end of the decade, resulting in higher wholesaling receipts. Tomato production alone totaled more than \$1 billion in 1998.

An ongoing concern for California and Florida tomato growers impacting wholesalers has been the impact of free trade with Mexico. Tomato imports were up 22 percent in 1996. Contentions are that Mexico dumped tomatoes into the market at prices well below market value. The commerce department and the Mexican government reached an agreement in October 1996 in which Mexican tomatoes were agreed to be sold at prices comparable to U. S. products. The United States International Trade Commission discontinued its investigation as a result.

Consumer interest in ethnic foods has encouraged diversity in crops and spurred wholesalers to add variety to the traditional fruits and vegetables they carry. Mediterranean, Southwestern, and Asian cuisine stimulated sales of vegetables such as eggplant, beets, Asian cabbages, jicama, beans, and peppers. Such new interests also helped increase sales.

Citrus was one of the largest product classifications. Tree-ripe fruit of all varieties, which required special

handling, helped increase profits for those able to deliver quality produce.

The total value of the vegetable and melon harvested crops totaled \$9.67 billion for 2003, up two percent from the 2002 growing season. According to the National Agricultural Statistics Service (NASS), California held the title of the “fresh market state”, including 44 percent of the harvested area, 49 percent of production, and 55 percent of the value. Onions, head lettuce, and watermelon accounted for 37 percent of the overall production. Tomatoes, as onions, and head lettuce combined, accounted for 35 percent of the overall value.

Citrus growers' receipts totaled \$2.30 billion for the 2002 to 2003 growing season, down 12 percent over the 2002 crops. Florida was in the lead with 74 percent of the total United States citrus produced. California accounted for 23 percent, and Texas and Arizona shared three percent.

Sunkist Growers, Inc. was the largest marketing cooperative in the fruit and vegetable industry and one of the ten largest marketing cooperatives of any kind in the United States. The organization's grower-owners governed the cooperative and provided direction to its subsidiaries and affiliates. Sunkist also had citrus processing facilities, fruit growers' supply warehouses, an asset management service, and a research center. The company was established in 1893 by 60 citrus growers who joined together to improve their ability to deliver products to the marketplace. Bypassing commissioned agents and brokers, they bolstered grower profitability by sharing packing and marketing expenses. More than one hundred years later, Sunkist had more than 6,000 grower-owners in California and Arizona. In 2001, the cooperative generated \$993 million in sales. This was an increase of \$99 million over 2000 sales of \$754 million.

SIC 5149

GROCERIES AND RELATED PRODUCTS, NOT ELSEWHERE CLASSIFIED

This industry is comprised of wholesale distributors of groceries and related products, not elsewhere classified. Some of the products included in this category are: breakfast cereals, bottled water, canned goods, coffee, cookies, cooking oils, crackers, dairy products, pet food, flour, dried fruits, health foods, honey, macaroni and spaghetti, canned or dried milk, pickles, salad dressing, sauces, soft drinks, soups, refined sugar, and yeast. Establishments primarily engaged in the wholesale distribution of beer and ale are classified in **SIC 5181: Beer and Ale**. Wine is classified in **SIC 5182: Wine and Distilled Alcoholic Beverages**.

NAICS CODE(S)

422490 (Other Grocery and Related Product Wholesalers)

INDUSTRY SNAPSHOT

Grocery wholesalers and distributors buy grocery items from manufacturers or other distributors and typically resell them to retail—including grocery and convenience stores—or other commercial enterprises—including food service establishments—that in turn sell the goods to users. The wholesaling industry also includes many firms that import foreign goods or export U.S. products. In practice many wholesalers are integrated with manufacturing and retailing of grocery products as well.

Grocery wholesalers and distributors claim more than 50 percent of the complete grocery and related product sales. Manufacturers' sales offices and branches account for 25 percent, and brokers and agents share 19 percent.

Products within this industry are subdivided into six categories: coffee, tea, and spices (representing about 8.6 percent of the industry's sales volume); bread and baked goods (7.7 percent); soft drinks (13.5 percent); canned goods (23.0 percent); food and beverage basic materials (3.6 percent); and other grocery specialties (43.6 percent).

BACKGROUND AND DEVELOPMENT

In 1997, Dun and Bradstreet listed 23,093 establishments engaged in the wholesale distribution of groceries

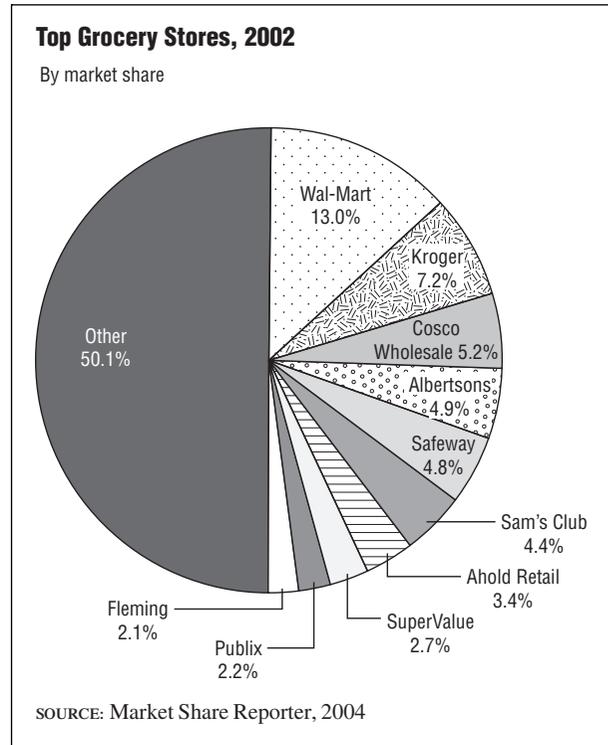

and related products. The top 50 wholesale grocers shared 38.6 percent of the market in 1997, with each business averaging \$1.62 billion in sales. The top 10 industry leaders totaled \$54.2 billion in sales. Industry employment increased nearly 10 percent during the first half of the 1990s, reaching 270,000 workers with a payroll of \$8.1 billion. Industry sales totaled more than \$150 billion during the mid-1990s, which accounted for more than half of the broader grocery wholesaling market in the United States.

The industry faced diminished sales growth during the late 1990s. In 1997, the top 50 wholesale grocery giants reported sales of \$81.1 billion, compared to \$81 billion the previous year. One reason for the stagnation was competition from vertically integrated grocery retailers such as The Kroger Co. and Safeway Inc., which, because of their size, were able to buy goods directly from manufacturers—as well as to make many of their own private label products—rather than relying on other distributors. The warehouse clubs, such as Sam's Club, Costco, and BJ's also grabbed market share from traditional wholesalers by offering volume discounts to small businesses and consumers. In 1998 Sam's Club had 451 U.S. locations, BJ's had 96 U.S. locations, and Costco had 288 locations in the United States, Canada, the United Kingdom, Taiwan, Korea, and Mexico. Costco generated the most revenue in 1998, totaling \$26 billion, while Sam's Club totaled \$24.4 billion and BJ's \$3.4 billion.

CURRENT CONDITIONS

According to the U.S. Census Bureau, there was a sharp decline in the total number of establishments in 2001, down to 13,703. There were approximately 301,333 employees with an annual payroll of \$11.8 billion. By 2003, the total number of establishments had risen to 19,083, which together generated approximately \$98 billion in sales, with the average sales per establishment totaling about \$6.4 million. The total number of employees fell slightly to 256,719 people. California had the majority of the establishments with 3,427, followed by New York with 1,622, and Florida with 1,288.

According to a report released from the *U.S. Food Marketing System*, the four largest U.S. grocery retailers accounted for 27.4 percent of sales. The eight largest accounted for 40.5 percent of sales, and the 20 largest controlled 52 percent of sales. The top ten grocery stores dominated almost 50 percent of the overall market and represented \$728.7 billion in sales. According to the *Market Share Reporter*, the leading grocery stores in 2002 were Wal-Mart, Kroger, Costco Wholesale, Albertsons, Safeway, Sam's Clubs, Ahold Retail, SuperValue, Publix, and Fleming. States with the largest grocery markets according to the *Market Share Reporter*,

were California, Texas, Florida, New York, Pennsylvania, Ohio, Illinois, North Carolina, Michigan, and Georgia.

Canada exported a value of \$2.5 million in food into the United States. Thailand was second, with \$1.8 million, followed by Mexico with \$659,321, China with \$640,776, and Chile with \$491,247. United States exports of miscellaneous food included Canada with \$1.3 million, Japan with \$1.3 million, South Korea with \$282,582, Mexico with \$206,005, and China with \$144,133.

INDUSTRY LEADERS

SuperValu Inc., of Minnesota, was the nation's largest grocery wholesale distributor in 1997, with more than 48,000 employees nationwide. Also a leading grocery retailer, SuperValu reported \$16.6 billion in sales in that year, 71 percent of which was from its wholesale business. In 1999 SuperValu acquired Richfood Holdings Inc., of Virginia, the largest grocery wholesaler in the mid-Atlantic and the fourth largest overall, with \$3.4 billion in sales during 1998. However, in 1999 Richfood lost a \$600 million contract with its biggest customer, Giant Food Stores Inc., of Carlisle, Pennsylvania. The contract represented about 17 percent of Richfood's annual earnings.

Fleming Companies of Oklahoma City was the second largest U.S. grocery wholesaler in 1997, with approximately \$13 billion in sales and a work force of

39,000 employees. But in 1999 Fleming announced a company-wide restructuring, cutting roughly 700 jobs and divesting itself of six supply centers and at least one retail operation. Fleming also said that it expected to lose \$1 billion in sales over the next two years. In April of 2003, Fleming filed for bankruptcy protection, but planned to keep its Core—Mark convenience business. On August 26, 2003 C&S Wholesale Grocers announced its completed acquisition of the Fleming Companies. This acquisition allowed C&S Wholesale Grocers to expand its market presence into new areas. With Fleming no longer in the grocery arena that placed C&S Wholesale Grocers as the second largest U.S. grocery wholesaler, behind SuperValu Inc.

C&S Wholesale Grocers Inc., based in Brattleboro, Vermont, employed more than 2,800 workers and had annual sales of approximately \$6 billion in 1998. The company provides customers with more than 53,000 food and non-food items, including meats, candy, tobacco, frozen foods, dairy, deli, and bakery products, and health and beauty aids.

The *Food Institute* reported there were a total of 40 mergers or acquisition in 2001, 35 in 2002, and 32 in 2003.

SIC 5153

GRAIN AND FIELD BEANS

This industry classification is comprised of establishments engaged in buying and/or marketing grain, dry beans, soybeans, and other inedible beans. Also included are country grain elevators, terminal elevators, and other merchants involved in marketing grain. Establishments primarily involved in the wholesale distribution of field and garden seeds are in **SIC 5191: Farm Supplies**.

NAICS CODE(S)

422510 (Grain and Field Bean Wholesalers)

A total of 6,401 establishments were classified in this industry in 2003. Their combined sales were estimated at \$62 million. They employed almost 54,000 workers and posted an annual payroll of \$1.8 million. Average number of workers per establishment totaled about nine, and average sales per establishment was approximately \$17 million.

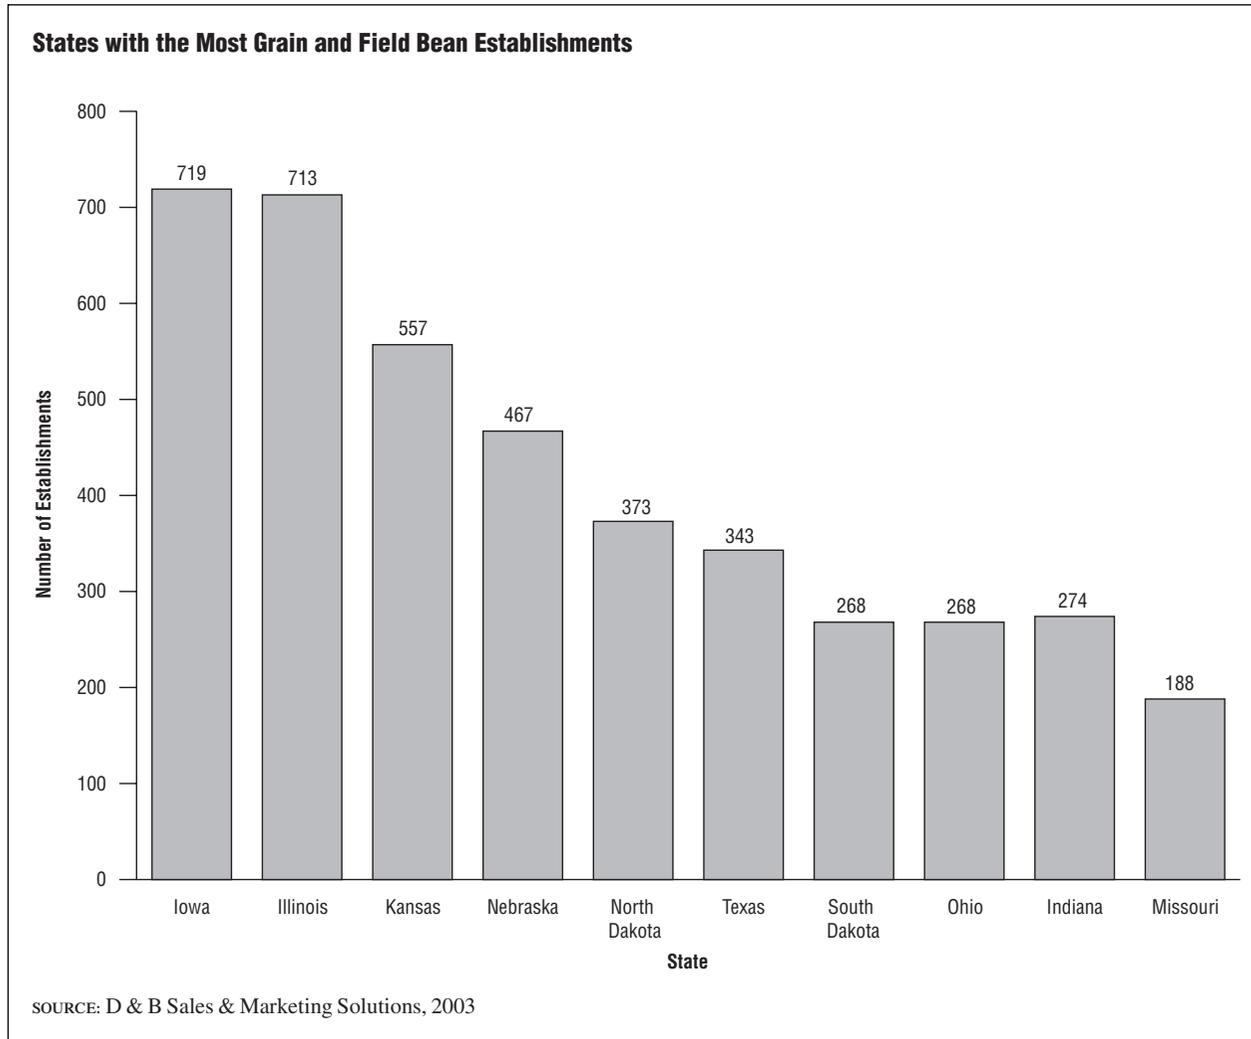

Leading states in 2003, as measured by number of establishments and value of sales, were Illinois, Iowa, Kansas, Nebraska, and Minnesota. Two other states with high sales' volume, despite relatively small numbers of establishments, were Louisiana, Missouri, Ohio, and Michigan.

Worldwide, the grain trade peaked in 1979 at 240 million metric tons. During the 1980s and early 1990s, however, both U.S. grain buyers and sellers suffered from market stagnation. Foreign policy decisions led to grain embargoes restricting the ability of U.S. merchants to peddle grains in some overseas markets. In 1992, *Fortune* reported that approximately half of the country's grain elevator and terminal capacity had been idled.

By the mid-1990s the condition of the industry had improved. The grain market of 1996 was the strongest since the 1970s, according to *The Wall Street Journal*. The failure of the winter wheat crop left supplies in storage at low levels, and high demand from importers like China pushed corn and wheat prices to record highs that year. The booming prices caused financial disaster, though, for farmers and elevators that had signed hedge-to-arrive contracts. Countrymark Cooperative Inc. of Indiana was embroiled in court cases as a result of these instruments.

The Federal Agricultural Improvement and Reform Act of 1996, or the so-called “freedom to farm” legislation, phased out farm subsidies over a seven-year period. It allowed farmers to grow whatever crops were profitable on the market, rather than restricting what they could plant or forcing them to leave some of their land unplanted. Grain storage facilities anticipated changes to their operations to meet the new demands of different amounts and types of crops that would come to them.

In an article released the University of Illinois Extension, marketing specialist Darrel Good expressed his concern over the current agricultural policy's and production of wheat and coarse grains. He noted that world crops have been varied from year to year, with less yield. The demand had been higher than total production, which in turn would lead to higher prices. In short, the annual world consumption goes beyond annual production. The current forecast called for 2003 to 2004 to be the fifth

straight year that annual consumption will out weigh total production. The total shortfall in coarse grain will go beyond 106 million tons.

According to data published in *Grain and Milling Annual 1996*, the top four companies as measured by total corporate grain storage capacity were: Cargill, Inc. (Minneapolis, MN); Archer Daniels Midland Co. (Decatur, IL); Continental Grain Company (New York, NY); and Bunge Corporation (St. Louis, MO). Based on annual sales, the leaders include Continental Grain, Bunge Corp., The Scoular Co., and ConAgra Trading Cos, according to *Ward's Business Directory 2000*.

In 1999, Cargill Inc. acquired its competitor, Continental Grain (the number 1 and number 4 grain traders, based on annual sales and total corporate grain storage capacity). This merger gave Cargill control of 15 percent of grain from farmers and at least 35 percent of America's export grain. Cargill also caused controversy when it expected farmers in Illinois to bypass country elevators. The country elevators established a boycott, sending their

customers' grain to a competitor, Archer Daniels Midland. In April of 2004, Cargill expanded overseas and acquired a Romanian grain silo, Comcereal S.A.

SIC 5154**LIVESTOCK**

Establishments falling under this classification are primarily engaged in buying and/or marketing cattle, hogs, sheep, and goats. This industry also includes the operation of livestock auction markets. Establishments primarily engaged in the wholesale distribution of poultry are classified in **SIC 5144: Poultry and Poultry Products**; companies involved in the buying and selling of horses are in **SIC 5159: Farm-Product Raw Materials, Not Elsewhere Classified**.

NAICS CODE(S)

422520 (Livestock Wholesalers)

INDUSTRY SNAPSHOT

According to the United States Department of Agriculture, in conjunction with the National Agricultural Statistics Service there were 94.9 trillion cattle reported in the United States in January of 2004. The highest concentration was in Texas with 795 establishments that are engaged in this industry. Iowa followed with 386, and California with 260. The industry employed 32,953 workers and generated \$5.7 billion in sales for 2003. The average sales per individual establishment was approximately \$1 million.

Cattle represented the highest number of establishments with 2,459 and more than 41 percent of the market value. Livestock numbered 1,835 and accounted for more than 30 percent of the market. Auctioning of livestock had 1,382 establishments and more than 23 percent of the overall market. Combined, their sales totaled \$5.3 billion. Hogs, goats, and sheep accounted for 258 establishments.

The marketing of livestock in the United States is conducted by a variety of businesses ranging from the order buyer who operates out of the front seat of his car to the video auction that sells cattle by beaming pictures of them to a satellite orbiting the earth. The livestock marketing business has evolved from the days when stockmen would send their livestock to a terminal market without any idea of the price they might receive. Terminal markets and commission agents still thrive in the ever-changing world of livestock marketing, but they have been joined by modern day merchants who use computers, video uplinks, fax machines, and cellular phones to market livestock.

Firms involved in the wholesale marketing of cattle, sheep, hogs, and goats include such diverse operations as stockyards, commission firms, order buyers, dealers, brokers, auction markets, and video auction companies.

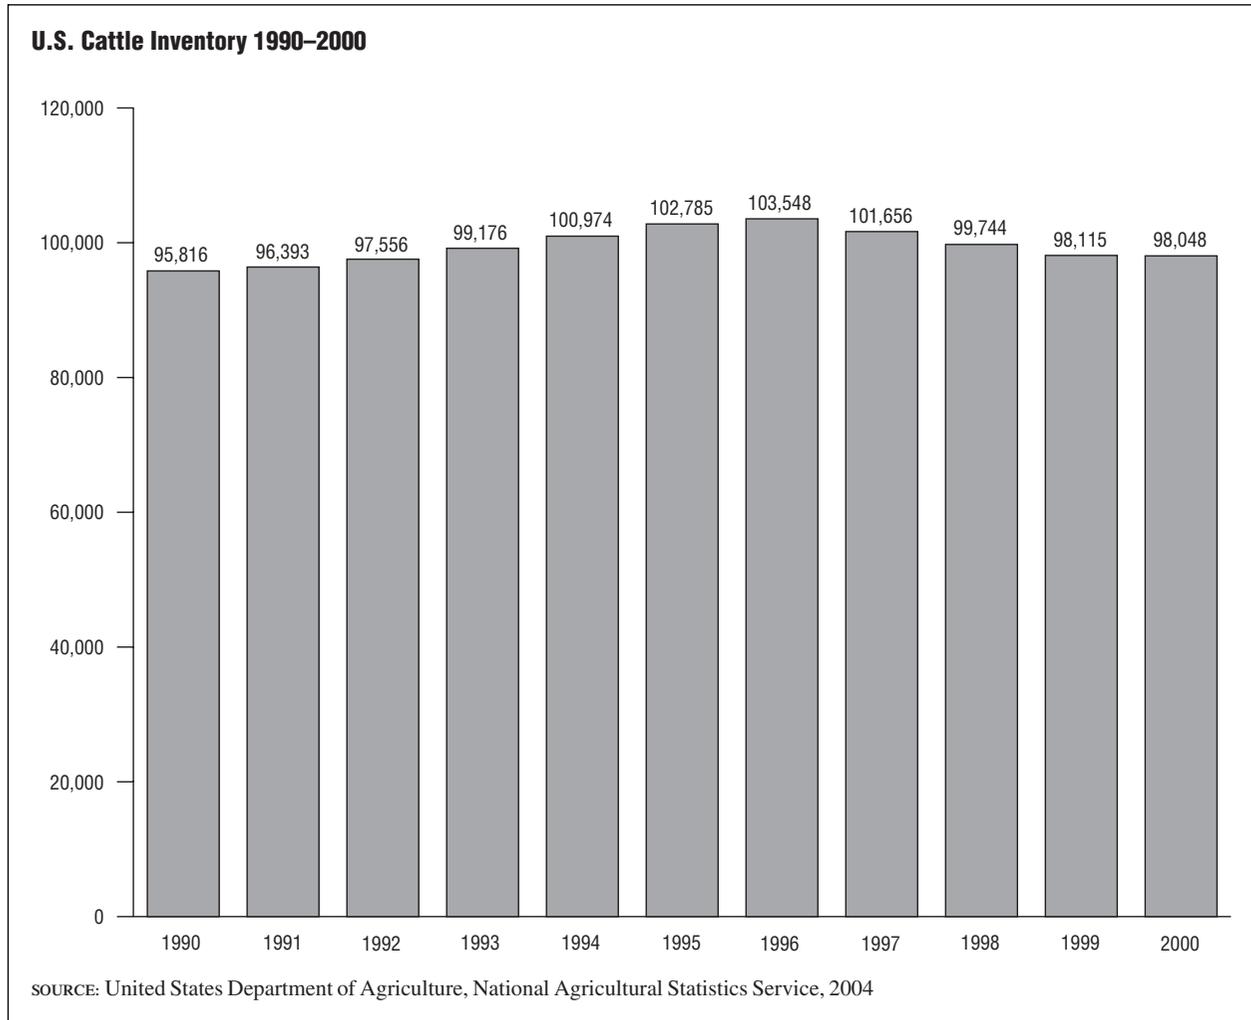

Livestock are consigned to auctions by ranchers, hog operators, sheepherders, and other stockmen to be sold by the chant of an auctioneer. Because trucking is a costly expense, most often stockmen will send their livestock to the nearest auction market. This may be ten minutes or ten hours away by truck. These auction markets are usually individually owned—only a handful were owned by conglomerates. The owner of the auction receives a commission or a per head fee for selling the livestock in addition to charging for the feed consumed while the livestock are in the auction yard. Typical commissions range from 2 to 3 percent or about \$7.50 per head.

One of the largest cattle auctions in the country where the cattle are actually herded through an auction ring was located in Oklahoma City, Oklahoma. Here cattle are sold nearly every day of the week. The auction in Norfolk, Nebraska was one of the largest auctions in terms of the number of species sold. There might be a hog auction taking place in one sale ring and a dairy cattle auction in another ring on the same premises on the same day. This is an exception, however, as most of the auction yards in the country conduct sales once a week. Sheep, dairy animals, goats, hogs, horses, and cattle are sometimes offered on the same day at the same location.

Commission agents are still used at some auctions around the country—the auction at Oklahoma City being the largest. This practice is a holdover from decades ago when ranchers would send their livestock to a commission agent located at any of the larger stockyards, such as those located in Chicago. These agents would then be responsible for the care and feeding of the livestock and the selling of them once they reached the yard, and would receive a commission based on how much the animals brought at market.

Livestock is usually sold by the pound except in the case of breeding animals, which are usually sold by the head. For example, a breeding bull may bring \$2,000 to \$3,000, whereas a steer destined for a feedlot may sell for \$60 per hundredweight. Old cows being sold for slaughter are usually sold one at a time. When a rancher sells his yearly production in the form of calves or lambs, however, the drafts may be composed of several dozen or even hundreds of head. In the latter instance the livestock are weighed and priced per pound. Steer cattle and heifers are usually sold separately, whereas a group of lambs or hogs may include both sexes.

Sitting in the auction arena are a variety of buyers who make their living attending several auction sales each week. They may be order buyers working on a per head or per pound fee, or they may be employees of a feedlot or a packing house. Order buyers may have several orders at the same auction sale. A feedlot manager may have called and wanted steers for the feedlot or a rancher may have phoned with an order for heifers suit-

able for breeding. Order buyers often to represent several interests at the same sale, although they usually try to avoid having more than one order for the same classification of livestock. The order buyers keep careful track of both the number of livestock they buy and the weight, which is flashed on an overhead “scoreboard.” Order buyers are highly skilled and are paid on a commission basis, which is usually “fifty cents per hundred”—this means that on a purchase of a \$500 animal the order buyer would be paid \$2.50.

At ringside buyers convey their desire to bid by sending slight body signals to an auctioneer who has learned his chant at one of many auction schools. The livestock are sold rapidly with as many as 50,000 head per day being sold. In the case of video auctions, it is not unusual to see the ownership of 60,000 head of livestock change hands in a single day.

ORGANIZATION AND STRUCTURE

Some ranchers prefer to sell their livestock “in the country,” which is the popular way of saying that buyers

come to the ranch or farm and purchase the animals directly from the owner rather than from an auction market. The livestock are weighed on a ranch scale that has been checked and sealed by representatives from state or county weights and measures. In most cases the same order buyers who sit in on the auction scour the country looking for livestock to buy “in the country.”

In discussing livestock marketing, a distinction must be made between classes of livestock. Feeder cattle or calves that are just being weaned are most often sold at auction. Many feeder pigs and lambs are still sold in this manner. But most cattle, sheep, or hogs that are older and ready for slaughter are sold directly to a packer buyer. Packer buyers are given “show lists” from major feed yards, and they bid on the cattle either in person or over the phone.

Often cattle and hogs are actually fed by the packing plant owner. This is known as “captive supply,” and at times the captive supply of fed cattle in the United States exceeds 20 percent. This is cause for worry among independent livestock producers who feel that if the “Big

Three” meat packers—IBP, Monfort, and Excel—are able to feed their own cattle, they can in some way control the market price for all classes of cattle. They would supposedly do this by withholding their cattle when supplies were large and using up their own supplies when livestock in the country were in short supply.

How livestock are marketed in the United States varies depending on what species is being merchandised. Hogs, for example, are marketed in a fashion similar to poultry—the animals are raised under contract to large packers. Although feeder pigs are still sold at auction, the tendency is toward more vertical integration and more contractual arrangements. In addition to this method there are also several hog buying stations, situated primarily in Iowa, Illinois, and Indiana, to which hogs are delivered, weighed and sold to a packer.

Purebred livestock, boars, rams, bulls, and other registered animals to be used for feedstock production are sold either at auction or by private treaty. At auction the animals are usually sold one at a time, with the auctioneer being paid 1 percent of the selling price and the sales manager receiving a commission of about 5 or 6 percent. In many farm or ranch production auctions, however, there are no sales managers, so that expense is eliminated. Private treaty sales occur when a rancher goes to the farm or ranch and purchases the animals directly from the breeder who produced them.

Legal Aspects. Many of the anti-trust laws in the United States were passed as a direct result of the problem of monopolization of the meat industry. On August 15, 1921, the Packers and Stockyards Administration was formed to police the livestock marketing industry. The P and S, as it is commonly called, works to insure the integrity of the livestock, meat, and poultry markets. This is accomplished through fostering fair and open competition and guarding against deceptive and fraudulent practices that could affect meat and poultry prices.

Producers, consumers, and the entire industry are protected by the P and S from unfair business practices which can unduly affect meat and poultry distribution and the price of meat at every level, from the ranch gate to the super market shelf. The P and S sends auditors to the various livestock marketing agents to review accounts and insure that the marketing agencies are properly bonded.

Commission firms, auction markets, dealers, and order buyers are required to be bonded as a measure of protection for livestock sellers. The size of the bond is based on the volume of business and is generally an average of two business days or a minimum of \$10,000. A dealer in livestock must be bonded to legally operate.

It is the primary function of the P and S to insure that commission firms, auction markets, order buyers, and dealers remain financially solvent. The administration is

also called upon to rid the industry of the unscrupulous traders who occasionally surface. Rules that livestock dealers must abide by include the prompt pay law, whereby consignors or owners of livestock must be paid promptly, usually by the close of business on the day after the transfer of possession. For example, if a cow buyer sitting on the auction seat buys a load of cattle, the livestock may be loaded and sent to the packing house but the packer must legally pay for those cattle on the day after they have been purchased. Another way the P and S insures that merchandisers remain solvent is by keeping an eye out for “check kiting,” which is merely swapping checks by placing them in two or more bank accounts for the purpose of creating a “float” or inflated balance.

The P and S also ensures that all firms engaged in livestock merchandising are playing on a level playing field. Tariffs or charges must be published, and auction markets cannot legally offer free trucking, price guarantees, or discounted commissions as an incentive for a rancher to send his or her livestock to one auction as opposed to another—doing so can result in a fine of \$10,000 for each infraction.

In the intricate, competitive world of livestock marketing, no single factor is as important as the accurate measurement of livestock weight. Employees of the Packers and Stockyards Administration check the scales which are used to weigh the livestock on a regular basis. Scales must be tested by an approved weigh master for accuracy at least once every six months.

A principal trade organization for the livestock marketing sector has been the Kansas City-based Livestock Marketing Association (LMA). In addition to lobbying Congress and state legislatures, the LMA is also in the insurance business and provides bonding for the various marketing agencies. The LMA’s Board of Trade issues “hot sheets” notifying the industry of unscrupulous dealers and firms that are no longer solvent.

BACKGROUND AND DEVELOPMENT

After experiencing declining beef demand throughout the 1980s and 1990s, the industry saw beef demand rise by 4.59 percent for the third quarter of 1999 as compared to third quarter 1998 demand, according to the National Cattlemen’s Beef Association (NCBA). The annual rate of decline began to slow in the late-1980s, and started to flatten in 1996; third quarter 1999 represented the first sustained gain in beef demand, following on the heels of a significant increase during the previous quarter, as compared to the second quarter of 1998, according to the Beef Demand Index, independently tracked according to USDA data. In a presentation to the Beef Summit ’99, Randy Bloch of the Denver-based market research firm Cattle-Fax attributed rising demand to increased consumer spending and per-capita consumption. A more tell-

ing revelation is the fact that consumer demand sustained growth in the face of record-high beef supplies, which drove prices up, surprisingly, in defiance of economic laws of supply and demand.

A growing trend in the beef business in the 1980s and 1990s was the custom feeding of cattle. This means that a rancher places his cattle in a feedlot and pays for feed and yardage expenses and then sells the cattle to a packer when they are ready for processing. In so doing, he maintains ownership of the cattle all the way through the feeding phase, which generally lasts from 120 to 200 days. The cattle are often sold on a grade and weight basis, meaning that the price per pound is determined by the quality of the meat carcass.

Despite a plethora of new methods of marketing livestock, the auction market remained, in the 1990s, the primary agent for assisting in the transfer of title for various species of livestock. As of the late 1990s, 1,500 livestock auctions existed in the United States according to the Livestock Marketing Association (LMA); a variety of livestock were sold on a weekly and sometimes daily basis at these auctions. In addition, the United States Department of Agriculture (USDA) identified about 19,000 livestock sellers—feedlots, farmer-feeders, auctions and dealers. Combined, beef and pork accounted for 68.4 percent of the meat market, with beef controlling the largest chunk at 40 percent.

According to November 1999 projections, Cattle-Fax extrapolated yearly beef supplies to reach 27 billion pounds, a 2.5 percent increase over 1998 supplies. Simultaneously, consumer spending rose by \$1.5 billion to \$36.7 billion for the first 3 quarters of 1999, a 4 percent increase compared to the same period in 1998. November projections placed 1999 consumer spending at \$48.56 billion, a \$2 billion increase over 1998 results. Per capita spending experienced its greatest gain since 1990, according to the projected growth of \$5 per capita to \$178 by the end of 1999, as compared to 1998 per capita spending. The increase in beef prices by 4 cents in 1999 compared to prices the year before contributed to some of the spending increase, while increasing per capita beef consumption also contributed to some of the increase. Per capita beef consumption rose 0.9 percent in the first three quarters of 1999 compared to September 1998 figures, with projections calling for a 1.6 percent increase over the entire year, compared to 1998.

The NCBA attributed increased beef demand to several factors: increasing exports, the strong domestic economy, rising wages, low inflation, and low unemployment rates. However, NCBA CEO Chuck Schroeder cautioned against over-optimism, reminding the industry of the changing consumer profile. Increasingly, consumers were becoming less knowledgeable about the intricacies of cooking red meat properly while also calling for more

convenient preparation methods, prompting the industry at the retail end to transform to more user-friendly packaging with clear cooking instructions and recipes and also packaging pre-fabricated meals and pre-cooked meats to enhance convenience.

In the 1990s, the livestock marketing industry was at something of a crossroads. Would it operate according to the rules of vertical integration, whereby livestock would no longer be sold at auction or “in the country,” but instead be under contract from the day of birth to the day of processing? Or would the auction market remain intact? Though auctions have not even started to fade, contract purchases offer packers a distinct financial advantage. For example, packers spent \$1.75 to \$2.00 less for contract cattle per hundredweight than they did for auctioned cattle. The USDA predicted that contract purchasing would increase, especially in the cattle and hog markets.

Also, the USDA reported in a 1996 study that out the 19,000 operations selling livestock, the 152 largest sellers accounted for 43 percent of the cattle sold. The USDA noted that concentration within the livestock industry seemed to spread to the sector responsible for selling livestock just as it had to other sectors such as packing and feedlots.

In the area of sheep marketing, another problem had surfaced by the mid-1990s—the market had become extremely concentrated, and lamb raisers had only two or three buyers in the entire United States. This has caused the Western Organization Resource Council to call on the U.S. Attorney General and the Justice Department to investigate the situation and to enforce antitrust legislation.

Likewise, the beef packing industry had become increasingly concentrated at the end of the 1990s. In 1994, just three firms in the beef packing industry—IBP, Monfort and Excel—processed 80 percent of all fed cattle and were increasing their market share cumulatively at the rate of 5 percent per year. When Upton Sinclair wrote *The Jungle*, a graphic 1906 novel that portrayed the wretched lives of workers in Chicago’s meat packing plants (and the impetus behind much antitrust legislation in the food industry), the five largest meat packing firms did not control as much of the slaughter as the “Big Three” do in the modern era. The general feeling among many livestock producer groups is with fewer buyers the lack of competitive bidding will not provide true market discovery for their livestock. The USDA has persistently urged Congress to take action against the large meat-packing companies, launching study after study to reveal their effect on livestock pricing.

CURRENT CONDITIONS

On May 20, 2003 a ban was issued on Canadian cattle imports and products, as a result of a cow testing positive for bovine spongiform encephalopathy (BSE),

commonly known as “mad cow disease.” A report released by the USDA in April 2004 ended the ban on the Canadian beef industry and reopened the border for trade. This further prompted the USDA to investigate an identification plan in conjunction with the state animal health officials and individual livestock industry groups. This group is called the National Identification Development Team. They will be working on a country-of-origin labeling (COOL) system, or “national standardization program that can identify all premises and animals that had direct contact with a foreign animal disease within 48 hours of discovery.” This would enhance the current Federal and state labeling requirements under the U.S. Farm Act.

The total number of cattle on feedlots in the United States totaled 10.6 million in 2003. That number was down from 11.6 million or eight percent in 2002. The United States consumed 3.86 billion pounds of red meat in 2002, while the cattle slaughtered totaled 2.77 million heads. The total number of cattle and calves on feedlots as of January 2004 numbered 11.2 million. There were 6.84 million steers and steer calves that were also included in the inventory. The red meat consumption totaled 3.88 billion pounds in December 2003, while cattle slaughter totaled 97.5 thousand heads of cattle. According to Cattle—Fax beef production for 2004 was expected to decrease to about 25 to 30 pounds per week. This was a decrease of 4.5 percent over 2003.

The United States Department of Agriculture issued its projections through to 2013. It was estimated that the U.S. consumers would spend less on red meat over the next ten years by about 1.8 percent. The total per capita would decline from approximately 185 pounds in 2003 to about 181 pounds, but is expected to stabilize by 2013. The United States exports are expected to rise as the demand for meats increase, however the domestic market is the United States main source. The total meat exports only accounted for 11 percent of the value of U.S. meat in 2003. That number is only expected to increase not more than 12 percent by 2009.

RESEARCH AND TECHNOLOGY

Nearing the end of the century, one of the ways in which the livestock marketing sector has responded to increased packer concentration is through the use of video auctions. As mentioned earlier, this relatively new tool allows cattlemen to offer their livestock for sale to buyers all over the country through the use of modern day telecommunications tools. Videotaped pictures of consignments of livestock are beamed to a satellite on a predetermined sale day, and buyers can view the livestock on their own television sets, providing they are linked to a satellite dish. While they are viewing the livestock, they can call on the telephone and take part in a

regular auction. This way, livestock only have to be moved once—to the new owner—thus avoiding the costly and time-consuming task of trucking animals to an auction market.

In video auction, buyers may come from down the street or across the country. The real value of video auction is the sellers have a free and open market to a much wider audience of potential buyers. The livestock are usually less stressed and healthier when sold in this manner. But descriptions of the livestock must be accurate when the buyers cannot view the animals in person. Another benefit of video auction is if a major buyer stays off the market that day, the seller does not suffer because there are plenty of other buyers to take his place.

Large video auction companies stage either monthly or biweekly sales. Western Video Market, headquartered in Cottonwood, California, is actually a consortium of auction markets that are using the video sales in combination with their own weekly, live animal sales. Superior Livestock Auction, with headquarters in Brush, Colorado and Fort Worth, Texas, on the other hand, has more than 300 agents in the country filming consignments and delivering the livestock to the new buyers. Superior was selling more than one million cattle annually by 1994; Western Video had sold more than 60,000 head in just a single day. Superior was also selling other species of livestock, including ostriches.

The marketing of livestock has come a long way from the days when cattle were herded up the Goodnight Trail in an attempt to find buyers. In the modern era the most up-to-date electronic communication tools are being used to market livestock of all species. There has also been a great deal of experimentation taking place with computer listings of livestock and computer auctions. These changes have been revolutionary for an industry steeped in tradition. One thing remains constant however; in the world of livestock marketing the transaction is bound by an honor code that has disappeared in other industries. Multi-million dollar deals are still consummated without a written contract—the marketing of livestock is still very much a handshake business between gentlemen.

SIC 5159

FARM-PRODUCT RAW MATERIALS, NOT ELSEWHERE CLASSIFIED

This industry consists of establishments primarily engaged in buying or marketing farm products that are not included in another classification. Some samples of the industry's products are animal hair, bristles, feathers, furs and hides, broom corn, raw cotton, hops, unprocessed or shelled-only nuts, tobacco leaf, raw silk, and bovine semen. Animals including chicks, horses, and mules are also industry products.

NAICS CODE(S)

422590 (Other Farm Product Raw Materials Wholesalers)

In 2001, the U.S. Census Bureau reported 1,517 establishments engaged in buying or marketing farm products that are not included in another classification. The total number of employees represented 12,866, with an annual payroll of \$468.8 million. There were a reported 2,402 establishments in 2003, with combined annual sales of \$16 billion. The average sales per establishment were about \$7.5 million. The employee number had grown to include some 16,983 people.

The industry was subdivided into five categories: cotton representing 34.7 percent of the industry's total sales volume; other farm-product raw materials, representing 25.1 percent; hides, skins, and pelts, representing 21 percent; leaf tobacco, representing 16.2 percent; and wool, wool tops, and mohair, representing 3 percent.

States with the highest number of establishments were Texas with 295, California with 203, Georgia with 135, and New York with 134. Combined, they represented more

than 32 percent of the overall market presence, generating approximately \$3.5 billion in sales. Tobacco leaf generated the most sales with \$7 billion, followed by cotton merchants with \$1.9 billion, raw cotton with \$1.8 billion, and tobacco distributors and products with \$1.2 billion.

The industry closely scrutinized one of its top sellers, cotton, conducting research to improve fiber quality, fiber processing, new yarns and fabrics, and dyeing and finishing. It also performed research on the consumer market by monitoring and analyzing retail sales, textile industry changes, international fashion trends, and consumer attitudes. Of course, the industry's most controversial product was tobacco.

In 2003, the industry leader was H.T. Hackney Co., of Knoxville, Tennessee, with posted sales of \$3.3 billion. Universal Corp. of Richmond, Virginia, followed close behind with \$2.6 billion in sales. Other leaders included DIMON Incorporated, located in Danville, Virginia, with sales of \$1.3 billion, Standard Commercial with \$993.7 million, and Louis Dreyfus Corp. with \$149.8 million for 2002.

Former leader, Agway Inc., a New York based agricultural cooperative, filed for Chapter 11 bankruptcy protection on October 1, 2002. The company blamed the market conditions over the previous three years, but noted the "agriculture sector" as the weakest link. Cargill, Inc. of Wayzata, Minnesota, acquired the majority of Agway's Feed and Nutrition assets on March 15, 2004. However, Agway planned to emerge out of bankruptcy by the end of 2004.

According to a report released by the U.S. Equal Opportunity Commission, there were a total of 9,494 people employed in this industry in 2002. Men totaled 71.2 percent and women totaled 28.8 percent. In the minority category men totaled 25.9 percent and women totaled 8.3 percent. There were a total of 16.1 percent of Hispanics employed in this industry, as well as 0.9 percent Asian Americans. The African American population represented 16.8 percent, while the Native Americans accounted for 0.4 percent.

SIC 5162

PLASTICS MATERIALS AND BASIC FORMS AND SHAPES

This industry includes companies engaged in the wholesale distribution of plastics materials and basic forms and shapes. Industry products include unsupported plastic film, sheeting, rods, tubes, and synthetic resins.

NAICS CODE(S)

422610 (Plastics Materials and Basic Forms and Shapes Wholesalers)

According to the U.S. Census Bureau, there were a total of 3,908 establishments involved in the plastics and basic forms and shapes industry in 2001. There were a total of 43,116 employees, with an annual payroll of approximately \$2 billion. In 2003, the workforce had decreased to 30,279 employees. The annual sales for the industry totaled \$10.9 billion in 2003.

The plastics materials and basic shapes sector controls more than 30 percent of the industry in terms of market share. The sector consists of 931 establishments, with total sales of \$3.3 billion. The plastics materials not elsewhere classified segment made up more than 24 percent of the market, with \$6.7 billion in sales. The plastics products not elsewhere classified segment made up more than 19 percent of the market, with \$6.7 billion in sales. Still others included resins with sales of \$24.9 million; plastics resins with sales of \$8.7 million; synthetic resins with \$3.6 million; plastic basic shapes, with \$2 billion; plastics film, with \$3.3 billion; and plastics, sheets, and rods with \$4 billion.

A panel of 67 journalists gathered by the Newseum, a journalism museum, ranked the invention of plastic number 46 on its list of the 100 most significant news events of the 20th Century, according to a February 1999 American Plastics Council (APC) press release. *Newsweek* magazine seconded this opinion. As the APC reported in November 1999, the year-to-date plastic resin production by August 1999 amounted to 52.1 billion pounds, a 5.3 percent increase over production for the same eight-month period in 1998. August 1999 production reached 6.6 billion pounds, a 0.7 percent decrease from July 1999 production but a 4.1 percent increase over August 1998 production.

Both shipments and employment in plastics rose over the 1990s. Employment continued its annual growth rate

of 3 percent since 1974, reaching 1,337,700 jobs by 1996, and shipment values continued their two-and-a-half decade growth rate of 4.1 percent, and between 1991 and 1996 alone shipment values rose 55 percent, reaching a value of \$274.5 billion in 1996, according to APC statistics.

The *1992 Census of Wholesale Trade* listed 3,490 companies as wholesale distributors of plastic materials and basic forms and shapes. Their combined sales totaled \$28.5 billion. At least 160 of these companies reported annual sales of \$25 million or higher. The industry employed 25,504 workers and posted an annual payroll of \$803.6 million. These figures can be compared to those of the 1980s, where the *1987 Census of Wholesale Trade* listed 2,744 companies in this group, with combined sales of \$20.3 billion, 28,453 workers, and an annual payroll of \$788.4 million.

Between 1988 and 1992, the average return on assets for the nation's plastic distributors dropped 45 percent, from 8.1 percent to 4.6 percent, although individual distributors had varying success. As Mark Bogin, of Roechling Engineered Plastics in Gastonia, North Carolina, observed in *IAPD Magazine*, "plastic distributors serve a cross-section of industry, and no two distributors serve the same market and industries in the same way." Bogin also said "there is hardly any industry that does not use our products, and regardless of general economic conditions there are always industries which are growing."

According to a report issued by the APC in 2003, the overall industry had remained flat. The economy had weakened by the war in Iraq and the workforce continued to decline. The plastics industry being dependent upon other industry's needs for their products, felt the rippling effect of the downturn in the overall economy.

In 2004, the plastics market began to recover from the downturn and production of plastic resin rose to 6.9 billion pounds in January of 2004, up 2.4 percent from the same time period a year before. The following month the production increased 5.1 percent.

Some analysts project overall plastic demand to increase 2.5 percent or 15.5 billion feet annually to 2007. The demand for plastic pipe is expected to experience the most growth. According to a study by The Freedonia Group, an industrial research firm that the demand is the direct result of "stricter water management regulations, continued highway and street construction, and the rehabilitation of aging or obsolete sewer, drainage and municipal drinking water systems". Construction is expected to contribute 48 percent towards the total pipe production in 2007.

As of 1999, the largest distributor of plastics in North America was the Ashland Distribution Company of Ashland Inc., in Ashland Kentucky. For the year ended September 30, 1999, the Ashland Chemical division, located

in Columbus, Ohio, generated specialty chemical sales of \$1.1 billion, distribution sales of \$2.8 billion, and petrochemical sales of \$300 million. As of 1995, the General Polymers Division of Ashland Chemical was the highest-grossing company in this industry, with 1995 estimated sales of \$650 million and 300 division employees. According to Ashland Chemical's Web site, "The General Polymers Division is the nation's largest source for prime, packaged thermoplastic raw materials and represents 26 major plastics producers. The division markets a broad range of thermoplastic injection molding, rotational molding, and extrusion materials to processors in the plastics industry through distribution locations in the United States, Canada, Mexico, and Puerto Rico. It also provides plastic material, bulk transfer and packaging services and less-than-truckload quantities of packaged thermoplastics."

The leading distributor of plastic sheet, rod, tube, and film was Cadillac Plastic and Chemical Company, with 1995 estimated sales of \$270 million and 1,500 employees. The company, founded in 1945, began as a reseller of surplus canopies from U.S. fighter planes. By the mid-1990s, Cadillac Plastic operated in more than 147 locations around the world. Sheet products, such as Lexan and Plexiglas, were some of the company's best-known products. Lexan, made by GE Plastics, was used in safety glazing, outdoor signage, machine guards, skylights, and windows. Plexiglas, the nation's first commercially available acrylic sheet, was used in display cases and bar-code readers. M.A. Hanna Co. of Cleveland, Ohio, an international specialty plastics company, bought Cadillac Plastic in 1987.

Cadillac Plastic's line of engineering plastics included Nylon, Acetal, Teflon, CastAcrylic, UHMW-PE, and High Performance Polymers (HPP). The company also sold tubing, lighting, adhesives, and silicones. Within the specialty film category, Cadillac Plastic provided materials used in automobile instrument panels, membrane switches, and graphic arts products. The company's Aircraft Products group marketed specialty products meeting FAA standards for commercial aircraft builders.

SIC 5169

CHEMICALS AND ALLIED PRODUCTS, NOT ELSEWHERE CLASSIFIED

This industry consists of wholesale distributors of chemicals and allied products not included in another classification. Industry products include acids, industrial and heavy chemicals, dyestuffs, industrial salts, rosin, and turpentine.

Companies primarily engaged in the wholesale distribution of agricultural chemicals and pesticides are in **SIC 5191: Farm Supplies**. Companies involved in the wholesale distribution of drugs are in **SIC 5122: Drugs, Drug Proprietaries, and Druggists' Sundries**. Companies that distribute pigments, paints, and varnishes are in **SIC 5198: Paints, Varnishes, and Supplies**.

NAICS CODE(S)

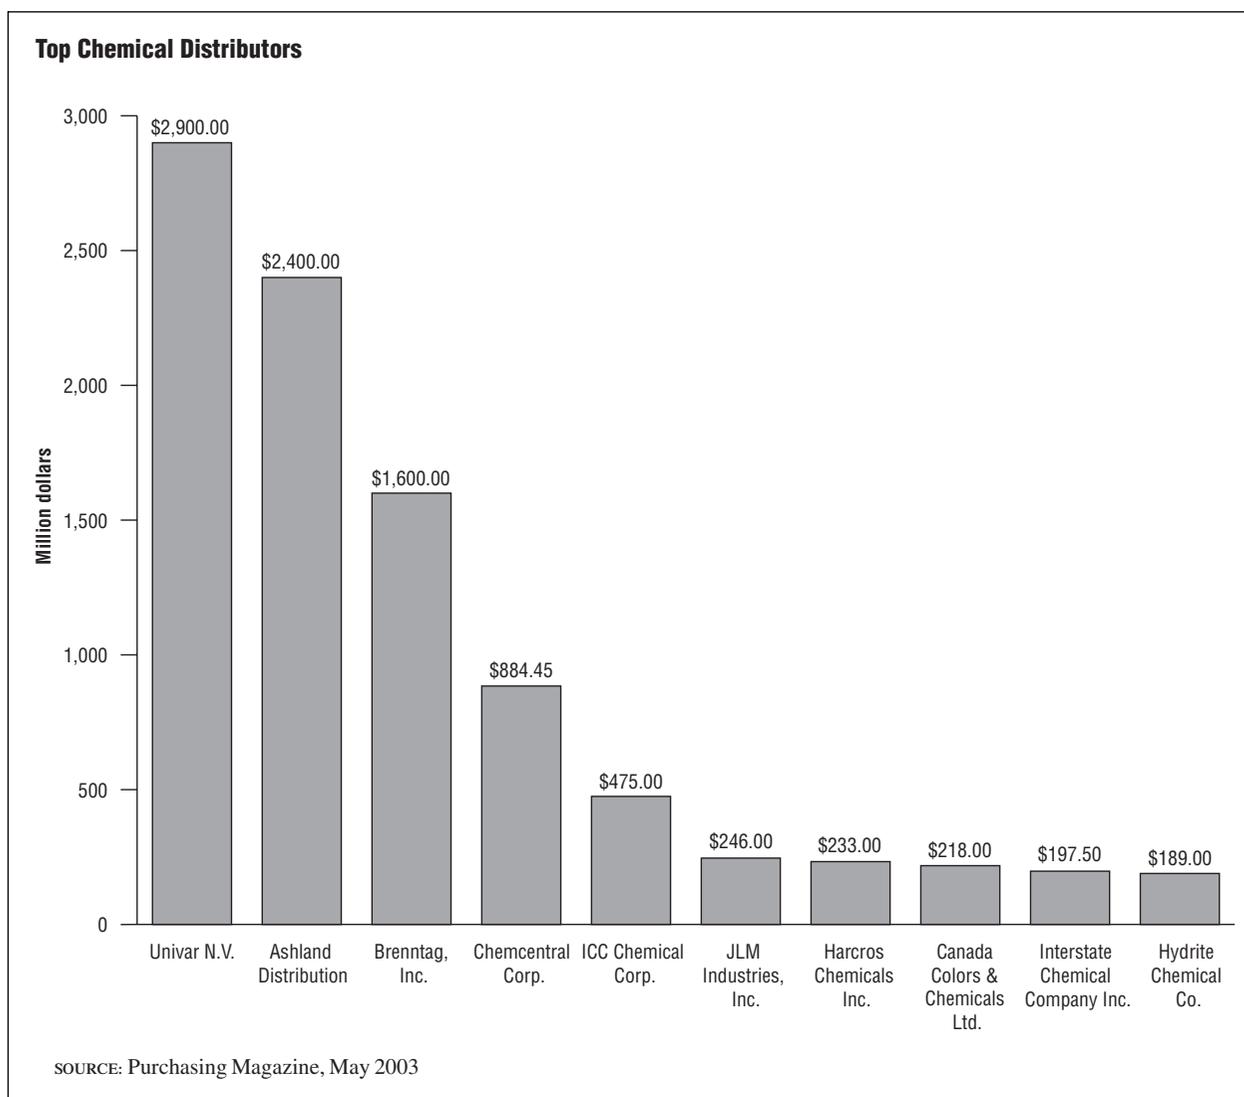

422690 (Other Chemical and Allied Products Wholesalers)

In 2001, the U.S. Census Bureau reported there were approximately 11,911 wholesale distributors of chemicals and allied products. Combined, they employed some 121,143 workers with an annual payroll of \$6.3 billion. In 2003, the total number of establishments increased to 13,457. Together they generated \$43.7 billion in sales. The average sales per establishment was about \$4.5 million. The employee count rose to 13,457 with approximately ten employees per establishment.

California and Texas represented the highest concentration with 2,801 establishments controlling more than 20 percent of the market. Michigan only accounted for 417 establishments; however, companies in this state generated the highest annual sales, valued at \$5.8 billion.

Chemicals and allied products not elsewhere classified accounted for 5,726 establishments and more than 42 percent of the overall market. The total sales combined were \$14.6 billion. Industrial chemicals numbered 1,370 establishments and more than ten percent of the market.

Analysts subdivide industry products into two categories: industrial gases (except liquefied petroleum) and other chemicals and allied products. During the mid 1990s, wholesalers of industrial gases represented 15.3 percent of the total number of industry firms and accounted for 3.9 percent of the dollar-value of industry sales.

According to "The Business of Chemistry in the USA: Performance and Outlook," a Chemical Manufacturers Association survey released in November 1999, the value of overall domestic shipments of chemicals and allied products climbed to a record \$412 billion in 1999, an increase of more than 5 percent. CMA director of economics T. Kevin Swift attributed these gains to new-product innovations in the biosciences and in specialty chemicals, as 16 percent of revenues to industrial chemical companies from 1994 through 1999 derived from new products.

Chemical exports remained flat at \$68 billion through 1999, continuing a trend since 1992, when exports rose only one percent to reach \$42 billion. However, the U.S. chemical industry enjoyed a \$526 million trade surplus with China (1998 U.S. exports to China amounted to \$1.97 billion while imports from China reached only \$1.44 billion).

The leading chemical distributors were positioned for growth and were able to acquire smaller distributors.

For example, Brentag, Inc. acquired Holland Chemical International, and Vopak acquired Ellis & Everard. However, the most significant acquisitions for 2002 include, Univar's spin off from Royal Vopak. The company then took on its new name of Univar N.V. That same year, Univar acquired Stochem of Toronto, Canada. Positioned for growth, Univar planned to expand throughout the United States, as well as into Western Europe.

Univar N.V. (formerly Vopak) was the top chemical distributor according to *Purchasing*, with \$2.9 billion in sales for 2002, up from \$2.4 billion in 2001. Second place Ashland Chemical Company of Dublin, Ohio, had sales of \$2.4 billion for 2002. The Industrial Chemicals and Solvents division of Ashland distributed more than 7,000 chemicals, solvents, additives and raw materials to industries as diverse as printing inks and industrial cleaning products.

Other industry leaders were Brenntag, Inc. with \$1.6 billion, Chemcentral Corp. with \$884.45 million, ICC

Chemical Corp. with \$475 million, JLM Industries, Inc. with \$246 million, Harcros Chemicals Inc. with \$233 million, Canada Colors & Chemicals Ltd. with \$218 million, Interstate Chemical Company Inc. with \$197.5 million, and Hydrite Chemical Co. had sales of \$189 million. The leading 100 chemical distributors reported \$139.8 million of overall sales for 2002, a decrease of 3.7 percent or \$145.3 million for 2001.

SIC 5171

PETROLEUM BULK STATIONS AND TERMINALS

This industry consists of companies that wholesale crude petroleum and petroleum products from bulk liquid storage facilities. Distributors of liquefied petroleum gas from bulk liquid storage facilities are also included.

NAICS CODE(S)

454311 (Heating Oil Dealers)

454312 (Liquefied Petroleum Gas (Bottled Gas) Dealers)

422710 (Petroleum Bulk Stations and Terminals)

In 2001, U.S. Census Bureau reported 7,020 petroleum bulk stations and terminals companies. Combined, these companies employed approximately 94,034 workers. The annual payroll totaled \$3.7 billion. In 2003, the total number of establishments dropped substantially to only 4,603. The employee number almost dropped in half to 45,419 workers. Total sales were \$33.1 billion, with the average sales per establishment at about \$10.9 million. Texas, Minnesota, and California reported the highest number of establishments.

Analysts subdivided the industry into three categories: petroleum bulk stations, petroleum bulk terminals, and liquefied petroleum (LP) gas bulk stations and terminals. Petroleum bulk stations were defined as businesses

with bulk storage capacity from 10,000 to 100,000 gallons for stations getting supplies by tanker, barge, or pipeline, and those with capacity from 100,000 to 2,100,000 for stations getting supplies from other sources. Petroleum bulk terminals were those businesses whose bulk storage capacity exceeded 100,000 gallons in facilities getting supplies by tanker, barge, or pipeline, and those whose capacity exceeded 2,100,000 gallons for facilities getting supplies from other sources. LP gas bulk stations and terminals were plants selling liquefied petroleum gas to dealers, wholesale distributors, industrial users, commercial users, and government and military units.

Petroleum bulk stations were the largest sector of the industry, with 2,860 companies that controlled more than 62 percent of the overall market, with combined sales of more than \$24 billion. Petroleum bulk stations and terminals accounted for 1,504 companies, more than 32 percent of the market value. Petroleum terminals numbered 239 companies.

The 1997 *Economic Census-Wholesale Trade* reported 69 petroleum bulk stations and terminals companies. Sales in 1997 totaled \$331.4 billion, based on the NAICS code. The mid-1990s sales breakdowns for industry products were reported as: motor gasoline, \$49.2 billion; no. 2 distillate fuel oil, \$11.8 billion; liquefied petroleum gas, \$1.8 billion; residual fuel oil, \$1.9 billion; all other distillate fuel oil, \$1.9 billion; jet fuel, \$3.9 billion; lubricating oil and grease, \$1.6 billion; crude oil, \$19.7 billion; aviation gasoline, \$208.0 million; and special naphtha, \$94.0 million.

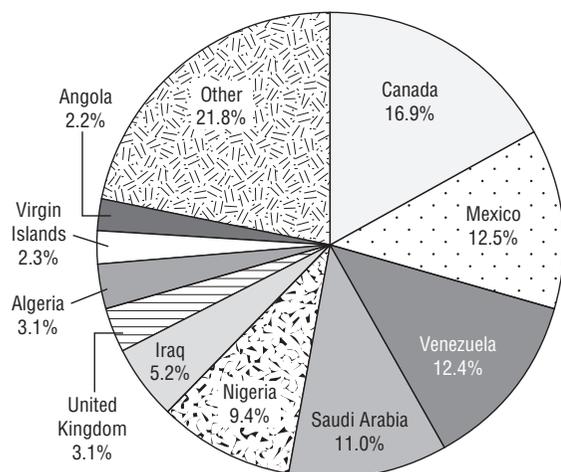

Industry watchers predicted that petroleum demand would rise as the U.S. economy improved after a slowdown in the early 1990s, and world crude oil supplies met demand. But even as forecasters predicted stable prices, this theory was disproved in the late 1990s. Further improvements in fuel-consumption efficiencies, however, could slow growth within the industry.

The petroleum industry climbed 4.1 percent in March of 2004, according to the American Petroleum Institute (API). For the first quarter of 2004, imports of distillate fuel, liquefied petroleum, and residual fuel remained the same, while jet fuel declined.

One of the largest companies classified in this industry was Coastal Oil New England, Inc., a petroleum products marketing subsidiary of the Coastal Corporation with 1999 sales totaling \$8.2 billion. The Coastal Corporation, founded in 1955, was one of the nation's largest energy companies; Coastal has the capacity for 468,000 barrels per day. In the early 2000s, the company agreed to be acquired by El Paso Energy, a natural gas leader. Another industry leader was EOTT Energy Partners, L.P. of Houston, Texas, with 1999 sales of \$8.7 billion. EOTT gathered and marketed crude oil and also used third-party

Countries Exporting the Most Crude Oil to the United States

By percent of crude oil imported to the U.S.

SOURCE: Department of Energy, Petroleum Supply Monthly, April 2004

pipelines to deliver jet fuel, fuel oil, and unleaded gasoline. The company gathers and markets approximately 430,000 barrels of crude oil each day.

In the propane segment, one leader was a UGI Corp. subsidiary, AmeriGas Partners, LP of King of Prussia, Pennsylvania, with 1999 sales of \$1.4 billion and more than 5,000 employees. Ferrellgas Partners is another propane leader, with 1999 sales of \$624.1 million and 4,463 employees.

The top propane companies held their positions in 2003. UGI Corp. posted sales of \$3 billion, AmeriGas Partners with 1.6 billion, and Ferrellgas Partners, L.P. had \$1.1 billion in sales. In December of 2002, Ferrellgas acquired ProAm, one of the top twenty propane companies. Ferrellgas sells about 900 million gallons of propane per year.

EOTT Energy Partners, L.P. filed for Chapter 11 bankruptcy protection in 2002, followed by the separation of their affiliation with the Enron Corp. Enron Corp., an energy trader, went bankrupt in late 2002. EOTT has since emerged from Chapter 11 with a new identity, and a new name. As of March 1, 2003, the former EOTT, now separated from Enron, conducts business as EOTT Energy LLC. The released statement also included that EOTT should return to its past performance.

The leading suppliers of imports included Canada, Mexico, Venezuela, Saudi Arabia, Nigeria, Iraq, United Kingdom, Algeria, Virgin Islands, and Angola. In April of 2004, the petroleum imports totaled 12,195,000 barrels

per day. That was a decrease of 4.1 percent over April of 2003. The average price for a barrel of OPEC crude oil on May 7, 2004 was \$33.72.

SIC 5172

PETROLEUM AND PETROLEUM PRODUCTS WHOLESALERS, EXCEPT BULK STATIONS AND TERMINALS

This industry class consists of wholesale distributors of petroleum and petroleum products (except those with bulk liquid storage facilities). Industry products include butane gas, fuel oil, aircraft fueling services, liquefied petroleum gases, gasoline, kerosene, lubricating oils and grease, and naphtha. Petroleum brokers are also included.

Companies that wholesale petroleum and petroleum products from bulk liquid storage facilities are in **SIC 5171: Petroleum Bulk Stations and Terminals**.

NAICS CODE(S)

422720 (Petroleum and Petroleum Products Wholesalers (except Bulk Stations and Terminals))

INDUSTRY SNAPSHOT

According to statistics compiled by the U.S. Census Bureau, the number of firms engaged in the wholesale distribution of petroleum and petroleum products has been on a steady decline since the early 1980s. By 2001, approximately 2,680 establishments operated in this industry. In 1982, there were 6,287 such firms, and ten years later the ranks had thinned to 3,700. The average wholesale distributor sells over 11.5 million gallons of petroleum each year.

ORGANIZATION AND STRUCTURE

From an overall petroleum-industry perspective, the transactions between wholesalers and the retail level are among the least efficient components of the supply chain, due to the sheer number of transactions and their fixed order and delivery costs, according to *National Petroleum News*. As a result, the cost per transaction tends to be higher. Thus the wholesale channel was a major target of the industry's efforts at consolidation as an attempt to boost overall efficiency and cost-savings.

Moreover, the majority of wholesalers remained relatively small and thus lacked the economies of scale to afford high-level electronic data and tracking equipment that would more thoroughly and systematically track their activities through the supply chain. As the petroleum industry consolidated and moved toward integrating supply chains among all trading partners, from the refinery stage to retail, the pressures on distributors were expected to grow.

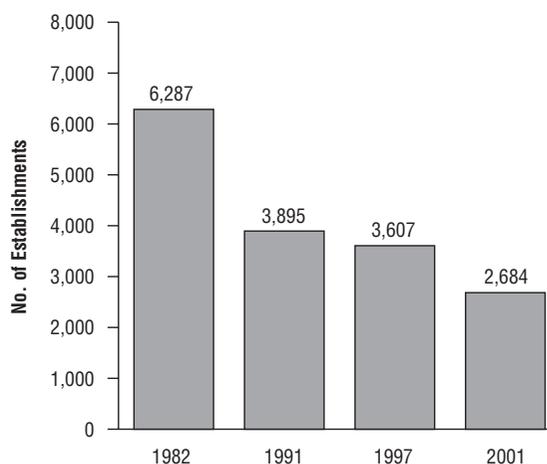

As of 2004 this industry was served by the Society of Petroleum Engineers (SPE), which conducted extensive research into methods of transport for oil and gas, among many other endeavors. The American Petroleum Institute (API) and the National Petroleum Council (NPC) were also crucial to industry players.

CURRENT CONDITIONS

The *National Petroleum News* reported in 2001 that 175,132 operations—including gasoline stations, truck stops, convenience stores, and marinas—were engaged in the sale of gasoline in the United States. Although petroleum delivery trucks sometimes shipped directly from the refinery to the gas station, most refineries shipped their products via barge or truck, or pumped through underground pipelines, to a bulk terminal, at which the trucks were filled for delivery to the stations' underground storage tanks, from which consumers drew the gasoline that filled their automobiles.

The petroleum industry was in the midst of a major consolidation wave in the early 2000s, as major oil companies restructured and joined forces to boost their efficiency and leverage. This was expected to squeeze the ranks of wholesale distributors further still. Major oil

Total Number of Establishments Operating in the Petroleum and Petroleum Products Wholesale Industry, 1982–2001

SOURCE: U.S. Census Bureau

firms, meanwhile, enjoyed record profits in the early 2000s, a result of high energy prices and cost-cutting measures resulting from the merger activity. The price of crude oil and natural gas, on a roller coaster in the early 2000s, were on the ascendancy entering the middle of the decade. Indeed, between late 2002 and late 2003, the price of oil nearly doubled.

The wholesalers that manage to survive were expected to be those with the greatest technological sophistication, those with strong relationships with the major oil companies and retailers, and especially those that can bolster their distribution operations with value-added services. In an increasingly consolidated industry obsessed with streamlining its overall supply chain, the role of the traditional wholesale distributor was anticipated to be increasingly open to reinterpretation, and so wholesalers would face pressure to broaden their focus in order to keep themselves viable and attractive in the eyes of the major oil companies.

INDUSTRY LEADERS

Flying J Inc., based in Ogden, Utah, was the leading distributor of diesel fuel in the United States, as well as a major truck-stop operator. Flying J employed 11,500 in a network that boasted over 160 Flying J Travel Plazas in over 40 states and in Canada. The firm also operated its own refinery and maintained its own oil and gas reserves. Flying J raked in revenues of \$4.6 billion in 2003, representing growth of 9.5 percent over the previous year.

A subsidiary of the Russian oil company LUKOIL, Getty Petroleum Marketing Inc., of East Meadow, New

York, was a major distributor of motor and heating fuels via some 1,300 service stations as well as its own petroleum and exchange terminals, primarily in the eastern United States.

Texaco Oil Trading and Supply Co., a subsidiary of Texaco Inc. based in White Plains, New York, was another major player in this industry.

over 3,000 in 1997 to 2,765 in 2003. Total industry employment likewise diminished through the late 1990s and early 2000s, from about 96,000 to 88,000.

ORGANIZATION AND STRUCTURE

Beer and ale wholesaling has always been relatively dispersed, characterized by a large number of independent distributors. The major beer companies have periodically made attempts to purchase some of their independent distributors in an effort to vertically integrate and obtain more control over the channel of distribution. Company-owned distributors can provide an advantage in controlling the pricing and presentation of the product to the final consumer and in maintaining retailer relations to ensure availability of the product. However, for the most part, brewers have been prevented by anti-trust considerations from purchasing their distributors, and efforts to build their own distributorships risked alienating their existing distributors and losing the market penetration they already have. The major breweries still maintained only a small handful of company-owned distributors in the late 1990s.

In order to maintain a modicum of control over distributors, larger breweries have often tried to replace restrictions on the ability of distributors to carry products of other brewers. However, because of Anheuser-Busch's dominating market share, competing brewers, such as Miller Brewing and Coors, have been forced to relax such restrictions, allowing wholesalers to acquire each other's brands, in order to guard their market shares. However, upon the acquisition of competing brands by wholesalers in markets such as Chicago, where Anheuser-Busch's dominance is far less pronounced, brewers complained that wholesalers were taking undue advantage of their greater freedom and forsaking the very logic that led to relaxed restrictions in the first place. Many wholesalers, at any rate, elect to stay with one brewer in order to maintain their positive relations.

In the early 2000s distribution involved several hundred regional independent distributors. Distributors generally remain regional since they are regulated by the state in which they do business. In most states, each distributor is awarded an exclusive sales area by the brewer and is primarily responsible for building relations with the retail and other consumer outlets in order to build the sales of the product. In a few states, such as Indiana, exclusive territories are not allowed, and competition is fierce. In states with exclusive territories, retail customers, including grocery chains, bars, and restaurants, have only one source of supply and are therefore at the mercy of distributor pricing. A strong dealer network is essential for brewers in order for them to obtain shelf space and keep the product available to the consumer. However, this is offset somewhat by the fact that there

SIC 5181

BEER AND ALE DISTRIBUTION

This industry includes establishments primarily engaged in the wholesale distribution of beer, ale, porter, and other fermented malt beverages.

NAICS CODE(S)

422810 (Beer and Ale Wholesalers)

INDUSTRY AND SNAPSHOT

Beer and ale wholesale distribution constituted a \$29.5 billion industry in 2003, representing a modest contraction from the \$35 billion in annual sales in the late 1990s. While much of this downturn was attributed to tapering consumption patterns among an increasingly health-conscious public, the industry also faced a number of challenges inherent to the evolving beer-industry structure. Wholesalers faced continuing pressure from major breweries attempting to streamline their delivery systems by integrating distributing into their businesses, though the nature of the competitive brewery industry opened a window whereby crafty distributors could gain leverage. Consolidation and tough market conditions forced the total number of wholesale distributors from

are so many distributors, so each has only limited power over the brewer.

BACKGROUND AND DEVELOPMENT

As long as breweries have done business in the United States, they have made refinements in their methods of distribution. For example, in the late 1870s, Adolphus Busch pioneered the use of refrigerated railroad cars for shipping beers long distances. Adolph Coors became the first brewer to develop and introduce an all-aluminum recyclable can in 1959.

When Prohibition was repealed in 1933, after 13 crime-ridden years, the federal and state governments tighten controls, and brewers, distillers, and vintners adopted policies of self-regulation. The Federal Alcohol Administration (FAA) Act was put into place soon after Prohibition ended. In the early 2000s the act still was responsible for the administration of regulations specifying who may qualify as a brewer; the collection of both brewer and wholesaler occupational taxes; and the regulation of trade practices, advertising, and labeling. As of 2004 most states had adopted various versions of the FAA Act in addition to their own statutes and rules. Different states used distribution techniques that varied from state-owned to private systems. But U.S. regulations demanded that brewers sell only to wholesalers, who then sell directly to bars in determined territorial markets.

After Prohibition, malt beverages were produced in some 750 different locations throughout the country and were distributed to wholesalers and then retailers within an extremely limited geographic region, by standards current in the early 2000s. Beer is a relatively expensive product to transport considering its value, so any brewers wishing to expand their area of sales had to consider the freight differences involved in shipping to another market. Thus for many years after Prohibition ended the United States developed a number of areas that might be called "brewing centers." That is, there were several areas that contained one or more local or regional brewers.

For competitive reasons, these local or regional brewers priced their beers at levels that would permit their wholesalers to generate the lowest consumer prices possible within their geographical areas. Any brewer desiring to sell in that area would need to consider the regional price structure, both in making their decisions about whether to enter the markets and in pricing their products. While there were fewer brewers in the mid-2000s, this basic pricing situation continued. Beer was priced to wholesalers by the case. It was packed in different sized packs and sometimes packed loose. Domestic brewers sold beer to wholesalers FOB (free on board) the brewery, meaning the wholesalers paid the freight charges. Importers generally sold beer to wholesalers CIF

(cost, insurance, and freight) port of entry, although some importers also maintained warehouses from which they sold FOB.

In the 1930s the chief means of selling beer were in draft form and in refillable bottles. Both of these packages were expensive to ship and return and, as a result, the need for less costly containers arose. The first answer to the shipping problem came with the development of the beer can in 1935. While World War II delayed its widespread use domestically, it was used extensively by the armed forces, and after the war sales in aluminum containers started to boom. The aluminum can, along with the glass companies' response to it (the one-way bottle), enabled brewers to ship more cheaply and expand their markets accordingly.

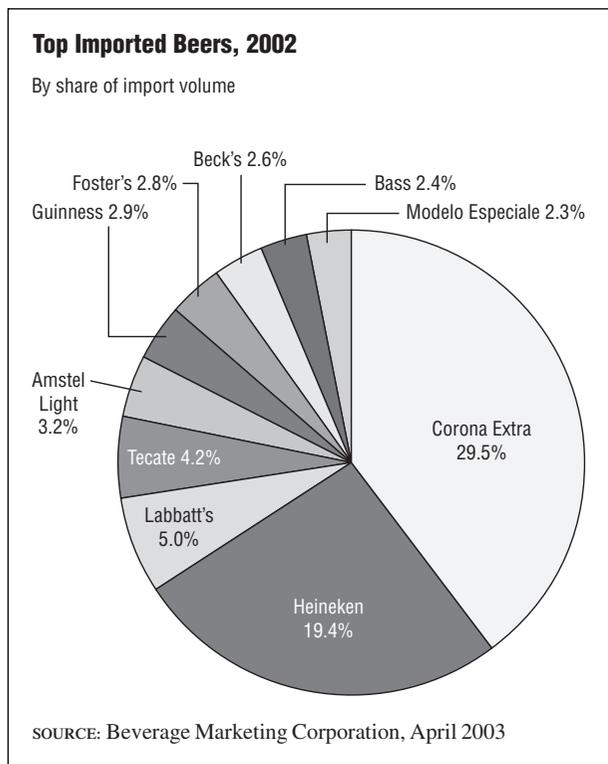

The shipping breweries, which had penetrated new markets in 1946 with minimal quantities of beer, now had product and lightweight one-way containers available to ship to these distant markets. Local breweries that had withdrawn from regional markets to protect more profitable local markets found it difficult to reenter markets they had left. In addition, many local breweries did not have the equipment to fill flat-top cans, which facilitated shipping. So, for the first time, the shipping breweries gained advantages not formerly available to them.

CURRENT CONDITIONS

While consolidation was the major buzzword as the beer and ale wholesaling industry entered the twenty-first century, major breweries increasingly viewed the effectiveness of the newly formed large multi-brand wholesalers with skepticism. In the early 2000s, according to *Beverage World*, the consolidation was in a rut, due largely to the financial structuring of the trend. Large wholesalers acquired smaller competitors and tended to assume those companies' debts entirely. Thus, the new multi-brand wholesaling behemoths were stuck in the middle of banks demanding debt-service payments, suppliers with high expectations for their new multi-brand distribution deals, and demanding retailers. The net result was a consolidation trend that was failing to register its predicted benefits, at least at the pace expected by suppliers and distributors alike.

By far the most popular off-premise outlet for beer consumers was the convenience store, where 2002 sales of \$12 billion outpaced the combined total from supermarkets, drug stores, supercenters, and wholesale clubs, according to ACNielsen. Over one-fifth of all U.S. beer was purchased at convenience and gasoline stores, according to *National Petroleum News*.

Beer drinkers' thirst for healthier and more value-added alternatives to traditional domestic beers was evidenced in a number of trends defining the beer and ale market in the early 2000s. The list of leading beer brands

in the United States was dominated by light versions, which claimed more than 40 percent of the domestic market, continuing a fifteen-year trend. And so-called “malternative” beverages, which add everything from vodka to lemon flavoring to their malt alcohol content, registered a 30 percent increase in retail sales in 2002, representing one of the fastest-growing sectors of the market.

Beer wholesalers meanwhile reported that, in the wake of a number of diet crazes featuring a diminished intake of carbohydrates, led by the Atkins diet, many of their suppliers were working to develop new low-carb beers that might appeal to an increasingly health- and body image-conscious beer-drinking market. Anheuser-Busch paved the way among the leading brands with its introduction of Michelob Ultra, which registered strong sales through its first year on the market.

The Specialty Brew Explosion The 1990s and early 2000s saw explosive growth in the number of microbreweries and brewpubs. In addition to the nation's 910 brewpubs, the mushrooming microbrewery industry boasted over 600 establishments in 2003. These breweries generally had a very localized distribution network, though even in their small, regional markets, they had to fight hard for distribution with larger brewers who covet the smaller markets. The major breweries quickly responded to the microbrew explosion with their own upscale beers intended mainly for urban markets. Anheuser-Busch, for instance, launched several brands,

including Michelob Maple and Michelob Spiced Ale, to compete with microbrews, but these products tended to flounder on a lack of consumer interest in major brewers' encroachment on the market niche.

INDUSTRY LEADERS

Distributors face a market in which three major brewing companies—Anheuser-Busch Co., Miller Brewing Co., and Adolph Coors Co.—account for roughly 75 percent of all beer category sales, and Anheuser-Busch alone controls about half the market. Thus, relationships with these brewers are of primary importance to the distribution market as a whole, though many wholesalers earn their bread and butter in localized or specialty-brew niches.

Based in Atlanta, Georgia, National Distributing Company Inc. focused its operations on the east coast but also reached into Colorado, New Mexico, and Ohio, and New Mexico. The private firm generated sales of \$1.6 billion in 2002, while employing 2,500. DeCrescente Distributing Co. of Albany, New York, boasted such clients as Coors, Miller, and Molson, which together accounted for about half of DeCrescente's 7.8 million annually shipped cases. The firm also distributed such heavy-hitting imports as Guinness, Corona, and Heineken.

AMERICA AND THE WORLD

North America continued to lead the world's major market regions in beer consumption per capita, at 62.9 liters per head in 2002. Eastern Europe registered the largest growth in consumption between 1997 and 2002, jumping 66.8 percent to reach 41.2 liters per capita. Western Europeans consumed an average of 34.5 liters, and Latin Americans consumed 23.5 liters, according to *Euromonitor International*.

Imported beers, an increasingly crucial sector for distributors, have met with some difficulties regarding their products' freshness. The resulting backlash focused scrutiny on distributors, who were under pressure to reduce “inventory days,” the number of days beer and ale remain on their shelves. Domestic breweries, eyeing the possible vulnerability of the burgeoning import sector, launched a campaign advertising their own freshness as a way of marketing on the strength of this problem. While analysts hold that Eurobrews generally have a longer shelf life than domestic products, wholesalers were scrambling to streamline their operations by more carefully and systematically monitoring product code dates in order to reduce turnaround time.

Still, imports have risen steadily, from \$1.2 billion in 1995 to over \$2.3 billion in 2002, representing the industry's fastest-growing sector. This growth was partly driven by shifting consumer tastes from mass-produced U.S. beers to more pricey imports. This preference was

good news for the larger U.S. wholesalers who invested heavily in the highly competitive market for distribution contracts with foreign brewers. Almost 95 percent of U.S. beer and ale imports come from Canada, Mexico, and Western Europe, especially the Netherlands, Germany, and the United Kingdom. The most popular beer import was Mexico's Corona, which sold 93.8 million cases in the United States in 2002, followed by Heineken, at 61.6 million cases.

In 2003, Anheuser-Busch rolled out Anheuser World Select, which was brewed from European noble hops, manufactured in several countries, and bottled to resemble European-style upscale imports. Although the major breweries enjoyed little success with their similar strategies to win back beer drinkers from microbrew and imported alternatives, their sheer market share and distribution muscle ensured at least a leg up in the competition with foreign imports.

Distribution is clearly an important factor in the domestic market, and its importance internationally has taken a significantly boosted priority. Obtaining access to distribution systems is a driving force behind the early 2000s wave of international joint ventures and alliances. The accelerating globalization of the brewing industry has generally tended to diminish the power and influence that distributors wield, since the larger multinational breweries tend to have significantly greater ability to move into foreign markets and establish deals on their own terms.

The European market differs from that of the United States and Japan in that it is more regional, with local brands dominating their regions. Very few European brands have established widespread distribution, and most have had difficulty in gaining acceptance outside their regions. U.S. beers have had tremendous difficulty reaching elsewhere the kind of market penetration they enjoy at home.

SIC 5182

WINE AND DISTILLED ALCOHOLIC BEVERAGES

This category includes establishments primarily engaged in the wholesale distribution of distilled spirits, including neutral spirits and ethyl alcohol used in blended wines and distilled liquor. The product range includes bottled wines and spirits, brandy and brandy spirits, cocktails, liquors, wine coolers, and wines.

NAICS CODE(S)

422820 (Wine and Distilled Alcoholic Beverage Wholesalers)

In 2001 according to the U.S. Census Bureau, 1,853 establishments were engaged in the wholesale distribution of distilled spirits, including neutral spirits and ethyl alcohol used in blended wines and distilled liquor. There were 63,050 people employed in this industry, with an annual payroll of \$3.3 billion. The total number of establishments increased to 2,691 in 2003. Combined, their annual sales were \$29.3 billion. The total number of employees fell to 60,804 in 2003. The average sales per establishment was approximately \$14 million, and there were about 23 employees per establishment. States with the majority of establishments were California, with 543, New York with 307, Florida with 197, and Texas with 142. Together, they accounted for more than 44 percent of the overall marketplace.

The wine sector accounted for 1,387 establishments and controlled more than half of the market. On the average, their sales totaled \$8.4 million. Wine and distilled beverages numbered 583 establishments and accounted for more than 21 percent of the market, with sales averaging about \$16.9 million. While brandy and brandy spirits numbered only ten establishments, they generated about \$118.2 million in sales. Liquor numbered 543 with \$22.8 million in sales while bottling wines and liquors averaged \$30 million in sales.

Like other sectors of the wholesale industry, the wholesale wine and distilled beverages business is very fragmented, with a few large companies and many small firms. In 1997, 3,214 establishments operated in this wholesale industry, down from 3,651 in 1993. The majority of operations—1,281 distributors—were small scale, with less than five employees. There were 553 businesses that employed between five and nine workers, 438 listed 10 to 19 employees, while another 439 employed between 20 to 49 workers. Finally, 364 establishments listed more than 50 employees on their payroll.

Most of the wholesalers operating primarily as wine and distilled beverage distributors, a total of 639, had

sales in the range of \$1 million to \$5 million. Another 602 reported sales exceeding \$5 million. 549 establishments recorded sales between \$500,000 and \$999,000, while 370 reported sales in the \$250,000 to \$499,000 range. There were 204 units that reported sales between \$100,000 and \$249,000, 30 between \$50,000 and \$99,000, and only 18 establishments that reported less than \$49,000 in sales.

While the number of wineries continued to increase, the number of wholesale distributors for smaller wineries became fewer and fewer as they consolidated with the larger wineries. An abundance of brands brought increased competition for wineries and distributors. As the economy began to improve in 2003, so did the wine industry. Some analysts were calling it a “Sellers Market,” which is good news for the almost flat sales the wineries experienced over the previous three years. According to the *Wine Business Monthly*, the wineries were also experiencing a “Buyers Market,” when it came to vineyard values. Although there are some that wanted to re-emerge back into the wine industry the number of vineyard space was limited. From October of 2002 and October of 2003, wine sales increased 4 percent.

The top wholesaler in 1998 was Johnson Brothers Wholesale Liquor, of St. Paul, MN, followed by Young’s Market Co, Glazer’s Wholesale Drug Company, and Sunbelt Beverage Corp.

The wholesale wine and distilled beverages business remained very fragmented in the 2000s, with a few large companies and many small firms. The majority of operations—1,752 distributors—were small scale, with less than five employees. There were 461 businesses that employed between five and nine workers, 362 listed 10 to 24 employees, while another 209 employed between 25 to 49 workers. Finally, 277 establishments listed more than 50 employees on their payroll.

In the mid-1990s, distilleries, losing market share in the United States to beer and wine producers, foresaw greater sales opportunities abroad. California wineries also looked to overseas suppliers to expand their product lines and provide customers with lower-priced alternatives to their premium wines. Faced with the prospect of declining wine consumption, the Wine Market Council planned an advertising campaign aimed at younger consumers. If Seagram’s 1996 decision to break with the industry’s self-imposed ban on broadcast advertising is any indication of things to come, the distillers may soon follow suit.

SIC 5191

FARM SUPPLIES

This category covers establishments engaged in the wholesale distribution of animal feeds, fertilizers, agricultural chemicals, pesticides, seeds, and other farm supplies, except grains. Establishments primarily engaged in the wholesale distribution of pet food are classified in **SIC 5149: Groceries and Related Products, Not Elsewhere Classified**; those distributing pet supplies are classified in **SIC 5199: Nondurable Goods, Not Elsewhere Classified**.

NAICS CODE(S)

444220 (Nursery and Garden Centers)

422910 (Farm Supplies Wholesalers)

422920 (Book, Periodical and Newspaper Wholesalers)

The range of items distributed by wholesale farm supply establishments is wide, including such disparate products as alfalfa, beekeeping supplies, flower and field bulbs, harness equipment, hay, insecticides, agricultural lime, pesticides, phosphate rock, garden flower seeds, and straw.

In 2001, the U.S. Census Bureau reported approximately 6,885 establishments involved in the farm supplies industry, down from 7,158 in 2000. According to D&B Sales & Marketing Solutions, there were a total of 17,070 in 2003. The combined establishments generated \$49.4 billion in sales. There were a total of 122,449 employees, up from 74,868 employees in 2002.

Farm supplies represented the largest segment of the industry. They numbered 4,597 establishments, and their combined sales totaled \$9.5 billion. Fertilizer and fertilizer materials numbered 2,076 establishments, with \$10.6 billion in sales. The animal feeds numbered 2,489, with \$2 billion in sales. States with the highest number of establishments were Texas with 1,521, California with 1,187, Iowa with 964, and Illinois with 907.

According to *Rural Cooperative Magazine*, farmer sales increased in 2002; however, the 3,140 farmer-

owned cooperatives dropped to \$96.8 billion in sales. The livestock feed and seed sales climbed to \$1.4 billion, but the petroleum and fertilizer sales fell 4.4 percent in 2002. Some analysts expected the demand for fertilizer to improve in 2004.

The farm industry experienced mergers, acquisitions, and consolidations throughout 2000 and 2002. There were 3,346 farmer-owned cooperatives in 2000, and that figure dropped to 3,140 in 2002. The memberships of the cooperatives also decreased from three million in 2001 down to 2.8 million a year later.

In 1997, farmer cooperatives increased their share of overall farm supply sales to 30 percent, the highest recorded total since tracking of this data began in 1951. In the same year, co-op sales of major farm supplies totaled \$21.9 billion, according to the November/December 1998 issue of *Rural Cooperatives Magazine*. These statistics, gathered by the United States Department of Agriculture (USDA) in conjunction with the Rural Business-Cooperative Service (RBS), included petroleum sales amounting to \$6.8 billion, a 7.4 percent increase over 1996's total. Notwithstanding the inclusion of petroleum sales, sales of other supplies increased similarly: feed sales rose 11 percent, and crop protectant sales increased 10.5 percent for farmer cooperatives selling farm supplies. Charles A. Kraenzle, Director of the USDA/RBS Statistics Staff, attributed these increases to "the favorable crop conditions farmers had experienced in 1997."

The increasing role of farmer cooperatives in farm supply sales in 1997 continued the trend reflected in 1996 USDA statistics, when co-op farm supply sales rose to \$24 billion, an increase of \$2.4 billion or 11 percent. While these statistics also included a 21 percent rise in petroleum sales, sales of other supplies increased similarly, such as the 11 percent climb in fertilizer sales. As was true in 1997, favorable weather in 1996 helped fuel these increases in farm supply sales for farmer cooperatives. Net income for farm supply co-ops rose almost 17 percent, from \$808 million in 1995 to \$942 million in 1996, and net business volume increased from \$21 billion in 1995 to \$23 billion in 1997.

Just over 28,000 companies operated businesses of this nature in 1996, with overall sales of an estimated \$56 billion, an increase of about 10 percent over 1993. According to *Dun's Census of American Business*, 28,481 wholesale farm suppliers were in operation, a decrease of 5,625 establishments since 1993.

In 1996 the typical wholesale farm supplier was small, with fewer than 10 employees and with sales above \$250,000. More than half of the total suppliers—about 16,000—had fewer than five employees. About 9,000 suppliers employed between five and 14; 2,500 establishments employed more than 15. In 1996, there were 5,316

concerns with sales between \$250,000 and \$499,000; 5,257 units had sales between \$1 million and \$5 million; 3,318 units had sales between \$500,000 and \$999,000; 3,983 units had sales between \$100,000 and \$249,000; and roughly 1,500 had sales less than \$100,000.

The wholesale farm supplier remained small—employing less than 5 people. In 2003, 10,238 suppliers had fewer than five employees; 3,621 had between five and nine; 2,379 had between 10 and 24; 592 had between 25 and 49; 170 had between 50 and 99; 53 had between 100 and 249; and about 63 suppliers had between 250 and 499.

Leading companies involved in the wholesale farm supply business included Illinois Agricultural Association of Bloomington, Illinois; Transammonia Inc., based in New York City; and Southern States Co-op, Inc. of Richmond, Virginia.

SIC 5192

BOOKS, PERIODICALS, AND NEWSPAPERS

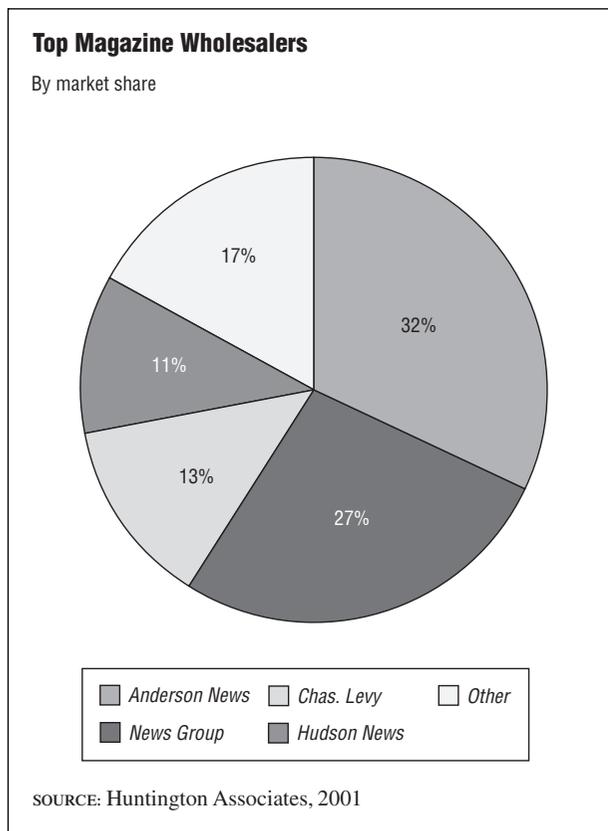

This category includes establishments primarily engaged in the wholesale distribution of books, periodicals, and newspapers.

NAICS CODE(S)

422920 (Book, Periodical, and Newspaper Wholesalers)

INDUSTRY SNAPSHOT

Book, periodical, and newspaper wholesale distributors in the early and mid-2000s enjoyed luxuries rare for wholesale industries: leverage and power. In fact, their strength relative to retailers and publishers produced no small amount of ire among those sectors. To counteract what they saw as overly aggressive tactics on the part of wholesalers to cut costs at their expense, major retailers

and publishers looked for ways to band together and bypass the distribution middlemen altogether.

ORGANIZATION AND STRUCTURE

Book, magazine, and newspaper distributors tend to be small, with more than half of the 3,345 in operation in 2003 employing fewer than six individuals; a mere 3 percent employed 100 or more people. In contrast, 622 businesses employed 100 or more in 1987. In addition to distributing books, periodicals, and newspapers, some wholesalers carried additional product lines including photographic equipment and supplies, religious and school supplies, stationary office supplies, greeting cards, art goods (including novelties and souvenirs), toys and hobby goods and supplies, electronic parts and equipment, and other durable goods.

BACKGROUND AND DEVELOPMENT

From its beginnings until as late as the 1980s, according to the *Wall Street Journal*, the magazine wholesaling segment was primarily populated by tiny establishments operating in their own local territories with little competition. Only in the 1990s did the industry undergo a major consolidation effort. This consolidation was driven in part by aggressive supermarkets and other large retailers, a key customer base to magazine and newspaper distributors, attempting to diminish costs by

ordering product for entire regions, rather than for specific local markets. These retailers flexed their newfound muscles to raise the bar for wholesalers to do business. In the ensuing shakeout, some 180 wholesalers closed their doors or were absorbed by the Big Four: Anderson, News Group, Chas. Levy, and Hudson News. Together, these wholesalers controlled 90 percent of the single-copy sales market in the country by 2003.

The explosive growth in electronic commerce also forced many wholesalers to close their doors beginning in the late 1990s. The online bookstore Amazon.com established a vast network of its own distribution outlets across the United States and maintained 10 times as much distribution space in 1999 as it did in 1998. To fight this trend, the intensely competitive wholesaler industry underwent immense consolidation by way of mergers and acquisitions in addition to the dropout of a number of players. The industry's trade association, the Periodical Wholesalers of North America, was even forced to disband, citing lack of sufficient membership.

CURRENT CONDITIONS

The magazine publishing industry as a whole faced its direst period since the early 1990s, with a number of major long-running publications—including Time Inc.'s *Life*,—ceasing publication, and some publishers, such as the New York Times Co., exiting the magazine market entirely. While the number of magazine titles skyrocketed in the late 1990s, magazine sales at newsstands actually declined from 2.1 billion in 1996 to 1.7 billion in 2000, forcing remainder rates up to 65 percent.

Leading magazine wholesaler Anderson News opted in 2002 to cut its distribution by some 400 million copies in an effort to boost its average sale efficiency or the percentage of its shipped titles that are actually purchased off the rack. The industry sell-through average was about 38 percent through the late 1990s and early 2000s; Anderson News hoped to raise their rate to over 50 percent. Meanwhile, Anderson announced a two-tiered distribution system demanding that those titles that bog down sales efficiency pay higher fees for Anderson's distribution services.

Number-two magazine wholesaler News Group even began insisting that publishers pay fees to take back copies of magazines that failed to sell, breaking with traditional industry practice, in which wholesalers absorbed the cost of returns. These measures reflected the growing power of the industry's major distributors, whose greater economies of scale translated into increased leverage with publishers and retailers alike. In retaliation to the potential decline in sales, magazine publishers increasingly looked to direct distribution, bypassing wholesalers altogether and taking their product directly to the retailers.

In the book segment, total book sales were on the rise, registering an increase of an estimated 2.7 percent in 2003 to \$27.06 billion, though this rise was driven by blockbuster titles. Mass-market paperback sales, moreover, jumped 11.8 percent between 2001 and 2003 to reach \$1.73 billion.

The sheer volume of books published, combined with tighter competition, created an emerging market for the wholesale distribution of bargain books. With so many titles published and shipped to bookstores, but with cost pressures demanding that retailers concentrate primarily on the best-selling titles, an increasing number of books were returned to publishers and sold at bargain prices. Bargain-book wholesalers thus had more product to choose from and more specialty book stores to which they could distribute those titles. Wholesalers were thus charged with finding alternative markets for these remainder books, which by the mid-2000s, had developed into a booming market niche.

INDUSTRY LEADERS

With 9,660 employees, Ingram Industries Inc. was among the largest wholesalers in the industry. Based in Nashville, Tennessee, the firm distributed over 175 million books each year to a network of some 30,000 retail outlets. The Ingram Book Group also maintained a strong presence in the library market. Wholesale book distribution accounted for over half of the firm's total sales of \$2.2 billion. In 2002 in order to boost efficiency, the firm consolidated its distribution centers into four supercenters.

Baker & Taylor Corporation, of Charlotte, North Carolina, was the leading distributor to public, school, and specialty libraries in the United States. The firm was also a major supplier to Internet retailers and independent bookstores and operated support services for Amazon.com and barnesandnoble.com. Baker & Taylor brought in revenues of \$1.12 billion in 2002 while employing 2,750.

The nation's largest magazine wholesaler, Anderson News Company, of Knoxville, Tennessee, distributed magazines to some 40,000 mass merchandisers, grocery and convenience stores, bookstores, and other outlets across the United States. According to the consultant firm Harrington Associates, Anderson claimed about 32 percent of the market for magazine wholesaling in North America.

News Group, based in Fort Mill, South Carolina, was the second-leading magazine and newspaper distributor. A subsidiary of the Vancouver-based Jim Pattison Group, News Group accounted for about one-fourth of its parent company's \$4.2 billion in revenues in 2003. News Group controlled an estimated 27 percent of the North American magazine distribution market by the mid-2000s, up from just 3 percent in 1995.

Chicago-based Chas. Levy Company was a leading distributor of books and magazines throughout the Midwest, controlling 13 percent of the North American magazine market. To concentrate on its core operations Chas. Levy closed the doors of its newspaper distribution centers. The firm maintained a payroll of 6,500 employees.

Hudson News Company of North Bergen, New Jersey, was another leading industry player, with 11 percent of the market share in magazine distribution and a particularly strong presence in the healthy New York-area market.

SIC 5193

FLOWERS, NURSERY STOCK, AND FLORISTS' SUPPLIES

This category includes establishments primarily engaged in the wholesale distribution of flowers, nursery stock, and florists' supplies.

NAICS CODE(S)

422930 (Flower, Nursery Stock and Florists' Supplies Wholesalers)

444220 (Nursery and Garden Centers)

422940 (Tobacco and Tobacco Product Wholesalers)

According to the U.S. Census Bureau 4,598 establishments composed this industry in 2001, with an annual payroll of \$1.6 million. In 2002, total annual sales were \$14.3 billion. The majority were small-scale, single-unit operations, which operated year-round. The industry employed some 60,890 people and had an annual payroll of \$1.6 million. In 2003, the number of establishments climbed to 9,123, with annual sales of \$8.9 billion. The total number of employees increased also to 86,292. The average sales per establishment totaled about \$1 million.

Bedding and garden plants and flowers make up approximately 66 percent of annual floriculture sales in the Midwest. The Northeast accounts for 55 percent, the

South was responsible for 43 percent, while the West represents 36 percent. In a report released by the *Floriculture and Nursery Crop Outlook*, the total sales for floriculture crops in 2003 was valued at \$5 billion; nursery crops generated \$9.4 billion; and floriculture and nursery were valued at \$14.4 billion.

The industry is divided into two general categories: Wholesalers primarily engaged in the distribution of flowers and florists' supplies, and wholesalers engaged in the distribution of nursery stock. Flowers and florist supplies contributed about 28 percent of its sales, and nursery stock generated about 26 percent of its sales. Combined they generated approximately \$3.8 billion.

The majority of companies in this classification were small—employing fewer than five persons. In 2001, 1,617 companies had fewer than 5 employees; 797 had between five and nine employees; 652 had between 10 and 19; 676 had between 20 and 99; 324 had between 100 and 499; and 64 had 500 or more employees.

Like other industries of its kind, the wholesale flowers, nursery stock, and florists' supplies industry experienced a decline in the number of establishments and with only modest increases in sales, rising an average of five percent a year throughout the early 1990s to an estimated \$2.3 billion by 1996. The *1994 U.S. Industrial Outlook* attributed the decline to mergers, acquisitions, and business failures. In addition, the increase of direct manufacturer to retail agreements and the use of mail order and catalog sales negatively impacted the wholesale industry.

The largest group, comprised of 4,300 units, reported sales between \$100,000 and \$249,000 in 1997, according to *Dun's Census of American Business*. The next biggest category included slightly larger operations with gross revenues between \$250,000 and \$499,000 that year: 1,754 wholesalers fell into this group. More than 1,500 units had sales between \$500,000 and \$1 million, and about 1,700 units had sales between \$1 million and \$5 million. 1,202 wholesale flower and nursery stock distributors had annual sales volumes between \$50,000 and \$99,000; and only 366 sold between \$1,000 and \$50,000 worth of stock in 1997. The smallest grouping, comprised of units reporting more than \$5 million in annual sales, remained relatively steady, increasing from 347 to 349 operators.

The leading states with the highest value of wholesale floriculture sales were California with 19.7 percent, Florida with 18 percent, Michigan with 6.4 percent, Texas with 5.6 percent, and Ohio with 3.9 percent. Combined, these states accounted for \$4.6 billion in sales.

In a report released from The United States Department of Agriculture, floriculture was expected to climb up 2 percent in 2003. This was in anticipation of the improvement of the overall economy that had been flat,

and rising retail sales. The report further concluded that some 4,600 growers had sales of \$100,000 or more. These individual growers represented 94 percent of the total wholesale value of production. California accounted for about 20 percent of the total crop. Michigan, Texas, and New York shared 17 percent of the value.

Leading companies in this industry include Florimex Worldwide, Inc.; Celebrity, Inc. of Tyler, Texas; Ball Horticultural Co. of West Chicago, Illinois; Hines Horticulture, Inc. of Irvine, California; and Shermin Nurseries of Danbury, Connecticut.

SIC 5194

TOBACCO AND TOBACCO PRODUCTS

This category covers establishments primarily engaged in the wholesale distribution of tobacco and its products. Leaf tobacco wholesalers are classified in **SIC 5159: Farm-Product Raw Materials, Not Elsewhere Classified**, and establishments primarily engaged in stemming and redrying tobacco are classified in **SIC 2141: Tobacco Stemming and Redrying**. Items handled by establishments in this business include: chewing tobacco, cigarettes, cigars, smoking tobacco, and snuff.

NAICS CODE(S)

422940 (Tobacco and Tobacco Product Wholesalers)

The wholesale distribution of tobacco and tobacco products in 2001 was a relatively small but profitable industry, employing about 57,261 workers and bringing in about \$50.3 billion in sales. 374 companies in this classification were small—employing fewer than five persons. 212 had between five and nine employees; 193

had between 10 and 19 employees; 270 had 20 to 99 employees; 69 had 100 to 499 employees; and about 35 establishments with 500 or more employees. In 2003, total annual sales dropped to \$27.7 billion. The total number of employees decreased to 28,898. The average sales per establishment were about \$20 million.

Wholesalers of tobacco and tobacco products benefited from the explosive growth of the cigar trend in the United States in the late 1990s. The cigar emerged as a symbol of success and even celebrity. After cigar sales fell five percent annually for three decades until the mid-1990s, the industry surged on the strength of the endorsement by celebrities and pop culture generally. Glossy magazines like *Cigar Aficionado* featured movie stars and athletes sporting cigars on its famous covers. Moreover, the industry moved to acquire premium product placement in motion pictures. Premium cigars sold 370 million units, valued at \$1 billion, in 1997, an almost 400 percent increase from 1992.

Continued success was not assured, however. Health concerns have intensified the examination of the cigar industry, leading to possible mandatory health-warning labels on their products, a series of printed advertisements warning against the dangers of cigar smoking, and calls from the Federal Trade Commission to prohibit cigar advertising on radio and television.

At any rate, despite the high profile of cigars, they still constitute a miniscule market sector next to cigarettes and smokeless tobacco. Throughout the entire industry, heightened regulatory scrutiny has forced wholesalers to raise their prices in order to remain competitive with increased expenses. Moreover, distributors have begun to more aggressively diversify their activities. While many have traditionally combined their cigarette shipments with the distribution of candy to capitalize on the lucrative convenience-store market, many have expanded into packaged and fresh foods as well. Like many other industries, e-commerce had been another source of distribution that had increased sales for the tobacco industry also.

Negative media attention has caused a gradual decrease in production over the last few years. More importantly, over the past sixteen years annual shipments have dropped from 244 billion pieces to 120 billion pieces. The trend continued with a four percent decrease in 2003. In fact, total output for cigarettes was the lowest since 1958. Tobacco consumption was predicted to fall between 1 and 2 percent annually.

Like many other industries, e-commerce has been another source of distribution that had increased sales for the tobacco industry as well.

Research and litigation continued to play a major role as the industry focused on secondhand smoke and an

effort to produce a "smokeless" cigarette. In 2001, The European Union had required health warning labels located on every pack of cigarettes. The mandated labels would cover 30 percent of the front of a single pack of cigarettes, as well as 40 percent on the backside.

The tobacco industry will continue to deal with litigation, competition, and higher Federal excise taxes. With many individual states dealing with budget deficits, the tobacco industry is usually their first target for additional funding through excise taxes. The total number of states passing excise taxes has increased from three in 2000 to 21 by 2002. In 2002, state tax had jumped from \$1.1 billion to \$9.5 billion. Combined, sixteen states currently have imposed excise taxes of a minimum of \$1.00 per pack. An additional 34 states have imposed taxes of a minimum of fifty cents per pack.

The leading companies in this industry included Philip Morris of New York, which controlled 49.3 percent of the U.S. market and 17 percent of the global market. R.J. Tobacco dominated 23.2 percent of the market; Brown & Williamson controlled 10 percent; Lorillard Loews & Carolina controlled 8.2 percent; and Liggett Vector controlled 2.3 percent. U.S. Smokeless Tobacco Co. was the leader in the snuff market under the brands Skoal and Copenhagen. Sales for snuff increased from \$1.6 billion in 2002 to \$1.8 billion for 2003.

In 2002, the leaders for cigar imports included, the Dominican Republic with 66.19 percent; Honduras with 20.21 percent; and Nicaragua with 7.94 percent.

SIC 5198

PAINT, VARNISHES, AND SUPPLIES: WHOLESALE DISTRIBUTION

This category covers businesses that distribute wholesale paints, varnishes, wallpaper, and supplies. Retail stores selling these items to the general public are classified in **SIC 5231: Paint, Glass, and Wallpaper Stores**. According to the Standard Industrial Classification, inventory handled by businesses in this category include calcimines, colors and pigments, enamels, lacquers, paint brushes, shellac, rollers, and sprayers.

NAICS CODE(S)

422950 (Paint, Varnish and Supplies Wholesalers)

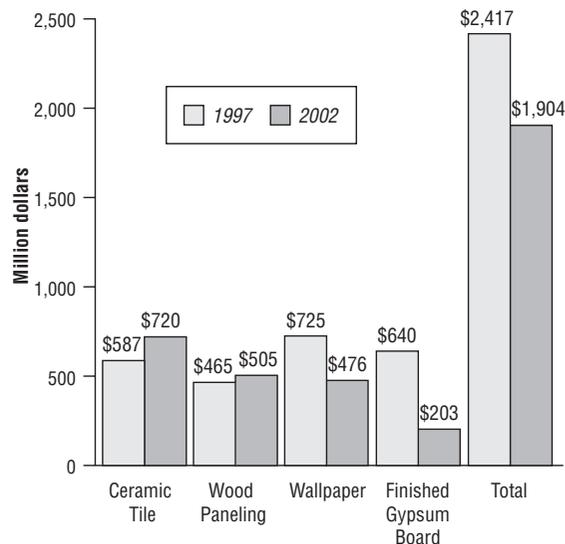

444120 (Paint and Wallpaper Stores)

The paint, varnish and supplies wholesale distribution industry is a relatively small one, with just 2,179 operators in 2001 according to the U. S. Census Bureau. The total number of employees was 20,619, and their annual payroll was about \$810,233. The paints sector represented the largest segment in the industry. They numbered 1,506 and the combined sales totaled \$1.76 billion, or 47 percent of the market. Paints, varnishes, and supplies numbered 899, with \$821.1 million in sales, or 28 percent of the market. The 489 wall coverings businesses had combined sales of \$789.9 million, or 15 percent of market share. States with the highest concentration were California, Texas, Florida, and New York. In 2003, the total number of establishments increased to 3,177, with total sales of \$3.8 billion. The number of employees climbed to 22,384. The average establishment accounted for \$1.8 million of the overall sales.

Like most sectors of the wholesale trade, this industry felt the ill effects of the early 1990s recession. Although sales were down between 1988 and 1992, there were signs of a recovery by 1993, and sales grew slowly during the rest of the nineties. The majority of paint, varnish, and supply wholesalers reported sales between \$250,000 and \$500,000 in 1993, according to *Dun's Census of American Business*; 1,278 establishments were in this net income range, compared with 1,138 in the previous year. One thousand and ninety-three wholesalers had a sales range of between \$1 million and \$5 million, compared with 1,119 in 1992. One thousand and two firms had sales between \$500,000 and \$1 million in 1993, 31 more than in 1992; 848 outfits had sales of from \$100,000 to \$249,000, just one more than the previous

U.S. Wall Coverings Demand, 1997-2002

In millions of dollars

SOURCE: The Freedonia Group, Inc., 2003

year. Three hundred and six companies had sales of more than \$5 million; 196 wholesalers earned less than \$100,000; and 105 earned less than \$50,000 in 1993.

Establishments were generally productive, even with small staffs: most had fewer than four employees but a high rate of staff turnover. According to *1997 County Business Patterns* published by the U.S. Census Bureau, 1,394 companies had four or fewer employees. This represented a decrease of 2,040 in this category since 1994. There were 776 establishments that had between five and nine employees in 1997, compared with 1,827 in 1994. Four hundred and twenty-two outfits employed between 10 and 19 workers, 133 less than in 1994. Companies that employed between 20 and 49 in the industry in 1997 numbered 153, compared with 178 in this category in 1994. Of the remainder, 30 employed between 50 and 99 workers; 12 employed between 100 and 249; and only four had more than 250 workers.

As consumers change, so will the wall covering industry overall. According to The Freedonia Group, wall covering demand was expected to climb to 5.7 percent, or \$2.5 billion by 2007. Ceramic tile was also expected to grow to 3.2 percent during the same time period, while wallpaper demand was expected to grow 4.2 percent.

The industry's leaders in the mid-1990s included the following companies: Seabrook Wallcoverings Inc. of Memphis, Tennessee, with estimated sales of \$100 million and 500 employees; Thompson PBE Inc. of Clearwater, Florida, with estimated sales of \$65 million and 300

employees; and Masterchem Industries, Inc. of Barnhart, Missouri, with estimated sales of \$50 million and 100 employees.

The employment rate—approximately 29,000 in 1997—was predicted to grow in the wholesale paint, varnishes, and supplies industry over the next 15 years due to a rise in wholesale exports. In particular, the passing of the North American Free Trade Agreement (NAFTA) in 1994 was expected to cause export demand to rise over the long term. The paint, varnish, and supply wholesale industry should benefit from NAFTA, in terms of both job creation and sales.

SIC 5199

MISCELLANEOUS NONDURABLE GOODS

This category covers wholesalers of nondurable goods, not elsewhere classified, such as art goods, industrial yarns, textile bags, and bagging burlap.

NAICS CODE(S)

541890 (Other Services Related to Advertising)

422990 (Other Miscellaneous Nondurable Goods Wholesalers)

Just a glance at the miscellaneous nondurable goods industry shows how complex it is to place every U.S. nondurable good into a distinct group. Even if each segment of this scattered industry were given its own classification, the need for new categories would likely emerge within a few months. Items listed in this diverse category include: artists' materials, textile bags, baskets, brooms, burlap, candles, charcoal, Christmas trees, clothes hangers, tropical fish, glassware, animal and vegetable greases, hairbrushes, ice, industrial yarn, cigar and cigarette lighters, matches, paper novelties, smokers' pipes, plant food, crude rubber, sheet music, wigs, wood carvings, woolen and worsted yarns, worms, and many other items.

According to the U.S. Census Bureau, the industry consisted of 16,168 establishments in 2001, down slightly from 16,458 in 2000. There were a total of 111,175 employees with an annual payroll of approxi-

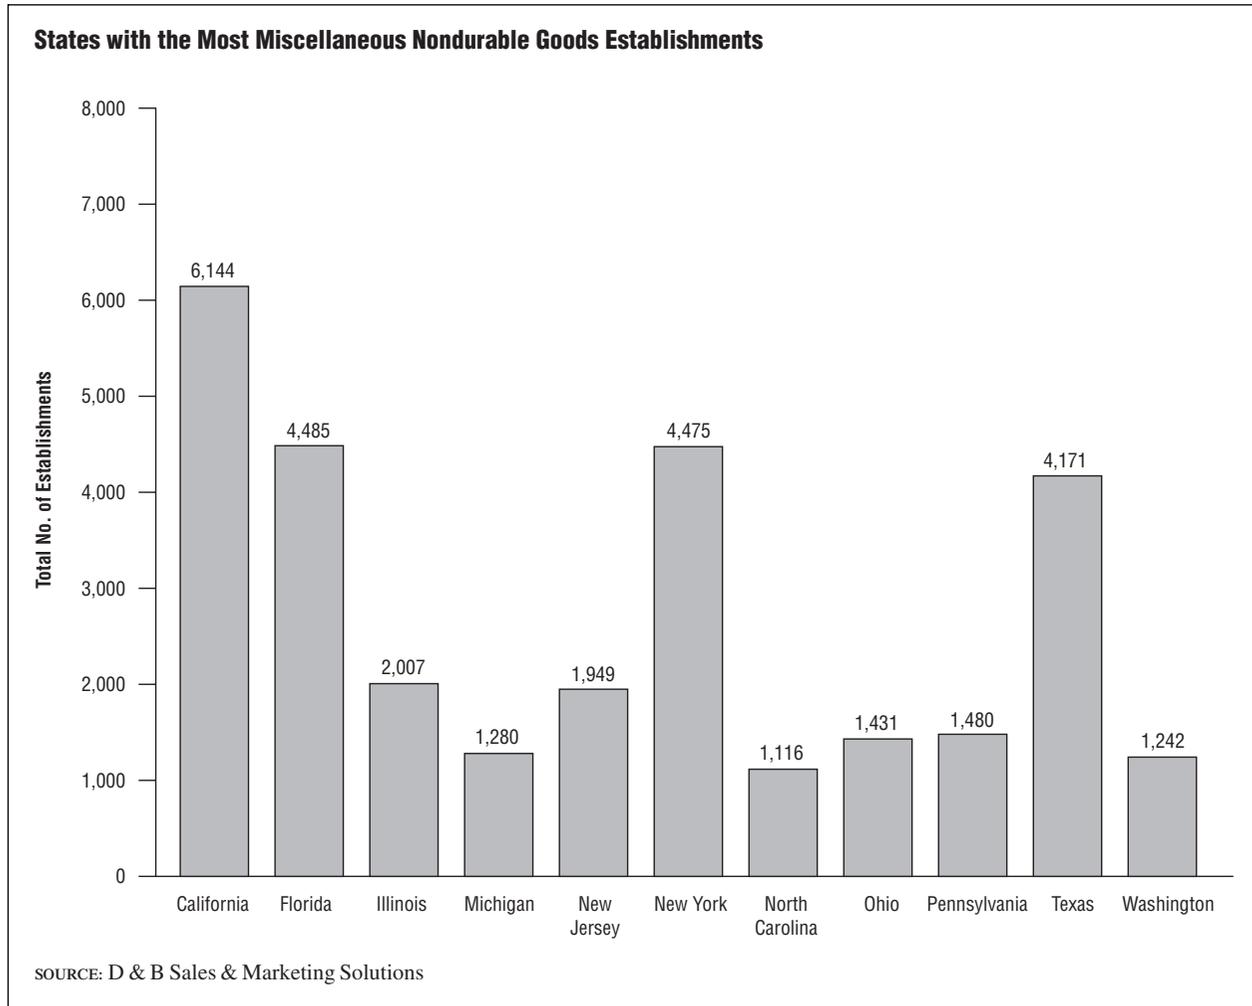

mately \$4 million. By 2003, the total number of establishments increased to 48,849, and the employee base reached 233,851. The industry generated more than \$40 million in sales. In April of 2004, the U.S. Department of Commerce reported that the nondurable goods industry had climbed 4.3 percent since 2003.

The majority of miscellaneous nondurable goods establishments were concentrated in Florida with 4,485, New York with 4,375, and Texas with 4,171 establishments. Combined, these states controlled more than 26 percent of the market as a whole, generating more than a \$100 million in sales in 2003. Packaging materials and advertising specialties contribute more than 22 percent of the overall nondurable goods.

In 1997 *Dun and Bradstreet* listed more than 49,000 establishments in the nondurable goods industry, which reported combined sales of \$491 billion, up from \$468 billion in the prior year. The industry as a whole reported profits exceeding \$107 billion, an increase of more than \$8 billion from 1996. The sale of nondurable goods contributed more than 15 percent to the U.S. Gross Domestic Product during the 1990s. As the century came to a close, more promising figures were reported by the industry. New orders in non-durable goods rose 4 percent from August to September 1999. Sales of non-durable goods rose 6 percent in October and 4 percent in November, compared to figures for the same months in 1998.

Approximately 7.6 million workers were employed in the miscellaneous wholesale trade nondurable goods industry during 1998, according to a *Washington Post* article. In 1997 the average industry worker brought home \$504.71 for 41 hours of work each week. Seventeen years earlier, the same worker brought home \$255.45 for 39 hours of work each week. A November 1999 survey of approximately 16,000 U.S. companies showed that workers in the nondurable goods industries would be in high demand as the new millennium began. Conducted by Manpower, Inc., the survey also showed that the shortage of skilled workers in the industry might continue until the year 2006.

A leading company in the miscellaneous wholesale trade nondurable goods industry was Golden State Foods Corp. A privately held food-processing company based in Irvine, California, Golden State Foods had about \$1.7 million in sales in 2002 and 2,000 employees. The company supplied hamburger patties, buns, tomatoes, lettuce, ketchup, and mayonnaise to 2,500 McDonald's restaurants. By 1999 it was the third-largest processor of beef patties for McDonald's and the second-largest overall supplier of products for the fast-food chain. Golden State Foods is now run by business consultant Yucaipa Companies and investment firm Wetterau Associates, who jointly acquired the food processor in 1998. Yucaipa acts as the controlling shareholder, while Wetterau manages

day-to-day operations. Other industry leaders were Keystone Foods LLC, based in West Conshohocken, Pennsylvania, with more than \$2.6 million in sales in 2002, and The Martin-Brower Company, L.L.C. in Rosemont, Illinois.

RETAIL TRADE

SIC 5211

LUMBER AND OTHER BUILDING MATERIALS DEALERS

This industry consists of establishments engaged in selling primarily lumber or lumber and a general line of building materials to the general public. While these establishments may sell primarily to construction contractors, they are known as retail in the trade. The lumber that they sell may include rough and dressed lumber, flooring, molding, doors, sashes, frames, and other millwork. The building materials may include roofing, siding, shingles, wallboard, paint, brick, tile, cement, sand, gravel, and other building materials and supplies. Hardware is often an important line sold by retail lumber and building materials dealers. Establishments that do not sell to the general public and those that are known in the trade as wholesale are classified in the Lumber and Other Construction Materials industries.

NAICS CODE(S)

444110 (Home Centers)

421310 (Lumber, Plywood, Millwork, and Wood Panel Wholesalers)

444190 (Other Building Material Dealers)

INDUSTRY SNAPSHOT

According to the National Retail Hardware Association (NRHA), which takes into account hardware stores, home centers, and retail-oriented lumberyards, industry revenues totaled \$186.9 billion in 2001. Hardware stores accounted for \$23.5 billion; home centers, \$112.7 billion; and lumberyards, \$50.6 billion. The NRHA predicted that the industry would reach \$246.5 billion by 2006.

Since 1997 the industry's top 25 chains have grown from 3,600 stores and total revenues of \$58.1 billion to 4,400 stores and \$95.9 billion in 2001, representing an annual compound growth rate of 13.3 percent for sales and 5.3 percent in number of stores.

The lumber and building materials industry is dominated by do-it-yourself (DIY) giant Home Depot, Inc., which markets its goods both to DIYers and contractors. Lowe's, Inc. has gained ground on Home Depot by investing heavily in friendly, well-lighted, well-stocked stores and exceptional customer service. A new focus for all home improvement stores is drawing in the growing number of women who are making home improvement decisions and spending an increasing amount of time on DIY projects.

ORGANIZATION AND STRUCTURE

There are several types of establishments that fall into the retail lumber and building materials category. The largest categories, by far, are lumberyards, home centers, and warehouse home centers.

Lumberyards, whether as single establishments or parts of a chain, rely heavily on the industry's traditional customer base of contractors, builders, remodelers, and other professionals. Most of their business, anywhere from two-thirds to three-quarters, comes directly from the sale of lumber and building material. Most of these businesses average annual sales of about \$3.8 million per unit. Sutherland Lumber, Grossman's, and 84 Lumber fall into this category.

Home centers, which often sell hardware as well as lumber and building materials, generally occupy about 30,000 to 35,000 square feet. Due to their size, they greatly outsell the smaller lumberyards. Many of these sales are to do-it-yourselfers, as well as professionals.

Hechinger, Lowe's Companies, and Payless Cashways are home centers.

By contrast, warehouse home centers have an average of over 100,000 square feet of floor space. They boast a wide selection of merchandise at lower prices, although they offer fewer frills than the smaller stores. Home Depot, Builder's Square, and HQ (Home Quarters) are warehouse home centers. At the end of 1999, annual sales reported by the U.S. Department of Commerce included totals from both home centers and warehouse home centers. The sales per unit averaged almost \$13 million annually.

Competition has driven many retailers to find new ways of attracting customers. Many outlets offer custom bath and kitchen design and installation, home decorating merchandise, garden centers, and "how to" classes. Some, such as Lowe's, have moved into even more diverse areas, for example, electronics, appliances, and home office equipment, accessories, and software.

Establishments in this industry purchased lumber from wholesalers or direct from factories and mills. Most of the lumber and wood products come from the Pacific Northwest and the Southeast. Other building materials, such as paints, cement, hardware, and related supplies were usually purchased through wholesalers, specialty distributors, or direct from the manufacturer. Some larger chains carried their own labels on products they sold through contractual agreement with manufacturers. Larger stores also worked with manufacturers in training employees about particular product lines.

The industry is represented in federal government policy-making processes by the National Lumber and Building Materials Dealers Association (NLBMDA.) The NLBMDA also provides educational and informational programs to meet industry needs. Some 6,800 retail lumber and building materials dealers, in all 50 states, belong to the Association. The NLBMDA also publishes the *Building Materials Retailer*, a monthly four-color magazine, and maintains a site on the World Wide Web.

BACKGROUND AND DEVELOPMENT

Wholesale establishments selling lumber and building materials appeared in America in the early 1900s. By the 1920s small retail operations began to develop. As the population increased, the industry followed suit. When the Great Depression hit the United States, the industry was adversely affected until public works projects gave it the boost it so desperately needed. During World War II, when home sales were down, the industry suffered another blow. However, the post war period brought tremendous growth for establishments in the industry as suburban America grew during the 1950s and 1960s.

As building increased, so did the number of retail lumber and building materials outlets. At this time many companies expanded into chain stores, and manufacturers began to enter the retail market. A recession in the 1970s caused a temporary decrease in new home construction that put the industry's rapid growth on hold. However, an active real estate market and an increase of home renovations in the 1980s gave the industry's sagging sales a much-needed boost.

Between 1990 and 1993 expenditures in residential repairs and improvement in the United States continued to rise from \$39 billion to \$41 billion, an increase of 2.5 percent. Overall prices for lumber and building materials increased less than one percent between 1989 and 1991.

Environmentalism had a serious impact on the lumber industry in the early 1990s, which, in turn, impacted those in the retail lumber business. In June 1990, the northern spotted owl was listed as an endangered species by the U.S. Fish and Wildlife Service (FWS). As a result, about 9 million acres of timberland in the Pacific Northwest were declared off-limits to the logging industry. In addition, the ruling targeted the areas where much of the country's old-growth trees are located. These trees are a vital part of the industry's livelihood. The lumber industry estimated that the nation's availability of lumber was significantly reduced, forcing over 200 mill closings and the loss of roughly 30,000 industry-related jobs. This shift also drove up the price of wholesale lumber, which in turn drove up the price of lumber for lumber retailers and consumers.

President Bill Clinton, introduced what he called a "forest plan" in July of 1993. The plan was created as a way to accommodate the logging industry and maintain enough old-growth forest to satisfy the demands of environmentalists trying to keep the spotted owl from extinction. After input from both sides, a revised plan was approved by the federal district court in December 1994. The plan allowed some logging on 693,000 of the roughly 1.5 million acres of land in national forests that contain old-growth trees.

The spotted owl controversy continued into the mid-1990s, and the government continued to take steps to help the industry. Restrictions were loosened on private landowners who agreed to use logging methods that were less damaging to the owls' habitat. Restrictions were also loosened on nonfederal lands in Washington State and northern California. In 1995, President Clinton signed a bill that called for 4.1 billion board feet salvage timber sales over the following two and a half years, including 300 million to 400 million board feet of "green timber," which had been previously deemed off limits. Also included was timber that had been burned in recent wildfires.

Despite the controversy in the early 1990s over the spotted owl and its habitat, the retail lumber and building

materials industry continued to expand creating fierce competition between smaller, independent stores and chains and the much larger home centers, or “big box” outfits as they are called in the industry. As the big box outlets sprung up all over America, many smaller chains were forced into store closings and even bankruptcy. Some of the smaller outfits merged in order to compete, while others decided to ride out the storm and hoped they could maintain their customer base with more efficient, personalized service.

The year 1995 was rough for retail lumber and building materials retailers. Consumers were spending less, housing starts were down by 10 percent, and lumber prices were down by 20 percent. Over 200 new stores entered the competition. There was only a 1.8 percent increase in industry sales as opposed to an 11.8 percent increase in 1994. Many companies changed their focus from the general public, back to contractors. In 1995 mixed retailers, those who sell to both markets, had a 0.6 percent drop in sales, while the top 250 companies who focused on industry professionals had a 4.1 percent increase. Competition between big box outlets and smaller chains and independents intensified into the late 1990s. The title of an August 1996 article in *Chain Store Age*, “Home Improvement Retailing: Get Tough Time,” summed up the industry’s climate.

In 1996, there was an increase in industry sales of 6.7 percent, due in part to gains in single-unit housing starts, increased spending on maintenance, and a rise in the price of lumber. Industry leaders predicted that 1997 would be a good year for retailers who specialized in lumber and building materials, with an estimated increase of 6 to 6.5 percent.

The industry grew dramatically in the 1990s, due largely to the great popularity and growth of giant home improvement retailers—almost 59,000 establishments in 1997. Retail lumber and building materials outlets accounted for a large chunk of the \$215 billion home improvement industry. Since its birth at the beginning of the twentieth century, the industry had grown and changed dramatically. At the start of the twenty-first century, companies across the United States strategized to find ways to keep and increase their share of this very competitive market.

In 1997 the NLBMDA was lobbying Congress for a cut in the capital gains tax, which would create a demand for building materials by encouraging construction, rehabilitation, and other investments. It also lobbied for permanent legislation to allow the salvaging of dead and dying timber and supported full funding of the timber sale and road building program of the U.S. forest service. Another hot issue was the tariff on Canadian lumber. According to an article by NLBMDA chairman, F. Carl Tindell, “We are the ones who have taken the brunt of

the United States tariff on lumber imports from Canada. Every time the price of Canadian lumber increases, the price of its American counterpart follows suit, creating unpredictable price fluctuations.” He then added that lumber dealers and home builders were expected to “sacrifice so that these select producers might profit.”

As in all sectors of the U.S. economy, consolidation within the industry was endemic. Over 40 percent of all retail sales were attributable to this sector’s top 500 businesses. With 6,918 locations, combined annual sales reached \$89.2 billion.

CURRENT CONDITIONS

Despite the weak economy of the early 2000s, the home improvement industry bucked the trend toward downscaling, reporting healthy growth through 2002. Lowe’s, Inc. was the biggest winner as the company strengthened its market position, gaining ground on its top rival, industry-leader Home Depot, Inc. For its part, Home Depot took several blows to its stock value during 2002 as Wall Street stepped back from the do-it-yourself (DIY) giant. Along with Lowe’s, smaller, independent DIY and home improvement stores also fared well during 2002. The industry benefited from the nesting instincts that characterized the American psyche after the terrorist attacks of September 11, 2001. Fewer people were taking vacations, and more were settling into the comforts of home, which generated more interest in home improvement projects.

Although home improvement stores are holding their own during the economic recession, they are focusing on core products and shying away from major changes. Hardware, tools, lawn and garden, plumbing, electrical, and paint account for 90 percent of all sales. Since 1990 lumber and home improvement stores had increased sales in these core categories, whereas sales of lumber and building materials had declined. For example, in 2002, lumber sales accounted for 32 percent lumberyard sales, down from 38 percent in 1990. Likewise, lumber sales at home centers declined to 20 percent, down from 25 percent, over the same time period.

Shedding their macho-man image, home improvement centers are working hard to make their stores and products more appealing to women shoppers. According to a study conducted by Lowe’s, women influence 80 percent of all home-improvement buying decisions. By 2003, both Lowe’s and Home Depot were reporting that 50 percent of their customer base was female. Home decorating and painting led the list of projects favored by women so stores stocked up on designer paints and inviting, in-store home decorating centers. According to Home Depot, 65 percent of the participants in its DIY workshops are women.

INDUSTRY LEADERS

The Home Depot, Inc. is the world's largest home improvement chain and the second largest retailer (behind Wal-Mart). In 2003 it operated nearly 1,500 Home Depot stores in the United States and Canada and employed approximately 280,000 people. The company successfully combined the economics of a warehouse store with high-level customer service usually reserved for smaller outfits. The average Home Depot store had more than 130,000 square feet of floor space and carried 40,000 to 50,000 products, including home improvement materials, building supplies, and lawn and garden supplies. The company's 50 EXPO Design Center stores showcase bath, kitchen, and lighting fixtures. In 2002 the company reported a net income of \$3.66 billion on revenues of \$58.2 billion.

Lowe's, Inc., which grew rapidly during the 1990s and early 2000s, operated about 850 stores in 45 states, with most stores in the Southeast, and employed about 153,000 people. Most of Lowe's stores are found in small towns where they can easily offer better prices and a larger selection than smaller outlets. Lowe's strategy for the new millennium focused on expanding operations into the Midwest and West. The firm was able to greatly support that goal by adding about 40 stores in the West by purchasing the Eagle Hardware and Garden chain of retail outlets. The company sells mostly building commodities and millwork, home decorating and lighting, structural lumber, garden supplies and kitchen, bathroom, and laundry fixtures. Lowe's also maintains an 18-percent market share of household appliances. In 2002 Lowe's reported revenues of \$26.5 billion, generating \$1.47 billion in net income.

Founded in 1972 and headquartered in Eau Claire, Wisconsin, Menard, Inc. ranks as the third largest home improvement retailer. Its 170 outlets, largely located in the northern region of the Midwest, feature a full complement of products similar to that of its competitors, Lowe's and Home Depot. Menard, however, operated a manufacturing facility to maintain competitive retail pricing and increase net profits. The company is owned by John Menard, the firm's founder, president, and CEO. It had 9,200 employees and annual sales of \$5.3 billion.

Other industry leaders are 84 Lumber Company and TruServe. With revenues of \$2.18 billion in 2002, 84 Lumber primarily serves professional builders, which accounts for about 75 percent of sales. With 430 locations, 84 Lumber employed about 5,800 people. The company created a market niche for itself as a no frills, low-cost retailer of basic building commodities and one-on-one personal service. TruServe operates 6,800 retail outlets, including its flagship True Value hardware stores. In 2002 the company reported a net income of \$21.2 million on revenues of \$2.18 billion, and it employed 3,200.

WORKFORCE

In 2001 the retail lumber and building materials industry employed nearly 664,000 people in the United States. The average annual wage in the industry was \$27,230. One third of the total workforce was employed as retail sales associates, with a mean annual income of \$24,550. All sales-related positions accounted for over 54 percent of the workforce. Transportation and freight-related positions totaled 18 percent of the workforce; office and administrative positions, 14 percent; and management occupations, 4 percent. Many of the industry's employees held part-time positions.

Sales associates were usually trained to work with the products as well as in customer service. As the need for salespeople with rising levels of industry knowledge has increased, retailers have had to rethink the way they hire and pay their salespeople. Retailers realized that a well-informed sales staff was key to winning and keeping customers.

AMERICA AND THE WORLD

Companies in this industry no longer limit their retail outlets to the United States and Canada. Some expansion into Mexico has taken place, although the Mexican economy has not created a favorable environment for further store openings. As of 1999, Home Depot had opened three stores in Chile, marking its entrance into international markets. The stores were developed jointly with Falabella, which is the largest retail department store in Chile.

RESEARCH AND TECHNOLOGY

The use of technology in the industry is continually increasing. In a 1996 survey of 303 retailers undertaken by the National Lumber and Building Material Dealers Association, nearly 100 percent of the retailers responded that they had incorporated the use of personal computers in their business. PCs are used in inventory, invoicing, point of sale, payroll, and accounting. The most important use for computers, however, focused on computerized inventory control; by permitting timely sales input, firms ensured that inventories remained at levels commensurate with consumer demand. Pricing was kept extremely competitive and profit margins were optimized. Most of the larger companies, such as Home Depot, Lowe's, and 84 Lumber, have extensive home pages on the Internet.

SIC 5231

PAINT, GLASS, AND WALLPAPER STORES

This industry consists of establishments engaged in selling primarily paint, glass, and wallpaper, or any combination of these lines, to the general public. While these establishments may sell primarily to construction contractors, they are known as retail in the trade. Establishments that do not sell to the general public or are known in the trade as wholesale are classified in the wholesale trade industries.

NAICS CODE(S)

422950 (Paint, Varnish, and Supplies Wholesalers)

444190 (Other Building Materials Dealers)

444120 (Paint and Wallpaper Stores)

INDUSTRY SNAPSHOT

In 2000, some 8,400 paint and wallpaper retail outlets were in operation in the United States and generated \$1.2 billion in revenues, according to the U.S. Census Bureau’s *Statistical Abstract of the United States*. Traditional paint, wallpaper, and glass stores have faced increasing competition from big-box homes centers and discounters, but they continue to maintain a market niche by offering superior selection and service to customers. Of all exterior paint purchases made in 2001, latex was the most popular, garnering 72 percent of all paint sales. Oil-based paint totaled 14 percent of sales; enamel, 9 percent; and two or more types, 6 percent. Latex was also the category leader for interior paint purchases, with 79 percent of the market.

ORGANIZATION AND STRUCTURE

There were two types of retail outlets for paints, glass, and wallpaper. The first was the independently operated store, which purchased products from manufacturers that operated distribution centers and warehouses. The second was the manufacturer-operated store, which offered factory direct products and generally used its own distribution center. Both types of stores ran centralized operations from their headquarters.

Paint, glass, and wallpaper stores were also distinguished as either warehouse stores, also called discount houses, or small retail outlets. Typically, the warehouse stores purchased large quantities of products from manufacturers and sold them at discount prices. The small retail stores, many of which were owned by manufacturers, emphasized service and personalized attention. Many stores in this industry also hired contractors to provide glass installation services for customers. Small, independently run stores occasionally offered painting services.

BACKGROUND AND DEVELOPMENT

By the early 1900s, establishments in this industry were emerging on a small scale. These establishments grew steadily though as the country’s population increased. In the early 1930s, many stores were adversely affected by the Great Depression. Public works projects, however, helped to boost paint and glass sales for these small companies. World War II saw another decline in home sales that affected the industry. The growth of suburban America during the 1950s and 1960s, however, created a period of tremendous growth for establishments in the industry. Many small companies expanded into chain stores, and manufacturers entered the retail market.

An economic recession in the 1970s caused a decrease in new home construction and a slump in paint, glass, and wallpaper sales. During the 1980s, the industry experienced another boom period in sales, engendered by an active real estate market and home renovations. The industry was projected to grow at only 1 to 2 percent per year through 2000.

The major product sold by this industry was paint. Other products sold by companies in the industry were paint supplies; wallpaper; wallpaper adhesives and supplies; varnishes for wood, anti-rust coatings for metal, glass, glass sealants; and hardware tools. Many stores in this industry also offered services ranging from decorating advice to glass window and door installation. With a greater emphasis placed on the do-it-yourself market in the late 1980s, paint, glass, and wallpaper stores offered painting clinics that taught customers how to paint professionally. Standard Brand stores, for instance, also had test walls for customers to see how certain paint looked on a wall.

The paint, glass, and wallpaper retail industry was characterized by strong brand loyalty among its customers. Most independent retail outlets relied on the manufacturers' advertising to promote their products. In response to a sales slump in the late 1980s, industry leaders started advertising campaigns to give products high visibility.

Environmental legislation affected manufacturer-owned retail outlets through hazardous waste restrictions for paint factories, which increased the cost of materials and factory produced items. In 1993, the Environmental Protection Agency (EPA) sued Sherwin Williams for failure to obtain a hazardous waste permit. This action followed a two-year investigation by the EPA.

An economic recession in the late 1980s and early 1990s put an end to eight years of consecutive growth in the paint, glass, and wallpaper retail industry. This trend was primarily caused by a decline in new home construction.

Retailers shifted from selling to industries and the architectural market toward the do-it-yourself market. While the market for new home construction dropped during the recession, the industry experienced an increase in sales as a result of property renovations and rehabilitations.

From 1990 to 1992 competition intensified greatly in the industry because of higher raw material prices and the money spent by manufacturers on research and development to comply with vital organic compound (VOC) restrictions, which dramatically reduced profit margins for many small companies. In the mid-1990s, companies in the industry suffered increased competition from mass retailers, such as Sears, Home Depot, and Wal-Mart,

which operated paint and wallpaper departments. Paint manufacturers were using mass retailers instead of small paint retail chains as a way of cutting distribution costs. The giant retailers' purchasing power and ability to control prices increased sharply in the late 1990s. As a result they expected manufacturers to provide low prices and to help control inventory.

CURRENT CONDITIONS

Despite the onslaught of competition from big-box home improvement centers and discount retailers, paint specialty stores held their own during the first years of the twenty-first century. Paint and home decor have been trouble areas for general hardware and home improvement stores as sales margins and sales-per-square-foot have declined. According to the National Retail Hardware Association in 2002, paint and home decor products account for 10 percent of floor space in home improvement stores but just 8 percent of sales. Hardware stores fared about the same, with 15 percent of floor space generating 11 percent of sales. Paint and home decor stores offer a wider selection, stock more available products, and emphasize customer service.

Another trend in the industry is the recent recognition of women as important decision makers in the do-it-yourself (DIY) market, altering the way the industry does business. Both Lowe's and Home Depot reported in 2001 that over 50 percent of their customer base was female. With an influx of women shoppers into the DIY market, home improvement and specialty stores alike are working hard to organize their stores to be bright, open, and attractive to women. New offerings include in-store design centers, more designer paint brands, and more extensive paint color samples. For example, Benjamin Moore & Co. offers approximately 3,200 colors of paint and can match almost any color using its Color Preview System.

INDUSTRY LEADERS

The industry's giant is the Sherwin-Williams Co., recording over \$5.2 billion in wholesale and retail sales in 2002 by selling paint, finishes, coatings, applicators and varnishes. Net income in 2002 was \$128 million. The company's products are geared toward the DIY market, but because of the acquisition of Cook Paint and Varnish Company in 1990, Sherwin-Williams also targets industrial customers. (Sherwin-Williams was founded by Henry A. Sherwin, a retail paint dealer in Cleveland and was incorporated in 1884.) The company also owned 12 paint plants in the United States and U.S. territories and had subsidiaries in Brazil, Mexico, Canada, Jamaica, and the Virgin Islands. In 2003, the company owned 2,650 stores in North America and 140 in Brazil, Chile, Mexico, and Jamaica.

Benjamin Moore & Co. markets its paints through a dealer network of 3,200 stores. In 2002, the company, which became a subsidiary of Warren Buffet's Berkshire Hathaway in 2000, reported revenues of \$800 million and employed 2,500. Kelly-Moore Paint Company operates 160 stores in 11 states, primarily in the western and southwestern regions of the United States. The company produces 20 million gallons of paint each year. Revenues for 2002 were \$350 million; 15 percent of that total was generated by retail sales.

WORKFORCE

In 2001, the industry employed 60,780 workers, according to the U.S. Department of Labor, Bureau of Labor Statistics. Of this total, 53 percent of jobs were related to sales. Sales associates totaled one-third the entire work force and earned a mean annual salary of \$22,410. Managers, sales representatives, and cashiers made up most of the remainder of the sales category. Office and administrative support positions totaled 14 percent and had a mean annual salary of \$23,330. Management occupations accounted for 6 percent of all jobs and had a mean annual salary of \$55,150.

Sales staff was usually given special training in working with paints and other chemical-based products, along with training in customer service. Generally, people with backgrounds in design, professional painting, or construction work are preferred.

AMERICA AND THE WORLD

The United States maintained a favorable trade balance in paints and coatings, but glass and wallpaper had little overseas activity. In the early 1990s, American exports of paints and coatings increased 19.2 percent to \$675 million in wholesale prices. Roughly 75 percent of these paints went to American owned retail outlets. Strong export growth was predicted for this industry into the mid-1990s.

RESEARCH AND TECHNOLOGY

In the early 1990s, the leading areas of research and technology emanated from paint and coatings manufacturing areas, such as research in waterborne, high solids, powder, and radiation-cured coatings. These types of coatings were geared toward increasing sales in automotive and appliance coatings and furniture finishes. Developments also were underway for new products to be sold by retailers in this industry. Titanium dioxide, which was used as a paint pigment with great covering power and durability, was being developed for the commercial market.

As a result of environmental legislation, research continued on waste management from these products, both for manufacturers and wholesalers. Another techno-

logical development for this industry intended to help protect the environment was products with no volatile organic compounds. These products were in demand because, in addition to being easier on the environment during production, they did not emit fumes when being applied to walls. In 1998 the U.S. Environmental Protection Agency announced national VOC limits for automotive refinished and architectural and industrial maintenance coatings, effective as of 1999. Eventually, these products were expected to help paint sales.

Like other retail businesses, establishments in this industry continued to increase their reliance on computers, simplifying many routine buying functions and improving the efficiency of in store sales staff. The larger paint, glass, and wallpaper retailers were relying less on sales staff for inventory counts and more on point of sales computer terminals, which provided up to date inventory and sales information.

Computerized inventory controls greatly increased the efficiency of ordering merchandise. Some systems monitored inventory levels, automatically reordered selected merchandise, connected chain stores to one centralized system, and calculated turnover by product, store, and sales area. For sales staff, point of sales computer systems were useful in calculating discounts, approving credit, and scheduling deliveries.

A significant development in the distribution of paints and wallpaper was the use of electronic ordering and inventory control systems, known as electronic data interchange (EDI). Replacing the use of the postal service, EDI systems enabled retailers to order paints through a computer linked directly to manufacturers and independent distributors. This facilitated quicker ordering and more accurate inventory controls.

SIC 5251**HARDWARE STORES**

This category covers establishments primarily engaged in the retail sale of a number of basic hardware lines, such as tools, builders' hardware, paint, glass, cutlery, housewares, and household appliances. Establishments primarily engaged in the sale of lumber and other building materials are classified in **SIC 5211: Lumber & Other Building Materials**. Those establishments are included in this industry analysis because of their dominant role in the hardware industry. Establishments that specialized in a particular line of hardware, such as paint or wallpaper stores, were classified in **SIC 5231: Paint, Glass & Wallpaper Stores**.

NAICS CODE(S)

444130 (Hardware Stores)

INDUSTRY SNAPSHOT

Hardware remained a healthy, growing business in the early part of the new millennium. There were approximately 20,290 hardware stores in the United States in 2002, a 7.3 percent decrease over a 10-year period. This could be attributed to the growth of home improvement chains, including Home Depot, replacing some of the independently owned, "mom and pop" hardware stores that were typical in past years. There were also roughly 10,000 home centers, which combine goods related to hardware retailing with goods related to building materials retailing. In 2001, the average hardware dealer had sales of more than \$3.6 million annually. The average home center is considerably larger, with sales of about \$5.6 million. Warehouse home centers had sales of \$35.9 million per store. Annual retail sales of hardware store were estimated at \$16.5 billion in 2001.

ORGANIZATION AND STRUCTURE

Most of the U.S. retail hardware stores are independent businesses. However, nearly all of them are affiliated with a nationwide wholesaler that offers private label brands, retail store advertising, and identification programs. Such affiliations create the appearance of a structured industry. Many of these wholesalers are actually cooperatives owned by independent hardware store owners, forming a distribution system that originated in the early twentieth century. Dealer-owned wholesalers sell only to member stores, but member stores can buy merchandise from other wholesalers or directly from manufacturers.

The largest dealer-owned cooperative is Cotter & Company, based in Chicago Illinois. It manufactures and distributes products to member-owner stores under the

retail trade names of True Value Hardware and V&S Variety Stores. In 1997 Cotter merged with ServiStar, a Minneapolis-based distributor that owned Coast to Coast Stores. Together they created a \$4.3 billion company that serves more than 10,000 retail outlets. Ace Hardware Corporation, based in Oak Brook, Illinois, is the nation's second largest cooperative with more than 5,100 members in 1999. Other dealer-owned wholesalers and their store identification programs include Our Own Hardware Co., of Burnsville, Minnesota (How-To Centers) and United Hardware Distributing Co., of Plymouth, Minnesota (Hardware Hank Stores).

Hardware Wholesalers, Inc., Fort Wayne, Indiana (Do-It-Best Centers) launched its own Internet Web site in July 1999. Already one of the nation's largest hardware cooperatives with recorded sales of \$1.9 billion in fiscal year 1998, www.doitbest.com listed 70,000 items for sale on opening day. The Web site is marketed as "The World's Largest Hardware Store." However, Internet hardware retailing is still rare.

Most retail hardware stores have less than 20,000 square feet of floor space. The National Retail Hardware Association (NRHA) categorizes larger formats as home centers. Home centers average more than 30,000 square feet and usually combine lumber with a greater selection of hardware products to create a one-stop shopping environment for home repair and home improvement projects. Home centers typically buy directly from the manufacturers and often sell to commercial accounts, as well as individual consumers.

The home center segment also includes large warehouse-style hardware stores that average nearly 100,000 square feet and have between \$12 million and \$15 million in annual sales. Warehouse stores began to appear in the late 1970s and have had a notable impact on the retail hardware industry. In the early 1990s industry analysts predicted that the warehouse format would revolutionize the industry. But despite attracting a great deal of attention and a significant customer base, warehouse chains such as Home Depot accounted for only about 12 percent of industry sales in the late 1990s.

Warehouse stores are able to negotiate greater discounts from wholesalers and manufacturers because of their size. Warehouse stores also base their retail business on generating a high volume of sales, rather than by pursuing high profit margins. This forces smaller, independent hardware stores and chains, which have traditionally operated on high margins, to lower their prices, become more efficient, redesign their stores, improve customer service, and bypass their wholesalers to get a better price directly from manufacturers. This new operating style has forced numerous wholesalers and retailers to go out of business.

BACKGROUND AND DEVELOPMENT

Hardware stores were among the earliest retail establishments in colonial America, selling tools imported from England. The oldest hardware store in the country is Elwood Adams Hardware in Worcester, Massachusetts. Founded by Daniel Waldo and son in 1782, it was still in business in 1999. The store was named for Elwood Adams, who purchased it in 1886. The first American manufacturer of hardware was probably John Ames, a blacksmith in Bridgewater, Massachusetts. He established a factory for making shovels in 1774. Ames' shovels became indispensable to American settlers.

The American Industrial Revolution of the early 1800s greatly increased the availability of manufactured goods and spurred the growth of general stores that stocked basic hardware. Peddlers selling hardware from the back of their wagons inundated rural areas. The industrial revolution also gave rise to factories that could supply more goods than nearby communities could use. This created the need for wholesalers and distribution networks. As the U.S. economic base shifted from agriculture to manufacturing in the last half of the nineteenth century, the hardware industry began to acquire distinct manufacturing, wholesaling, and retailing segments.

National Retail Hardware Association. Many hardware stores established in the late 1800s survived for more than 100 years. These stores were largely small, family-owned businesses, and, like neighborhood grocers before the advent of supermarkets, hardware store owners knew their customers well and were important members of the local business community. Although they valued their independence, hardware store owners also recognized the need to organize. By 1900 there were 25 state hardware associations, created primarily to lobby against what retailers believed were unfair trade practices conducted by manufacturers, who sold directly to hardware store chains and mail order houses at a significant discount.

Delegates from nine of these state associations met in Chicago in 1900 to discuss their common concerns, and eventually groups from seven states formed the Interstate Retail Hardware Association. In 1901 the name was changed to the National Retail Hardware Dealers Association, which later dropped "Dealers" from its name. The NRHA campaigned for fair-trade laws to protect storeowners from unfair pricing. Later the association offered members a broad range of management, marketing, and research services. Headquartered in Indianapolis, Indiana, the NRHA became a federation of 14 state and regional hardware associations in 1993, including the Canadian Retail Hardware Association. Five years later the entire federation voted unanimously to amend its by-laws so that NRHA could accept direct retail members from all 50 United States.

Wholesale Cooperatives. In addition to seeking legislative relief from what they perceived as unfair pricing policies, hardware store owners also began forming wholesale cooperatives to increase their leverage with manufacturers. One of the first cooperatives was the American Hardware Supply Company (AHSC), which was founded by retailers in Pittsburgh, Pennsylvania, in 1910. AHSC, the forerunner of ServiStar Corp., eventually shipped hardware to retailers throughout most of the eastern United States.

One of the most successful U.S. cooperatives has been the Ace Hardware Corporation, founded in 1924 by four Chicago retailers. The four retailers had been members of an innovative promotional program created by the E. C. Simmons Hardware Co., a St. Louis distributor providing advertising, window displays, and other store identification materials. In addition to buying directly from manufacturers on behalf of its members at volume discounts, Ace Hardware revived the Simmons promotional program. For 50 years Ace Hardware was run by Richard Hesse, a flamboyant marketer and hardware industry legend who strove to create emotional as well as economic bonds between members of the cooperative. In 1998 Ace Hardware was the second-largest hardware wholesaler with 5,100 stores and sales of \$3.1 billion.

Coast to Coast Stores, though not a dealer-owned cooperative, was formed in 1928. Coast to Coast was initially both a wholesaler and a franchiser. The Minneapolis-based company assisted storeowners in arranging financing, selecting store locations, and understanding the retail hardware business. In 1990 Coast to Coast was purchased by ServiStar, the Pennsylvania-based wholesale cooperative founded in 1910. At the time of the sale, Coast to Coast had about 1,100 franchisees and annual sales of \$400 million. Our Own Hardware Co. is another well-known cooperative. Founded in 1913, it was originally known as the Hall Hardware Company. By 1992 Our Own Hardware Co. had about 1,000 members and sales of \$185 million. The company merged with ServiStar in 1996 to form ServiStar Coast to Coast Corporation. A year later ServiStar merged with Cotter & Company, the wholesale cooperative behind the True Value chain. Together they created a \$4.3 billion company with more than 10,000 retail members.

Home Centers. The boom economy that followed World War II led to a tremendous expansion of the retail hardware business. Homeowners began buying more tools, housewares, plumbing, electrical supplies, paint, building materials, and other staples of the hardware business. The do-it-yourself market was beginning to take shape. The post-war economy also gave rise to another form of competition: large, chain-owned hardware stores known as home centers. These chains were

led by Lowe's Companies, Inc.; Payless Cashways, Inc.; and Builders Square, Inc., originally known as Home Pro.

Warehouse Stores. In 1979 a start-up company, The Home Depot, Inc., opened two warehouse centers in Atlanta, Georgia, sparking dramatic changes in the retail hardware industry. Home Depot's stores were greatly expanded home centers. Each store featured 60,000 square feet of space, an informal atmosphere, and low prices. Beginning with a severely limited budget, Home Depot's top shelves were often stocked with empty boxes to avoid an empty feeling in the cavernous stores. The concept, however, was an overwhelming marketing success. By 1983 Home Depot was operating 10 stores in Atlanta and southern Florida. Each store averaged 60,000 square feet in size and nearly \$12 million in annual sales.

Competitors soon copied Home Depot's warehouse format. In 1983 W. R. Grace & Co. opened two House Works stores in New Orleans. Within weeks Home Depot also opened two stores in the Crescent City. This was followed by two more House Works stores. Within a span of 90 days, six warehouse hardware stores opened in New Orleans with a combined 400,000 square feet of space. Warehouse stores soon opened in other areas of the country in a confusing flood of similar sounding names, including HomeOwners Warehouse in Florida, Home-Pro Warehouse in Texas, and HomeClub in southern California. By the end of 1983, 11 companies had opened a total of 47 warehouse hardware stores.

But Home Depot was not outdone by the competition. In 1999 the Atlanta-based home-improvement giant was reporting annual sales of \$30.2 billion. With 874 stores in the United States, Canada, Puerto Rico, and Chile, Home Depot was by far the largest hardware retailer in the world. According to company executives, during the late 1990s Home Depot was opening a new store every 53 hours.

In the course of this industry-wide expansion, many independent hardware stores were driven out of business. Hardware store failures were attributed largely to the success of suburban malls and discount stores, such as Kmart and Wal-Mart. For example, Wal-Mart and its growing hardware sales expanded from about 30 stores in 1970 to about 9,000 stores in 1999. Most of these stores were typically located in stores near small communities.

The malls and discount retailers changed shopping patterns throughout the United States. Hardware stores moved away from downtown areas in both big cities and small towns where people no longer came to shop. Warehouse stores, on the other hand, actually expanded the hardware market. By one industry estimate, when the first Home Depot store opened in 1979, the do-it-yourself market was reporting earnings of about \$35 billion annually. Ten years later, the market was estimated to be

worth nearly \$90 billion. Many retail hardware stores were able to capitalize on the expanding market by becoming more efficient and offering more personal service.

Wholesale cooperatives also helped their members deal with increased competition. Cotter & Company was credited with creating innovative store identification programs to counter the advertising campaigns and name recognition of the home centers. These programs included national advertising in consumer magazines and cost-efficient mass-produced circulars for member stores. Many such programs were copied by other cooperatives.

The chain-owned home centers may have been more adversely affected by the warehouse stores than independent hardware stores. Initially, home centers competed based on price, but competition from warehouse stores forced home centers to add services, such as installation services, and hire more qualified employees. Home Depot was an industry leader in customer innovations such as how-to clinics, bar code standards, employee training programs, and satellite communications between the chain's mainframe computer in Atlanta and point-of-sale computers in its stores nationwide.

A 1999 NRHA report showed that the typical hardware store annually sells \$104,754 per employee, whereas the high-profit stores (the top 25 percent of all hardware stores) annually sell \$112,644 per employee. Average hardware stores sell \$1.01 million annually, whereas high profit stores sell \$1.11 million a year. Gross profit margin is 37.7 percent for typical hardware stores, whereas high-profit stores do 39 percent. Thus, although the industry as a whole grows at about 4.4 percent each year, a noticeable gulf between the high-profit hardware stores and the average store continued to exist.

As the new millennium approached, most retail hardware stores were still family-owned businesses, with many family histories extending back four or five generations. In the majority of these stores, sons and daughters worked along side their parents. But many of the present owners did not expect to pass their stores on to the next generation. Those who expected to someday sell their stores to outsiders cite hard work, long hours, an uncertain future, and the lower-class image of hardware store owners as contributing factors to the decreasing appeal of hardware store ownership. Long-time employees often purchased hardware stores that are sold outside the family. In this regard, many hardware stores have established employee stock ownership programs that make it easier for employees to take over ownership.

Storeowners are also more likely to cite competition from discount retailers such as Kmart and Wal-Mart as the most serious threat to their businesses. Financially, the strongest independent hardware stores are those that

have staked out a variety of niche markets, such as kitchen remodeling centers and lawn and garden centers. Some wholesale cooperatives, including Our Own Hardware, began helping members establish tool rental departments. At the same time, many storeowners were reluctant to make radical changes in their businesses and made no plans to change their product mix. Other owners became interested in bypassing traditional distribution channels to buy directly from the manufacturers.

Although none of the other warehouse hardware companies came close to duplicating the success of Home Depot, warehouse stores continued expanding in the 1990s. Lowe's Companies Inc., which began experimenting with larger stores in 1984, made a corporate decision in 1988 to hold the line at about 60,000 square feet. In the early 1990s, however, the company decided to build larger stores and by the mid-1990s more than half of its stores were more than 60,000 square feet. Lowe's experimentation paid off. In November of 1999 it had solidified its position as the second largest home-improvement store in the United States.

Another leading company with major expansion plans in the early 1990s was the Hechinger Company. Based in Largo, Maryland, Hechinger operated a chain of traditional hardware stores. In 1988 Hechinger purchased Home Quarters Warehouse Inc., and in 1991, the company opened its first warehouse-size Home Project Center. By the mid-1990s Hechinger had become the fourth largest home-improvement retailer in the nation. However, the company fell on hard times in 1997. Two years later it filed for bankruptcy protection from its creditors and began liquidating a number of its stores.

Legislation. Among other issues of concern to the retail hardware industry during the 1990s was the question of product liability. Increasingly, courts were holding retail stores liable for damages caused by defective products. Several courts had ruled that hardware stores have an obligation to ensure the safety of their products and held them liable for money damages when they failed to fulfill this obligation. For two decades Congress has conducted hearings to determine if they should enact federal laws to insulate hardware store retailers from product liability lawsuits. Despite several pieces of proposed legislation, no bill ever passed both Houses. Thus, hardware stores continued to insure themselves against the risk of liability.

CURRENT CONDITIONS

Despite a weakened economic climate preceding, and worsening after, the events of September 11, 2001, home channel market sales managed to increase 6 percent in 2001. Total home channel sales were \$343.1 billion, which included sales from hardware stores, home centers and other building material dealers, lawn and garden

equipment and supply stores, department stores, paint and wallpaper stores, and other general merchandise stores. Hardware stores made up \$16.5 billion, or 4.8 percent of total home channel market sales.

In 2001, the typical hardware store sold \$127,000 per employee, with home centers average \$133,000 per employee, and warehouse dealers at \$189,000 per employee. Hardware stores sold \$3.6 million per store, and warehouse dealers averaged \$35.9 million in sales per store.

Although many sectors of the economy suffered, hardware managed to thrive due to a number of factors. The increasing trend toward do-it-yourself (DIY) projects was one of the chief reasons. People were purchasing tools and other hardware and household items at a record pace. According to the NRHA, the DIY market increased at a compound annual rate of 6 percent from 1995 to 2000. The NRHA expected the trend to continue, growing 3.8 percent through 2005. The trend toward staying home, or "cocooning," after September 11, 2001, was another factor that drove home sales. As travel declined, Americans had more to spend on home renovations instead. Cable television started a home renovation and design programming trend that became popular with viewers and further encouraged sales in the home sector. The good news for home sales did not stop there: with ongoing low interest rates in 2002 and 2003, housing remained stable and even strong in some markets. The demand for new housing was also on the rise, with an estimated demand at 1.8 million units per year, compared with 1.6 million housing units per year during the 1990s.

A noticeable trend among hardware stores in the early 2000s was the bid to attract more female customers. According to the National Association of Realtors, single women are the second biggest group of homebuyers after couples. They influence a large number of home improvement purchases, and are increasingly involved in DIY projects. Leading the way toward increasing appeal to women buyers were Lowe's, the first to incorporate a home decor department in the mid-1980s, Home Depot, and Sears. Now, traditional hardware stores, including Ace Hardware, were following suit. In addition to female-friendly marketing and advertising, more and more decor programs were cropping up alongside new store designs and display programs geared toward the distaff set.

INDUSTRY LEADERS

Atlanta-based Home Depot is the largest hardware retailer in the United States. It had 1,500 stores worldwide and generated more than \$58.3 billion in sales in 2003. It is credited with driving the retail hardware industry to adopt newer technologies, including the use of bar codes for maintaining inventory. In the late 1990s Home Depot began to roll out a line of large-format stores called

EXPO, which featured 80,000 to 100,000 square feet of space focusing on interior design materials rather than the lumber and construction offerings of its flagship chain. In 2002, Home Depot unveiled a new prototype store in Brooklyn, New York, that was half the size of a regular Home Depot. The stores were designed for use in crowded, urban areas and are neighborhood-friendly, offering a targeted mix of products and services.

North Carolina-based Lowe's Companies, Inc. is the second leading hardware retailer in the country, reporting more than \$26.5 billion a year in sales from 850 stores in 2003. TruServ Corporation was a leading cooperative in the hardware sector, serving some 6,800 retail outlets and reporting sales of \$2.2 billion in 2002. Ace Hardware, based in Oakbrook, Illinois, was the second leading cooperative in the United States behind TruServ with 2002 sales of \$3 billion and more than 5,100 stores worldwide.

WORKFORCE

The retail hardware industry employs approximately 150,000 people, with the average hardware store employing 12 full- or part-time workers. Entry-level workers are usually paid at or near the minimum wage. Smaller hardware stores with a lower profit margin commonly complain about the difficulties in finding and retaining a competent staff. The problem is especially critical in small towns. Home centers typically hire away experienced employees at higher wages. They also offer employee training programs and more opportunity for advancement. Home Depot is a leader in hiring employees with a construction or building industry background to improve service. Wholesale cooperatives have attempted to help their members by instituting employee-training programs.

AMERICA AND THE WORLD

In 2001, Ace Hardware became the first non-Japanese retail company to join the home improvement market in Japan. Ace Homeplace, as it will be known, opened under a licensing agreement with Sunstar Engineering of Osaka that would allow another 200 stores to open in Japan through 2011. Smaller than its 35,000-square-foot American counterparts, the store measured 5,000 square feet and differentiates itself in the Japanese market by catering to female and DIY customers and offering a more specialized mix of products, including paint, lawn, garden, housewares, and home decor products.

Although Mexico is dominated by family-owned independent hardware stores, Home Depot made a move into the market in 2002 with the purchase of two small Mexican chains, Del Norte and Total Home. In response, Ace Hardware and Do it Best also began stepping up efforts in the region.

SIC 5261

RETAIL NURSERIES, LAWN AND GARDEN SUPPLY STORES

This category covers establishments primarily engaged in selling trees, shrubs, other plants, seeds, bulbs, mulches, soil conditioners, fertilizers, pesticides, garden tools, and other garden supplies to the general public. These establishments primarily sell products purchased from others, such as plant wholesalers, but may sell some plants that they grow themselves. Establishments primarily engaged in growing trees (except Christmas trees), shrubs, other plants, seeds, and bulbs are classified in the major group for agricultural production—crops. Establishments primarily engaged in growing Christmas trees are classified in **SIC 0811: Timber Tracts**.

NAICS CODE(S)

444220 (Nursery and Garden Centers)

453998 (All Other Miscellaneous Store Retailers (except Tobacco Stores))

444210 (Outdoor Power Equipment Stores)

INDUSTRY SNAPSHOT

Retail nurseries and lawn and garden supply stores operate under a variety of names, in a multitude of con-

sumer settings, and offer a wide range of products to serve a peculiarly American need to cultivate, trim, embellish, and control a small plot of greenery. The robustness of a homeowner's front lawn and the pleasing visual effect provided by planted shrubs and flowers has become a status symbol in a modern industrialized society of property owners. Explaining the consumer-appeal of gardening, Seattle-based Swanson's Nursery owner Wally Kerwin said, "Planting is therapeutic, environmentally sound and increases the value of the home . . . And it's counter-technical. Virtual gardening is not really an in thing." Thus, gardening did not compete against the technological revolution, but rather worked as an elixir to complement and soothe those immersed in cyberspace at work all day.

The retail nurseries, and lawn and garden supply stores consisted of 17,770 establishments in 2001, an increase from 16,459 in 2000, employing about 3,652,750 people and bringing in approximately \$39.6 billion in sales in 2002. The majority of companies were small in this classification were small—employing less than five persons. In 2001, 5,586 companies had less than 5 employees; 3,189 had between 5 and 9 employees; 2,298 had between 20 and 99; 840 had between 100 and 499; and 1,905 had 500 or more employees.

ORGANIZATION AND STRUCTURE

Nursery and garden stores were either single-unit establishments or branches of multi-unit establishments such as Frank's Nursery. Single-unit establishments were primarily individual proprietorships, many of which concentrated on providing hard-to-find products to local or mail-order consumers, and often cultivated a variety of unique seeds and plants in-house. Multi-unit locations also situated themselves in conjunction with a larger outlet, such as Builder's Square stores alongside Kmart stores.

There are a number of professional or industry-related organizations for the nursery and garden supply business. The American Association of Nurserymen (AAN) dates back to 1875. In the late 1990s, most states had individual associations of nurserymen with member rosters that included individual owners/operators of small nurseries, growers of trees and shrubs, and plant wholesalers. They provided a multitude of small-business services to their members. The AAN's retail division is the 600-member Garden Centers of America, founded in 1972. Its stated aim is to meet the daily needs of garden center managers.

BACKGROUND AND DEVELOPMENT

Retail nursery and garden supply stores have been in existence since the nineteenth century, but only in the decades following World War II did this segment of the

retail economy flourish into a profitable business. To meet the postwar housing shortage, new communities filled with single-family homes grew exponentially as a result of expansion into suburban and rural areas. The availability of open acreage in the United States meant that every family could hope to own a modest plot of land surrounding their home—a front yard buffeting the home and occupants from the street, and a more private backyard for children's playtime, barbecues, and small vegetable gardens. In many of these newly created bedroom communities, a holdover from the area's more rural beginnings could be found under the awning of the local feed store. These family-owned businesses had served the needs of the area's farmers in previous decades, but with the influx of new homeowners into the community in the postwar years they soon adapted to changing demographics. They began stocking items less suitable for maintaining a large tract of cropland than for keeping a small lawn. More successful businesses purchased competitors, making major lawn and garden supply retail chains common, especially in midwestern states.

The retail nursery and lawn and garden supply industry added products and services to meet changing consumer demands over the years. It stocked chlorine and other swimming-pool maintenance items as family recreational facilities multiplied in suburban backyards in the 1960s and 1970s. Retail centers began carrying less seeds and more bedding plants in the 1990s as busy two-career households found less time to cultivate a garden plot from scratch.

Retail nurseries and lawn and garden supply businesses witnessed phenomenal growth during the 1980s and 1990s. Most of this gain is due to changing demographics in the United States that place more consumers in the age and income category that has traditionally spent money on gardening. The overall industry has been transformed by two important trends during this period of growth. The first is the dominance of larger, multi-unit retail chains that are usually regional in scope but often provide outlets from coast-to-coast. This shift has brought a more corporate strategy to what had for many decades been a rather localized industry. Computers to track inventory and uniformed cashiers are now common in even smaller establishments. The second major change in the industry has been the increased segmentation of the nursery market.

Smaller companies, faced with the threat of competing against well-stocked chain stores whose products were bought in volume and then sold to consumers at a discount, have found that narrowing their focus has kept them afloat in the industry. Many now specialize in a certain variety of plants, which are cultivated on the premises, or aim to capture the more environmentally conscious gardener with specialized products. Another

means of coping with profit losses has been the development of a segment to provide landscaping services. The industry has also been affected by the increase of large discount lawn and garden supply departments in new warehouse-style home centers such as Builders' Square and Home Depot. Such stores offer an immense selection of standard lawn and garden products, and their entry into the market has introduced greater competition.

Homeowners in the 1990s came to view sprucing up their lawns and shrubbery as a relatively low-cost way to boost property values as well as spirits. According to some leisure-time experts, gardening became one of the most rapidly-developing hobbies among Americans in the 1990s. Not only did the larger, corporate-based retail nursery and garden-supply centers benefit from the boom of the 1980s, but small, individually owned firms also flourished. These latter establishments were able to provide specialty plants, rare seeds, and unusual implements and accessories for new legions of dedicated gardeners. Smaller enterprises often cultivated their own varieties of one certain plant, such as lilac or rose bushes, or geared themselves toward gardeners interested in producing their own fruits, vegetables, and herbs. Savvy consumers recognized the distinction in knowledge and expertise provided by these independents, who thrived by catering to the growing legion of buyers educated in the wares they were purchasing.

In 1991, the retail nursery and lawn and garden supply industry was hit by a disaster with costly repercussions. The problem stemmed from the use of a fungicide called Benlate, manufactured by the chemical giant DuPont. The pesticide had been on the market for two decades and was known by nursery growers to be a quick-acting cure for minor blighting diseases affecting fruits, vegetables, and ornamental plants. However, nurseries and growers in 40 states soon began reporting problems in the spring of 1991, complaining that their plant stock was rapidly dying or failing to reach maturity. The company began investigating the disaster and months later were still baffled. Scientists speculated that unknown interactions between the chemical compounds in Benlate may have created a undetectable toxic element. They believed the culprit may have been an inert ingredient that was suddenly aggravated by greenhouse conditions. Growers began treating the diseased plants with activated charcoal, which seemed to ameliorate some of Benlate's effects, but some experts believed that the wayward chemical compound lingered in the plants. DuPont began paying millions of dollars in settlements to growers faced with bankruptcy, particularly to nurseries and growers in Florida. The scandal also raised an ethical issue among nurseries—although some owners were fully aware of the Benlate-diseased plants, they sold them anyway in an attempt to reduce some of their losses.

Naturally, the plants quickly died when removed from the greenhouse setting.

In 1996, approximately 12,000 establishments operated retail nurseries and garden stores in the United States. With the exception of the large home-centers, the majority of these were small establishments, with the average employee count per establishment at about 7, compared to the average of 12 for all retail industries. The total number of employees has increased approximately 22 percent since 1990, reaching an estimated 92,000 in 1996.

The entire retail nursery and lawn and garden supply industry generated \$25.9 billion in sales in 1995, according to the National Gardening Association. That represented an increase of \$3.5 billion, or 15.5 percent, over the previous year. Throughout the previous five years, sales increased about 10 percent annually.

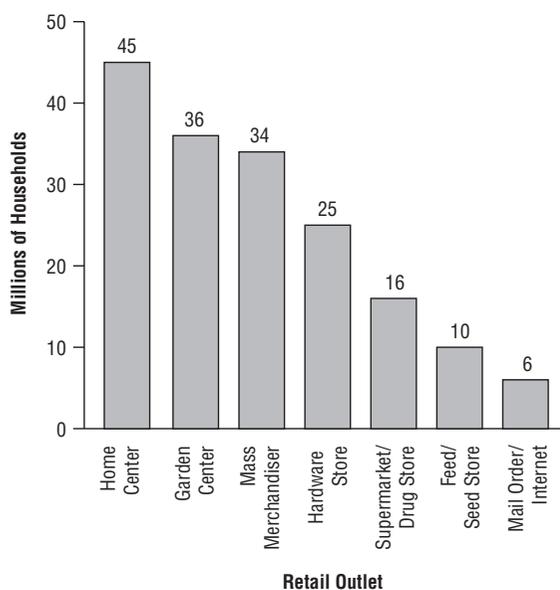

CURRENT CONDITIONS

The midwestern region of the United States, with its higher concentration of people who grew up on or near farmland, remains the most avid-consuming region of nursery and lawn and garden supply items. The area also boasts one of the highest rates of home ownership in the nation, and the average size of the property lot is larger than the rest of the country. The increased environmental consciousness among all consumers, but especially within the midwestern group, also positively impacted the nursery and garden supply industry. This trend is reflected in the shift toward more nature-like gardens, with an assortment of wildflowers and a less-manicured look. This transition is also evidenced by the increase in sales of organic fertilizers and the growing popularity of landscaping that appears less contrived and more natural. An example of the back-to-nature movement is seen in the use of woodland plants or prairie grasses as opposed to water-thirsty and high-maintenance trimmed lawns.

According to a survey conducted by the National Gardening Association, consumers spent an average of \$466 per household, \$39.6 billion total, on their lawns and gardens in 2002. That represented an increase of \$30.2 billion over previous four years. Mail order or online purchases, an increasingly popular method for consumers to obtain gardening supplies, have grown to about 8.4 percent over the past few years. In fact, survey results concluded that 23.8 million consumers used mailorder to purchase their gardening supplies in 2002. The survey also concluded that 7 percent of total industry purchases were completed via mail order. Garden centers account for about 43 percent of total gardening purchases; hardware stores for 33 percent; mass merchandisers for 48 percent; feed and seed stores for 14 percent; supermarkets or drug stores for 21 percent; home centers for 52 percent; and mail order for 28 percent.

Top Retail Outlets in the Lawn and Garden Supply Industry

By number of households using retail outlet, in millions

SOURCE: Mailorder Gardening Association, 2003

Further results concluded that 50 percent of consumers who purchased their nursery, lawn, and garden supplies by mail order or online was because of its convenience. Furthermore, mail order and online shopping offered items that were not found in retail nurseries or garden centers. The favorite items were seeds, live plants, bulbs, gardening books and magazines, gardening tools, fertilizers and insect controls, seed starters, watering products, and composting supplies, and gardening gifts or decorative items. The mail order and online method of alternative shopping generated additional sales for retail suppliers.

The National Gardening Association reported total sales of \$38.4 billion in 2003. In fact, the retail nurseries, lawn and garden supply stores experienced an annual growth of five percent for a consecutive three years.

INDUSTRY LEADERS

One of the largest retailers of nursery plants and lawn and garden supplies is Frank's Nursery and Crafts. The company was founded in Detroit, Michigan, and in the postwar years capitalized on the area's high concentration of single-family homes in both the city and surrounding suburbs. Frank's outlets operated year-round, but switched to selling craft items such as macrame kits and artificial flowers during the lean winter months. The company has also done a brisk business as a live Christmas tree lot each December. Traditionally, Frank's Nurs-

eries were larger than the average garden-supply store at the time and provided customers with shopping carts to traverse their many indoor and outdoor aisles. The outdoor segment, open during the temperate months, sold a variety of shrubs, bushes, vegetable plants and seedlings, and flowers to home gardeners.

The company's user-friendly, supermarket-type approach appealed to not only the serious gardener but also to the more inexperienced, easily daunted neophyte, and proved remarkably successful. In addition, its larger corporate structure allowed it to purchase supplies in volume at a discount and then warehouse and distribute them as needed. Frank's stocked not only plants and gardening tools but also patio furniture, lawn mowers, swimming pool products, and power tools.

General Host, which owned Frank's, also owned the 11-store Calloway's Nursery, Inc. of Fort Worth, Texas. In the late 1990s, Calloway's operated 16 stores in Texas that sold lawn and garden products. Calloway's, in turn, acquired Houston-based Cornelius Nurseries, the other large Texas-based retail garden center in September 1999.

WORKFORCE

The majority of employees in retail nurseries and lawn and garden centers tend to fit the profile of the average retail or service industry worker. They often have little more than a high-school education and hold jobs that pay poorly and lack benefits such as health care and pension. The firms that kept payroll records employed an estimated 92,000 workers in 1996. According to U.S. Department of Labor statistics, the average nonsupervisory worker in the industry worked 32.4 hours per week in 1995 and earned \$263.41 at \$8.13 per hour. Since many of the firms are seasonal in nature, layoffs during the winter months present additional financial setbacks to workers in the field. The nursery business is unusual in that it is extremely susceptible to negativity among employees. Low wages and a lack of benefits often correspond to a general malaise among workers in any industry, but in a retail nursery it is a relatively simple matter for one person to stealthily damage thousands of dollars worth of plants, with the undetected crime resulting in severe financial losses. Workers in the industry face additional problems from the daily exposure to pesticides. In the early 1990s, the U.S. Environmental Protection Agency (EPA) issued stringent standards for acceptable pesticide levels for farm workers.

SIC 5271

MOBILE HOME DEALERS

This industry consists of establishments primarily engaged in the retail sale of new and used mobile homes and their parts and equipment. This classification excludes companies selling travel trailers or campers; these companies are discussed in **SIC 5561: Recreational Vehicle Dealers**.

NAICS CODE(S)

453930 (Manufactured (Mobile) Home Dealers)

Since the 1950s, the demand for mobile homes had increased approximately 2,700 percent, and by 2000, the U.S. Census Bureau reported 8.8 million mobile homes. 2003 found approximately 8,785 establishments primarily engaged in the retail sale of new and used mobile homes and their parts and equipment. Mobile home dealers represented the largest sector with 8,260 establishments, or 94 percent of the overall market. Their combined annual sales were about \$11.1 billion. Together, they employed some 45,534 people. Mobile offices and commercial units number 22 businesses, and generate \$10.9 million.

As reported by the U.S. Census Bureau, there were 1,449,754 new units manufactured from 1995 to March of 2000. Florida represented the highest number of mobile homes, with 849,000, Texas with 732,000, and North Carolina had 557,000. More than half of the mobile homes in the United States are located in the South, or 56.1 of the housing market. The Western states numbered 1.7 million mobile homes. Mobile homes in the South were about 11.6 percent of the housing structures, and mobile homes in the West made up 7.1 percent. The one state that contributed more than 20 percent of mobile homes to the housing structure was South Carolina. That was followed by New Mexico with 18.6 percent. Alabama, Mississippi, North Carolina, and West Virginia

shared about 15 percent. There were about eleven states that added up to more than one—quarter million mobile homes located in the United States.

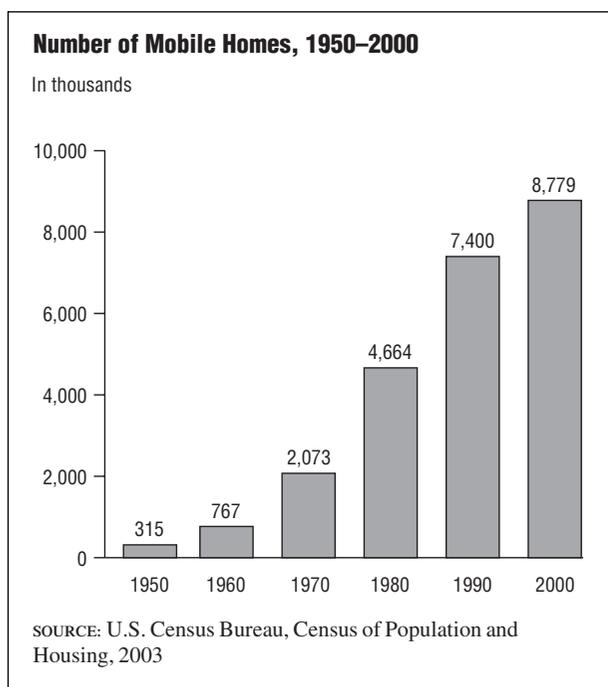

The mobile home retail industry originated in the United States following World War II. The growth of suburbs coupled with increased demand for low-cost housing enabled mobile home dealerships to establish a foothold in the housing market. Sometimes referred to as "trailer homes," mobile homes became immediately popular because they allowed families to own homes at a relatively inexpensive price. Moving was also made easier by these "houses on wheels." As mobile home sales rose, mobile home parks, which leased plots of land to mobile home owners, began to offer more conveniences to their renters, including swimming pools. Mobile home owners also enjoyed the ordinary amenities offered by rental parks, like yards to mow and flowerbeds to plant.

The industry experienced steady growth until the late 1970s, when mobile home sales sagged with the rest of the economy. Even after the recession lifted and the economy improved in the 1980s, the mobile home industry lost some of its market share to traditional homes that became more affordable to consumers due to lower interest rates. Some large mobile home dealers filed for bankruptcy during this depressed market.

Mobile home retail sales began to pick up again in the late 1980s with the introduction of "manufactured homes," which are steel-framed homes built in factories and driven to lots. These homes usually include at least two bedrooms and two bathrooms and cost roughly one-quarter of the price of regular houses. The mobile home industry further solidified its position during the 1990s: in 1991 total sales for mobile home dealers totaled \$5.57 billion, and by 1999 sales topped \$14 billion. Unit sales increased from around 150,000 in the 1980s to more than 350,000 in 1999.

In the late 1990s, about 20 million Americans, or 7 percent of the population, lived full-time in more than 8.5 million mobile homes. Approximately 3.3 million mobile homes were located in the southeastern United States, 1.9 million in the Southwest, 1.7 million in the Midwest, 864,000 in the Northwest, and 855,000 in the Northeast. Florida was the top ranked state with 900,000 mobile homes, followed by Texas with 722,000, North Carolina with 633,000, and California with 596,187. Most states have passed laws regulating the construction and safety of mobile homes to allay consumer concerns about their durability during storms.

At an average cost of \$43,000 per unit, manufactured housing was the fastest growing sector of the housing industry. It accounted for more than 25 percent of all new single-family homes built in the United States. Mobile homes were alternatively marketed as cost-effective re-

tirement homes, affordable housing for working folks, and seasonal housing for others.

According to industry leader, Clayton Homes, Inc., “the mobile home sector is suffering one of its periodic busts.” In fact, since 1999 some 4,000 “retail outlets have shut their doors,” according to James Lee Clayton, which included some top competitors. Clayton Homes has enjoyed a total of 28 years with continued growth and expansion.

The industry leader in mobile home retail sales in the late 1990s was Oakwood Homes Corp., a Greensboro, North Carolina, manufacturer with \$1.14 billion in annual sales from 359 retail locations. Clayton Homes Inc., a manufacturer based in Maryville, Tennessee, ranked second with \$535 million in sales from 273 retail locations. Fleetwood Enterprises Inc., a manufacturer based in Riverside, California, ranked fourth with approximately \$250 million in annual sales from 182 retail locations. In 1999 Champion Enterprises, an Auburn, Michigan, mobile home manufacturer, acquired Care Free Homes Inc., a manufactured home retailer headquartered in Salt Lake City, Utah. The acquisition left Champion with 281 retail locations in 28 states, and sales were expected to top \$1 billion in the year 2000. Former industry leader Oakwood Homes Corp., was acquired by Clayton Homes Inc. in 2004. Oakwood Homes closed 2003 with \$398.2 million in sales. Upon the acquisition the company was renamed Reorganized Sale OKWD, Inc. Clayton Homes generated \$1.1 billion annual sales for 2003, followed by Fleetwood Enterprises Inc. with \$2.3 billion. Fleetwood is the leader of RVs, and places

second next to Clayton in manufactured homes. Champion ranks third with sales of \$1.1 billion for 2003.

SIC 5311

DEPARTMENT STORES

This category includes retail stores carrying a general line of apparel, such as suits, coats, dresses, and furnishings; home furnishings, such as furniture, floor coverings, curtains, draperies, linens, and major household appliances; and housewares, such as table and kitchen appliances, dishes, and utensils. These stores must carry men’s and women’s apparel and either major household appliances or other home furnishings.

NAICS CODE(S)

452110 (Department Stores)

These products and other merchandise are normally arranged in separate sections or departments with the accounting on a departmentalized basis. The departments and functions are integrated under a single management. The stores usually provide their own charge accounts, deliver merchandise, and maintain open stocks. These stores normally have 50 employees or more.

Establishments that sell a similar range of merchandise with less than 50 employees are classified in **SIC 5399: Miscellaneous General Merchandise Stores**. Establishments that do not carry these general lines of merchandise are classified according to their primary activity.

INDUSTRY SNAPSHOT

Part of the early allure of department stores was their atmosphere and decor, making the shopping experience a form of entertainment. At one time, these stores were the fashion monitors of the day and led the way with new trends in retailing. They were the first to provide consumer credit and to create mass-produced clothing, and they became the home for national fashion designers. They also were influential in the development of many American holiday traditions still celebrated today.

By the early 2000s, department stores had lost their cutting-edge appeal to specialty shops and brand-specific stores that could move in and out of fashion trends quicker and more efficiently than departments stores. Department stores were also steadily losing customers to big discounters, especially Wal-Mart and Target. Wal-Mart has the ability to “out-discount” all other retailers, and Target effectively combined chic fashions with discount prices by striking deals with several designers. By the twenty-first century, department stores’ market share was steadily eroding, and management teams were scrambling to reinvent their stores to attract and retain new customers.

Approximately 10,400 department stores existed throughout the United States in 2001. Most operations began as a single store located within a downtown district. When customers moved to the suburbs, so did the department stores; soon branch outlets appeared throughout the country. Ownership of most department stores reverted to publicly held conglomerates. Many of these companies also owned or held interest in discount retailers or general merchandisers.

The top department stores ranked by 2002 sales and number of employees are: Sears Roebuck & Co., with sales of \$41.4 billion and 289,000 employees; J.C. Penney Corp., with sales of \$32.3 billion and 228,000 employees; Federated Department Stores Inc., with \$15.4 billion in sales and 118,800 employees; May Department Stores, with sales of \$13.5 billion and 116,000 employees; and Dillard’s Inc., with sales of \$7.9 billion and 55,208 employees.

ORGANIZATION AND STRUCTURE

Department stores, along with other retailers, were quick to embrace advanced computer technology. The ability to centralize operations, have a complete and up-to-date status of inventory, and get an exact reading of items purchased are but a few pieces of information that can be generated by computerized point-of-sale systems. Retailers were also able to reduce paperwork and lead time in updating stock.

The usage of computer technology has moved from a luxury to a necessity in order for any retailer to survive in

the competitive market characterizing the early 2000s. Included in this technology is Internet retailing. In *Chain Store Age*, Stephen Finn, an Ernst & Young partner, commented that: “For sure, the Internet is changing how retailers will distribute their goods and services and interact with customers.” The department store sector of the retail industry is taking this issue seriously, with Internet sales projected to increase to more than \$40 billion by 2002. For example, Federated Department Stores put its plan in motion to buy Fingerhut Companies Inc., a catalog retailer, in spring of 1999 in a multi-billion dollar deal. The purchase was expected to ease Federated into a multi-distribution platform on which it could handle Internet sales, warehousing, and shipping.

Retail establishments primarily selling merchandise for personal or household consumption played a major role in the U.S. economy by providing nearly 20 percent of all jobs in the private sector in 1998. Department stores had always held a leadership position among “traditional” retailers. However with discount mass merchandisers chipping away at market share, department stores have seen increasing competition. The very definition of department stores changed within the industry as well, as many stores eliminated some individual departments. This new definition covered the traditional department stores, but also included the “multi-department soft goods stores with a fashion orientation, full-markup policy, and operating in stores large enough to be a shopping center anchor,” Penny Gill stated in *Stores*. Such stores included Lord & Taylor, Neiman-Marcus, and Saks Fifth Avenue.

Changes in how merchants sold products and in how consumers shopped led to the creation of this new division of retailers—discount mass merchandisers. This category included superstores and price clubs, which both cut into the market share of traditional retailers. Also known as off-price retailers, these stores featured a specialized merchandise line at discount prices. Superstores were large retail establishments offering discount prices on a limited product line with extensive complementary merchandise. Examples of superstores included Toys ‘R’ Us and Wal-Mart. Price clubs were a new type of superstore with more retail floor space and a more extensive line of merchandise at more sharply discounted prices.

BACKGROUND AND DEVELOPMENT

The department store became one of the most durable creations of modern American life. Created in the heart of emerging business districts, department stores gradually became part of the landscape. The first department stores opened as early as 1846 in New York City. Although they primarily catered to the city’s elite, early merchants also wanted to make themselves accessible to women of all classes. So instead of keeping goods behind

the counter, they openly displayed merchandise on the floor to encourage browsing.

Stores with elaborate decor and fancy window displays created a new variety of entertainment for the masses. Even if people could not afford to buy the merchandise, they still came to the department store to peer in the windows to see what they might attain someday. The traditional department stores sold “soft goods,” such as apparel and linens, as well as “hard goods,” including furniture, appliances, and housewares. The now defunct “notions aisle”—the place for buttonhooks, thread, sewing needles, linens, laces, and silks—was the original foundation of the department store. Notions first were sold by peddlers, who traveled by foot through the rural South and Midwest. Eventually, these peddlers obtained a horse and buggy and then graduated to a small storefront, the prototype department store.

Another innovation that emerged in the late nineteenth century was the budget floor. Filene’s obtained legendary status with its Automatic Bargain Basement—selling cashmeres salvaged from a fire at Neiman-Marcus and Schiaparelli and Chanel gowns evacuated from Paris showrooms at the start of World War II. Credit began in 1911, when Sears Roebuck offered payment plans to farmers for large mail-order purchases. By the 1920s, “layaway” installment plans were common. The introduction of department store charge plates encouraged customer loyalty since that was the only form of consumer credit available at the time.

From the earliest days, merchants catered to women. By 1915, nearly 90 percent of all department store customers were female. Women also began to take the place of men on the selling floor, offering fashion advice and fittings.

Department stores were considered a fantasyland for toy vendors and children alike. Stores became famous for elaborate Christmas decor. No one knows exactly when Santa Claus began to show up on the scene, but in 1939, Montgomery Ward’s started to give away a book featuring a character first called Rollo, then Reginald, and finally Rudolph, a reindeer with a red nose. Gene Autry recorded Rudolph’s signature song in 1949, and the famous reindeer became a Christmas icon.

Department store managers also influenced other major American holidays. In the past, Thanksgiving was held on the last Thursday in November. In 1939, the holiday fell on the 30th, leaving only 24 days for Christmas shopping. Ohio merchant Fred Lazarus Jr. led a campaign to move the holiday to the fourth Thursday in November. President Franklin D. Roosevelt complied, and Thanksgiving remained on that date ever since.

After World War II, department stores began expansion into the suburbs, following the flight of their customers. By the 1950s, most department stores turned to upscale clients and merchandise, doing away with the low-end, bargain basement sales. This decision opened the way for discount operations like Kmart to enter the market. Customer loyalty quickly dissipated as the arrival of bank credit cards in the 1960s allowed consumers to shop on credit virtually anywhere. In due time, the costs of suburban expansion plus the lack of experience or interest on the part of third- or fourth-generation family members drove many department store owners to sell their operations.

By the 1980s, many department stores were in fairly poor shape. Although consumer spending was up, the stores found fierce competition from discounters, specialty stores with numerous outlets, and mail order houses, which sent out 14 billion pieces of mail annually. In an attempt to lure back customers, department stores engaged in competitive price-cutting. The result was a frenzied period of leveraged buyouts (LBOs), mergers, and acquisitions. Of the eight companies that composed the Standard and Poor’s index at the beginning of 1986, four were acquired or taken private, while a fifth company undertook major restructuring.

One negative fact hanging over the industry—as well as the rest of the \$3.2 trillion retail market—was that for the last 25 years, the amount of retail space per person in the United States increased by 450 percent. “It generally is agreed that the country is already over-stored, so successful operators are the ones taking market share from others. The battle for market share continues to be fought largely on the pricing front,” William G. Barr reported in *Value Line Investment Survey*.

By the mid-1990s, department stores changed the product mix somewhat. “White goods”—appliances such as stoves and refrigerators—were less emphasized to make room for more apparel items. Sears adopted the slogan, “Come see the softer side of Sears,” emphasizing that power tools and lawn equipment were not the only items you would see in the store. J.C. Penney upgraded store merchandising, also emphasizing more apparel.

However, the departure of the shop-weary consumer continued to hurt department stores’ sales. In sharp contrast to the retail heyday of the 1980s, consumers in the 1990s became thriftier. Feeling financially strained, people tried to maintain their lifestyles on a smaller budget. Since consumer confidence remained relatively low, many retailers kept markups just high enough to maintain market share. As general economic conditions improved in 1996, confidence and consumer spending increased.

Changes in demographics in the early 1990s also posed challenges to department store retailers. The rate of household formations slowed dramatically in the early 1990s, and in the next two decades the percentage of young adults was projected to decline. The fastest-growing segment of the population, people between the ages of 45 and 54 years, was marked to grow 46 percent between 1990 and 2000. In other words, the baby boomers, who “shopped till they dropped” during the 1980s, would reach middle age by the year 2000. This age shift was forecast to have far reaching ramifications for the marketing and merchandising direction of department stores. In addition, the 65 and older segment of the American population continued to grow quickly. This group tended to spend more on health care and leisure activities and less on goods like apparel.

To top it off, research indicated that consumers no longer considered shopping “fun.” According to the *Lieber/Yankelovitch Monitor*, the number of consumers who described shopping for clothes as fun dropped 4 percent from 1991 to 1992. Shopping was regarded as time consuming and frustrating. However, as economic conditions improved, interest rates trended downward, and personal income slowly rose, more shoppers extended themselves on credit, bucking the earlier trend of frugal shopping. The key for retailers during the 1990s was their ability to attract new customers, regain old customers, and make existing operations more productive. Creative merchandising and keeping up with the fashion trends of the day was a crucial component to gaining sales.

There was finally a break in 1996, when department stores saw the business environment improve from the previous two years. The department stores placed more emphasis on sales of women’s clothing, which was always an important item to increase store sales. The combination of better quality, higher fashion women’s wear, and increased demand due to improved economic conditions in 1996 helped spur sales for department stores. Regionally, the increased economic activity in California and the Pacific Northwest also aided sales. Most large department stores also placed more emphasis on meeting the new purchasing trends—namely, that apparel, jewelry, and quality home furnishings play more of an important share of department store sales than the home improvement hard goods and home electronic products did in the past. Many department store retailers were also emphasizing their own private label brands, which had significantly improved in quality and marketing. On the operations side, these companies generally had also taken advantage of improvements in retail automation that made merchandising, accounting, inventory, and logistics functions more efficient and accurate.

The correct combination of service, customer responsiveness, and merchandise presentation was critical to the future growth of department stores. The stores

would have to recreate the original pleasant, almost entertaining experience for shoppers if they were to find their space among the crowd of discount mass merchandisers.

Many retailers in 1998 had a favorable year with sales in U.S. retail operations up 5.1 percent, and as they entered 1999 the retail outlook was expected to remain stable. The economic conditions in 1994 and 1995 that left concerned retailers and resulted in price cutting, higher interest rates, and a general economic slowdown, were worries of the past. As the retail industry rebounded, consumer spending and confidence rose. As 1997 began, overcapacity of retail space in comparison to the general U.S. population was not estimated to grow as fast as it did in the early 1990s. By 1999, there were 20 square feet of retail space for each person in the U.S, a decrease from past figures. This industry should see positive increases in sales growth into the early 2000s, especially with the increasing popularity of online retailing. However, consumer spending is expected to slow eventually and the Asian economic crisis will also play a factor in international retail sales.

The department store division of the retail industry was hit particularly hard in the early 1990s by discount retailers siphoning market share away and by a drop in consumer spending. It rebounded, however, in the late 1990s with sales growth of just over 6 percent since 1988, and department stores slowly benefited from the rise in consumer spending. However, this division faces many barriers including the rising popularity of discount mass retailers. For example, Sears—one of the oldest and best-known department stores—was ousted from its number one position in sales by Wal-Mart, which had over three times more revenue in 1998. In an attempt to regain their leadership position, many department stores tried to create a new identity that would attract new customers, as well as keep existing customers happy.

The entire retail industry realized gains in 1997, 1998, and into 1999. Department stores continued to see increases in sales and profits, although many factors deterred from those increases being even larger. The Internet, mass discount retailers, specialty retailers, and catalog shopping were competing with the traditional department store for consumer loyalty. *Chain Store Age* reported that in October 1999, “The department store sector continues to be hot for some chains and cold for others.” Federated Department Stores, Dillard’s, and May saw increases in same-store sales, while J.C. Penney saw a slight decrease in sales and Sears remained stagnant.

In order to keep existing market share and boost sales, many department stores have adopted new ad campaigns, revamped stores, focused on high margin profit mixes, and began online retailing. Montgomery Wards, for example, updated the floor plans of its existing stores

and focused on higher end merchandise. Sears, with its “softer side” campaign, targeted a younger, trendier crowd with its apparel line. Although this line had a negative effect on profits from 1996 to 1998, sales in 1999 began to show signs of life. Sears also jumped aboard the Internet wave and began to sell appliances online. By the 1999 holiday season, it also planned to sell tools. Eventually, Sears.com will offer home furnishings, lawn and garden products, and consumers will be able to request repair service online. An October 1999 *Chain Store Age* article stated that by the year 2010, at least 15 percent of all retail sales would stem from online purchasing. This apparent fact has department stores scrambling to provide the type of products that Internet savvy consumers want both online and in the stores.

Consolidation has also been a trend in the department store sector. Proffitt’s, a Birmingham, Alabama-based company, purchased Parisian in 1996, and had a bid on the table for Saks Fifth Avenue in August 1998. Dillard’s also bid for Mercantile Stores, an Ohio based department store chain, in 1998. Elder-Beerman took over Stone & Thomas as well. This trend has left the department store industry with a handful of larger, powerful competitors whose focus in the late 1990s was growth through acquisition.

The long-term forecast for department stores showed continued slow growth into 2000. This projection was based largely on the simple fact consumer spending would eventually slow or decline. According to a U.S. Department of Labor projection, retail sales adjusted for inflation should show an average annual growth rate of 2.5 percent from 1990 to 2005, compared with a 3.5 percent annual rate posted during the preceding 15 years. The key for retailers entering the next millennium would be the ability to attract new customers, regain old customers, and make existing operations more productive. Creative merchandising and keeping up with the fashion trends of the day would be a crucial component to gaining sales.

Whatever approach department stores decided to take with regard to merchandise mix, industry executives agreed that department stores also needed to differentiate themselves from each other.

CURRENT CONDITIONS

National department store chains (without considering discount chains) had total revenues of \$92.3 billion in 2001, down from \$97.3 billion and \$97.4 billion in 1999 and 2000, respectively. Department stores were already struggling with an economy that was moving toward recession when the terrorist attacks of September 11, 2001 occurred. Following the attacks, the U.S. economy stagnated and, after several unfulfilled attempts at recovery during 2002, remained slow into 2003. The forecast

for a reinvigorated retail market was cautious at best for the remainder of 2003. Retail sales rose 4.6 percent overall in 2002 and were expected to rise just 3 percent in 2003.

The economic outlook does not present an optimistic picture for department stores. According to Jim Ostroff of *Kiplinger Business Forecasts*, some department stores will suffer: “Several department store chains are going to hit hard times in 2003. Sears, Federated Department Stores, May Department Stores Co., Dillard’s and Marshall Field’s will suffer sales declines of as much as 5 percent as they vainly attempt to beat mass marketers such as Wal-Mart and Target at the discounting game.” Ostroff sees better days for chains, such as Nordstroms, that focus on higher quality merchandise and better customer service.

Department store chains have bigger problems than a gloomy economic forecast. Once the premiere centerpiece of the American shopping experience, mall-based department stores have become antiquated, offering too much sameness in products. They have also grown a sizable reputation for poor customer service. The modern attitude toward department stores was expressed by Barbara Ashley of Retail Ventures, who told *Real Estate Finance and Investment*, “Department stores are overpriced, the merchandise assortment is redundant and prices change frequently. Shopping is abysmal with untrained sales assistants.”

With large discounters beating them on price and trendy specialty shops beating them on up-to-date fashions, department stores are trying to remake their image and revamp their offerings. To start, department stores are focusing less on “departments” and much more on brands. Sears jump-started its apparel division in 2000 with the purchase of catalog specialist L.L. Bean for \$1.9 billion. At the end of 2002 J.C. Penney inked an exclusive deal to offer Bisou Bisou apparel, a line of contemporary sportswear previously available at upper-end retail outlets. J.C. Penney has also benefited from contracting with brands Mudd and I.e.i., both of which specialize in the trendy fashions of the teenage crowd. As profit margins continue to narrow, the industry is expected to see increased merger and acquisition activities through the 2000s as the industry plays out the adage “bigger is better.”

INDUSTRY LEADERS

Sears, Roebuck & Co. Headquartered in a Chicago suburb, Sears, Roebuck & Company was the second largest retailer in the world in the late-1990s—based on its sales of merchandise and service—behind Wal-Mart. In 2002, Sears operated more than 870 department stores and 1,750 off-mall format and specialty stores across the nation, and employed approximately 289,000 people.

Sears' revenues totaled \$41.4 billion, with net income of \$1.4 billion.

Richard Sears opened R.W. Sears Watch Company in 1886 in Minneapolis. The following year, Sears moved his business to Chicago and joined in a partnership with Alvah Roebuck, another watchmaker. In 1893 they created the corporate name Sears, Roebuck and Co. Sears began as a mail-order company, primarily providing farmers with low-cost goods delivered via the railroads and postal service. In 1895, Chicago clothing manufacturer Julius Rosenwald bought the company, and in 1906 Sears went public.

Sears' customers soon began to move from the farm into the city, so in 1925 the company decided to open a retail store. Robert E. Wood, then a vice president of Sears and later president and chairman of the board, became known as the father of Sears' retail expansion. He started with one store located in a Chicago mail-order plant, and by 1927 had 27 stores in operation. Company records indicated that during one 12-month period in the late 1920s, Sears stores opened at an average rate of one every other business day. Soon Sears began selling merchandise under its own brand names, creating the still popular brands of Craftsman, Kenmore, and DieHard.

In 1931, the retail side accounted for 53.4 percent of Sears' total sales, topping mail order for the first time. Sears continued to open stores during the 1930s despite the Depression. By the start of World War II, more than 600 stores were in operation. During the 1940s and 1950s, Sears expanded internationally with stores in Cuba, Mexico, and Canada.

In 1931, Wood also launched Allstate Insurance Company as a wholly owned subsidiary of Sears. At first, Allstate operated only by mail, but by 1933 Allstate sales booths were installed within Sears stores. In 1973, Sears completed its new headquarters in Chicago—the world's tallest building at 110 stories and 1,454 feet tall.

To combat declining market share in the 1980s, Sears initiated a restructuring of its retail division. The company acquired the 405-store Western Auto chain in 1988, introduced a new pricing policy, and added non-Sears brands in 1989. Sears also announced it was relocating from the Sears Tower to a northwestern Chicago suburb in 1992. In January 1993, Sears announced another major restructuring program to streamline its Merchandise Group. The company discontinued its U.S. catalog operations, closed unprofitable retail and specialty stores, and offered early retirement to employees. Completed in early 1994, the restructuring improved the company's net income by \$300 million annually, increased cash flow, eliminated roughly 16,000 full-time and 34,000 part-time positions, and positioned Sears to compete with its discount rivals.

The company displayed a strong year in 1996—same-store sales increased 5.4 percent. Apparel, softlines, hardware, computers, and electronic product lines all recorded double digit increases. The firm achieved these increased sales while maintaining stable selling and administrative expenses. The company has successfully updated the look of the firm and its product lines. The home service businesses—along with the cosmetics, jewelry, and footwear areas—were expected to receive more attention in 1997, as well as the credit levels of Sears' 27 million cardholders. Delinquencies of cardholders rose substantially in 1996, and increases in interest rates placed demands on cardholders to watch their debt levels. Successes by Sears in "off-mall" areas such as Sears Hardware, Western Auto, Sears Tire, and HomeLife Furniture were also evident in 1996.

In 1997, Sears opened 275 National Tire and Battery stores across the nation. Credit operations continued to deteriorate, although fourth-quarter revenue increased 9.2 percent in comparison to 1996 figures. In 1998, the company's profits fell 12 percent from 1997. In 1999, Sears' appliance and electronic sales were strong, as well as home fashions and apparel. In October of that year, total revenues were down 2.7 percent from 1998. Sears was also named one of the "Retailers of the Century" by Lebhar-Friedman Publications.

J.C. Penney Company. In 2002, J.C. Penney operated 1,050 department stores in all 50 states and Puerto Rico. J.C. Penney also owns Eckerd Drugstores. The company started off the twenty-first century by cutting costs, including more than 100 underperforming stores. Annual sales for the company reached approximately \$32.3 billion, with net income of \$405 million in 2002.

In 1902, after working for many years as a sales clerk for the Golden Rule Mercantile Company, James Cash Penney opened his first store as part owner and store manager in Wyoming. Buying out his two partners in 1907, Penney launched his own Golden Rule stores. To consolidate operations, Penney established headquarters in Salt Lake City in 1909. Although Penney moved his headquarters to New York the following year, the company's growth continued in the western portion of the United States.

J.C. Penney exploded into a nationwide organization from 1917 to 1929—growing from 174 stores to 1,395—while sales skyrocketed from \$14.9 million to \$209.7 million. By the 1930s, a J.C. Penney store could be found in nearly every town with more than 5,000 people, and the company continued to expand from the west to the east coast. By 1951, a J.C. Penney store existed in every state, and sales passed \$1 billion for the first time.

The company entered the catalog business in 1962 and built its volume primarily through catalog sales cen-

ters located in stores. J.C. Penney Financial Services was created in 1967, including an acquisition known today as the J.C. Penney Life Insurance Company. The J.C. Penney National Bank was created in 1983 with the acquisition of the First National Bank of Harrington in Delaware.

During the 1980s, J.C. Penney closed many downtown locations or moved them to suburban malls. Stores were classified as metropolitan or geographic for those located outside metro areas. The company's real estate strategy produced hundreds of well-located stores in regional shopping centers throughout the United States.

In 1983, the company announced plans to spend more than \$1 billion to modernize stores. To accommodate these changes, J.C. Penney eliminated auto service, major appliances, paint and hardware, lawn and garden merchandise, and fabrics from its stores. Upon completion, J.C. Penney began to focus on better serving the fashion needs of its customers—especially women, who accounted for more than 70 percent of apparel purchases in its stores. The composition of 1992 sales for the department store was 42 percent in women's, 29 percent in men's, 15 percent in the home division, and 14 percent in children's. The department store group accounted for nearly 75 percent of sales.

The J.C. Penney Company moved its headquarters to Dallas in 1988. J.C. Penney Telemarketing also was created that year to take catalog phone orders and provide telemarketing services for other companies. This network became the largest privately owned telemarketing system in the United States. At the start of the 1990s, J.C. Penney continued to expand stores and catalog services and also ventured into international markets such as China.

Seventy-three percent of 1995 sales was generated from department stores and 18 percent came from catalog sales. The company acquired Kerr Drug Stores and Eckerd in 1996, which placed the total number of drug stores at 2,600—accounting for approximately one-third of total company sales. About 12 percent of pre-tax income comes from insurance and banking subsidiaries. It is estimated that women comprise 80 percent of the firm's customer base. Sears, Wal-Mart, and Kmart have tried to attack this base by enhancing their own private label apparel brands. With the increased use of online retailing by people using the Internet to go shopping, the catalog business was made available online for Internet shoppers.

In 1999, J.C. Penney sold its credit business to GE Capital in an effort to reduce debt. Sales grew by 3.6 percent over 1998 and net income increased by 4.9 percent as well.

May Department Stores. The May Department Stores Company owned regional department store companies that

operated more than 445 stores in 2002. These included Lord & Taylor headquartered in New York; Filene's in Boston; Hecht's in Washington, D.C.; Kaufmann's in Pittsburgh; Foley's in Houston; Famous-Barr in St. Louis; Robinsons-May in Los Angeles; The Jones Store; and Meier and Frank in Portland, Oregon. The May Company sold Payless ShoeSource Stores, accounting for 15 percent of sales and 16 percent of operating earnings, in May 1996; sold Caldor's in November 1989; and sold Venture in November 1990. May Department Stores' sales totaled \$13.5 billion in 2002, with net income of \$542 million, an increase of 4.8 percent over 2001.

Built on a series of acquisitions, May Department Stores Company became a leading U.S. department store operator, maintaining its independence and financial strength. German immigrant David May started with his first store in Leadville, Colorado, in 1877 and expanded into Denver in 1888. In 1892, he and the Schoenberg brothers bought The Famous in St. Louis, and in 1898 they purchased a store in Cleveland. David May moved the company headquarters to St. Louis in 1905, and in 1911 bought Barr's, creating the flagship store Famous-Barr.

While the May Company purchased other stores from 1912 to 1966, two other companies reorganized in 1916 to form Associated Dry Goods, whose principal businesses were Lord & Taylor in New York, Hahne's in Newark, and Hengerer's in Buffalo. From the 1950s to the 1970s, Associated Dry Goods also acquired various other family-owned stores. In 1986, the May Company bought Associated Dry Goods for 70 million shares of stock. Foley's and Filene's were added in 1988, purchased from Federated Department Stores for \$1.5 billion. Since then, May Department Stores Company consolidated some operations and closed or sold off others. Despite the 1991 recession, the company boasted its twenty-second consecutive year of record sales and earnings per share in 1996.

The May Company has a very strong track record of earnings and dividend increases, and its return on capital is above its industry competitors. However, Federated Department Stores and Target have recently moved into many of the Northeastern markets where May Company has been strong, and they present challenges to the firm. However, 1997 was still another strong year for the company and in 1998, the company achieved its twenty-fourth year of record profits and sales.

WORKFORCE

Approximately 10,400 department stores operated throughout the United States and employed more than 2.5 million people in the early 2000s. Many of the industry's employees were under the age of 25 and worked part-time, evenings, and weekends. More than 47 percent of

the people employed by department stores were cashiers and retail sales associates—the people who “worked the floor” selling merchandise. Administrative support personnel were the next largest group with 23 percent of total employment. These employees provided general office skills and bookkeeping tasks, in addition to working as customer service representatives. No formal training was required for most sales and administrative support positions, although a high school education was preferred.

Management positions in department stores made up just over 2 percent of total employment. These positions included department managers, buyers, merchandise managers, store managers, and retail chain store area managers. A college degree became increasingly important for management positions, especially with large department stores. Companies preferred to hire people who earned a bachelor's degree in marketing or business to join management training programs.

Hourly workers in department stores earned two-thirds the average pay of all workers in private industry. This lower wage might be due to the high proportion of part-time and less-experienced workers. Few employees belonged to a union, and those who did generally received the same pay as nonunion workers. Department store jobs were projected to increase nearly 23 percent over 1990 through 2005, nearly as fast as the average for all industries. Large numbers of job openings should result from the high turnover rate generally found in this industry. The mean annual salary of a retail sales associate in 2001 was \$17,700.

Advancement in computer technology should not greatly affect employment figures. However, due to computerized operations, worker productivity in the retail industry should double from 1990 to 2005, according to the U.S. Department of Labor. Although some bookkeeping and inventory control positions might be eliminated, retail sales should continue to rely upon personal interaction, even as e-commerce trends continue.

AMERICA AND THE WORLD

Most department stores had plans for some sort of international expansion by 2005. With the completion of the North American Free Trade Agreement (NAFTA) in September 1992, many stores sought opportunities in both Canada and Mexico. According to a Coopers and Lybrand survey, retailers had plans to open stores in Canada. However, those who wanted to expand in Mexico were more inclined to work through joint ventures or partnerships.

Canada has become an increasingly attractive market. The T. Eaton Co. of Toronto collapsed in the fall of 1999, leaving only Sears Canada and the Hudson Bay Co. in that market. With 64 outlets available on the auction

block, players such as Federated Department Stores, J.C. Penney, Wal-Mart, and Target are expected to enter into the Canadian playing field.

Some stores have entered Mexico, and both J.C. Penney and Dillard Department Stores have anchor malls in Mexico City, Monterrey, and Guadalajara, Mexico. The Mexican malls were designed in a similar style to American malls, and Mexican retailers would occupy nearly half of the rental space. Sears also entered the Mexican market with its Homelife furniture stores.

Another possible entry into the international arena might come through catalog sales and telemarketing. In this scenario, merchandise would be sold through a partnership with a third-party national. A special catalog would be created targeting international markets, and operations would be set up similar to catalog service companies in the United States. A licensed catalog sales program would place U.S. goods in foreign markets through a licensee with little risk to the American company. All sales would be concluded domestically, with the licensee responsible for transporting goods across borders. J.C. Penney began such a program in Bermuda and Aruba, and negotiations were ongoing in Russia, Iceland, Brazil, Panama, and Argentina for additional licensed catalog sales.

“Going global”, as retailers call it, is an important issue in international commerce, especially as technology increases and trade barriers are broken. However, the Asian economic crisis is making several retailers think twice. *Stores* magazine reported in its February 1999 issue that, “The economic turmoil in Asia left most of that region in recession, and, as a result, consumer spending contracted sharply. In rapid succession, worrisome news from Russia and several South American countries gave rise to talks of global economic meltdown.” However, European spending was steady due a strong economy, and with the Euro expected to become the Continental currency in 2002, entering that market will appear more attractive to stores.

RESEARCH AND TECHNOLOGY

Despite the sluggish retail forecast in the mid 1990s, department store companies continued to invest in technology. Using computer technology, such as inventory management systems and point-of-sale bar code scanning, provided a tremendous advantage for stores trying to regain their competitive edge. Many stores gathered data from scanners at the point-of-sale (POS), which identified for managers peak selling periods and allowed them to better shape work schedules. This data also showed managers exactly what products were selling, which helped in keeping the stores fully stocked and in forecasting upcoming selling trends.

For example, J.C. Penney implemented a state-of-the-art, automated, merchandise replenishment system. This computerized program triggered orders based on projected sales demand so that stores were constantly stocked with basic merchandise items. Orders were processed every week instead of every two to four weeks. J.C. Penney also operated an information network based on seven large mainframe computers and 120,000 terminals, which processed about 700 million retail transactions annually.

With that technology in place, most industries, including the retail industry, came face to face with the pressures of the Internet. With the advent of online retailing—e-tailing—Internet sales are predicted to reach astounding numbers in just five years, and many department stores have begun to implement some form of online purchasing. J.C. Penney now has its catalog available for online shopping, Sears offers many products available on its site, and the May Company offers gift card purchase on its division's Web sites. Tom Reynolds, an Ernst & Young director, stated in a *Chain Store Age* article that, "There will always be a need for brick-and-mortar retailers with improved buying experiences. But to succeed into the next century, they'll have to respond to what's emerging on the Internet, and even consider it as a primary way of doing business."

Retail information technology professionals are becoming more in demand as well. As international expansion is forecast, these professionals will be called upon for technology guidance and telecommunications expertise. POS systems, among other computer systems, will have to be updated to handle foreign currency and tax issues. Their knowledge will also be required for Internet business. As technology changes quickly, stores will be faced with challenges to keep up pace with other retailers and increased competition.

In a news release from PR Newswire, J. Roger Friedman, CEO of Lebharr-Friedman, commented: "We began the 20th Century with quaint downtown shops and we finish it with huge shopping malls, e-tailing and international chains featuring uniform quality standards and high customer service."

SIC 5331**VARIETY STORES**

This category includes establishments primarily engaged in the retail sale of a variety of merchandise in the low and popular price ranges. Sales usually are made on a cash-and-carry basis, with the open-selling method of display and customer selection of merchandise. These stores generally do not carry a complete line of merchandise, do not carry their own charge service, and do not deliver merchandise.

NAICS CODE(S)

452990 (All Other General Merchandise Stores)

INDUSTRY SNAPSHOT

Discount department stores generated \$134.4 billion in sales in 2001, up 2.64 percent from the previous year. They are also known as discount variety stores, general merchandise discount stores, mass merchandisers, full-line discounters, or discount houses. Discount stores numbered 9,120 in 2001, up 10.5 percent for the decade. This industry is dominated by the Wal-Mart, Kmart, and Target chains. Combined 2001 sales for these "Big Three" discount retailers was more than \$123 billion, with Wal-Mart adding an impressive \$63 billion to the total.

The Big Three discount retailers began operations as individual variety stores, and by the late-1990s had evolved into chains averaging 80,000 square feet of discount-selling space per store, providing: clothing; hardware, housewares, auto supplies, and small appliances; stationery and candy; sporting goods and toys; health and beauty aids; pharmaceuticals; gifts and electronics; and shoes and jewelry. Although overshadowed by the Big Three, groups of regional stores, such as Ames Department Stores, McCrory, Family Dollar Stores, and the Dollar Tree Stores, are also listed under the variety stores category. The common element among all stores in the industry is the focus on low prices.

The emergence of discounters, which relied heavily on technological advances to improve productivity and cut costs, had a tremendous impact on the financial well-being of full-price retailers. This trend was expected to continue in the new millennium, as consumers are increasingly concerned with value shopping and saving money. Other factors affecting the future of discount retailing include a consumer base of greater ethnic diversity, a heightened concern for the environment, interactive technology, and international retailing.

ORGANIZATION AND STRUCTURE

Variety stores can be categorized by price and level of service, and generally fall into one of the following

categories: discount department stores, wholesale clubs, supercenters, hypermarts, and so-called category killers.

Wholesale clubs are no-frills stores that sell in bulk to people who pay dues to maintain membership. Originally targeted toward small businesses, which appreciated the opportunity to purchase supplies in large quantities, membership requirements have been made broader to include many segments of the general populace. Supercenters, or superstores, are large retail outlets offering general merchandise in addition to a complete grocery area. The supercenter concept evolved from the hypermart, which offers discounted merchandise and groceries, as well as ancillary businesses, such as branch banking and photo processing. Finally, category killers are specialty chain stores offering a single line of merchandise, such as T. J. Maxx, Dress Barn, and Burlington Coat Factory. Although industry information related to discount retailers often includes statistics on category killers, many of these stores are formally listed under the SIC related to the merchandise in which they specialize.

BACKGROUND AND DEVELOPMENT

Although discounted sales have existed since the early 1900s, the discount variety store industry picked up shortly after World War II. During this time, according to *Discount Store News*, entrepreneurs were prompted to open large variety stores due to the increasing demand for consumer goods, including such new products as record players and television sets. In the northeastern part of the country, in particular, large facilities became available to potential variety store owners when manufacturers moving operations to the South vacated several mills. Taking over such facilities for retail operations, variety store owners found that their proximity to those mills that had remained in operation facilitated the timely restocking of stores with apparel and domestic items.

By 1962, industry leaders and a standard store format were well established. Discount department stores were formed by the Dayton Company, which pioneered the Target chain, as well as Kmart stores, an offshoot of S. S. Kresge, the F. W. Woolworth Company's Woolco stores, and Sam Walton's Wal-Mart. These new stores transformed the variety store business into large, low-price, self-service stores, featuring both hard goods and apparel.

Several mergers occurred in the late 1960s and early 1970s, as chains sought to expand quickly through acquisitions. During this time, Kmart became the decided leader with more than 300 stores, which was more than double the number of the next largest chain. Although over a dozen discount stores filed for Chapter 11, attributable to economic recession, Kmart and Woolco grew into national companies, whereas Wal-Mart expanded in the Southeast and Target in the Midwest.

During the 1970s, discount stores began exploring advances in technology, using computers, electronic registers, UPC bar coding systems, point-of-sale (POS) scanning, and satellite communication systems. Wal-Mart's explosive growth, in particular, was attributed to its successful implementation of computer technology. The company established highly automated distribution centers, which cut shipping costs and delivery time, and installed an advanced computer system to track inventory and speed up checkout and reordering. As a result, Wal-Mart increased the number of its retail establishments from 18 in 1970 to 270 in 1980.

By the end of the 1980s, Kmart, Target, and Wal-Mart dominated the industry. At the same time, other chains had filed Chapter 11, including Woolco, FedMart, Memco, Twin Fair, Zayre, Zody's, Kings, Ames, and Hills. Regional operators experiencing moderate success included Jamesway, Caldor, and Bradlees in the East; Rose's in the South; Clover in Philadelphia; Fred Meyer in the Pacific Northwest; Fedco in southern California; and Venture, Meijer, and Value City in the Midwest.

The introduction of a full line of grocery items to the discount store format represented an important aspect of the successful supercenter in the early 1990s. Although the majority of store profits were attributable to merchandise sales, food divisions began to draw customers into the store and accounted for 40 percent of a supercenter's sales in the early 1990s. This trend was expected to have a negative impact on the traditional supermarket owner. Nevertheless, some analysts have viewed the discounters' venture into the food business with skepticism. Critics noted that since grocers earned an average of less than one penny per dollar of sales in the early 1990s, superstores faced the challenge of imposing even stricter cost controls to compete.

In their ongoing battle for market share, discounters also began focus on appealing to specific ethnic groups, striving to become familiar with the needs of the diversifying market in the 1990s. For example, some stores employed bilingual clerks, particularly in Hispanic communities, and featured signs and advertisements in languages other than English. Moreover, an awareness of traditions and holidays specific to certain ethnic groups helped store managers to stock seasonal merchandise.

In another effort to draw and retain loyal customers involved the promotion of environmental awareness. In addition to touting recyclable and environmentally friendly products, many discount stores attempted to cut back on lighting, heating, cooling, and other energy-draining expenses. They also began using recycled paper for printed advertisements and sign boards.

In June 1993, Wal-Mart opened an "environmental demonstration store" in Lawrence, Kansas. The store

featured a community recycling center as well as an environmental education center. During this time, Kmart introduced programs to recycle cassette tapes, auto and truck tires, and auto and marine batteries. Target sponsored Kids for Saving the Earth, a grass roots environmental organization.

Some consolidation in the industry, particularly affecting the warehouse clubs, occurred in 1993 due to increased competition, market saturation, and a slow economy. In November 1993, Wal-Mart agreed to acquire 91 of Kmart's 113 Pace Membership Warehouse clubs for \$300 million. The sale gave Wal-Mart access to five additional states and expanded its presence in California. Some of the Pace Warehouses would operate as Sam's Clubs, and others were designated for remodeling as supercenters.

Wal-Mart's supercenter business achieved annual sales of \$5 billion by 1994, a substantial increase over the reported \$1 billion in 1992. By 1997 there were 344 Wal-Mart Supercenters in operation, mostly in Texas and Missouri, and by 1998 that number climbed to 441.

Led by the strength of such retailers as Wal-Mart, the discount industry surpassed \$200 billion in sales in the early 1990s. The Dollar General chain of discount stores was second to Wal-Mart in percentage sales growth, having found a niche market in towns considered too small to support Wal-Mart stores. Kmart maintained its position as the second largest discount chain in the nation in volume, with \$31 billion in 1996 sales; and Target neared \$18 billion in sales in 1996. Regional discount chains that achieved strong sales growth included Connecticut-based Caldor (with \$26 billion in 1996 sales) and St. Louis-based Venture Stores (with \$1.5 billion in 1996 sales). The increased popularity of discount operations also led to their inclusion as anchor stores in suburban malls, a location once considered inappropriate by developers and more up-scale merchants.

Since strong national chains originated in the 1960s, they have taken an increasing share of the market away from traditional full-price retailers, a trend that continued into the late 1990s. Discounters have seen sales rise from \$2 billion in 1960 to \$175 billion in 1998. The battle for market share is ongoing as traditional department stores try to fend off increased competition from these discount retailers. The August 1999 *Chain Store Age State of the Industry Supplement* stated, "Discount stores continue to be in the catbird seat in the retail industry. As long as they continue to provide customers with value and quality merchandise, they will be hard to beat."

In keeping with that statement, discounters maintain top position in the market in girls, boys, and men's apparel. Traditional department stores and specialty

stores still have control over the women's apparel segment, but discounters are gaining market share quickly. The stores success is attributed to meeting consumer demands, constant review of product mix, and offering higher quality, private label products. For example, Kmart began offering a "business casual" line, and Target has focused on a trendier line with its Xhilaration label. Sears, Roebuck and Company's CEO Arthur Martinez stated in *Chain Store Age*, "Target and Wal-Mart have done a better job of improving and are more credible on price than Sears and mass-market retailers."

Discount stores have also seen success by diversifying product mix. In 1998, more than 36 percent of vitamins and mineral supplements were sold at discount stores. These stores also account for the largest share of bath product sales with 36 percent. In 1998, Wal-Mart took the lead over Toys "R" Us in toy sales, and Kmart and Target also saw gains in this area.

This industry has also increased focus on brand names, proprietary brands, and partnering. Kmart teamed up with Garth Brooks in 1999 to promote his new CD online. The company has also paired with Martha Stewart to offer her line of home products, sales of which exceeded \$1 billion in 1998. Kmart's apparel lines—Jaclyn Smith and Kathy Ireland—also were successful in the 1990s, as well as its Sesame Street line. Wal-Mart has also shared success in partnering; its Kathie Lee apparel line had more than \$250 million in sales in 1998.

Along with its success, however, the industry saw bankruptcies, consolidation, and mergers in 1998 and 1999. Many regional chains suffered under the increasing competition from larger chains. Jamesway and Clover went through liquidations, Caldor and Venture no longer operate, ShopKo purchased Pamida, Ames bought Hills, and Bradlees filed Chapter 11.

Meanwhile, stronger, successful chains continued to grow. Both Target and Wal-Mart increased square footage significantly from 1998 to 1999. Wal-Mart, Dayton Hudson, and Kmart also increased expenditures in efforts to expand. At the same time, retailers invested in older store overhauls and closed stores that were not profitable.

CURRENT CONDITIONS

The early 2000s were a tough time for retail due to the events of September 11, 2001, combined with a shaky economy. The picture for discounters was mixed at best. More people went to discounters to save money but overall sales were generally flat. The big three continued their dominance in this sector in the new millennium, and small businesses within the industry were becoming scarcer. Small companies such as Ann & Hope closed completely, regional ShopKo was forced to close stores, and Ames was forced into bankruptcy.

Leader Wal-Mart not only bucked the flat sales trend but also became the largest company in the world during 2002. Not surprisingly, the company continued plans for expansion in 2003, with an estimated 45 to 50 new discount stores and 200 to 210 new supercenters, 140 of which would be expansions or relocations. Sam's Club planned 40 to 45 new stores. New retail space for the company would total 48 million square feet, up 8 percent over 2002. Wal-Mart operated 1,066 stores at the end of 2001. Supercenters, which generated the largest portion of sales, remained the company's number-one growth vehicle. Wal-Mart also added more food to its mix, unveiling the new Neighborhood Markets in the United States and in China. By 2002, the megacompany was making headway toward the goal of becoming the largest grocer in the United States. Entering a newly hot market, Wal-Mart also began offering more than 12,000 DVD titles for rent through its walmart.com Web site. Most Wal-Mart stores currently have less than 1,000 titles available to rent. Wal-Mart managed a gain of more than 5 percent in sales in 2001.

Target is also expected to grow in the future. A report from Retail Forward, a management consulting and market research firm, forecast that Target could grow to more than 1,500 stores and sell \$65 billion per year. Target was not as aggressive at converting into superstores in the early 2000s. Instead, the retailer focused on honing its merchandise assortments, including the trendier line of clothing and merchandise that has differentiated Target from its less chic competitors. Target gained more than 6 percent in sales during 2001.

Kmart had its share of problems early in the decade. After a foray into specialty retailing that cost the company sales, Kmart filed for bankruptcy in 2002. In all, some 600 stores were closed in a massive restructuring effort in 2002 and 2003 that also saw a complete turnover in its executive leadership. The company also suffered during an investigation of stock transactions by Martha Stewart. Stewart was accused of receiving insider information leading her to sell shares of ImClone. The store continued to support Stewart, whose products accounted for approximately \$1.5 billion of Kmart's \$36 billion in sales. However, Brand Keys Customer Loyalty Index noted a decline in consumer perception for both brands in different areas. Still, Kmart continued to convert its traditional stores to superstores, also adding food. The new concept of in-the-box supercenters combined the traditional discount store and grocery store into one supercenter. Kmart posted a sales loss of 2.43 percent in 2001.

Dollar stores continued their popularity and expansion. By 2002, leader Dollar General had 5,500 stores, followed by Family Dollar with 4,455 stores, and Dollar Tree at 2,060. Others in the category included Freds, headquartered in Memphis, Tennessee and 99 Cent Only

Stores, with headquarters in City of Commerce, California.

INDUSTRY LEADERS

Wal-Mart. Arkansas-based Wal-Mart has long been the world's largest retailer but in 2002 it surpassed General Motors and Exxon Mobil Corp. to become the world's largest company, as well. That year the company also made serious headway into becoming the largest grocery chain in the United States with addition of the newly conceived Neighborhood Market chain of grocery-drugstores. The company operates more than 4,700 stores, including Wal-Mart discount stores, supercenters, and Sam's Clubs. In 2003, Wal-Mart reported \$244 billion in sales and employed 1.4 million workers. Net income reached more than \$8 billion. Their sales exceeded the combined sales totals for Target, Kmart, Sears, J. C. Penney, Costco, Kohl's, BJ's, ShopKo, and Ames. Wal-Mart's founder, Sam Walton, entered the industry with a few Ben Franklin stores operating under the "Walton 5 & 10" name. When management at the Ben Franklin Company rejected the idea of opening larger discount stores, Sam Walton and his brother James "Bud" Walton opened their first Wal-Mart Discount City in Rogers, Arkansas, in 1962.

The explosive growth of the chain was facilitated by its effective use of computer technology. In the early 1990s the company invested almost \$600 million in computerization and information systems, enabling it to reduce its costs to 15 percent of its annual revenues, well below the 25-percent industry average. An innovator of the wholesale club and hypermart concepts, Wal-Mart eventually came to favor the supercenter format, and in the early 1990s many Wal-Mart stores were redesigned as supercenters. In 1998, more than 40 percent of Wal-Mart's selling space went to its supercenters. During the mid-1990s the company's return on capital declined significantly due to large-scale investments in international stores, which totaled 310, with expansions mainly in Canada and Latin America. The company benefits from large economies of scale, and in 1998 foreign sales were up 63 percent to \$12.2 billion.

Kmart. Michigan-based Kmart was the country's third-largest retailer in 2002, with about 1,500 stores after closures—down from a high of 4,792 in 1992. With sales steadily declining, the company filed for bankruptcy in 2002, emerging as a leaner operation after hundreds of store closures the following year. The company posted revenues of just over \$30 billion, a 14.9 percent loss for the year, resulting in a net loss of \$3.2 billion. Kmart employed 212,000 workers in 2003 and had stores in all 50 states.

Kmart's origins may be traced to 1897, when Sebastian S. Kresge and John McCrory opened their first five-

and-dime stores in Memphis and Detroit. They split their partnership in 1899, and Kresge remained in the retail business. Kresge incorporated his company in 1912 as the S. S. Kresge Company, the second largest dime store chain in the United States. By the 1950s, Kresge's company had grown to become one of the largest general merchandise retailer in the nation. In 1958, company management decided to enter into discount retailing, transforming three unprofitable stores into discount operations. The first Kmart discount store was opened in Garden City, Michigan, in 1962. Americans soon grew accustomed to Kmart's "blue-light" specials—spontaneous sales in various departments signaled by a flashing blue light.

Growth continued in the 1970s, and the Kresge Company changed its corporate name to Kmart in 1977. During this time, the company began a series of acquisitions that included Furr's Cafeteria and Bishops Buffets, both of which were sold in 1986. Other acquisitions included Payless Drug Stores, Waldenbooks, and Builders Square. In 1988, Kmart opened its first Pace warehouse clubs as well as its first hypermart, American Fare. By 1990, Kmart had surpassed Sears, Roebuck & Co. in retail revenue, but sales at both stores were quickly eclipsed by Wal-Mart. A major rejuvenation program, begun in the early 1990s, included the renovation or relocation of more than 2,400 Kmart stores. However, outdated inventory and old storefronts hurt sales, and the company found itself heavily discounting merchandise to retain sales. As reported in *Valueline*, "the crucial core challenge remained the same: get customers to come back more often." The typical Kmart customer came in only 15 times a year, compared to 32 for Wal-Mart. Customers, in addition, often drove greater distances to avoid Kmart and go to Wal-Mart.

Target. Target Corporation, formerly Dayton Hudson, operated more than 1,500 stores, including more than 1,100 Target stores, along with Mervyns and Marshall Fields department stores. Target stores, including SuperTarget and Target Greatland, accounted for more than 80 percent of Target Corporation's sales. The company posted 2003 sales of \$43 billion, up more than 10 percent from 2001, and had 306,000 employees.

By 1995, Target operated 30 Greatland stores in and around the Chicago area. The company also launched its Club Wedd bridal gift registry and the Lullaby Club baby registry. At the same time, Target also began the development of a prototype store for smaller markets, carrying merchandise similar to that in larger Target stores. Dayton Hudson, as reported in *Valueline*, earmarked 80 percent of its \$1.4 billion capital budget for 1997 to add an additional 65 stores, 5 of which would include groceries. This added eight million additional square feet to Target stores, an increase of 10 percent in 1997.

WORKFORCE

The retail industry was a significant source of employment in the United States, accounting for roughly 18 percent of the labor force. According to the U.S. Department of Labor, the retail industry should realize significant growth between 1998 and 2005, with more than three million new jobs created. Discount stores employed nearly two million people in 1999.

As larger companies relied more heavily on computer technology, lowering labor costs and increasing productivity, employees of Wal-Mart, Kmart, and other discount establishments found that job descriptions changed accordingly. With these advances, more jobs became available. According to *Discount Store News* editor Tony Lisanti, Wal-Mart is the largest employer in the United States and soon will become the largest employer in the world.

The average nonsupervisory retail worker's hourly wage was \$9.17 in September 1999 and average weekly hours were 28.7.

AMERICA AND THE WORLD

Whereas the economy remained strong in the United States and Europe in 1998 and 1999, Asia suffered. Consumer spending in that region decreased dramatically in 1998 with the economy in recession. However, international growth remained a priority in growth strategies for discount chains. The advent of the Euro has sparked interest in many European markets; Wal-Mart has forged into the German market, and Latin America remains attractive.

In 1999, Wal-Mart had operations in Puerto Rico, Canada, China, Mexico, Brazil, Germany, the United Kingdom, Argentina, and South Korea. David Toung, analyst with Argus Research, stated, "These are very important areas for them because there is more growth opportunity for them than there is in the U.S." The company remains focused, along with other strong discounters, on operations abroad. By the 2002, Wal-Mart saw its greatest growth opportunities in the Asian markets of China, Japan, and Korea. The company had 20 stores in China at that time, and planned to open 120 to 130 stores worldwide by 2003. By the late 1990s, several discount retailers had opened stores in foreign markets, most notably in Europe and Mexico. Furthermore, companies began creating alliances with foreign operations in the form of licensing and franchising agreements, investments, and joint ventures.

Kmart began entering into joint ventures with foreign partners as early as 1968 with Coles Myer Ltd., the largest retailer in Australia. A long-time operator of stores in Canada, Kmart was also the first U.S. discount retailer to enter Eastern Europe with a 76-percent pur-

chase of Maj, a large Czechoslovakian department store in 1992. The company had operations in Puerto Rico, Guam, and the U.S. Virgin Islands by 1996. Overall, Kmart has spent more than \$100 million on the selection and renovation of department stores in the downtown areas of several foreign cities.

Success in international retailing remains linked to a company's sensitivity to cultural differences. In a *Chain Store Age* article, Ames Department Store CFO Rolando de Aguiar stated, "Too many retailers do not pay attention to differences of doing business in different countries." This mistake lead to technological problems as well, as different countries use different types of communication and computer systems.

RESEARCH AND TECHNOLOGY

The Internet became a significant contributor to the retail environment with the increasing number of retailers who created Web sites for general marketing information and to allow customers to purchase goods online. In 1996, Wal-Mart created two Web sites for both higher and lower priced items, Kmart began offering online shopping in May 1998, and Target offers online purchasing as well. With Internet sales expected to increase by the billions by 2003, discount retailers have been forced to create an online presence to tap into increased market share. As a result of increasing technology, information technology and information services retail professionals have been called upon and now play substantial roles in the discount stores infrastructure.

Due to the price sensitive nature of the industry, discount stores have to maintain efficient operations to achieve maximum profitability. The implementation of computer technology was, and is, essential to store operations. Development of technology such as computer-assisted bar code scanning, online receiving, merchandise tracking, and labor management is crucial to store profitability. With the onset of computerized operations, discount stores were able to reduce inventory, speed up inventory turnover, and shorten the lead time required to move merchandise into the store.

Interactive touch screens for point-of-sale (POS) operations went into development in 1998. Graphical user interface (GUI) payment terminals are slated to become increasingly popular, despite negative feedback. Jim Dion, a senior partner with the J. C. Williams Group, stated in a *Stores* article, "For some time now, retailers have made interactive kiosks, touch-screen information terminals, and similar capabilities available to customers at or near the point-of-sale. In most cases, the technology was ignored by customers over age 50 and used infrequently by 25- to 50-year-olds. Most stores and malls have backed off this technology for the time being."

Nevertheless, vendors are pushing the new POS systems. Checkmate developed a new product, the eN-Touch 1000, which is predicted to replace existing countertop credit and debt terminals. In the same *Stores* article, Mary Lynne Campbell, Director of Business Development for Checkmate, stated, "retail marketers can achieve 'virtual customer intimacy' through nonpayment applications such as advertising, personal messaging, instant credit, loyalty programs, cross selling, electronic coupons, surveys, managerial signoff, information kiosks, and product locators." Large, national retailers are expected to implement these new devices.

Use of handheld computers in the industry also increased in the late 1990s, greatly facilitating in-store communications, particularly for price verification and inventory tracking. Wal-Mart, Target, and Kmart used wireless in-store systems. The handhelds proved beneficial in maintaining stock levels and facilitating price markdowns.

Moreover, the development of spread-spectrum radio promised greater bandwidth in wireless communications, allowing stores to use wireless systems for a wide variety of tasks. Future applications for spread-spectrum radio included use as a local-area network infrastructure, which would connect handheld computers; new generations of wireless (and possibly mobile) POS systems; and electronic shelf labels to provide graphs of sales trends among other information. Manufacturers of spread-spectrum radio systems continue development on graphical interfaces.

SIC 5399

MISCELLANEOUS GENERAL MERCHANDISE STORES

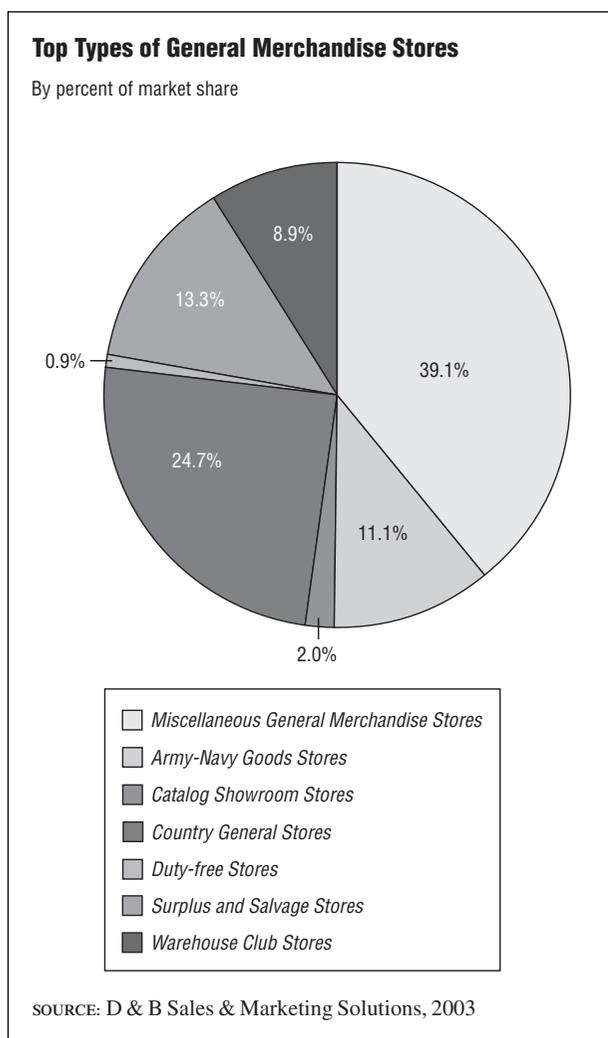

This industry classification includes establishments primarily engaged in the retail sale of a general line of apparel, dry goods, hardware, housewares or home furnishings, groceries, and other lines of limited amounts. Stores selling commodities covered in the definition for department stores, but normally having less than 50 employees, and stores usually known as country general stores are also included in this industry. Establishments primarily engaged in retail sale of merchandise by television, catalog, and mail-order are classified in **SIC 5961: Catalog and Mail-Order Houses**.

NAICS CODE(S)

- 452910 (Warehouse Clubs and Superstores)
452990 (All Other General Merchandise Stores)

Sales in the larger retail industry topped \$3.0 trillion dollars in 2000 and continued to climb, reaching nearly \$3.4 trillion in 2003. Of this total, combined sales of miscellaneous general merchandise stores and warehouse club stores accounted for approximately \$256.9 billion.

The miscellaneous general merchandise stores industry is subdivided into seven groups: miscellaneous general merchandise stores, which have accounted for approximately 39 percent of sales in recent years; county general stores (about 24 percent); surplus and salvage stores (13 percent); Army and Navy goods stores (11 percent); warehouse club stores (10 percent); catalog

showroom stores accounted (2 percent); and duty-free stores (less than 1 percent).

Although miscellaneous general merchandise stores outnumber warehouse club stores like Sam's Club, warehouse club stores sales totaled \$217.5 billion in 2003, compared to \$39.4 billion for miscellaneous general merchandise stores. States with the highest number of establishments were Texas (1,640), California (1,232), Florida (897), and New York (604).

In the United States there were 30,795 stores that comprised the general merchandise segment of the retail sector in the early 2000s. They employed approximately 798,641 employees with an annual payroll of \$13.6 billion. While warehouse clubs and superstores made up about 1.4 percent of this category, they were responsible for nearly 85 percent of the sales. Costco and Sam's Club are the leaders within the warehouse clubs and superstores segment. They give consumers an opportunity to purchase items at a discount and in bulk. They are typically housed in warehouses and are about 60,000

square feet larger than a regular department store or discounter.

A handful of major players dominate this retail industry segment in the United States. Arkansas-based retail giant Wal-Mart Stores Inc. topped the list in fiscal year 2004, with sales of \$256.3 billion and 1.4 million employees. Wal-Mart operates some 1,500 discount stores in the United States. However, the company also has 1,470 Wal-Mart Supercenters that span anywhere from 90,000 to 261,000 square feet, along with Neighborhood Market stores in select states, and more than 500 Sam's Club warehouse stores in 48 states.

Minneapolis-based Target Corp. followed Wal-Mart, with fiscal year 2004 sales of \$48.2 billion and 192,000 employees. Although it operated the well-known department store chains Marshall Field's and Mervyn's, the company claimed a large share of the general merchandise market with its 1,147 Target Stores. Located in 47 states, these included regular Target stores spanning about 126,000 square feet, as well as 145,000-square-foot Target Greatland stores and 175,000-square-foot SuperTarget stores.

Headquartered in Issaquah, Washington, Costco Wholesale Corp. was another leading industry player, with 2003 sales of \$42.5 billion. The company enjoyed status as the nation's leading operator of warehouse clubs during the early 2000s. At this time, about 41 million club members frequented Costco's 430 stores in 36 states and several foreign countries, choosing from an array of roughly 4,500 different products.

Based in Grand Rapids, Michigan, the family owned general merchandise and grocery chain Meijer Inc. reported sales of \$11.1 billion in fiscal year 2004. The company operated approximately 160 stores in a handful of Midwestern states, including Michigan, Ohio, Illinois, Kentucky, and Indiana. Meijer employed about 75,000 people in the early 2000s. Its stores, which were open 24 hours a day, 364 days a year, spanned anywhere from 200,000 to 250,000 square feet in size, and offered patrons a selection of some 120,000 items.

The miscellaneous general merchandise stores industry also includes discount/closeout merchandisers like Dollar General Corp., with 2004 sales of \$6.9 billion and 57,800 employees, and Big Lots Inc., with 2004 sales of \$4.2 billion and 47,249 employees.

Heading into the mid-2000s, the retail industry in general was doing relatively well. Following an economic downturn during the early 2000s, retail chains were witnessing an increase in consumer spending. Due to the continued market dominance of discount retailers, superstores, and warehouse clubs, the future growth of catalog showrooms, which also are a part of this retail segment, appears to be flat. Customers are frequenting

superstores on a fairly regular basis and those stores that want to stay competitive need to explore ways to improve customer service and use technology effectively in their store's operation.

SIC 5411

GROCERY STORES

This category includes supermarkets, food stores, and grocery stores, primarily engaged in the retail sale of all sorts of canned goods and dry goods (such as tea, coffee, spices, sugar, and flour), fresh fruits and vegetables, and fresh and prepared meats, fish, and poultry.

NAICS CODE(S)

447110 (Gasoline Stations with Convenience Stores)

445110 (Supermarkets and Other Grocery (except Convenience) Stores)

452910 (Warehouse Clubs and Superstores)

445120 (Convenience)

INDUSTRY SNAPSHOT

Some 243,800 establishments comprised the U.S. retail food industry in 2000, according to the U.S. Census Bureau's *Statistical Abstract of the United States*. The entire retail food industry combined for total sales of \$483.7 billion in 2000, up from \$368.3 billion in 1990. Grocery stores totaled 163,000, including 24,600 supermarkets (defined as having at least \$2.5 million in annual sales). These supermarkets reported total annual sales in 2000 of \$453.8 billion. Although supermarkets accounted for only 67 percent of the industry stores, they took in 95 percent of the industry's revenues. Supermarkets are further categorized as conventional (9,900

stores), superstores (7,900 stores), warehouse (2,400 stores), combination food and drug (3,700 stores), superwarehouse (500 stores), and hypermart (200 stores), a small subcategory that sells the broadest range of consumer goods along with food items.

Also included in the food industry are convenience stores, superettes (grocery stores that produce under \$2.5 million in annual sales), and specialty food stores (stores that specialize in a single category such as meat, seafood, or baked goods). Convenience stores totaled 81,900 and generated \$48.5 billion in sales in 2000; superettes numbered 56,700 and had sales of \$72.5 billion; and specialty food stores totaled 80,600 with annual sales of \$25.4 billion.

After undergoing extensive consolidation during the 1990s in response to flat sales and increased competition, in the early the 2000s mergers and acquisitions abated. The primary focus of the grocery industry is to shift market share away from the conventional supermarkets to favor superstore discounters, namely, Wal-Mart Superstores. Clearly the discounter grocers are here to stay. During the remainder of the 2000s, the industry will continue to adjust to Wal-Mart's ever-increasing domination of the market. The question will be how traditional grocers will adjust to the new competitive environment to continue to survive and prosper.

ORGANIZATION AND STRUCTURE

Like all retail industries, the grocery industry at its most basic, functioned by obtaining goods from distributors and manufacturers, marking up the price to cover costs and to allow for profit, and reselling the merchandise to the general public. Larger grocery chains typically manufactured or prepared a limited line of goods for exclusive sale in their stores. These goods included those prepackaged under a private label or store brand and those offered ready-to-eat through in-house bakeries and delicatessens.

The choice of which goods appeared on grocery shelves and how many of each was often carefully calculated by both manufacturer and grocer alike. Shelf space, considered a commodity, was purchased by manufacturers and distributors based on the amount of shelf space they wished to reserve for their products. According to *Sales & Marketing Management* of March 1996, the cost of shelf space, called a "slotting fee," might range from \$5,000 to \$25,000 per product. On the retail side, grocery stores tracked their inventories—frequently using a computer system integrated with their cash registers—to determine the frequency and volume of sales for each product and ordered from their suppliers based on this data. In this arrangement, both manufacturers and retailers sought to maximize the volume of sales by giving ample shelf space to high-volume items while leaving room for lower volume and niche products. Also competing for space were the thousands of new products introduced every

year. According to the Food Marketing Industry Speaks 1999, median number of supermarket items was 40,333.

The grocery industry was dominated by supermarkets, that is, grocery stores with more than \$2.5 million in annual sales. In 2000, there were 24,600 such units, with a total of \$337.3 billion in sales and a 70 percent share of the market, down from 77 percent in 1998. This group was subdivided into affiliated independents and corporate chain supermarkets. Their differences lay in their respective financial and organizational structures.

Affiliated independents were characterized by a wholesaler-retailer interdependence. Under the terms of an agreement between the wholesaler and retailer, the retailer took advantage of the wholesaler's purchasing power and had the right to use the wholesaler's name. In return, the wholesaler maintained the retailer's business for products purchased and also for services provided by the wholesaler. The independent retailers in the United States controlled a 15.9 percent share of the total market volume in 1998, a decrease of 5.9 percent from 1988. These stores reported \$71.6 billion in combined sales in 1998.

Affiliated independents were further divided into voluntary wholesaler groups and retailer-owned cooperatives. The former were companies who bought the franchises of independently owned wholesalers. These, in turn, sponsored voluntary groups of independent retailers in their respective communities. Included in this category were supermarkets such as Supervalu and Scot Lad Foods. The retailer-owned cooperative was an association of retailers who organized for the purposes of achieving greater purchasing power and other services. Among these were the Associated Group and United Grocers.

The chain supermarkets continued to control a strong segment of the market. Their combined sales in 1998 amounted to \$274.5 billion, or 61.1 percent of total industry sales. Corporate chain retail stores were company operated and included such well-known outlets as Safeway, Kroger, A&P, Winn-Dixie, Jewel, Publix, and Acme Markets. Because of their size, these firms typically bypassed third-party wholesalers and purchased in bulk directly from manufacturers. No single chain, however, dominated the national market, and none had operations in all 50 states.

Convenience stores made up the majority of units in the industry. They were defined by *Food Retailing Review* in 1993 as "small, high margin, easy-access stores with a limited line of high convenience items, including staple groceries, nonfoods, and ready-to-heat and ready-to-eat foods." There were, in turn, two kinds of convenience stores: stand-alone units and gasoline station units. In the early and mid-1990s, the gas station stores, known as "G stores," held significant advantage over their stand-alone counterparts. Many of the grocery stores

were newer and equipped to sell a wider array of foods—including such nontraditional convenience offerings as fresh fruit in some cases—than conventional convenience marts, and all of them shared the advantage of having gasoline customers they could lure into convenience sales. In general, the G stores outperformed stand-alones, leading some stand-alones to pursue niche markets to maintain their customer base. The National Association of Convenience Stores reported that convenience outlets in the United States totaled 95,700 in 1997, up 1.6 percent from 1996. According to the association, "the strong shift towards urban store development continued in 1997. More than three out of every four new stores built is located in an area with a population of 50,000 or greater. While urban store development costs dropped 6.2 percent in 1997 to \$1.2 million, rural store development broke the million-dollar mark. New rural stores averaged \$1,027,300 with land costs averaging \$272,400, building costs averaging \$341,000, equipment costs averaging \$347,800, and inventory costs averaging \$66,100."

The industry held relatively few foreign interests outside North America in the late 1990s; however, several corporate chains were held by foreign parents. One major player was Delhaize Frères & Cie., "Le Lion" of Belgium, and its new holding company—Delhaize America—which held a controlling interest in the Food Lion chain in 1999. Dutch retailer Ahold NV had a sizable U.S. presence through its acquisitions of First National, Bi-Lo, Giant Foods, Pathmark, and Tops stores. Also as of 1999, a 55 percent majority of The Great Atlantic and Pacific Tea Co. (A&P) was held by Tengelmann Warenhandelgesellschaft of Germany. U.S. holdings in other countries included Safeway's Canadian operations, as well as its interest in the Mexican chain Casa Ley S.A. de C.V, which operated 80 stores in 1999. A&P also had operations in Canada. In a September 1999 press release, A&P CEO Christian Haub reported that company "market share is also increasing in Ontario, both through internal and acquired growth. Comparable store sales in our operated Canadian stores continue to be among the strongest in the Company. The mostly franchised Food Basics format continues to do very well, including the 10 additional stores converted so far this year. Finally, we have concluded two agreements to acquire a total of 11 stores in Ontario, strengthening our positions in several markets, particularly the Hamilton/Niagara Falls area. While making these acquisitions, we improved our balance sheet during the quarter with a successful offering of 40 year bonds."

BACKGROUND AND DEVELOPMENT

"The food supermarket was perhaps the single most important innovation in retail distributive institutions in the entire period from 1850 to the present," according to Malcolm McNair and Eleanor May in *The Evolution of*

Food Institutions in the United States. Supermarkets, particularly chains, were able to achieve greater economies of scale than smaller outfits and were thus able to charge the consumer less while still earning a greater profit margin.

Characterized by carrying a large variety of different food stuffs, dry goods, and health and beauty products under one roof, supermarkets developed in the early 1930s. The expansion of their stock beyond essential food items was encouraged by rising operating costs, particularly rent and wages, influenced by government regulation and union bargaining. Prior to this, food was sold through local “mom and pop” grocery stores and chain “economy stores.” Faced with competition from supermarkets that undercut them by as much as a third or a half, the old style grocery store chains either converted to supermarkets, were bought out, or went out of business.

Supermarkets provided consumers with lower-priced goods during the Great Depression. Concentrating less on personalized service and more on bare bones cash and carry, supermarkets emphasized the utilitarian aspects of the business and let the customer do the work of selecting and handling goods. With their emphasis on high stock turnover, supermarkets benefited from the new tendency toward bulk buying, supported by the growing use of refrigeration and the proliferation of cars. The growth of automobile traffic also influenced store location, with placement for traffic convenience becoming a primary concern.

From 1930 to 1950, the industry witnessed radical and far-reaching changes in methods of food distribution. Noticeable changes included increased self-service, the wide expansion of lines, and the great increase in the number and size of stores. Consequently, consumers benefited from greater choice and convenience. Through creative marketing techniques and low competitive prices, supermarket chains, both independently affiliated and corporate, had established themselves as the leading outlet for retail food distribution by World War II.

After 1950, increased competition fostered further developments in the retail food business. The large profit margins that stores had been able to realize were undercut as supermarkets found it necessary to increase print and television advertising and initiate such promotional efforts as trading stamps, games, and contests to win business. These efforts succeeded only in pushing up supermarkets’ overhead faster than they could increase gross margins. These percentages narrowed consistently throughout the 1950s and 1960s. By 1954, the United States had 288,000 grocery stores, almost 100,000 fewer than in 1948.

By 1965, supermarkets had won a 71 percent share of all retail food sales, with superettes (stores having annual sales between \$150,000 and \$500,000 a year) accounting for 13 percent and small stores (sales less than \$150,000 annually) 16 percent. It had become evident by the 1960s that an integrated chain of self-service supermarkets could offer consumers a better deal due to their economies of scale. It was also clear, however, that cut-throat competition, which forced chains to keep their price margins low, was wiping out some of these economies.

Supermarkets sought ways to cut their costs even further and found inspiration in the new soft goods discount stores that were starting to appear. These businesses applied the same techniques pioneered by supermarkets to create low-price department stores. Supermarket managers subsequently decided to employ the discount idea in their own businesses. Doing so necessitated abandoning their previous promotional schemes and focusing on price cutting. For consumers, the appeal was immediate, and discount pricing spread throughout the industry.

While the industry was undergoing these transformations, many supermarkets simultaneously endeavored to raise their profit margins by expanding their stock to include more general merchandise. Others bought out existing discount department stores and opened the two kinds of stores side by side or under one roof in strategically located shopping centers. Another development was the trend for supermarkets to ally themselves with discount drug stores.

The net effect of these changes was a gradual decline in the number of general food stores—although the food retailing market saw some increase in the number of specialty stores. The 1972 census recorded 194,000 supermarkets with sales per establishment more than seven times greater than in 1948. By 1996, the number of grocery stores had fallen to 130,000, but sales had grown upwards of \$400 billion.

The industry enjoyed moderate sales growth during the late 1980s, although it was not shared uniformly across the industry. According to the U.S. Bureau of Census, pre-inflation growth between 1987 and 1992 for the industry as a whole was 23.5 percent, which included a 50 percent sales boost in the convenience segment. Supermarkets reported a 22 percent net gain in the same period, while other segments of the industry languished around 10 percent. Different firms in the industry also fared differently in this period: while some chains experienced growth in sales, others such as A&P suffered millions in losses.

Growth in that period was dampened by the recession in the early 1990s, which hit retail grocers especially

hard. Already operating under low profit margins due to fierce competition, numerous chains took severe financial beatings because of the austere consumer-spending climate. Fiscal weakness helped set the stage for several smaller chains to be acquired by their aggressive large-chain rivals. This consolidation trend continued into the mid-1990s. In 1993, the industry began a slow recovery from its heavy recession losses—so slow that growth was at its lowest point in the past 40 years. From an annual high of 7.2 percent sales gains in 1989, growth plummeted during the recession and then leveled to between 2 and 4 percent through the mid-1990s.

By the mid-1990s the grocery industry had at least shown signs of solid recovery thanks to its ability to remain competitive. Aided by a more robust economy, the industry posted modest gains because of corporate cost savings, horizontal and vertical integration, private label expansion, and innovative marketing. Industry gains in current dollars, however, were often neutralized by inflation, according to the Food Marketing Institute (FMI), which estimated that the industry's modest 4 percent sales growth in 1995 amounted to only 0.7 percent after inflation. Despite this, the FMI noted that some measures of industry productivity had increased in 1995 following three consecutive years of decline. Average sales per labor hour in the industry, according to the FMI, were at \$111.40 for 1995 compared to \$106.50 in the previous year.

To remain competitive with such formidable competitors as Wal-Mart, supermarkets pursued new avenues of growth, including the expansion of private label brands, the introduction of larger stores, and the development of specialty services like delicatessens. Private labels—brands offered exclusively by a particular chain—were seen as opportunities to boost sales growth by providing lower-cost alternatives for shoppers while retaining a greater share of the profit, since private label goods were often manufactured by the supermarkets themselves or under contract by third-party purveyors. According to the Private Label Manufacturers Association, "Store brands now account for one of every five items sold every day in U.S. supermarkets, drug chains and mass merchandisers. They represent a \$43.3 billion segment of the retailing business that is achieving new levels of growth every year." The 1998 \$43.3 billion figure was up from \$41 billion in 1997.

The association also reported that consumer sentiment for private label items was high in 1998. "For American consumers, store brands are brands like any other brands. In a recent Gallup study, 75 percent of consumers defined store brands as "brands" and ascribed to them the same degree of positive product qualities and characteristics—such as guarantee of satisfaction, packaging, value, taste and performance—that they

attribute to national brands. Moreover, according to Gallup, more than 90 percent of all consumers polled were familiar with store brands, and 83 percent said that they purchase these products on a regular basis."

A&P, for example, continued a heavy push in the late 1990s for its mid-priced America's Choice label, which was offered in addition to its low-cost Savings Plus store brand. *Private Label* reported that the firm intended to offer an in-house brand to reach three separate consumer buying segments through differential branding of its private labels. Owning the manufacturing plants for private labels, however, was not always key to realizing higher profits, as Safeway reported in 1995 when it closed several of its plants due to poor performance.

New store formats were another major component of the supermarkets' late-decade growth plan. With such competitors as warehouse clubs and the new Wal-Mart and Kmart superstores, having more physical retail space was seen as an advantage. Most of the new store introductions by the supermarket chains boasted greater retail square footage than was typical of existing units in the industry. In 1998, the median average store size was 40,483 square feet, up from 38,600 in 1996. Many of the new stores were much larger than the median, with some reaching upwards of 60,000 square feet. A typical new store in 1998 was just over 57,000 square feet, up from about 52,400 square feet in 1997.

In addition to broader nonfood selections, fresh produce and ready-to-eat dishes were often a focal point of the new stores. Enticing consumers with a wider selection of produce and high-quality, in-house delicatessens, these stores were designed to win back market share from both restaurants and discount superstores that were drawing away traditional grocery business. In the late 1990s, deli revenues were one of the fastest growing segments of total supermarket sales, with 5.79 percent of total store sales.

The larger format supermarkets maximized profits in both food and nonfood offerings. The impetus towards these combination stores was the large profit margins—in the region of 35 to 40 percent—to be made on many of the items they sold, including health and beauty items, deli food, pharmaceuticals, and bakery goods. In contrast, the markup on food and dry goods was only 15 to 20 percent, and stores devoted exclusively to grocery items were purely functional and provided less in the way of "shopping as entertainment."

Marketing was also key to maintaining growth in the late 1990s. This did not mean, however, that chains were spending more on advertising. Several chains actually reported decreases in total advertising expenditures as part of broader cost saving initiatives. Several marketing innovations responded to consumer concerns and envi-

ronmental issues. In 1995, for instance, Safeway launched an “animal welfare charter” on the meats it sold to reassure customers that the livestock had been treated humanely. On a similar note, more stores began to implement sections that contain foods that are natural or organically grown, an attempt to win consumers who are attracted to the growing natural food specialty store segment. Another tool to increase revenues was to dedicate more space to high-volume goods and focus on core product categories that earned the most money. Market research and advertising also supported major private label expansions, such as those of A&P and Kroger.

Large chains have also implemented savings cards to lure more customers. For example, Kroger began offering a “Kroger Plus Savings Card” that allows ‘members’ to receive special discounts on promotional items without having to clip coupons. Farmer Jack also offers a savings card and teamed up with Northwest Airlines in Michigan in 1999. Consumers now receive points towards airline travel every time they use their card.

The key to maintaining profits into the 2010s will be to optimize cost awareness and attract new and existing customers. This industry has had modest growth and is predicted to have only slight growth in the future. Many larger chains have sought growth through acquisition including Albertson’s, who purchased American Stores in 1999, and Kroger, who had plans to purchase 74 Winn-Dixie stores in late 1999, and bought Jay C Stores of Indiana in August 1999.

CURRENT CONDITIONS

With overall spending slow during the early 2000s due to a sluggish economy, the retail grocery sector worked hard to keep costs down and revenues up. Although the industry was slightly more immune to changes in the economy because food is a basic, necessary expenditure, changes in shopping and spending habits were reflected in grocers’ bottom lines. According to a survey of consumer attitudes conducted by the Food Marketing Institute in 2002, price was considered a major factor in food purchase for 84 percent of respondents, up from 77 percent the previous year.

With price becoming increasingly important to consumers, conventional grocers were facing stiff competition from the price-slashing methods of mega-retailer Wal-Mart. In 2003 Elliot Zwiebach noted in *Supermarket News*, “Alternate channels of distribution are continuing to flex their muscles and grab food sales away from traditional supermarkets, forcing supermarket operators to adapt and change—or continue to lose market share.” Wal-Mart continued to increase its market share, which stood at 12 percent in 2002. The giant discounter planned to expand square footage devoted to food by 8 to 10

percent in its supercenters, and Sam’s Club planned food square footage increases of 5 to 6 percent.

Moreover, supermarkets are not just facing off against Wal-Mart. Discounters Costco and Target are also increasing their presence in the grocery industry. In 2002 Costco’s same-store food sales increased from 10 to 15 percent, and Target Supercenters ranked twenty-second in the industry, jumping from thirty-third the year before. According to research conducted by AGNielsen, annual trips to the grocery store declined from an estimated 86 in 1998 to 75 in 2001, whereas annual trips to supercenters increased from 14 to 18 during the same time interval.

In order for traditional grocers to survive the onslaught of discounters, they will need to find ways to convince customers to shop their aisles. Richard George, chair and professor of food marketing, at St. Joseph’s University, Philadelphia, told *Progressive Grocer*, “There are things the small independent operator should always do better than big chains like Wal-Mart. No one should out-fresh them and no one should out-service them. . . . [Wal-Mart] stores aren’t that appealing and the service is not that great. There is a lot of opportunity there, so supermarkets have to consider how they can improve the whole shopping experience. They’ve got to focus on the customer. People have Palm Pilots and computers, but supermarkets are the same. They still have 25 checkouts and only six open.” According to FMI’s report, *Trends in the United States: Consumer Attitudes & the Supermarket, 2002*, consumers are looking for clean, neat stores with a good selection of high-quality fruit and vegetables and high-quality meats. These are the primary areas where traditional grocers can create a profitable and sustainable niche in the retail grocery industry.

INDUSTRY LEADERS

In the early 2000s, Wal-Mart passed traditional grocery chains to become the nation’s leading grocer, with a 12 percent market share in 2002. The grocery business was dominated by the multi-unit and regional supermarket chains Kroger, Albertson’s, and Safeway. Other companies with a significant portion of the market share included Albertson’s, A&P, Winn-Dixie, Super-Valu, Publix, and Food Lion.

Kroger Co. Ohio-based Kroger operates approximately 3,600 stores across the nation, including 2,400 supermarkets. Doing business under approximately 25 banners, only 15 percent of sales are attributed to Kroger stores themselves. Among others, the company owns Dillon Food Stores, Fry’s Food Stores, City Market, King Soopers, and Gerbes Supermarkets. It also operates approximately 800 convenience stores under the names Kwik Shop, Loaf ‘N Jug, Mini-Mart, Quik Stop Market, Tom Thumb Food Stores, and Turkey Hill Minit Market. Sales

in 2002 totaled \$50.1 billion, resulting in a net income of \$1.04 billion.

Founded by Bernard Kroger in 1883, the company began as the Great Western Tea Company in Cincinnati, Ohio. It immediately set itself apart from its competitors by being the first grocery store to use print media advertising and to introduce an in-house bakery. By 1902, the company's name had been changed to Kroger Grocery and Baking Company, and the operation had expanded to include 40 stores in two states. Its growth continued unabated ever after. Since the 1960s, Kroger maintained a presence in the drug store market and, in the 1980s and 1990s, concentrated on operating combination grocery and drug stores, emphasizing one-stop shopping. The average size of these stores was 48,745 square feet.

One of Kroger's strengths was its decentralized structure, which enabled it to respond to localized buying habits. This arrangement allowed it to build customer loyalty. Its decentralized structure also allowed for flexibility in its pricing structure. Both "Every Day Low Pricing" and "High-Low" structures were used. Competition for the company's local market shares increased steadily in the early 1990s, especially from Meijer, Food Lion, and Publix. Kroger sold off its more than 100 Time Savers convenience stores in 1994, but as of 1995, the company reported that its convenience store sales per square foot slightly exceeded that of its supermarkets. Nonetheless, convenience sales accounted for just less than 10 percent of Kroger's total sales in 1995. The company relocated, expanded, or opened 116 stores in 1996, increasing overall store square footage by 6.7 percent. The company continued an aggressive growth strategy with plans for acquiring Winn Dixie stores in Texas and Oklahoma in late 1999, and J. C. Stores in Indiana. Kroger also began its foray into jewelry with its purchase of Fred Meyer Inc. in 1999. In July 1999, Kroger also announced plans with U.S. Bancorp to offer a co-branded credit card to Kroger customers.

Albertson's. The nation's second largest grocery retailer in 1999 was Albertson's. Its purchase of American Stores Company in June 1999 launched it into one of the top spots in the grocery industry. The company had \$35.6 billion in sales for fiscal 2002, with a net income of \$485 million. In 2003, the company ran 2,300 outlets in 31 western, mid-western, and southern states including Jewel Osco, Acme Markets, Sav-on, Seessel's, and Super One Foods. Many of its operations are combination food and drug stores, a strategy that Albertson's pioneered.

Albertson's was founded in 1939 in Boise, Idaho. An innovator in the grocery industry, Joe Albertson introduced such services as scratch bakery, magazine racks, homemade ice cream, and automated machines that held donuts. The first store was also the largest of its time—

10,000 square feet—eight times larger than typical stores.

Albertson's continued to post profits into the 1980s. The company continued building larger stores, implemented electronic scanning, and offered personalized customer service. In 1988, it opened its first mechanized distribution center in Portland, Oregon, covering more than 500,000 square feet.

In the late 1990s, Albertson's became one of the leading names in the industry. With more than \$567 million in net income, it had plans for growth into 2004 included building 1,850 new stores and remodeling 730 existing stores.

Safeway Inc. As the third largest supermarket chain in the United States, Safeway had 2002 sales of \$32.4 billion but a net loss of \$828 million. Since going public in 1990, California-based Safeway has pursued a course of vigorous expansion that included its 1997 acquisition of the 320-unit California chain The Vons Companies, Inc. In 2003, Safeway operated approximately 1,800 stores, primarily in the West, Southwest, and mid-Atlantic regions. Safeway also had substantial holdings in Canada and Mexico. Like its competitors, Safeway continued to close nonperforming stores and to seek other ways to reduce costs. The company struggled to remain viable during the first years of the 2000s, sustaining significant losses during 2002.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, there were three million workers employed by retail grocers in 2001, down from 3.5 million in 1998. Sales-related occupations accounted for nearly 44 percent of workforce, which included over one million cashiers with a mean annual salary of \$16,940.

By sheer employee count, the workforce was concentrated regionally in the Southeast, Mid-Atlantic, Great Lakes, and West Coast states, according to the Bureau of Economic Analysis. More than a quarter of the industry's labor was located in the Southeast alone. New England, the Plains states, and the Rocky Mountain states employed proportionately fewer workers in the grocery industry; combined, these regions accounted for just 16.2 percent of the total industry work force. Labor recruitment and retention remained an issue in the early 2000s. A survey by the Food Marketing Group found that labor costs, including warehouse, supervision, and staff, represented an average of 69 percent of a food distributor's total cost of operation and that 38 percent of survey respondents reported an turnover rate greater than 20 percent.

The labor pool is expected to decrease for grocery executives as well, due to increased jobs with Internet

and other companies. According to the *Progressive Grocer*, “a myriad of executive recruitment firms, colleges and universities, other retail channels, manufacturers, homegrown executive training programs and old-fashioned networking will become increasingly important in an industry where the shortfall in talent could reach critical proportions in less than a decade.”

Overall, unionization has declined somewhat in the industry. Although supermarket workers remained unionized at many chains, the entry into the market of nonunionized competitors, such as warehouse clubs and discount outlets, pressured the traditional chains to break the power of the unions. The industry experienced regional strikes in most years of the 1990s. In 1995, Safeway, American’s Lucky Stores, and Save Mart stores were targets of a 9-day work stoppage in northern California and Oregon. Profits in 1996 for two of the industry leaders, Kroger and Safeway, were dampened somewhat from a 44-day Colorado strike against both chains. In the same year, Safeway suffered a 40-day walkout at its Canadian stores in British Columbia, where replacement labor was against provincial law and its stores were forced to close until a labor agreement was reached. Safeway’s Canadian holdings continued to experience disputes with organized labor into 1997.

RESEARCH AND TECHNOLOGY

The grocery industry is now facing challenges and increased competition due to Internet shopping. For example, according to a November 1999 *Progressive Grocer* article, “online shoppers will be able to name the price for their favorite name-brand grocery items. Beginning this month in New York, New Jersey, and Connecticut, Priceline.com—the Internet service that offers airline tickets and other high-priced items at consumers’ bids—is licensing its business method and trademark to The Priceline WebHouse Club Inc. WebHouse club members name their grocery store of choice (including A&P, King Kullen and Gristedes) and pick products from more than 140 categories of perishables, non-perishables, canned foods, and pet supplies, along with two or more of their favorite brands. Accepted requests are confirmed within 60 seconds and immediately charged to the customer’s credit card. The customer then goes to the store to pick up the items.” Another example of such a site is Homegrocers.com. Along with grocery stores offering shopper friendly sites, third-party companies are looking to team up with local grocers to provide services to online shoppers.

Electronic couponing and U-Pons became available in the late 1990s. Many grocery store chains offered printable electronic coupons that are available on company Web sites. In September 1999, Kroger began offering U-Pons on its Web site. This electronic form of saving

allows customers to select coupons they wish to receive. The coupons are then mailed to the customers’ address in three to five business days. Retailers expect that tracking coupon performance will be much easier with this process.

Research in the grocery industry has also focused on technologies to help stores reduce costs and increase efficiencies. Retailers continue to invest in technologies that will improve their accounting, ordering, receiving, and scheduling systems, particularly to integrate these operations—otherwise done on paper in some cases—into a single computer system. In 1998, for instance, Grocer Systems Support software—marketed by GSS—offered programs for inventory control, bill-back tracking, direct buy ordering, shopper tracking and analysis, direct store delivery, cashier security analysis, and accounts receivable analysis.

One of the most revolutionary of these is Efficient Consumer Response (ECR), a scanning system. The system works as follows: a customer selects a product and takes it to the cashier for checkout; the cashier runs the item through the scanner, which records the transaction; the scanner then sends a record of the sale to a central computer system, which itself is networked to the product manufacturer’s computer; the manufacturer notes the sale and automatically orders a replacement on a just-in-time basis. An automatic ordering system enables the product’s manufacturer to match production with demand using this information about product movement and forecasting techniques. The result is that product production becomes directly linked to consumer demand, obviating the need for the retailer to store large amounts of inventory. When the merchandise arrives at the store, the computer system acknowledges its receipt and issues a computer-generated payment for an electronic fund transfer payment. This system eliminates the need for paper invoices and streamlines the accounting process.

The second phase of ECR, crossdocking—moving products from a supplier’s truck through the distribution center and onto a store-bound vehicle without putting them into pick or reserve slots as defined by *Stores* magazine—was introduced to reduce warehouse costs and increase service. However, the grocery store industry has been slow to implement this process in comparison to the department store industry. Supervalu opened one of the first crossdocking facilities in 1996, one that the grocery industry looked to as a model. According to *Stores* magazine, “in order for crossdocking to take root, retailers will need to become more adept at forecasting demand and more confident when making sourcing commitments. Expanded use of advanced ship notices (ASN) and 128 labeling, now in the early stages of implementation, are also crossdocking enablers.” In 1998, only 15 to 20 percent of grocery items were crossdocked.

On the consumer side, several further technologies were implemented in the late 1990s. Many grocery stores installed at the point-of-sale (POS) various card-scanning devices that allowed customers to pass their credit, debit, or store-issued check cards through the scanner at the counter. Particularly for shoppers paying by check, use of store-issued magnetically encoded identification cards, or check cashing cards, represented a significant convenience over the common practice of requiring the customer to provide multiple forms of identification at the point-of-sale each visit. The results for retailers who implemented such systems were speedier checkout lines, more thorough validation of checks, and a reduction in bad checks being passed.

Stores magazine reported that in 1999 there was a “plethora of options—including credit, debit, electronic benefits transfer, smart cards and customer self-checkout—initiating changes in the mission critical front-end POS systems deployed by supermarkets. In an effort to improve customer service, enhance operations, keep pace with their competitors and, above all, lower costs, operators are exploring new payment technology and looking to update POS applications.”

SIC 5421

MEAT AND FISH (SEAFOOD) MARKETS, INCLUDING FREEZER PROVISIONERS

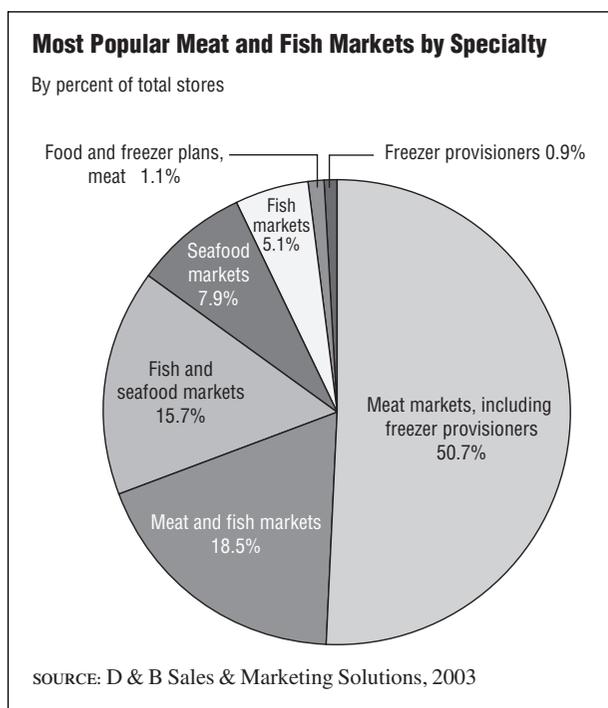

This category includes establishments primarily engaged in the retail sale of fresh, frozen, or cured meats, fish, shellfish, and other seafood. Also included are establishments primarily engaged in the retail sale, on a bulk basis, of meat for freezer storage and in providing home freezer plans. Meat markets may butcher animals on their own account, or they may buy from others. Food locker plants primarily engaged in renting locker space for the storage of food products for individual households are classified in **SIC 4222: Refrigerated Warehouse and Storage**. Establishments primarily engaged in the retail sale of poultry are classified in **SIC 5499: Miscellaneous Food Stores**.

NAICS CODE(S)

- 454390 (Other Direct Selling Establishments)
445210 (Meat Markets)
445220 (Fish and Seafood Markets)

Meat markets, including freezer provisioners, are the dominant types of retail establishments found in this classification, with 5,665 retail outlets. Meat and fish markets consisted of 2,070 establishments, followed by fish and seafood with 1,752 establishments. Combined, they generated approximately \$3.8 billion in sales, and controlled about 85 percent of the overall market. States with the highest number of establishments were New York with 1,564, California with 1,305, and Texas with 759.

According to the U.S. Census Bureau, the majority of these establishments were small—employing fewer than five people. In 2001, 1,940 markets had fewer than five employees; 350 had between five and nine; 142 had

between 10 and 19; 86 had between 20 and 99; 2 had between 100 and 499; and 2 markets had more than 500. There were 8,990 employees. The total number of employees climbed to 56,827 in 2003. Total sales for the industry totaled approximately \$4.77 billion in 2003. The average sales of individual markets were about \$500,000.

While most industry leaders post sales in the billions, individual companies in this industry generated much lower sales than most of its brethren industries. According to the most recent results on Infotrac databases, Murry's Inc. of Upper Malboro, Maryland led the industry in 1997 with sales of \$180 million, and Detroit-based Cattleman's Inc. followed with sales of more than \$125 million for its fiscal year ended April 1996. Performance Northwest of Portland, Oregon generated sales of \$78 million for its fiscal year ended June 1998. American Frozen Foods Inc. of Stratford, Connecticut rounded out the top five industry leaders with sales of \$70 million for its fiscal year ended April 1998.

The retail meat and fish market industry, like other retail food markets, experienced a steady downsizing throughout the early to mid-1990s, due in large part to competition from supermarkets, superstores, and wholesale clubs that catered to consumers' desire for one-stop shopping and low prices. Total sales for this industry fell from \$6.05 billion in 1993 to \$5.97 billion in 1996, and sales dropped 6 percent from December 1995 to December 1996.

According to *Dun's Census of American Business*, the number of retail meat and fish markets shrunk steadily

throughout the 1990s. There were 27,788 markets in 1993; by 1996 that number dropped to 20,811. The majority of these establishments employed fewer than five people. In 1996 about 17,000 markets had nine or fewer employees; about 3,000 employed between 10 and 50; and roughly 450 markets had more than 50 employees.

In the early to mid-1990s, the majority of meat and fish markets had sales between \$100,000 and \$500,000. In 1996, 223 establishments had sales between \$1,000 and \$49,000; 1,572 establishments had sales of \$50,000 to \$99,000; 6,191 stores had sales between \$100,000 and \$249,000; 5,123 had sales between \$250,000 and \$499,000; 2,761 had sales between \$500,000 and \$999,000; and 3,000 stores had sales above \$1 million.

Independent meat and fish markets face continued competition from supermarket chains and superstores. The *1994 Industrial Outlook* interpreted the shift in some consumer segments from one-stop shopping to more of "buy as you go" attitude as beneficial to independent retailers. New retail strategies, combined with these consumer changes, could help stores hold on to and increase their market share in this industry.

SIC 5431

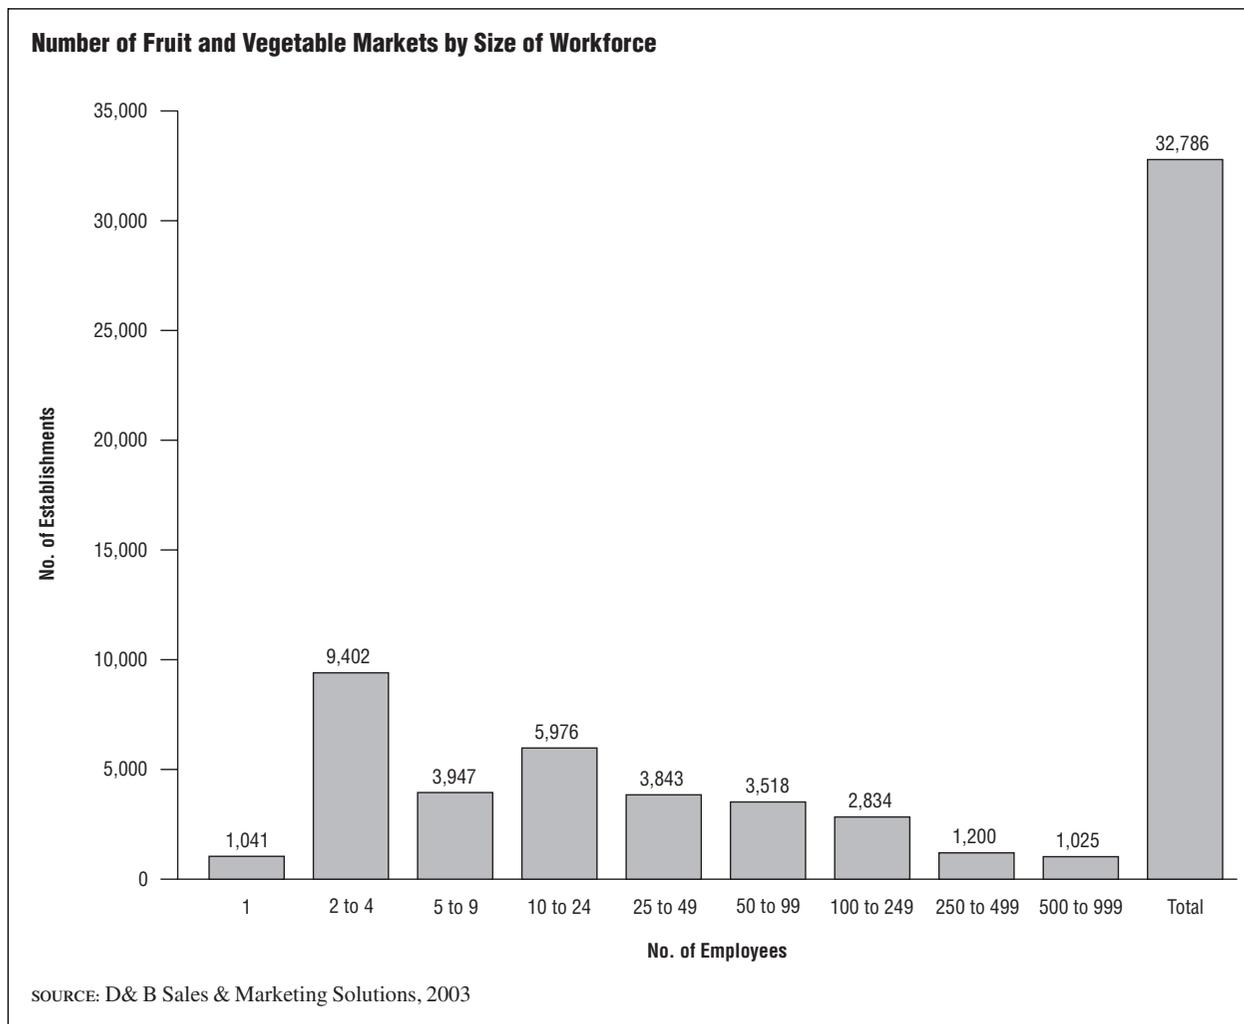

FRUIT AND VEGETABLE MARKETS

This category includes establishments primarily engaged in the retail sale of fresh fruits and vegetables. They are frequently found in public or municipal markets or as roadside stands. Establishments that grow fruits and vegetables and sell them at roadside stands, however, are classified in a range of agricultural crop production areas.

NAICS CODE(S)

445230 (Fruit and Vegetable Markets)

In 2001, the U.S. Census Bureau reported a total of 3,382 establishments engaged in the retail sale of fresh

fruits and vegetables. There were 20,615 employees and a payroll of \$374,488. The employee figure climbed to 32,786 in 2003. The total sales were approximately \$2.4 billion. States operating the largest number of establishments were California with 813, New York with 850, and Florida with 613. Combined, they accounted for more than 35 percent of the market.

The largest segment was fruit and vegetable markets with more than 77.8 percent of the market. They numbered 5,025 establishments and employed 22,517 workers. The fruit stands or markets numbered 1,066 establishments. They accounted for 16.5 percent of the market and employed 8,552 workers. The vegetable stands or markets consisted of about 371 establishments, and employed some 1,717 workers

The retail fresh fruit and vegetable market industry, like other retail food markets, experienced declining sales throughout the early to mid-1990s, largely due to competition from supermarkets, superstores, wholesale clubs, and discount stores. An additional competitor was the newly classified "G" stores. Operated by large gasoline

companies, they offered a mix of items including fresh fruit and vegetables. The total number of establishments in this industry fell from 8,265 in 1997 to 6,462 in 2003.

According to D&B Sales & Marketing Solutions, almost 80 percent of fresh fruit and vegetable markets (a total of 5,132) were small, employing less than four persons, while 641 establishments employed between five and nine people. At the other end of the scale, only 23 outlets employed more than 100 people.

In 2003 the majority of fruit and vegetable markets had sales in the \$100,000 to \$500,000 range. There were roughly 814 markets reporting sales under \$100,000; 23,360 markets with sales between \$100,000 and \$249,000; 5,063 with sales between \$250,000 and \$499,000; 4,902 with sales between \$500,000 and \$999,000; and 290 markets with sales of more than \$1 million.

Leading companies in this industry are Fresh America, Corp., based in Houston, Texas; and Norman Brothers Produce, based in Miami, Florida.

SIC 5441

CANDY, NUT, AND CONFECTIONERY STORES

This category includes establishments primarily engaged in the retail sale of candy, nuts, popcorn, and other confections.

NAICS CODE(S)

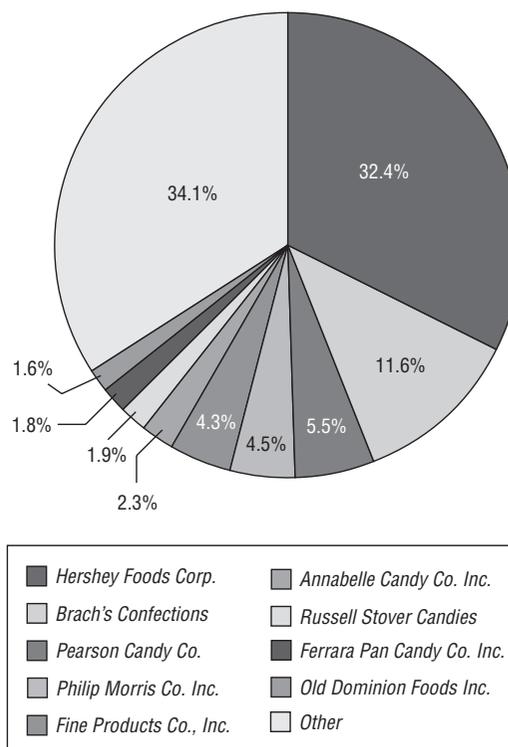

445292 (Confectionery and Nut Stores)

According to the U.S. Census Bureau there were 3,839 of these kinds of stores in 2000; by 2001 the total number of establishments remained unchanged. 997 of the stores in this classification employed fewer than five people. Another 432 employed between five and nine; 275 employed between ten and 19; 362 employed between 20 and 99; 136 had between 100 and 499; and 1,304 had more than 500. In 2003, the number of confectionery stores climbed to about 7,138, with sales of approximately \$936.3 million. The total number of employees was 30,193. States with the highest number of stores were California, with 865, and New York with 801 stores.

The largest segment was the candy, nut, and confectionery stores, with 3,064 establishments. They employed 11,546 workers and accounted for more than 42 percent of the overall market. Candy stores numbered 2,835 and employed 13,193 workers. They accounted for more than 39 percent of the market.

In 1997, most of the businesses in this classification were small, generating sales between \$100,000 to \$249,000. That year, there were 2,860 such establishments, down slightly from the previous year, when 2,989 companies reported sales in this range. The next largest category was establishments reporting sales between \$50,000 and \$99,000. There were 2,300 stores in this range in 1997, up from the 2,200 stores with sales in this range in 1996. There were 940 with \$250,000 to \$499,000 in sales in 1997 while 863 reported sales of \$1,000 to \$49,000. In 1996, 1,103 companies reported sales of \$250,000 to \$499,000, while 909 reported sales

Top Specialty Nut/Coconut Candy Makers, 2002

SOURCE: Market Share Reporter, 2004

of \$1,000 to \$49,000. Finally, the smallest categories were at the high end of the industry. In 1996, 882 stores reported sales between \$500,000 and \$5 million; in 1997, 795 were listed. The smallest category, however, was consistently in the \$5 million plus range: only 86 businesses reported sales in this range in 1997.

The leading specialty nut and coconut candy makers according to *Market Share Reporter* include Hershey Foods Corp., Brach's Confections, Pearson Candy Co., Philip Morris Co. Inc., Fine Products Co. Inc., Annabelle Candy Co. Inc., Russell Stover Candies, Ferrara Pan Candy Co. Inc., and Old Dominion Foods Inc.

Leading companies in this classification were Fannie May Candy Shops of Chicago, which reported sales of \$120 million in 1997. Leaders in 2004 included Godiva Chocolatier, Inc. of New York; Alpine Confections Inc. of Utah; and Candy Express Franchising of Columbia, Maryland. Alpine Confections Inc. was in the process of acquiring some of Fannie May and Fanny Farmer brands from parent company, Archibald Candy Corp. Upon the completion of the acquisition, Alpine may reopen candy shops under the Fannie May, or Fanny Farmer name. According to a report issued by the Food Institute, Archi-

bald planned on closing all its candy stores prior to the sale to Alpine.

SIC 5451

DAIRY PRODUCT STORES

This category includes establishments primarily engaged in the retail sale of packaged dairy products to over-the-counter customers. Ice cream and frozen custard stands are classified in **SIC 5812: Eating Places**, and establishments selling ice cream and similar products from trucks or wagons are classified in **SIC 5963: Direct Selling Establishments**. Establishments primarily engaged in processing and distributing milk and cream are classified in the various dairy products manufacturing industries.

NAICS CODE(S)

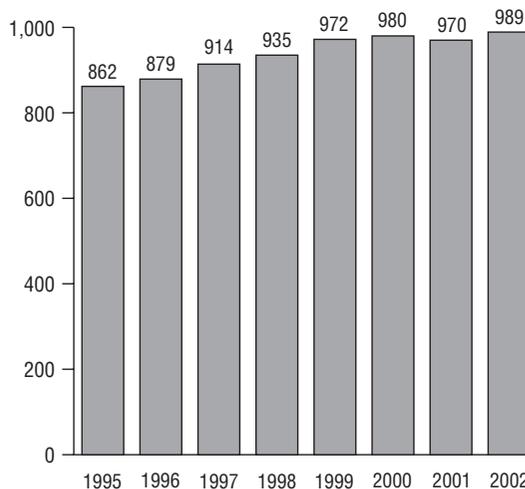

454390 (All Other Specialty Food Stores)

Cheese, milk, butter, and other dairy products stores, as well as packaged ice cream stores, are the predominant types of retail establishments found in this group. Like other retail grocery segments, dairy markets underwent a steady downsizing as supermarkets and superstores eroded market share by offering convenience and lower prices. Total annual sales were about \$930 million in 2003.

Most stores in this classification were small, private companies with less than ten employees. Of the 5,406 total establishments active in 2003, roughly 1,439 had four or fewer employees, and 877 had between five and nine employees. There were 849 establishments that employed between 10 and 24 people, and 155 that had between 25 and 49 employees. Eighteen establishments employed between 50 to 99 people, while just 11 establishments had more than 100 employees.

Ice Cream Consumption in the United States, 1995–2002

In millions of gallons

SOURCE: United States Department of Agriculture, National Agricultural Services, 2003

According to D&B Sales & Marketing Solutions, there were 1,973 dairy products stores with a total of 12,603 employees that contributed some \$343 million to the overall sales in 2003. The butter and cheese segment had 358 establishments and 1,957 employees that totaled almost \$7 million in sales. Milk contributed about \$1 million with 454 employees. The largest specialty market with 3,033 establishments was ice cream, which contributed about \$56 million in sales.

The U.S. dairy industry has a long history of consolidation by way of mergers and acquisitions. This trend is expected to continue as larger merchants want to conduct business with “national dairy producers.” The “national dairy producers” are better equipped with an efficient means of distribution, as well as the national brands they market.

Leading establishments in this classification included WH Braum Inc., based in Oklahoma City, Oklahoma, Farm Stores Inc. of Miami, Florida, Yogurt Ventures USA Inc. located in Atlanta, Georgia, and Heritage Dairy Stores Inc., headquartered in Thorofare, New Jersey.

- 311811 (Retail Bakeries)
- 445210 (Baked Goods Stores)

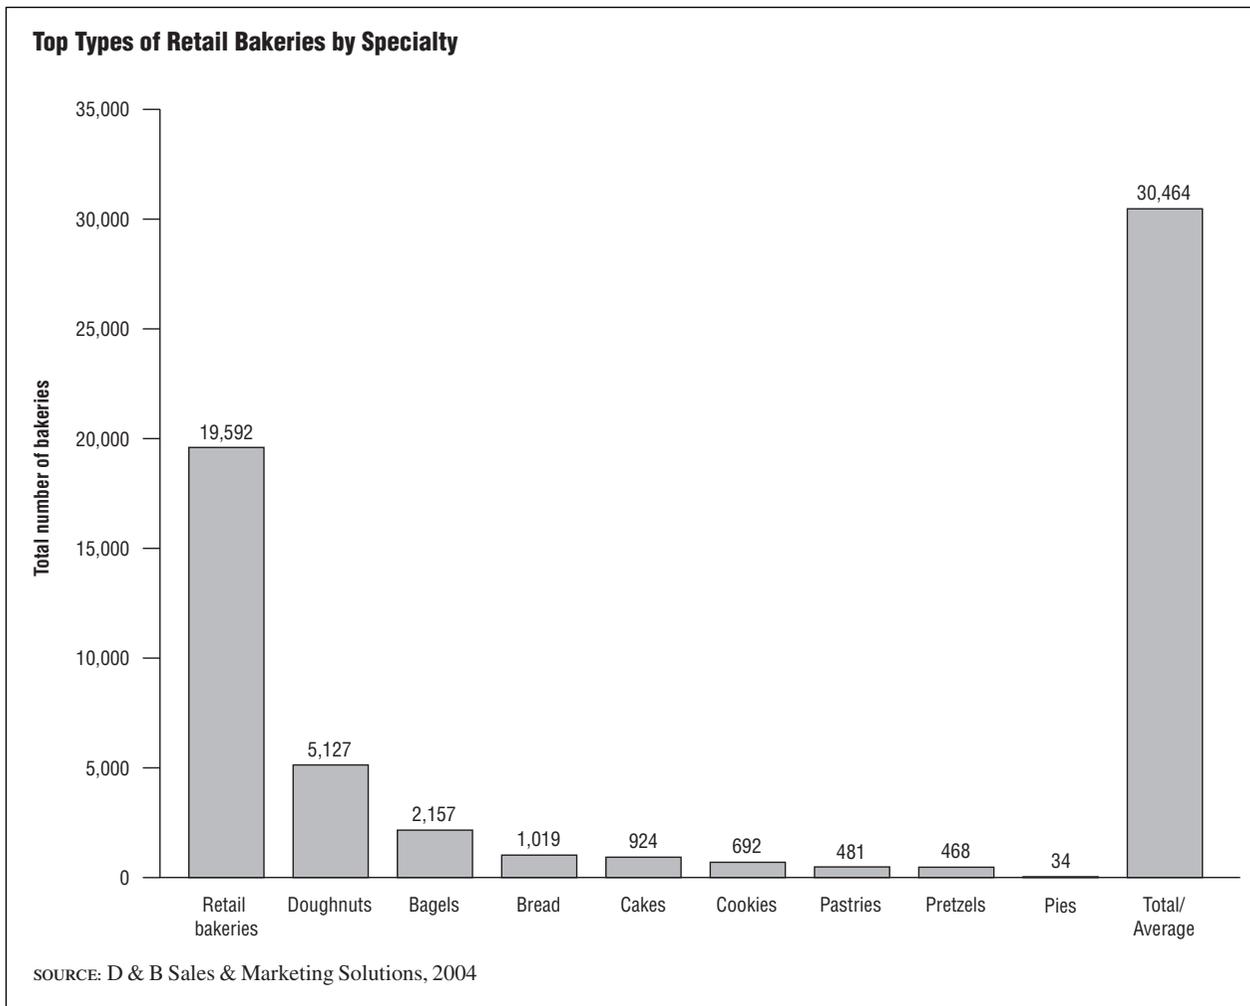

SIC 5461

RETAIL BAKERIES

This category includes establishments primarily engaged in the retail sale of bakery products. The products may be either purchased from others or made on the premises. Establishments manufacturing bakery products for the trade are classified in **SIC 2051: Bread and Other Bakery Products, Except Cookies and Crackers**; **SIC 2052: Cookies and Crackers**; or **SIC 2053: Frozen Bakery Products, Except Bread**. Those purchasing bakery products and selling house-to-house are classified in **SIC 5963: Direct Selling Establishments**.

According to D & B Sales & Marketing Solutions, there were 30,494 retail bakeries in 2003. Retail sales were approximately \$6.2 billion. The bakery industry employed about 209,922 people, and the average number of employees per bakery totaled about seven workers. The bakery industry continued to experience growth in the 2000s according to a report released by the *U.S. Food Marketing System*. Specialized food stores, which include retail bakeries, expanded with the “growing popularity of cookie shops and bagelries.” In fact, bakeries are considered the largest segment within the specialized food stores category.

Most of the retail bakeries are located in California with 5,219, followed by New York with 2,963, Texas with 2,456, Florida with 1,635, Pennsylvania with 1,339, Massachusetts with 1,246, and Illinois with 1,154. Com-

bined, these represented more than 57 percent of market share.

The retail bakery segment alone accounted for 19,592 bakeries, and controlled over 64 percent of the market. The doughnut segment represented 5,127 bakeries and about 16 percent of the market. The bagel segment numbered 2,157 bakeries and accounted for 7 percent of the market, while bread numbered 1,019 bakeries.

Unlike other segments of the retail grocery industry that experienced steady loss of market share to competing supermarkets and superstores throughout the 1990s, the retail bakery industry experienced steady growth. According to *Dun's Census of American Business*, there were 30,530 retail bakeries in 1996 and 32,530 in 1997. Retail sales increased from \$6.5 billion in 1995 to \$6.9 billion in 1999, according to *Ward's Business Directory of Private and Public Companies, 1999*. This growth was attributed to new retailing strategies, new products, and consumers' increased demand for bakery goods. According to Peter Houstle, Vice President of the Retailer's Bakery Association, the ability to merge the independent baker with the supermarket was crucial to the industry's survival. In *Bakery Production and Marketing*, Carol Meres Kroskey wrote that a number of supermarkets opted to house bakeries of regional and national brands rather than expand in-house bakeries. Furthermore, products like the bagel experienced tremendous growth during the mid-1990s, adding significantly to the industry's overall growth.

The majority of stores in this classification are small, employing less than four persons and having sales around \$100,000. More than 18,000 stores had sales in this range in 2003, and 814 stores reported sales under \$80,000. There were 29,390 stores that had sales between \$100,000 and \$249,000; 231 stores had sales between \$250,000 and \$499,000; and about 56 that reported sales of more than \$5 million.

New World Restaurant Group, Inc. of Golden, Colorado, led the market in 2002 with \$398 million in sales. Moving up were Saint Louis Bread Company, Inc., operating under Panera Bread Company of Richmond Heights, MO, with sales of \$277 million; Winchell Donut Houses of Santa Ana, California, with estimated sales of \$60 million; and Cinnabon of Seattle, Washington, with estimated sales of \$65 million. New World Restaurant Group, Inc. continued to lead with sales of \$383.3 million for 2003, and Saint Louis Bread Company also posted increased sales of \$355.9 million.

SIC 5499

ALL OTHER SPECIALTY FOOD STORES

This industry covers establishments primarily engaged in the retail sale of specialized foods not elsewhere classified, such as eggs, poultry, health foods, spices, herbs, coffee, and tea. The poultry stores may sell live poultry, slaughter and clean poultry for their own account, and sell dressed fowls, or sell fowls cleaned and dressed by others.

NAICS CODE(S)

- 445210 (Meat Markets)
- 722211 (Limited-Service Restaurants)
- 446191 (Food (Health) Supplement Stores)
- 445299 (All Other Specialty Food Stores)

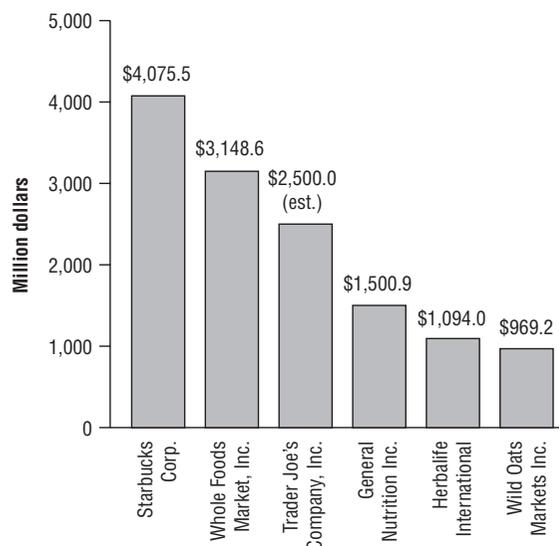

Industry leader Herbalife International Inc. of Los Angeles, which generated 1998 sales of more than \$1.6 billion, foundered in the late 1990s amidst plummeting stock prices and persistent allegations of foul play. From 1985 FDA findings of unsafe ingredients in the company's diet shakes and the California Attorney General's litigation for pyramid scheme practices, to a 1999 privatization bid that left investors in the lurch, Herbalife's growth, not surprisingly, slowed considerably.

The two biggest natural foods markets, Whole Foods Market Inc. of Austin, Texas and Wild Oats Markets Inc. of Boulder, Colorado, both launched World Wide Web sites in 1999 to extend their in-store sales. Whole Foods, which placed second in the industry with sales of almost \$1.6 billion for its fiscal year ended September 30, 1999, limited its budget for promoting this Web site to \$3.8 million, relying mostly on in-store ads and incentives to employees for encouraging customers to register with the site. Wild Oats, which placed fifth in the industry with sales of almost \$399 million for its fiscal year ended January 2, 1999, hosted a Web site featuring real-time inventory and automatic updates to accounting ledgers.

Pittsburgh-based General Nutrition Inc. placed third in the industry with sales of more than \$1.4 billion for its fiscal year ended January 31, 1998. Seattle-based Starbucks Corp., placed fourth in the industry with sales of

Industry Leaders in the Specialty Food Stores Industry, 2003

By sales, in millions of dollars

SOURCE: 2003 sales figures were taken from individual company websites

more than \$1.3 billion for its fiscal year ended September 27, 1998.

In the late 1990s, the fastest-growing sector of this industry was coffee stores, which typically sell coffee beans, ground coffees, and cups of brewed coffee ready to drink. Coffee stores represented the second largest segment of the industry behind health food and vitamin stores, which accounted for more than half of the estimated 7,900 establishments operating within this industry in 1996. Marianne Wilson observed in *Chain Store Age* that the tremendous surge in self-care positively impacted the health food and vitamin industry throughout the 1990s. Also represented in large numbers were gourmet food stores and water stores. Together, these stores reported sales of an estimated \$3 billion in 1996, averaging about a 4 percent annual rise in sales since 1992.

The gourmet food retail section of this industry was also profitable throughout the 1990s. These food stores are known for their more expensive lines of foods and specialty items not typically sold at regular food stores. Despite higher prices, these businesses performed well during the economic recession of the late 1980s and early 1990s. According to *Progressive Grocer*, these stores weathered the recession because their clientele were not bargain shoppers in the first place, and because, in general, people were going out less and entertaining more at home.

SIC 5511

MOTOR VEHICLE DEALERS (NEW AND USED)

This classification is comprised of establishments involved in the retail sale of new automobiles and light trucks. These establishments are franchised retail outlets for domestic and foreign automobile manufacturers. Products include passenger cars, pickup trucks, and minivans. Many establishments also sell used vehicles, replacement parts, tires, batteries, and other automotive accessories. In addition, many operate service departments.

NAICS CODE(S)

441110 (New Car Dealers)

INDUSTRY SNAPSHOT

The number of new car dealerships has been declining steadily since the late 1980s. According to the National Automobile Dealers Association (NADA), as of January 1, 2002, there were 21,800 total new car and light truck dealerships in the United States. This number represented a decrease of 350 dealerships from the previous year. A number of factors, including weak economic conditions and industry consolidation, attributed to the brisk decline in 2001.

Despite a decline in the number of dealerships, new car dealers achieved healthy combined sales increases in the early 2000s. Sales increased 7 percent in 2000 and 6 percent in 2001, reaching a record \$690 billion. The new car and truck sales category is one of the largest within the retail sector.

New auto sales for 2001 reached a total of 17.1 million units. That total included a little more than 8.4 million passenger cars and about 8.7 million light-duty trucks. Sales of light trucks outpaced cars for the first time in 2001, consistent with past predictions of industry analysts.

The total number of cars in operation continued to rise. According to the NADA, the total number of vehicles in use in 2001 was 216.7 million—approximately 128.7 million cars and 88 million trucks. Of these, more than 38 percent were more than 10 years old, almost 26 percent were between 3 and 6 years old, more than 22

percent were 7 to 10 years old, and almost 14 percent were less than 2 years old.

New car dealerships traditionally were comprised of three profit-making departments: new car sales, used car sales, and service and parts. According to the NADA, the average dealership profile in 2001 was: new-vehicle department sales were a little more than \$18.8 million, used-vehicle department sales were at about \$9.2 million, and parts and service totaled approximately \$3.7 million. Total dealership sales increased throughout the 1990s and early 2000s.

ORGANIZATION AND STRUCTURE

Despite the large numbers of automobiles sold in the United States, auto manufacturers had relatively few customers. Manufacturers' customers consisted primarily of their franchised dealers. Dealerships purchased cars and light duty trucks from manufacturers, and in so doing they obtained ownership of the vehicles. The millions of people who made retail auto purchases were customers of the dealerships, not the manufacturers.

Because the car-buying public made purchases from franchised, individual dealers, manufacturers had no authority to establish fixed vehicle prices. Manufacturers were able only to suggest retail prices because price fixing was forbidden by law under statutes prohibiting the restraint of trade. Dealers, who were independent businesses, were legally free to negotiate selling prices with their customers.

Many new car dealerships were members of the National Automobile Dealers Association (NADA). NADA was formed in the post-Depression era to represent dealers' interests in coping with legislative issues and in negotiating areas of concern with manufacturers. In 1988 NADA members accounted for 79 percent of the nation's dealers. NADA membership steadily increased and by 1992 accounted for 83 percent of U.S. new car dealers, representing about 19,500 franchised new car and truck dealers. By late 2002 this number had fallen slightly to 19,400.

Another organization representing the interests of some automobile dealers was the American International Automobile Dealers Association (AIADA). In 2002 AIADA claimed membership of 10,000 American-owned businesses that sold and serviced automobiles with overseas nameplates. AIADA's mission was to represent its members' views on issues such as U.S. trade policy, domestic content requirements, taxes, fuel economy, and antipollution legislation. AIADA also undertook studies of the positive aspects of international automobile trade, focusing on its benefits to U.S. consumers, the national employment situation, and the economy.

BACKGROUND AND DEVELOPMENT

Early in the twentieth century, carmakers became increasingly proficient at producing automobiles. Mass production techniques necessitated mass distribution, and that developed a system of selling cars through dealers who held exclusive franchises.

During the early decades of the 1900s, market conditions—driven by excess demand and limited supply—left dealers largely unprotected against territorial infringement and forced them to accept whatever conditions a manufacturer offered. Under a typical franchise agreement, a dealer was limited to the selling of a specific line of new cars, usually the products of one company. Dealers were required to accept vehicle quotas, and the quota limit was established by the manufacturer. Dealers were required to pay for cars upon delivery, and manufacturers held the right to cancel dealer franchises.

The preexisting availability of a widespread dealer network helped some of the major automakers become established during their early years. For example, before he entered the automotive industry, William C. Durant (who went on to become the founder of General Motors Corp.) sold carriages and wagons through a network of Durant-Dort dealerships. When Durant assumed control of Buick in 1904, the Durant-Dort dealerships began to sell Buick automobiles. In 1906 they sold 1,400 vehicles, and in 1907 they sold 8,800. Studebaker, another company with prior experience selling wagons and carriages, also entered the automotive industry with a pre-established, widespread network of dealers. Other car manufacturers developed dealership networks by granting franchise rights to independent selling establishments. Most new car dealers also provided repair service for the vehicles they sold. Packard, in 1903, became the first company to offer factory training for repair personnel.

The Ford dealership network developed quickly in response to the popularity of the Model T. By 1914 the company boasted 7,000 dealers. In order to help owners keep their cars running, Henry Ford pressured his dealers to stock replacement parts. The practice became established as an industry standard that others followed.

The practice of making financing arrangements for new car purchases also began during the early decades of the twentieth century. The idea of financing was not unique to cars. Isaac Singer helped increase sales of sewing machines during the middle of the nineteenth century by offering financing. Studebaker embraced the concept in 1911, and General Motors established the General Motors Acceptance Corporation in 1919. Although Henry Ford held a personal bias against granting credit to customers, many Ford dealers offered the service.

By the middle of the 1920s, three out of four new car purchases were made on the installment plan. A typical agreement called for a down payment of one third and the remaining balance to be paid over a 12-month period. In 1925 auto dealers made an estimated \$2.5 billion in loans to finance new car purchases. The repossession rate was 2.09 percent.

By the 1920s the practice of trading in an old car and using it as a down payment on a new one was also well established. By the end of the decade, approximately 80 percent of new car purchases involved trading in an old car. Profit on used cars was small, and dealers disliked used cars because they took customers away from the more profitable new car market.

Other changes also occurred within the auto market during the 1920s. While previous decades had seen demand exceed supply, the market became saturated, and the supply of new cars began to exceed demand for the first time. Ford, struggling with financial restructuring and facing a depressed market for its products during 1920 and 1921, raised money by shipping unwanted vehicles to its dealers, who were required to buy them or lose their franchises. Although the practice bankrupted some dealers, most were able to sell the extra vehicles, and the cash flow enabled Ford Motor Company to survive its crisis.

Ford dealers, however, continued to lose sales during the mid-1920s, as Americans shopped around for cars. Other manufacturers had instituted annual model changes featuring innovations and offering speed, comfort, and styling in addition to mere transportation—which had been the Model T's claim to fame. An estimated 70 percent of Ford dealers lost money in 1926 as a result of lagging Model T sales. Ford dealers asked Henry Ford to produce a new model, and in 1927 the company announced plans bringing the Model T era to a close. The Model A appeared for the 1928 selling season.

Enthusiastic interest in Ford's new model netted deposits on 125,000 units, sight unseen. When sample models were manufactured and displayed, the American public gathered to see them. In places where no actual model was available, people lined up to see photographs. According to one estimate, 25 million Americans, about 20 percent of the nation's population, saw a sample Model A at a dealership or special showing within a week of the model's introduction. After the Model A had been offered for two weeks, 400,000 orders had been taken.

Excitement within the industry proved short-lived. The Depression years devastated auto sales. Nationwide, General Motors' dealers sold 5,810 cars during the entire month of October 1932. The figure approximated the number sold on a single weekday during 1929. Some analysts blamed the industry's reliance on credit for the

severe impact it felt during the early Depression years. People were simply unwilling to go into debt when the future was uncertain.

Depression era difficulties exacerbated weaknesses in the dealer franchise system. Manufacturers put increased pressure on dealers to sell cars and canceled franchises arbitrarily. As a result of such abuses, dealers formed the National Automobile Dealers Association (NADA). Although NADA initially wielded little power because a lack of unity prevented the organization from making immediate changes, it eventually evolved into the industry's largest trade association.

During World War II, automakers refocused their energy on providing products for the war effort. With few new cars available, dealers increased their participation in the used car market. Following the war, many people were ready to enter the new car market, and demand quickly outstripped supply.

In an effort to help reduce the possibility of runaway inflation throughout the economy, the Office of Price Administration issued an order that all car selling prices had to be held to their 1942 model year levels. At the same time, manufacturers were slow to return to prewar production levels because of problems surrounding the changeover and strained labor relations. Price ceilings combined with curtailed production led to a shortage of vehicles. Dealers took full list price and offered little on trade-ins. Some dealers were criticized for taking advantage of the shortage by offering cars only with extra, high-profit accessories, demanding prices over list, and accepting bribes to make delivery. The situation improved somewhat following the end of price regulations in 1946.

In the postwar years, NADA obtained legislative victories for dealers at the state and national levels. Two principle areas concerned territorial rights and manufacturers' ability to arbitrarily cancel franchises. Prior to World War II only five states protected franchise holders: Wisconsin, Iowa, North Dakota, Florida, and Mississippi. After the war the number increased to 20 states, but enforcement remained difficult. Although franchisee protection laws theoretically safeguarded dealers from arbitrary franchise cancellation and against the practice of being required to accept and pay for unordered shipments, some abuses continued. Territory preservation also remained difficult, as manufacturers established more and more retail outlets in their efforts to increase market share.

The federal government enacted the Dealers Day in Court Act of 1956 to further protect dealerships from detrimental manufacturer actions. Although the law banned coercion and intimidation, it permitted persuasion and urging. Some automotive historians speculated that

the statute's principle effect was to urge manufacturers to restructure their relationships with their dealers and avoid future, possibly more demanding, legislation.

In addition to passing laws to protect dealers from manufacturers, Congress also passed laws to protect the car-buying public from dealers. The Monroney Act, for example, required dealers to attach stickers to new automobiles when they were offered for sale. The labels were required to state the suggested retail selling price, specify items considered standard equipment, and list available options along with their suggested prices.

By 1970 almost 31,000 new car dealerships were operating in the United States. Their numbers, already trimmed from the 47,000 in operation in 1950, began diminishing further. Domestic makes lost market share to imports, car sales slumped during economic downturns, and dealers slashed prices and profits on new car sales in order to move their inventories. Some dealers closed, and others merged. Industry-wide consolidation brought decreasing numbers and changing types of new car dealerships. In 1982 NADA reported 25,700 dealers remaining. They included 8,600 small dealers with annual new-unit sales of less than 150, and 3,500 high volume dealers with annual new unit sales in excess of 750. By 1993 the total number of dealerships had diminished further to 22,950. Of these, only 5,300 were small dealers, but the high volume category had grown to 5,700.

The changes within the industry also altered dealerships' revenue sources. Although total sales dollars from new vehicles remained the largest portion of receipts, the new vehicle department no longer represented the largest portion of profit. According to NADA statistics, in 1978 new vehicle departments had represented 74.7 percent of average dealership profit; used vehicle departments accounted for 23.7 percent; and service and parts departments 1.6 percent. By 1985 profit-making segments of dealerships had shifted. New vehicle departments still accounted for most profits, 78.5 percent, but growing service and parts departments were responsible for 14.5 percent. Used vehicle departments represented the smallest portion, 7 percent. By 1992, however, the picture had changed again. NADA statistics revealed that the service and parts department accounted for 66.5 percent of the average dealer's profits. The used vehicle department accounted for 32.5 percent, and the average dealer obtained only 1 percent of its annual profits from its new vehicle department. Most of that profit was attributed to aftermarket sales, such as financing, insurance, and extended service contracts rather than the actual sale of a new car.

During the first two years of the 1990s, auto dealerships faced recessionary conditions. In 1990 the average dealership profit, measured as a percent of sales, stood at only 1 percent, and one out of every four dealerships lost

money. NADA reported that the average dealership's new vehicle department operated at a loss in 1990 and 1991 before returning to profitability in 1992. The profits were slim, however, equaling about \$3 per new vehicle sold at retail. Although conditions began improving during the end of 1992 and in 1993, industry watchers predicted profit margins would remain low.

To cope with the severe financial conditions, dealerships began restructuring efforts to make more efficient use of capital and to increase employee productivity. One measure was the increased presence of multiple-franchise dealerships. According to NADA, by 1993 more than 30 percent of dealerships belonged to chains, and the average dealership had at least two franchises. Although the trend led some analysts to forecast an eventual end to the franchise system, NADA predicted its continuation and a slowing rate of dealer consolidations. At the same time, manufacturers such as Ford Motor Co. and General Motors Corp. launched efforts to shrink the number of dealerships, a move that would increase dealer profitability, allow more attention to service, and help boost brand images.

Megadealers and auto malls were two emerging forces in the industry. Megadealers were those who sold multiple kinds of automobiles either at one location or at several locations. Auto malls were large, single locations offering numerous types of cars. Two types of auto malls were "enclosed" and "open air." Enclosed auto malls were typically comprised of the different franchises owned by one megadealer. Open air malls were typically a gathering of independent dealers on adjoining lots. In 1992 there were 117 auto malls in the United States and 5 in Canada. One auto mall under construction in Nevada was planned to include 20 franchises. Some forecasters estimated that 350 auto malls would be operating in North America by 2005.

Auto manufacturers did not universally accept multiple franchises at a single location. For example, Mitsubishi enforced a policy against the practice. In 1993 five Mitsubishi dealers threatened suit against the manufacturer, claiming that they would go out of business unless they were permitted to combine with other franchises. Mitsubishi claimed that dual franchises produced fewer sales.

Another factor that helped auto dealers begin to recover from the conditions of the early 1990s was falling interest rates. In 1992 new car loans dropped below 10 percent, and the average loan length fell to 54 months, the shortest since 1987. Falling interest rates also helped dealers reduce floor plan interest expense, the interest they paid on money borrowed to finance cars in inventory.

In their own efforts to increase auto sales, car makers instituted programs that tied dealer sales incentives to Customer Satisfaction Indexes (CSI). NADA reported that dealership spending to increase customer satisfaction succeeded only in creating more demanding customers. In addition, the contests for sales incentives forced dealers to compete with other same brand dealers, thereby cutting profitability. NADA further claimed that a high CSI did not help dealers retain customers, and that 80 percent of the customers who had a loyalty to a particular make of car still shopped comparatively between dealers.

In addition to the diminished profits on new vehicle sales, auto dealers received reduced income on aftermarket items. As manufacturers offered longer warranties, fewer car purchasers opted for extended service contracts. As technology improved rust resistance, fewer buyers bought rust prevention packages. Antitheft systems, however, represented a growing aftermarket category. Systems included numbers etched into windows, starter interrupters, alarms, and radar tracking devices. Antitheft devices were especially popular among buyers using long-term financing. Under long-term financing agreements the amount outstanding during the early years of a loan was often greater than the vehicle's value. To protect car buyers from losses associated with the theft of such cars, manufacturers of antitheft systems often provided guarantees to reimburse owners for insurance shortfalls.

As new vehicle sales departments experienced falling profits and even losses, parts, service, and body departments became increasingly important. In 1992 parts and service profits accounted for almost 70 percent of total dealership profits, with profit margins of 5 to 6 percent—significantly higher than the 1 to 2 percent margins realized in vehicle sales. Because dealer service departments traditionally served vehicles less than five years old, dealers expected the sales slump of 1990 and 1991 to reduce the growth possibility within their service departments. Some losses, however, were expected to be offset by increases created through extended manufacturer warranty work and as a result of the increasingly complex electronic equipment and pollution abatement devices in cars.

To accommodate more customers and increase opportunities to provide service, many dealers were expanding their service hours. By 1992 almost half of all dealers offered hours beyond traditional workday hours. According to a NADA survey, 11.2 percent offered evening hours; 30 percent offered weekend hours; and 8.6 percent offered both evening and weekend hours. The average service department was open 51 hours per week. Some dealerships were also considering opening satellite service centers in residential areas, so car owners could have their autos serviced by qualified dealer technicians

without sacrificing convenience. A few even initiated home pickup and delivery for vehicles in need of service.

Used car sales provided another growing source of income to new car dealers. In 1989 new car dealerships sold more used vehicles than new ones for the first time since World War II. Used vehicle profits increased 50 percent in 1992. In that year, new vehicle dealers sold 15.1 million used vehicles and only 12.8 million new ones. Net profit on an average used car was \$236, compared with an average on a new car of \$3. Approximately 65 percent of the used vehicles sold were obtained from trade-ins. The remaining came from sources such as street purchases and auctions. By 1996 used cars had become even more important; new vehicle dealers sold close to 20 million used cars in that year with an average net profit of around \$259 versus \$77 on each new vehicle sold.

One important category of used cars was the "nearly new" car. These cars, called "program cars," were sold by automakers to rental fleets with guaranteed buy-back provisions. As manufacturers increased subsidies to daily rental companies in an effort to increase sales, the length of time cars were kept shortened. As a result, manufacturers were buying back three- and four-month-old cars with low mileage. Program cars were sold to dealers at auctions, and dealers resold them to the car-buying public with warranties intact but at prices often thousands of dollars below new car list prices.

Although many dealers enjoyed the extra per-vehicle profits associated with program cars, they also complained that the practice undermined potential sales of new cars. As a result, auto manufacturers began to cut back on the number of program cars by requiring rental companies to hold cars longer. Program cars peaked at an annual volume of 1.3 million vehicles during the early 1990s and then began declining. In 1993 mileage on program cars was 10 to 12 percent higher than it had been in 1992. As the number of program cars declined, new car dealers turned to other sources to supplement the offerings on their used car lots. These included vehicles from auctions, wholesalers, repossessions, seizures, and lease returns.

Lease returns, in particular, had become a primary source of used cars by the mid-1990s, as leasing spread from the corporate to the consumer markets. Franchised new car dealers were particularly well positioned to take advantage of the boom in used car sales in spite of fierce competition from used car superstores. As NADA president, John Peterson, said at the association's 80th annual convention in February 1997, "There is still plenty of opportunity out there for us, because the future of the used car business is about supply. As franchised new car dealers, we have first access to trade-ins, first access to off-lease vehicles and first shot to buy smart at the

auctions.” A 1996 NADA report confirmed this view, noting that franchised new car dealers were taking in and selling a higher percentage of trade-in vehicles and earning higher gross margins on them than vehicles purchased from other sources. Nearly 50 percent of used car sales in the first nine months of 1996 involved a trade-in to the selling dealer, compared to 38 percent in 1982.

Industry watchers expected used vehicle departments to continue providing a significant contribution to dealership profits. Economic factors, such as slow growth, stagnating family income, and the ever-increasing price of new vehicles, were expected to keep a larger segment of the population out of the new car market. In 1996, for example, the average selling price of a new vehicle was \$22,000, compared to \$11,600 for a used vehicle. In addition, used vehicle certification programs, manufacturer interest in protecting residual values, and a greater emphasis on brand loyalty combined with the increasing quality and reliability of cars, served to enhance the image of used cars and therefore made them more acceptable to former new car buyers in the used car market.

Another challenge facing automobile dealers was improving public perception and countering negative stereotypes based on past practices and abuses. NADA reported spending \$1 million to develop a program aimed at helping dealers market themselves and their products, as well as to promote ethical and moral business practices. The program, launched at NADA's 1992 convention, provided sales training and certification in an effort to bring increased professionalism to the industry.

One area identified as a potential cause of negative impressions was the practice of bargaining over car prices. Because sales people traditionally sold cars on a commission basis, buyers sometimes felt they were being pressured to make purchases or given incorrect or misleading information. As a result, some dealers began switching to one-price selling during the early 1990s. Although one-price selling was not a new concept, its popularity flourished after it was embraced by General Motors's new Saturn division. Under one-price policies, dealers put a nonnegotiable price on a car and theoretically did not bargain. In practice, sticker prices fluctuated according to ever changing market conditions, and bargaining occurred over the value of trade-ins, accessories, and sometimes the actual vehicle price.

According to a report published by *Automotive News*, the number of dealers instituting one-price selling policies was increasing. In 1992 more than 1,600 dealers were “no-haggle” dealers, up 70.8 percent from 1991. Their numbers were expected to reach 2,265 in 1993. Sometimes in making the switch, dealerships replaced their commissioned sales people with salaried “sales consultants” or “greeters.” Dealers adopting one-price

selling policies expected to improve customer loyalty through building better human relationships.

Another trend observed during the early 1990s was toward short-term leasing. As Richard Strauss, former president of NADA, explained in *Automotive News*, “Retail leasing is changing the industry. Two-year leases are good for the manufacturers, dealers and the customers because they shorten the trade-in cycle. We have to find ways to make cars more affordable.” Strauss pointed out that a 24- to 36-month lease returned customers to the dealership a lot quicker than 48- to 60-month financing plans. Off-lease cars also provided used cars for dealer-owned used car lots.

In addition to the challenges of changing economic times, dealerships confronted changing environmental regulations. The Environmental Protection Agency (EPA) provided guidelines regarding toxic wastes, emissions of volatile organic chemicals (VOCs), and the handling of chlorofluorocarbons (CFCs). In 1992 new EPA rules were adopted to exempt dealers from future liability regarding subsequent off-site oil spills. The regulations came after some dealerships that had sent waste oil to other companies for disposal or recycling were charged for cleanup costs at toxic waste sites.

New EPA rules concerning the release of VOCs from auto paints were expected to limit the availability of paint colors, and increase labor and training costs. EPA rules about CFC recycling mandated technician certification to service air-conditioning units. The cost of industry compliance was estimated at \$15 million. Other environmental regulations focused on proper disposal of gas, diesel fuel, antifreeze, degreasers, and brake fluids.

In the late 1990s, the auto industry experienced many consolidations by manufacturers (Daimler-Benz A.G. and Chrysler Corporation, November 1998 and Ford Motor Company's purchase of Volvo Car, March 1999) and by new car dealers. The decline in the number of franchised dealers to 22,076 in January 1999, indicated that the dealership base was transforming to larger, well-financed companies. These modern dealerships' goals were to reach high unit volume. Since they were multifranchised dealers, they tried to increase their opportunity for a sale by lumping together different franchises on one large property.

At the close of the twentieth century, the push to change the format for retailing automobiles was encouraged by U.S. manufacturers themselves. Ford Motor Company instituted *Auto Collection*, a retail venture, which they hoped to build into a national retail name. Their intentions included building multibrand superstores with large inventories, consolidating all Ford, Lincoln, Mercury, and Mazda stores in a market under a single ownership group, open satellite service centers with ex-

tended hours to compete with quick-oil-change shops, and switch dealerships to one-price selling. Typically, the transformation took place by dealers selling their stores to a new company and then Ford Motor and the dealers taking shares in the new venture. One dealer was then put in charge, and the others often took other positions in the company.

The Ford Retail Networks operating in the United States in early 1999 were in Tulsa, Oklahoma, and Oklahoma City, San Diego, Salt Lake City, and Rochester, New York. Ford enlisted Republic Industries, Inc. as an equity partner in the Rochester, New York, Auto Collection project. The retail network consisted of nine dealerships and was operated by Republic, but Ford Motor Company remained the majority shareholder.

In October 1999 General Motors announced its plan to enter the retail business. General Motors dealers thought that this was a declaration of war on independent dealers. The underlying factor behind GM's plan was to keep GM vehicles away from large dealer groups like AutoNation, Inc. GM feared their product would suffer when treated like a commodity by these superstores.

General Motors dealers felt that GM, after they analyzed the problem, came up with the wrong solution. GM looked to support from their dealers, emphasizing the threat by megadealers, but the dealers saw GM as the threat. The independent dealerships believed that factory stores would have an unfair advantage over them and threatened their existence.

The National Automobile Dealers Association (NADA) planned to lobby legislators to pass or tighten state laws that restricted automakers from selling their vehicles without a licensed dealer. Laws in 26 states restricted or banned automakers from owning retailers of their vehicles. In November 1999, after GM dealerships mobilized, General Motors halted their dealership plans.

CURRENT CONDITIONS

Through the third quarter of 2002, overall industry sales were stronger than they were at the same time in 2001. However, the industry's prosperity is not distributed equally across the board. As automotive dealers entered 2003, consolidation remained a key trend. According to *Automotive News*, the leading 100 U.S. dealerships sold more than 16 percent of all light vehicles in 2001. This is in stark contrast to 1996, when the top 100 accounted for only 9 percent of all sales. Even though overall sales fell slightly in 2001 (1.3 percent), *Automotive News* reported that the leading 100 U.S. dealerships achieved an increase of almost 3 percent.

To help offset the effects of a weak economy, auto manufacturers relied on a series of consumer incentives in 2001 to generate sales at franchised new car dealer-

ships. These included cash-back offers and zero-percent financing. While such tactics are useful for increasing sales in the short-term, they are difficult to sustain long-term, since they cost automakers interest income. Some industry analysts noted that the success of these incentives was starting to wear off by late 2002.

Because of quality improvements in automotive manufacturing, used vehicles were an increasingly important market for car dealers in the early 2000s. Consumers and lenders were more willing to take risks on high-quality used vehicles. According to the NADA, used vehicles continue to represent a significant profit center for dealers. Some 26 percent of the average dealer's operating profits was attributable to used vehicle sales in 2001. In addition, used vehicles accounted for 29 percent of the average dealership's overall sales in 2001, compared to 24.5 percent in 1991.

Special incentives like zero-percent financing has a negative effect on the sales of used vehicles. *Automotive News* indicated that, in late 2002, this was having an especially harsh impact on dealerships that concentrate on the sale of used vehicles. The publication also reported that, of the nation's leading 100 automotive dealers, more than 50 percent of used car sales were attributable to the top 10 dealerships in 2001. Furthermore, the top 10 used car dealerships saw their sales of used vehicles increase significantly in 2001, by almost 29 percent.

In 2002 J. D. Power and Associates conducted a study involving more than 27,000 new vehicle buyers. This study revealed the Internet's growing importance in the car-buying process. According to the study, "of the 60 percent of new-vehicle buyers who use the Internet while shopping, 88 percent visit automotive Web sites before arriving at a dealership for a test drive. The average automotive Internet user visits seven Web sites while shopping for a new vehicle and starts the online shopping process nearly two months before they purchase." Although the study found that third-party Web sites were the most widely used by consumers shopping for new vehicles, it explained that Web sites for automotive manufacturers and dealers were receiving increasing amounts of traffic. Dealership sites received an especially noteworthy increase in traffic, with levels rising 55 percent from 1999 to 2001.

The Internet also was coming to the forefront of manufacturer-dealer relationships. For example, in early 2002 the financial divisions of Ford, General Motors, and DaimlerChrysler announced plans to cooperatively launch an online system that would enable dealers to approve loans—and thus drive more sales—in a more expedient manner. The system also would electronically link dealers with other lenders, including banks and credit unions. Around the same time, Ford introduced a Web-

based service to help dealers locate vehicles at other dealerships.

One Internet-related dealer-manufacturer development was especially noteworthy. In late 2002 Daimler-Chrysler was in the process of establishing a Web portal called DealerCONNECT. According to *Automotive News*, by 2003 the automaker planned to require its dealers to use the portal for dealer-manufacturer communications. As the publication explained: "Dealers will need access to this portal to order vehicles and parts, submit warranty claims or do training or other business with the automaker." As of late September 2002, some 30 percent of dealers did not have the appropriate high-speed Internet connections in place to use DealerCONNECT.

INDUSTRY LEADERS

In 2002 AutoNation, Inc. was the largest automotive retailer in the United States. Their sales for 2001 included 712,000 vehicles, 454,000 of which were new. AutoNation also was the largest online retailer of both new and used cars in the early 2000s, earning \$1.8 billion in 2001. That year, the company had more than 370 automotive franchises (284 dealerships) in 17 states. The company's revenue from all departments in 2001 was \$20 billion.

United Auto Group, Inc. was ranked second in 2002. At that time, the company had 126 domestic franchises and 71 international franchises. Group revenue from all departments in 2001 was \$6.2 billion, an increase of more than 27 percent from the previous year. On April 12, 1999, Penske Capital Partners agreed to purchase the controlling share of United Auto Group, Inc., with Roger Penske to be the chairman.

WORKFORCE

According to statistics compiled by the NADA, franchised automotive dealers employed a record 1.1 million workers in 2001, including 228,900 salespeople, 265,500 technicians, 325,800 service and parts workers, and 309,700 supervisory and office personnel. In 2001 NADA figures placed average dealer employment at 52. However, this was much higher with the leading U.S. auto groups. For example, AutoNation, Inc. employed 30,000 people in 2001, and United Auto Group Inc. employed 8,500.

SIC 5521**MOTOR VEHICLE DEALERS (USED ONLY)**

This category covers establishments primarily engaged in the retail sale of used cars only, with no sales of new automobiles. These establishments also frequently sell used pickups and vans at retail. Establishments who sell both new and used cars are classified in **SIC 5511: Motor Vehicle Dealers (New and Used)**.

NAICS CODE(S)

441120 (Used Car Dealers)

INDUSTRY SNAPSHOT

The National Independent Automobile Dealers Association (NIADA) reported that 43 million used cars valued at \$370 billion total were sold in 2002, also noting that the average age of vehicles on the road was about 8.5 years. NIADA concluded that the used car sales would remain at about 40 million in the coming years. In 2003, used vehicles accounted for 28.3 percent of the overall market. According to the National Automobile Dealers Association (NADA), new car dealers purchased some 19.4 million used cars in 2003. NIADA also reported that there were more than 16,000 independent dealers in the United States in 2003. Many independent used-car dealers belong to NIADA, which reported that its members sold between one and two million vehicles annually and that the average used-car dealer has been in business for more than 22 years.

The majority of the independent dealers were concentrated in Texas with 7,465 dealerships. California had 5,217, Florida had 3,920, and Pennsylvania had 3,069. The largest segment was used automobiles only, a segment that commanded more than 77 percent of the market. Used car dealers had 20 percent of the market. There were 507 dealers of used trucks, tractors, and trailers, and 118 dealers of used pickups and vans.

BACKGROUND AND DEVELOPMENT

The used-car industry grew out of the automobile manufacturing industry. When manufacturers began encouraging their customers to trade in old cars and purchase new models, used cars became increasingly available. By the mid-1920s, used-car lots were a part of the American landscape.

The abundant availability of cheap used cars made car ownership within reach of almost everyone. In 1927, the average four-year-old "basic transportation" car sold for approximately \$100, and although low income families were unable to buy new cars, even on installment, approximately 64 percent of American families did own an automobile of some kind.

During the Depression years, sales of new cars plunged, but car usage declined only slightly. In 1929, 26,704,825 vehicles were registered. The number fell to a low of 24,159,203 in 1933. People kept their cars longer and looked to the used-car market when replacement was necessary. Used cars and trucks also served to carry thousands of displaced farmers from the Dust Bowl region into California.

As the nation emerged from the Depression, car sales increased. Vehicle registrations in 1937 topped the 30 million mark. Strengthening new car sales served to fuel the used-car market. In 1938, the nation's first automobile auction was held in South Carolina; the first car auctioned was a 1932 Ford Model A.

Used cars also played an important role during World War II. During the war, production of civilian automobiles halted, and once again people held onto their cars as long as possible. Sales of parts soared, and as cars wore out, people turned to used-car dealers for replacements. Used-car prices were controlled by the Office of Price Administration, but according to automotive historian, Stephen W. Sears, "under-the-table dealing frequently raised the price of old clunkers to more than they had cost new."

Following the war, auto manufacturers were slow to return to full production and demand for cars was high. The shortage enabled used-car dealers to continue the brisk business they had enjoyed during the war. By 1948, the number of vehicles on American roads exceeded the number of American households.

Short supplies and heavy demand led to abuses within the industry. During the 1950s legislative efforts were made to protect buyers from unscrupulous dealers. Most states passed laws requiring dealers to give potential buyers accurate information regarding the condition of vehicles. Laws were also enacted prohibiting tampering with odometers.

To help handle the volume of used cars in the American marketplace, auto auctions expanded. During the 1970s, there were approximately 180 auctions throughout the country. Until new car dealers increased their participation in the nation's auction network during the late 1980s and early 1990s, auctions were attended almost exclusively by used-car dealers.

Most new cars were eventually sold on the used-car market. According to a study undertaken by the Federal Highway Administration in 1984, average vehicle ownership was 7.2 years, but average vehicle lifetime was 12 years. A typical vehicle's lifetime mileage totaled 120,000 miles.

Federal legislation aimed at protecting used-car buyers was enacted in May of 1985, but not enforced until 1987. Under the terms of the so-called "Used Car Rule,"

dealers were required to post window stickers called "Buyer's Guides" describing a car's warranty. The stickers were required to state whether the car came with a full warranty, a limited warranty, or if the car was sold in "as is" condition with no warranty. The Buyer's Guides were legally part of the used-car sales contract and superseded any other claims. In addition, many states added protections, claiming that "as is" sales contracts carried implied warranties that cars were drivable.

Governmental agencies also addressed the problem of odometer tampering. In 1985, federal officials and the Pennsylvania Attorney General's Bureau of Criminal Investigation began an investigation into an odometer fraud scheme. Participants were accused of setting back mileage readings and fraudulently obtaining altered titles. The practice permitted unethical dealers to purchase low-cost, high-mileage cars and sell them at substantial profits.

During the early 1990s, as the U.S. economy experienced sluggish conditions, used-car sales surged. For the first time since World War II, sales of used cars and trucks surpassed sales of new vehicles at new car dealerships. In 1990, an estimated 32.1 million used vehicles were purchased from dealerships, used-car dealers, and through private transactions.

NIADA reported that there were 58,750 independent dealers in the United States in 1998, controlling 24 percent of the used car market. The average price of the used vehicles they sold was \$7,172. NIADA also stated that 52 percent of the independent dealer market procured credit through finance companies and that they accounted for 49 percent of buyers at auctions. In the United States, retail sales of used vehicles total approximately \$300 billion annually.

Legislative control over used-car sales also continued during the early 1990s at both the federal and state levels. In 1992, Congress passed a law requiring that all states use the same information on titles. One item of concern was the inclusion of permanent salvage brands on auto titles in all 50 states. The bill created a federal task force to focus on eliminating "title washing," a fraudulent procedure which cost U.S. consumers an estimated 3 billion annually. Title washing occurred when unethical used-car traders were able to purchase salvage vehicles and transfer them to a state that did not require a salvage notation on the title. Cars were rebuilt, retitled, and transferred back with clean titles.

CURRENT CONDITIONS

Used-car dealers obtain their vehicles through a variety of outlets. Chain and independent auto auctions offer vehicles retired from rental fleets. Auctions also make consignment sales on behalf of new car dealerships and insurance companies. Dealership cars most frequently came from trade-ins and insurance company offerings

resulting from totaled or theft recovered vehicles. Other sources of used cars include street purchases, purchases of government owned vehicles, repossessions, and seized vehicles.

Some used-car dealers sold cars to customers who made traditional arrangements for financing. Others provided their own financing to customers who were typically unable to arrange for conventional financing either because they were unable to make a sufficient down payment or because they were judged a poor credit risk. Used-car dealers who provided financing were sometimes referred to as "note lots." Note lots charged high interest rates to cover the expenses associated with high default levels.

The popularity of leasing new vehicles provides a steady supply of cars and trucks to the used-car market. The addition of late model cars and trucks increases the public's interest to purchase a used car. The improved quality and reliability of used cars and trucks along with the monetary savings of purchasing them expanded the used-car market to 40 million transactions a year.

The strength of used-car activity brings large franchise dealers into the market. Used-vehicle superstores use a "no-haggle" one-price sales approach in their retailing philosophy. Used-vehicle retailing had been a highly fragmented industry that, historically, had no single market share leader—the megastore concept changed that.

Advanced computer technology offers many possibilities to the used-car industry. One system under development is designed to help match buyers with available cars. Called the Vehicle Information Network, the system permits used-car dealers to list vehicles for sale. Car shoppers can call a toll free number to get a list of cars matching their needs. The system is funded through a fee charged to the dealers, and although it is not expected to take the place of more traditional forms of advertising, the possibility has promise as a supplemental form of advertising.

Computers are also being used to track car inventory costs. Some dealers feel that charges for items such as detailing and repairs are easily overlooked during the negotiating process. Computer programs help ensure that all expenses associated with a particular vehicle are considered and that a sale is profitable. In addition, computer software helps determine which cars sell the fastest, which are most profitable, and which are not moving. Another specialized software package helps appraise special interest vehicles such as antiques and other collector cars.

A different type of computer technology is used to develop diagnostic equipment. Dealers can more precisely determine the mechanical condition of cars on their

lots and even offer printouts of specific tests to potential customers. One diagnostic tool expected to be perfected uses ultrasound testing to determine if a car has been repaired by “clipping,” a procedure in which the vehicle is cut in half and the damaged half is replaced with parts from the same type of automobile.

According to J.D. Power and Associates’ 2003 UsedAutoShopper.com survey, online used car sales remained at 47 percent for 2002 and 2003. Scott Weizman, senior director of Internet research for J.D. Power, noted that the “zero percent financing and aggressive incentives may have dampened Internet usage.” However, Weizman forecast online sales of at least 50 percent for 2004. During that period, the average age for online shopping for used cars shifted from 40 to 44 years old. The study concluded that consumers still like to make a trip to the dealership prior to purchasing their used car online.

According to some data gathered from two leading auto auction companies, the wholesale prices for used cars showed signs of increasing in 2003. Tom Webb, Manheim’s chief economist, concluded that one cause was the incentives offered by the new car dealerships to clear out their 2003 inventory. In short, Webb stated, “heavy new—car incentives have a negative impact on used vehicle prices.” Car—Mart’s CEO, T.J. Falgout III, agreed in *Ward’s Dealer Business*, and added “As new car manufacturers scale back on incentives, the attractiveness of lower priced new cars will decrease.” However, auctions still showed positive results at 34 percent for 2003.

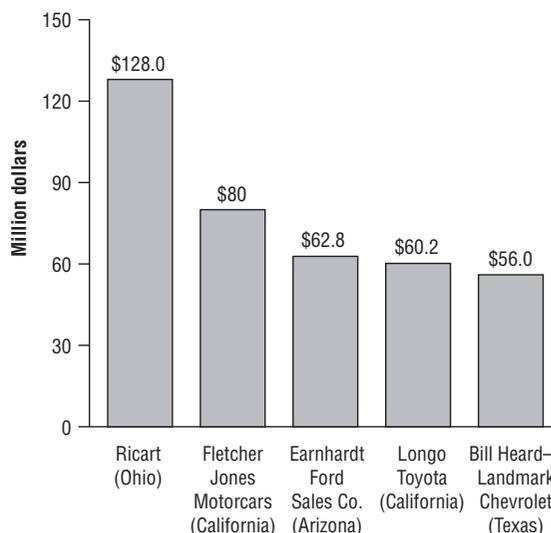

INDUSTRY LEADERS

AutoNation, Inc. was the largest automotive retailer in the United States in 1999. *Fortune Magazine* named it the fastest growing company in America. In 1998, Auto Nation entered the Fortune 500 list at number 151 and jumped to number 83 in the 1999 Fortune rankings. Auto Nation’s revenue was more than \$16 billion in 1998, an increase from 1997 revenues of \$9 billion.

CarMax was a subsidiary of Circuit City Stores, Inc. in 1999. Car Max generated sales of \$874.2 million in fiscal year 1998. In June of 1999, it had 30 used-car superstores in operation. The superstore, located at U.S. Route 1, just north of Laurel, Maryland, is the nation’s largest used-car retail location. Some additional leaders in 2002 include, Ricart, located in Ohio, Fletcher Jones Motorcars, and Longo Toyota, both located in California, Earnhardt Ford Sales Co., located in Arizona, and Bill Heard—Landmark Chevrolet, based in Texas. Combined, they generated about \$387 million in sales. AutoNation Inc. recorded \$19.4 billion in 2003 sales. As leader of the largest automobile retail chain, chairman and CEO Michael T. Jackson was honored with the Auto-

Leading Used Car Dealerships, 2002

By used car sales, in millions of dollars

otive Hall of Fame’s Industry Leader of the Year award in 2004.

RESEARCH AND TECHNOLOGY

General Motors was the first manufacturer to enter the used-car business and its Internet Web site could be a prototype for outlets nationwide. They chose Houston, Texas for this project because it was the fourth largest used-car market in the United States. Studies showed that Houston residents were also very open to Internet use. The Web site contained descriptions and set prices along with pictures of the car. Customers, after giving a refundable \$100 deposit, could set up an appointment to test drive the vehicle and, if desired, buy it on the spot.

SIC 5531

AUTO AND HOME SUPPLY STORES

This classification comprises establishments primarily engaged in the retail sale of new automobile tires, batteries, and other automobile parts and accessories. Frequently, these establishments sell a substantial amount of home appliances, radios, and television sets. Establishments dealing primarily in used parts are classified in wholesale trade, **SIC 5015: Motor Vehicle Parts, Used**. Establishments primarily engaged in both selling and installing such automotive parts as transmissions, mufflers, brake linings, and glass are classified in services, industry group 753 (Automotive Repair Shops).

NAICS CODE(S)

441320 (Tire Dealers)

441310 (Automotive Parts and Accessories Stores)

INDUSTRY SNAPSHOT

As a group, auto and home supply retailers participate in what is commonly referred to as the automobile aftermarket, a term referring to all the parts and services needed by motor vehicles after they leave the manufacturing plant. This broadly defined market includes the manufacturing and sale of fuel, lubricants, tires, batteries, brakes, accessories, and a host of other products used to maintain or heighten an automobile’s performance, or simply to improve its appearance. Additionally, the automobile aftermarket encompasses the installation or servicing of these products.

This multibillion-dollar market includes various types of retailers other than auto and home supply stores, such as oil companies, rubber companies, service stations, discount wholesalers, and department stores, all of which control a portion of the automobile aftermarket. Moreover, auto and home supply retailers, as defined by the *Standard Industrial Classification Manual*, participate in only a portion of the automobile aftermarket. They do not generate revenue from the sale of fuel, nor do they derive the bulk of their revenue from selling and installing transmissions, mufflers, brakes, or windshield glass. These establishments generally are franchised or

independent stores devoted entirely to selling, installing, or servicing a strictly limited number of automobile parts, such as the Midas brake and muffler chain, or Minit Lube, a chain specializing in lubricating automobiles.

Although consigned to a share of the automobile aftermarket, by both other retailers and the parameters of the *SIC Manual*, auto and home supply retailers generate an aggregate revenue measured in billions of dollars, the size of which is augmented by sales garnered from the industry’s other focus, home supplies. These products generally consist of goods such as refrigerators, television sets, radios, or essentially any item a retailer believes consumers will purchase. Although the combination of auto parts and home appliances under one roof seems an odd mix, the inclusion of home supply products in auto parts retail stores has roots stretching back nearly to the genesis of the auto parts industry itself. Intended to complement the revenue realized from the sale of auto parts, home supply products historically have played an integral role in the performance of auto and home supply stores.

Within the auto and home supply industry, there are several types of retailers, some selling only one product such as tires and others concentrating on one particular segment of the automobile aftermarket, such as vehicle accessories. “Speed Shops” are an example of the latter, offering products to increase, as their name suggests, the performance capabilities of a vehicle, which also can include an assortment of decorative merchandise. Some large tire manufacturers, such as Goodyear and Firestone, also operate retail stores devoted solely to selling their products, while the same is true of battery manufacturers.

On a broad level, the fortunes of the auto and home supply industry generally are dictated by economic factors that determine the welfare of nearly all retail, manufacturing, and service industries. Increases in the amount of disposable income held by consumers will have a favorable effect on auto and home supply retailers’ business, as will appreciable increases in the nation’s population, which eventually will mean more licensed drivers and more automobiles on the road. Also, significant increases in the number of new automobiles entering the market will boost retailers’ sales, as new automobile owners buy products to equip their new purchases.

But auto and home supply retailers also may realize higher revenue when these same conditions worsen, lending the industry the enviable characteristic of benefiting from both the good and the bad. Reduced consumer spending can increase, in certain circumstances, the business activity of auto and home supply retailers, primarily because automobile owners will be more inclined to repair their vehicles themselves, rather than paying for the services of a professional mechanic. Similarly, fewer new automobiles on the road generally means consumers are continuing to drive their existing, older vehicles.

Positioned as such, auto and home supply retailers have enjoyed steady, and sometimes prolific, growth since the emergence of the auto and home supply concept in the early twentieth century. But in the mid-1990s, various challenges portended substantial decline as the auto and home supply industry entered the twenty-first century. One concern was the increasing technological advancement and complexity of automobiles, which made them more difficult for consumers to repair themselves, thus redirecting business toward trained garage mechanics, and away from auto and home supply retailers.

A second concern was the proliferation of massive discount stores and wholesale distributorships, which led to a greater representation of these types of retailers in the automobile aftermarket, further shrinking auto and home supply retailers' customer base. To help dampen the effects of this potentially deleterious situation, more and more retailers involved in the industry began placing an emphasis on service by including additional service bays within their store format. Other concerns included the consolidation of the auto and home supply industry into just a few very large companies and the challenges presented by computers in this industrial-age business.

ORGANIZATION AND STRUCTURE

The auto and home supply industry is a densely populated niche within the automobile aftermarket, with stores fairly evenly distributed throughout the nation. In 1980, there were 35,200 establishments in operation. That number spiraled to 46,000 in 1987. During the late 1980s, a combination of store closures and consolidations blew through the ranks of auto and home supply stores, dropping the nationwide total to approximately 41,300 by the early 1990s. Industry employment has declined in recent years, falling from 408,300 people in 1997 to 405,840 in 2001.

In 1980, auto and home supply retailers registered \$18 billion in sales, a total that increased by some 40 percent to \$25.2 billion in 1985, just five years later. The number increased dramatically again in the three years between 1985 and 1988, to \$30.3 billion. By 1989, growth had begun to taper to \$31.7 billion, which grew to \$34.2 billion in 1990. The increase from 1989 to 1990 would be the last significant gain for several years, as a global economic recession negatively affected nearly all sectors of retail trade. The industry achieved steady growth throughout the 1990s, with sales totaling more than \$59 billion by 1995 and almost \$72 billion in 1999.

The composition of the auto and home supply industry changed during the 1980s, as multi-unit corporations increased their representation in the industry. This growth of auto and home supply chain stores followed the general retail trend toward larger stores. Larger inventor-

ies enabled retailers of all types to lower prices and, consequently, attract more customers—a concept and format auto and home supply retailers adopted with increasing frequency throughout the decade. In 1980, corporations with 11 or more auto and home supply retail outlets accounted for 26 percent of the industry's total sales, a proportional representation that increased by the decade's close, when multi-unit organizations accounted for 31 percent of the industry's total sales. By the early 1990s, firms with 10 or more establishments represented 43 percent of total sales. A poor economic climate in the 1990s exerted further negative effects on smaller independent auto and home supply retailers, forcing some to exit the business. Rapid consolidation continued to impact the industry throughout the 1990s and into the early 2000s. However, the Automotive Aftermarket Industry Association (AAIA) reported that by 2001 merger and acquisition activity was beginning to slow down.

BACKGROUND AND DEVELOPMENT

Auto and home supply stores date back to the early twentieth century, emerging roughly at a time when automobiles themselves were becoming a common sight on American roadways. Western Auto Supply Co., the industry's first retailer to achieve widespread success, was founded in 1909 as a mail-order company, and opened its first outlet in 1913. It is fair to assume, however, that smaller, local stores were in operation before this time, though there are few existing figures for the scale of their operations.

It was a time when automobile owners purchased nearly every auto part or accessory they needed from automobile dealers. Auto parts retailers sold a limited selection of products and only products intended for use with automobiles. It would be roughly 20 years before household merchandise would begin to appear on the shelves of auto parts stores, and then only to a limited extent. Instead, retailers relied on the sale of basic auto parts and supplies, such as antifreeze, polish, and other related items. But the growth of auto supply retailers during those fledgling years was severely restricted by the overwhelming command of the automobile aftermarket enjoyed by automobile dealers, whose only appreciable competition came from automobile repair garages.

It would be several decades before any type of retailers—service stations, garages, or repair specialists—would begin to wrest control of the automotive aftermarket away from automobile dealers. Nevertheless, the small auto supply retail market already amounted to a considerable amount of money, enough that even a small percentage represented a sufficient incentive for additional auto supply stores to join the fray. Several future auto supply empires emerged in the 1920s, particularly Pep Boys—Manny, Moe, and Jack, and

Gamble-Skogmo Inc., both of which began operations in 1925. By this time, automobile dealers' control of the automobile aftermarket's distribution channels had begun to slowly lessen as the number of repair garages increased. In 1920, automobile dealers commanded 99 percent of the market; 15 years later, their share of the aftermarket had fallen to 80 percent.

In the late 1930s, auto supply retailers began to sell nonautomotive merchandise in their stores as a rudimentary marketing ploy to attract customers. Because these stores catered primarily to male consumers, the nonautomotive merchandise consisted of what then were considered traditional male products, such as screwdrivers, wrenches, and other hardware items, as well as sporting goods and garden supplies. There was, however, no steadfast rule governing the selection of merchandise; retailers were merely fleshing out their display shelves to boost sales. These nonautomotive products represented roughly 20 percent of the average inventory held by auto parts stores in the late 1930s, and their product mix would become more balanced in the coming years.

By 1940, the automobile aftermarket had opened up considerably. From 1935 to 1940, automobile dealers' share of the distribution channels experienced its most precipitous drop yet, falling from 80 to 66 percent. Service stations, general garages, repair specialists, and auto and home supply stores composed the balance. By 1940, auto and home supply stores accounted for approximately 10 percent of automobile aftermarket sales, twice the percentage garnered five years earlier.

Following World War II, the trend toward greater parity in the automobile aftermarket continued, as automobile dealers' share dropped to 56 percent by 1945 and then below 50 percent by 1950. Meanwhile, the auto and home supply industry's share in the market increased, rising to roughly 14 percent by 1950. Consumers' voracious appetite for home appliances and other hard goods during the decade further improved the position of auto and home supply retailers. Refrigerators, housewares, toys, radios, and televisions began to appear in auto and home supply stores during this postwar economic boom era. Stores also began to attract female customers in large numbers for the first time.

The product mix of auto and home supply stores' merchandise reflected an increased demand for home appliances and related products. The two elements reached equal representation in the early 1950s, and, a decade later, nonautomotive products were more prevalent than automotive parts. As this trend developed, the types of home supply products offered became more diverse, and, in some cases, the auto and home supply stores assisted in the design of products. In 1957, for instance, Western Auto Supply Co. (the progenitor of auto and home supply stores) helped to design a portable

typewriter called the Wizard, which the retail chain featured in its approximately 400 stores. Another large retailer, White Stores Inc., offered its customers sewing machines, vitamins, and more than 1,000 health and beauty products, in addition to the more traditional home supply products.

Whereas automobile dealers' market share had slipped to 40 percent by 1955, the auto and home supply retail industry experienced tremendous growth following World War II. It generated roughly \$1.5 billion in annual sales during the mid-1950s, and aggregate revenue would continue to balloon, more than doubling to \$3.1 billion in 1962. The competition was higher, too. By that time there were 550 retail chains operating 6,000 stores, 4,000 independent outlets, 20,000 franchised dealers, and 3,000 wholesalers and discount stores.

The proliferation of credit sales and the addition of service bays for installing automotive parts and accessories also fueled the industry's growth. In the early 1960s, retailers began offering basic installation services for products such as automobile tires—a bid to keep customers in their stores for a longer period of time. Credit purchases increased the frequency of customers' visits. By the mid-1960s, many retailers had expanded the number of services they offered, branching into brake and ignition repair, as well as wheel alignment and balancing. The addition of these services was integral to the industry's future growth. From 1960 forward, the percentage of the market controlled by service stations shrank. The same held true for garage mechanics, who saw their presence in the market begin to ebb a decade earlier.

Other factors were contributing to the industry's growth as well, notably the rising number of consumers servicing their own automobiles. The percentage of automobile owners in the United States who tuned their own engines doubled to 20 percent between 1957 and 1966, a period during which the number of automobile owners also increased. By the mid-1960s, 40 percent of all automobile owners changed their spark plugs themselves, up from 25 percent in 1957. This growth of the do-it-yourself market was indicated by other developments in the mid-1960s, such as a significant leap in the sales of *Glenn's Auto Repair Manual*, of which 55,000 copies were sold in 1965 and another 50,000 in the first three months of 1966. When *Popular Mechanics* began running an advice column regarding auto repair, the magazine was inundated with letters. The editorial board had anticipated 50 responses a month; instead, it received 400 to 500.

Accordingly, as the auto and home supply industry entered the 1970s, the potential for profit was in place, limited mostly by the fierce competition pervading the industry. By this time the automobile aftermarket was

divided fairly evenly among the major distribution channels, with auto and home supply stores controlling roughly 20 percent of the market. Recessive economic conditions in the mid-1970s, however, coupled with the effects of an oil embargo, negatively affected many industries. Consumers purchased fewer new automobiles, thus creating a national pool of vehicles that were aging and in need of repair. With less disposable income to use for professional mechanics, the do-it-yourself market, and in turn the auto and home supply industry, entered a period of invigorated growth.

But by the late 1970s, other types of retail operations had discovered automotive parts as a means to help mitigate flagging sales. Mass merchandisers and supermarkets began to stock significantly more automotive parts and accessories, frequently devoting a portion or end of a display aisle to them. Moreover, these types of retailers also began selling home appliances and other related merchandise, impinging on both segments of auto and home supply retailers' market niche. But the effect of this new breed of competition on auto and home supply retailers was partly offset by several favorable developments during this time, and others to come in the early 1980s.

Tire sales, perennially the most lucrative segment of the auto and home supply business, benefited from the introduction of small, lightweight "mini-spares" by automobile manufacturers in the late 1970s. These temporary spare tires, usable for only a limited number of miles, increased the sales of conventional tires in the aftermarket. Additionally, recreational vehicles and small pickup trucks began to emerge in greater numbers, creating a new category of vehicles that required repair and maintenance, as well as auto parts and accessories to heighten performance.

In the early 1980s, the industry's position was further buoyed by a depressed automobile manufacturing market, in which production levels descended to historic lows, and by the attrition of service stations. Due in part to the energy crises in the mid-1970s, the number of service stations (which generally sold batteries, tires, and automobile accessories) had dropped by 75,000 during the mid- and late 1970s, leaving 150,000 in existence by the early 1980s—many of which had discontinued the practice of selling automobile parts. In 1981, new automobile production plummeted to the lowest level since 1961, and in March 1982, to the lowest monthly output since 1948. As in the past, this situation meant older automobiles were populating American roads, automobiles that required more replacement parts than newer automobiles. During this time, the average age of an automobile in the United States was 6.6 years, the highest since 1952.

In the mid-1980s, a relatively new segment of the automobile aftermarket, the automobile security industry, recorded a growth rate of roughly 30 percent per year. As

more and more automobile owners protected themselves against car theft by purchasing security systems and alarms, car alarms became a business estimated at \$155 million to \$200 million a year. This enriched auto and home supply retailers, who generally concentrated on lower-priced security systems, giving them an additional \$30 million worth of business nationwide.

But technological strides in automobile manufacturing had, by the early 1980s, made the automobile a complex piece of machinery replete with electronic components, thus causing the do-it-yourself market to lose some of its vitality. By the late 1980s, this development became a pressing concern for retailers involved in the auto and home supply industry. To make matters worse for auto and home supply retailers, the same technological strides that had spawned more sophisticated automobiles also made many types of automobiles virtually maintenance-free for significantly longer periods of time. Consequently, as industry participants entered the 1990s, questions arose as to whether they could successfully compete in a dramatically changing market that threatened to keep dwindling.

Emerging from the recessive economic conditions of the early 1990s, the automobile aftermarket represented a \$200 billion annual business, employing 2.5 million persons in approximately 500,000 establishments (auto and home supply stores operate in only a part of the aftermarket and thus represent a fraction of these figures). The period from 1988 to 1992 had seen a shift of \$3.9 billion of product volume at the user level in the automobile market. This volume was not lost but simply redirected into different distribution channels, such as Wal-Mart and other large nonautomotive stores that now marketed some auto supplies. Industry pundits in the early 1990s anticipated another shift between 1992 and 1996, this time of \$7.3 billion.

According to predictions, by 1997 there would be dollar changes in distribution-channel volume greater than the growth of the aftermarket itself, which would mean a more intense battle among competitors for the existing market, rather than for the growth of the market. The traditional channels of distribution, in which auto and home supply retailers are included along with parts manufacturers, warehouse distributors, and jobbers, was expected to increase its aggregate sales total by \$500 million during this four-year period. But it also was expected to cede market share to other distribution channels at the same time, giving up \$2 billion.

The predicted shifts in the market seemed to be materializing in the latter part of the 1990s. Companies were becoming bigger, and stores were increasing in size. Hence, Aid Auto Stores, a strong competitor in the New York City and Long Island markets, announced the opening of a warehouse superstore in 1996. It pioneered a new

concept in auto parts sales, one that had already shown itself effective in selling items as varied as groceries and stereo equipment. Symptomatic of the fact that department stores were entering the auto parts market was the announcement by Target Stores in February 1996 that it had entered into an exclusive agreement with Car and Driver brand to sell its products, which included oil and antifreeze.

A report in *Discount Merchandiser* magazine in February of 1997 compared the numbers of outlets in various segments retailing products in the automobile aftermarket and analyzed the shift in numbers of outlets from 1980 to 1995. According to the study, between 1992 and 1995, the automobile aftermarket had a number of losers and very few winners. Auto parts stores, for instance, had seen a decrease in their numbers, as had tire stores, service stations, and new car dealers. But discount stores, drugstores, and especially warehouse clubs had seen an increase in the number of outlets marketing auto aftermarket products. With even drugstores getting in on the act, traditional auto and home supply retailers were bound to suffer.

Companies that could not roll with the changes in the market did not last. In August 1995, one of the industry's former leaders, Nationwide, filed Chapter 11 bankruptcy and sold a large portion of its stores to Western Auto, which in 1998 was owned by Advance Holding Corp. Pep Boys CEO Mitchell Liebovitz remarked that the automotive aftermarket was starting to experience the effects of consolidation. Even successful players such as his own company had to adjust. Thus, Pep Boys realized that it had perhaps overcorrected in accordance with market shifts and was missing out on a large market segment that still worked on their own cars. In 1996, it opened 50 new establishments under the name Parts USA, geared toward less affluent consumers who still did their own repairs. As of 1999, AutoZone Inc. also catered to a market that performs their own repairs, as well as to professionals.

After reorganization and restructuring, the industry was stable and growing. In 1999, the industry was again on the upswing, with all of the major companies experiencing tremendous growth in both sales and number of employees.

CURRENT CONDITIONS

According to U.S. Census Bureau figures, overall retail sales for auto parts, accessories, and tire stores increased throughout the 1990s, peaking at \$73.6 billion in 2000. However, in 2001 sales dropped to \$72.7 billion. This decline was partially due to weak economic conditions that impacted both commercial travel levels and consumer spending. On a retail basis, the Automotive Aftermarket Industry Association (AAIA) reported that

total automotive-related aftermarket sales exceeded \$178 billion in 2001. Less service repair revenues of \$122.9 billion, this figure amounts to \$55.9 billion and includes \$29.1 billion in "do-it-yourself" (DIY) parts and accessories, \$20.6 billion in tires, and \$6.2 billion in DIY chemicals and lubricants.

One factor hindering industry growth is the proliferation of higher quality parts for both new and used vehicles, which has required drivers to replace parts less frequently. Although growth in the automotive aftermarket as a whole has slowed down, the aging of the car population and the rise in miles driven bode well for industry's future, according to industry analysts and the AAIA. The Freedonia Group forecast North American aftermarket manufacturer-level (wholesale) sales would reach \$53 billion by 2006 and indicated that Mexico would outpace the United States and Canada in terms of retail aftermarket growth. A decline in automotive leasing was another positive factor for the aftermarket industry in the early 2000s, because this trend will likely increase levels of vehicle enhancements and repairs. Another positive sign was that, despite a challenging economic environment, industry leader AutoZone, Inc. planned to open 150 new stores by August 2003.

INDUSTRY LEADERS

Gone are the days when local, independent stores can generate sufficient revenue to be included in the upper echelon of their field. This holds true for many retail enterprises and particularly for auto and home supply stores, considering the enormous inventory required for them to operate successfully. The increasing number of foreign-manufactured automobiles driven by American consumers has created a commensurate increase in the number of different automobile parts and accessories an automobile owner may need, which only well-financed conglomerates are able to provide. As illustrated in *Automotive Marketing Online*, in 1987 the top 100 chains owned 2,771 stores. However, by 1999 the top four chains owned more than 6,000 stores.

In the early 2000s, the industry's leading firms included AutoZone, Inc. of Memphis, Tennessee, with \$5.3 billion in 2002 sales, a growth of nearly 11 percent from the previous year. AutoZone reports more than 3,000 outlets and 44,179 workers. Close behind is Advance Auto Parts, Inc. (formerly Advance Holding Corp.), which took over former number-two company Western Auto in 1998. This acquisition caused Advance to increase its sales by 44 percent and to nearly double its workforce. In 2003, Advance was rated number two in the industry, with Advance Auto Parts, Western Auto, and Discount Auto Parts (acquired in 2001) stores. Genuine Parts Co. had \$8.3 billion in 2002 sales (which includes other products) and 30,700 employees. Pep

Boys reported \$2.2 billion in 2003 sales and 22,201 employees. Finally, CARQUEST Corp., a Raleigh, North Carolina-based automotive parts distribution group, had sales of \$2.5 billion in 2002.

WORKFORCE

During the 1980s, total employment by auto and home supply stores increased, keeping pace with the growth of the industry's aggregate sales. In 1980, auto and home supply stores employed 225,000 people. Then, as the number of establishments in the industry increased, the workforce total responded in kind, expanding to 286,000 by 1987 and to 298,000 two years later. In 1990, 305,000 people were employed in the industry's 43,400 establishments. But by 1992, the figure had dropped to 269,069. The industry was on the upswing in late 1999 when there were an estimated 408,300 employees. However, by 2001 levels had declined again, reaching 405,840.

In 1980, employees involved in retail trade earned \$4.88 per hour, whereas members of the automobile aftermarket paid their employees an average of \$5.66 per hour. In 1990, employees in the retail trade earned an average of \$6.75 per hour, whereas a typical retail employee in the automobile aftermarket earned \$8.92 an hour, bringing the industry's total payroll to \$5.1 billion and reflecting a greater wage disparity between the two segments than existed a decade earlier. By 1992, the average retail employee made \$12,107 a year, and employees in the auto and home supply industry made \$17,405. In 2001, the industry's average hourly wage was \$12.49.

GASOLINE SERVICE STATIONS

This category includes gasoline service stations primarily engaged in selling gasoline and lubricating oils. These establishments frequently sell other merchandise, such as tires, batteries, and other automobile parts, or perform minor repair work. Gasoline stations that include other activities, such as grocery stores, convenience stores, or carwashes, are classified according to the primary activity.

NAICS CODE(S)

447110 (Gasoline Stations with Convenience Stores)

447190 (Other Gasoline Stations)

INDUSTRY SNAPSHOT

In recent years, almost 127,000 gasoline service stations operated in the United States. These establishments took very different forms than they had before, with self-service islands and ancillary retail outlets—convenience stores, known as C-stores—creating major changes in the distribution of market share.

The total number of stations has been steadily decreasing since 1982, reflecting a trend by major oil companies to close smaller-volume franchises and concentrate on maximizing gallonage at major locations. Cost cutting in the oil industry in general, as well as environmental legislation mandating upgrades for the gasoline service station industry, meant that most dealers were looking for ways to reduce expenses and increase sales. This was especially true in the early 2000s. Traditional "mom-and-pop" style stations were frequently a casualty of market changes; consumer emphasis shifted more toward large, multifunction, automated outlets. To survive, gasoline service stations will continue to expand the range of goods and services they offer and emphasize convenience to the consumer through automatic pay ma-

chines, more self-service islands, and streamlined traffic flow organization.

ORGANIZATION AND STRUCTURE

The U.S. market for consumer gasoline had four major competing categories in the 1980s, 1990s, and early 2000s: service stations, which offered service through at least one bay and had a volume greater than a set limit (typically 20,000 gallons per month); pumpers, which had more than six nozzles and had a volume exceeding a set limit (typically 50,000 gallons per month) and possibly having such ancillary services as a C-store, car wash, or remote bays; convenience stores, with a minimum of 600 square feet of retail space, the primary business of which was the sale of food items, typically with one or two islands and fewer than six nozzles; and others, facilities with gasoline volume below minimum volume for pumpers or service stations that may also include ancillary services such as a C-store, car wash, or bays. All of these competitors except convenience stores fall under this classification. In 2003 industry players pumped 370 million gallons of gasoline each day in the United States, according to the American Petroleum Institute. This was a 2.4 percent increase from the previous year.

Within this relatively simple categorization of outlet types, a complex web of supply sources and brand loyalties exists. More than two-thirds of gasoline service outlets were branded by major oil companies by 1992, a trend that continued into the early 2000s. Managers of branded stations, called dealers, either owned their own station or rented from the branding company—the latter were “lessee dealers.” Dealers bought gasoline either directly from parent companies or from branded distributors, called jobbers, who bought from parent companies. The others, known as independents, bought from unbranded jobbers who distributed products from a variety of companies on a surplus basis. The independents were at an obvious disadvantage in terms of purchase price and supply reliability; such factors virtually guaranteed the domination of the market by branded dealers.

Sales of accessories such as tires, batteries, oil, and anti-freeze—as well as services such as carwashes, lube jobs, and tune-ups—were once considered fringe options for gasoline retailers. In the early 1990s, however, an increasing number of facilities responded to competitive pressures by incorporating these various services into their business plans, with the result that the distinction between C-stores and service stations or pumpers grew progressively tenuous. Standard delineation of industry classifications such as “principle” focus of business became less obvious; only income proportionality allowed pinpointing in many cases.

BACKGROUND AND DEVELOPMENT

Gasoline service stations are a phenomenon of the twentieth century. Brought into being by the simultaneous maturity of petroleum production and refinement and the invention of the combustion engine, gasoline service stations began as suppliers for a “lunatic element” in the population who used “horseless carriages” for recreational transport purposes. These early stations were actually supplied by horse-drawn tank carts; conservative petroleum refiners did not initially trust such odd contraptions as fuel-powered trucks.

The mass production of the automobile spurred mass construction of gasoline servicing facilities, with all the major oil companies staking a claim on some corner of the fledgling consumer market. Small, family-run franchises were the norm and remained the mainstay of the market in remote areas well into the 1970s.

Domestic gasoline production capacity grew with World War I and II, as did the Big Three automakers’ factories. Consequently, by the 1950s, average American families had at least one car, and that car was large, gas guzzling, and a source of intense pride. The heyday of the labor-intensive service station with several attendants in uniform to service every customer reached its peak in those post-war years.

The revolution of form that results in modern service stations began in the 1970s, when self-service islands came into vogue. In 1975, only 22 percent of the market share went to self-service facilities; in 1992, 86 percent went to self-service, and in 1997, self-service was the mainstay, with maybe one or two pumps reserved for full serve at larger stations. There were 220,000 full service stations in the 1970s; in 1997 there are only 40,000. The number of service stations has decreased by one-third since 1980. Self-service essentially ended the “service” orientation of gasoline retailers; consumers made it clear that lower prices were more important than uniformed attendants. Small, unbranded dealers were the first to feel the impact of this emphasis on price over service. No longer able to compete on the basis of superior, individualized attention to detail, small dealerships began to close.

In the early 1980s, department stores also began withdrawing from the gasoline retailing market. Giants such as J.C. Penney and K-Mart found it difficult and increasingly unprofitable to compete against major oil companies. Simultaneously, the large oil companies embarked on extensive expansion of services and renovation of facilities in branded retail outlets as their competitors forged elaborate marketing schemes to encourage brand loyalty.

Architectural homogeneity and multipurpose stations became a chief focus for most; the Texaco “family

of buildings” style, which basically eliminated structural clutter and revamped unplanned layouts, became a model for the industry. The trend toward having similar building structures increased with the addition of C-stores to many stations throughout the 1980s and into the 1990s.

The history of gasoline stations has been marked by trends. The first seven decades of the twentieth century saw an evolution of gasoline service stations that corresponded to consistent increases of consumer interest and disposable income; the last three decades revolutionized the industry through successive waves of automation and streamlining. If self-service was the trend of the 1970s, credit card payment was its corollary in the 1980s, and debit card machination in the 1990s was the overwhelming trend. As the twenty-first century began, stations were experimenting with machines that take cash at the pump.

Gasoline service stations generated \$19.8 billion in sales in 1997, up from \$14.5 billion in 1996, despite the decrease in the actual number of establishments. These figures illustrated an important trend—large oil companies were cutting unproductive franchises and pouring capital into strategic stations, increasing overall franchise income while reducing the number of individual franchises. The average gross profits per gallon rose 10.5 percent for C-stores in 1998. Total gasoline sales increased 3.3 percent from the previous year.

This streamlining process, a “more with less” motto of productivity, characterized most facets of the gasoline retailing industry in the early 1990s. Although in the 1970s self-service sped up pumping and allowed customers to buy more gas while allowing retailers to operate with fewer employees, in the 1980s credit card payment capability sped up transactions even more and, at the same time, seemed to encourage larger sales. One survey showed that customers purchased 45 percent more fuel when using a credit card than when paying cash.

Improving on the modern self-serve, charged-with-credit tank of gas was in-pump point of sale (POS) technology, which allowed customers to purchase gasoline with credit cards without ever interacting with a cashier. Initiated in the 1980s, widespread adaptation of POS technology had largely occurred by the mid- to late 1990s. Despite the expense of installing units—POS technology cost approximately \$5,000 per unit—consumer fascination with speedy, paperless transactions made it virtually mandatory for retailers to install. Self-service pumps with POS capability allowed consumers to fill their tanks without ever interacting with another person, cutting personnel needs while increasing overall efficiency.

In the 1990s service stations rushed to install POS pumps in all their service bays. By the end of the decade, it was rare to pull into a station and not see POS technol-

ogy in place. However, despite the convenience of POS technology, 60 percent of all consumers still paid with a check or cash inside the store according to a 1999 survey of convenience stores conducted by NFO Research Inc. Only 21 percent of all consumers paid at the pump, preferring to go into the store and make additional purchases beyond the gasoline.

The last consumer-driven shift in the gasoline service station industry in the early 1990s was the emerging market domination of stations with C-stores. Aiming for gasoline sales of 100,000 to 200,000 gallons per month, major oil companies installed large numbers of branded stations with ancillary food stores in strategic locations such as major highway intersections. The investment for one of these station/superstore units was high—state-of-the-art fiberglass underground storage tanks, vapor recovery equipment, multiproduct dispensers, roomy and attractive fuel islands with elaborate security lighting systems, and capacity for dispensing alternative fuels such as natural gas. Each site was a major investment and ensured that only major oil companies would be able to compete in the new C-store market.

The late 1990s saw an expansion of the convenience store/gasoline station in the form of multifranchising. Known as “co-branding,” it involved the pairing of two or more franchises under one roof, a move that benefited the franchisee as well as the customer. Fast food outlets, such as Burger King, McDonald’s, and Subway, became popular co-branders with gasoline stations. In Memphis, Tennessee, Mirabile Investment Corp, the area’s largest Burger King franchisee, teamed full-size Burger King stores with Exxon gas stations and convenience stores. Subway had about 1,270 of its 11,000 North American outlets in nontraditional locations, co-branded primarily with convenience stores and gasoline stations. Texaco teamed up with Burger King, Taco Bell, and Subway, and the company planned to build or rebuild 63 outlets in the Los Angeles area in 1997, co-branding with Star Mart convenience stores and/or a fast food franchise. In 1996, Amoco Corporation shared the cost of property and maintenance costs of 50 new gas stations with McDonald’s—up from 13 in 1995.

Other technology that may dominate gas stations in the next century is the return of full service, without the helpful attendant in uniform. In 1996, BMW, Mercedes-Benz, and the German oil company Aral were testing robotic gas station attendants. Drivers pull up to specially marked pumps, swipe a plastic tank card, enter a PIN number, and the unit immediately identifies the make and model of the automobile. A red laser beam then guides the robotic arm to the car’s fuel door. The robots even replace the cap when finished fueling.

Adapting to consumer demand was not the only expensive challenge for gasoline service stations in the

early 1990s. Environmental legislation targeted retailers in a number of ways, primarily in the arenas of gasoline evaporation, underground storage tanks, and improved refrigerants. Like C-store investment, environmental compliance spelled doom for those small independent retailers who remained in business in the early 1990s.

Stage II of the 1990 Clean Air Act stipulated that retailers use equipment that captured gasoline fumes when gasoline was discharged into a vehicle's gasoline tank. Marketers in California, New Jersey, Missouri, New York, and Washington, D.C. were already using Stage II equipment in 1993; marketers elsewhere may need to do the same, or the EPA may mandate on-board canisters in automobiles. Pump nozzles will most likely bear the brunt of the requirement because canisters could leak while the automobile is in motion. Estimates of costs for updating pumps ranged from \$20,000 to \$40,000 per station.

Underground storage tanks (USTs) came under attack by the EPA because older tanks were made of steel and many had rusted through, contaminating surrounding soil and threatening water supplies. New regulations went into effect in late 1993 and were estimated to cost \$100,000 per station as individual sites sought to repair or replace existing tanks. Station remediation costs were estimated to cost an additional \$155,000.

Chevron was one of the first major companies to replace steel tanks with corrosion-resistant fiberglass and has underground monitors to detect leaks of less than a quart an hour. But for the small independent stations, removing the tanks and cleaning the soil was too costly a proposition, and many were forced to close in the mid-1990s.

Other environmental costs included updating refrigerant installation facilities. As chemical manufacturers phased out dangerous, ozone-depleting chlorofluorocarbons (CFCs), retailers learned to use hydrofluorocarbons as refrigerants. Hydrofluorocarbons as refrigerants and reformulated gasolines were the two major new product technologies in the early 1990s.

Alternative fuel sources such as natural gas, propane, methanol, ethanol, and electric power were making headway. In 1996 the natural gas-powered Ford Crown Victoria automobiles were on duty as law enforcement vehicles in Ventura County, California; Wixom, Michigan; and Savannah, Georgia. Ford also delivered 68 electric-powered Ecostars to utilities and other customers for testing in real-life driving conditions and aimed to build 250,000 vehicles by the year 2001 that ran on ethanol, gasoline, or a combination of the two. Chrysler Corporation also was expected to announce a major commitment to flexible fuel vehicles or FFVs, and General Motors has manufactured an electric car, the EV1. Tradi-

tional gasoline service stations will continue to change to meet the needs of these new technologies.

CURRENT CONDITIONS

According to U.S. Census Bureau figures, after rising from \$209.4 billion in 1999 to \$244.5 billion in 2000, retail sales for gasoline stations fell to \$237.7 billion in 2001. A number of factors had a negative impact on the industry's health during the early 2000s, including weak economic conditions, a subsequent decline in consumer spending levels, and unstable gasoline prices. For example, gasoline prices increased from an average of \$1.00 per gallon in early 1999 to \$1.80 in May 2001 before declining again.

Terrorist attacks against the United States on September 11, 2001, as well as a U.S.-led war with Iraq in early 2003, further exacerbated already volatile gasoline prices. Responding to the latter situation, a number of concerned industry associations—the American Petroleum Institute (API), American Automobile Association, National Association of Travel Plazas and Truck Stops, Society of Independent Gasoline Marketers of America, Petroleum Marketers Association of America, and Service Station Dealers of America and Allied Trades—issued a joint statement to the news media on March 20, 2003, assuring American consumers that the industry was working to maintain adequate fuel supplies and urging them to continue purchasing gasoline and diesel fuels.

During the early 2000s, the industry was characterized by ever-increasing competition. Supermarkets, warehouse clubs, and mass merchandisers—known as high-volume retailers (HVRs)—were steadily taking market share away from traditional industry players by offering lower prices. In late 2002, *National Petroleum News* reported that between 1998 and mid-2002, HVRs' share of the gasoline market increased from less than 1 percent to almost 6 percent. While market share percentages varied by state, HVRs were most successful in Texas, where they held more than 14 percent of the market, followed by Washington (13.9 percent), Arkansas (11.4 percent), Tennessee (11.1 percent), and Kentucky (10.2 percent).

In the October 2002 issue of *National Petroleum News*, NPD Automotive Products Group Spokesman David Portalatin remarked on the emergence of HVRs, explaining: "Unlike the traditional gasoline service station whose profit margin is gasoline-dependent, HVRs can operate at much lower retail prices. By taking advantage of consumer demands for lower-priced gasoline, HVRs can drive tremendous traffic volume to their sites. In fact, it's not uncommon for HVRs to sell 500,000 to one million gallons per month as opposed to the average retail gasoline facility that may sell 100,000 gallons in the same period."

Amid a challenging and increasingly competitive climate, industry players are focusing on ways to increase profits and reduce costs. Royal Dutch/Shell Group, which became the leading gasoline retailer in the United States after acquiring a number of stations and refineries from Texaco in 2001, announced plans to shutter 6,000 gas stations by 2004, representing 30 percent of its total locations. This was part of a strategy to increase sales at high-volume locations and close down lower volume stations. Station operators also looked at other ways to reduce costs. One potential area of savings involved reducing energy costs at convenience stores. These gasoline retailers had some of the highest nonmanufacturing energy costs on a per-square-foot basis because of a reliance on bright lighting, refrigerators, and the fact that many stores were open 24 hours.

INDUSTRY LEADERS

In 2003 Exxon Mobil was the number-one integrated oil company. The result of a merger between Exxon and Mobil, its 2002 sales reached \$178.9 billion. The company currently operates more than 40,000 stations in the United States. The next largest competitor is ChevronTexaco, with sales listed at \$98.7 billion in 2002 and some 25,000 gas stations in the United States. Other key players in the U.S. market include the Netherlands-based Royal Dutch/Shell Group of Companies, with 46,000 stations worldwide and 2002 revenues of \$179.4 billion. Based in the United Kingdom, BP Plc (formerly known as BP Amoco) operated 29,000 stations throughout the world, including 15,000 in the United States operating under the BP, Amoco, and ARCO trade names. BP was the second-largest integrated oil company in the world. By late 2001, it had fixed U.S. assets totaling approximately \$40 billion. With revenues of \$174.2 billion in 2001, BP employed 110,159 workers worldwide, including 42,000 in the United States.

WORKFORCE

In 2001, gasoline service stations employed 630,340 people, down from 689,400 in 1998. Workers earned an average hourly wage of \$9.30. Service station dealers essentially managed all aspects of the stations, from ordering supplies to supervising personnel. Typically, they employed attendants who filled tanks at the full-serve island, checked oil, and cashied, and mechanics who attended to more complicated maintenance and repair work.

AMERICA AND THE WORLD

The supply of gasoline and refined products is the only important aspect of the gasoline service station industry that is international in scope. In terms of consumption, in 2002 the United States imported almost 60 percent of its oil, according to the API. While more than

42 percent of the nation's oil came from domestic sources, Canada was the leading foreign source (9.7 percent). Other leading foreign sources included Saudi Arabia (7.8 percent), Mexico (7.7 percent), and Venezuela (7.3 percent). Oil imports have fluctuated since 1991, and figures will shift as domestic production and refining capacities shrink and alternative fuels increase in both popularity and by government regulation. The possible ramifications for retailers hinge primarily on questions of supply; over-dependence on foreign petroleum has historically resulted in price wars and shortages.

SIC 5551

BOAT DEALERS

This classification covers establishments primarily engaged in the retail sale of new and used motorboats and other watercraft, marine supplies, and outboard motors.

NAICS CODE(S)

441222 (Boat Dealers)

In 2001, the U.S. Census Bureau reported 5,301 establishments primarily engaged in the retail sale of new and used motorboats and other watercraft, marine supplies, and outboard motors. The industry employed approximately 39,405 people. The National Marine Manufacturers Association (NMMA), which tracks the industry, reported the downturn in the boating industry as the nation focused on the threat of terrorists attacks and the war with Iraq. However, the market ended 2003 on a positive note. There were an estimated 17.49 million registered, and non—registered boats in the United States as of 2003. Powerboat sales had increased equally in units and sales. The unit sales were up one percent, while the total sales were up 9.3 percent. Sales were up for new boats, as well as engines, and accessories reached \$16 billion for 2003. The trend continued in January of 2004, with all boats up 15.6 percent. NMMA predicted positive results for February, as well. There were a total of 17.49 million registered and non—registered boats in the United States as of 2003. Equally important, there were an estimated 72 million people "participating in recreational boating."

After a period of deep industry recession, in which boat and marine accessory sales dropped from \$18.0 billion in 1988 to \$10.3 billion in 1992, the boating industry at both the manufacturing and retail levels

rebounded strongly during the mid-1990s. Buoyed by the strong economy, continued low interest rates, and the repeal of a 10 percent federal luxury tax on new boats priced at \$100,000 and above in 1993, the industry saw retail expenditures on boating rise to \$19.3 billion in 1997, although they did drop a bit to \$19.2 billion in 1998.

NMMA reported that overall sales of new boats (measured in units) fell by six percent to 571,100 and total retail sales dropped by one percent to 19.2 billion in 1998. Sales of the recent market-leading product, personal watercraft or PWCs, often called "jet skis," a Kawasaki Motors Corp. brand name, had almost doubled in only two years with peak sales in the mid-1990s topping at 200,000 units sold in 1995. The price of these PWCs were key to their popularity. NMMA statistics show that in 1998 the average PWC sold for \$6,681, compared to \$254,365 for large cabin cruisers and \$23,167 for the average stern-drive power boats. However, this PWC market segment has seen a steady decline in sales into the late 1990s. The number of units sold dropped 26 percent from 176,000 in 1997 to 130,000 in 1998. The NMMA reported that the "bread and butter" of the retail market, outboard motor boats, held even in terms of units sold but dropped in sales figures by four percent; this was attributed to a retail unit price drop of roughly \$300 per unit.

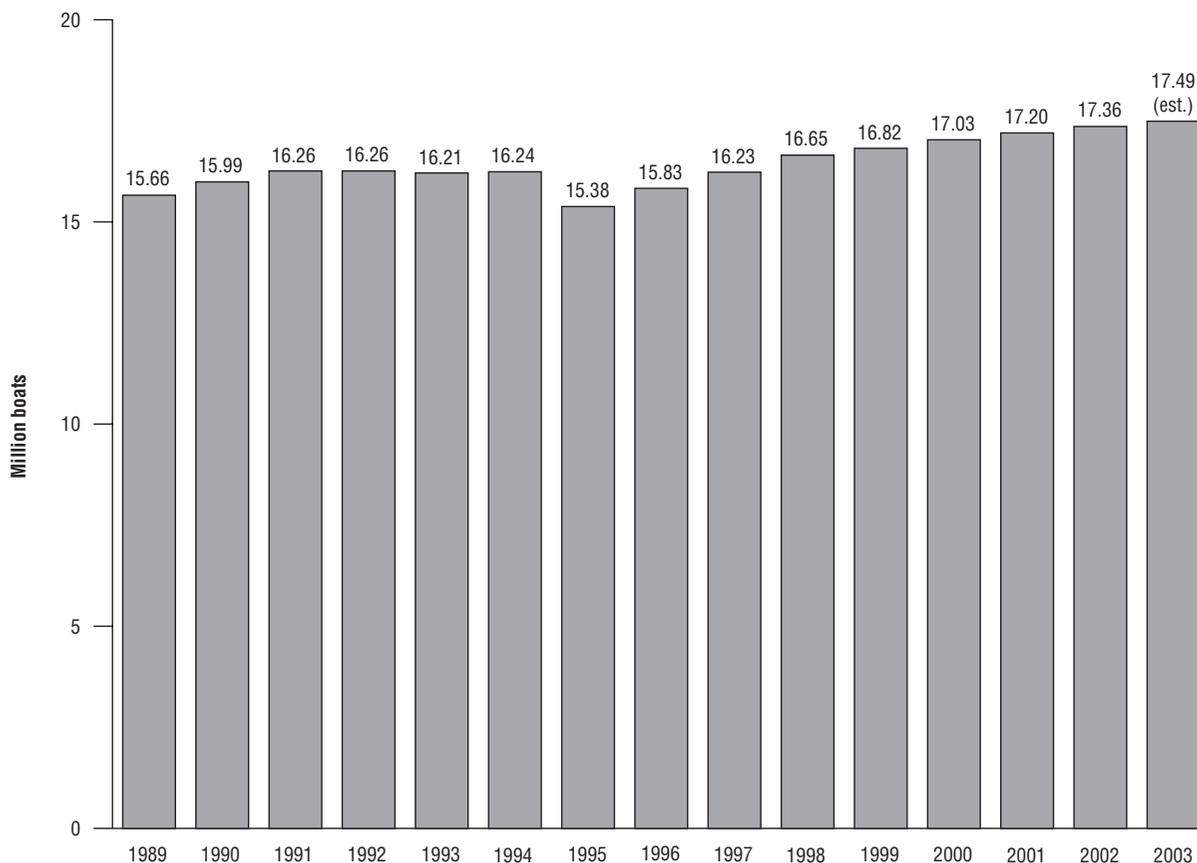

On the up side of boat sales, the industry saw an increase of nearly one third for center console and "walkaround" fishing boats. Sales of all-purpose deckboats rose by 20 percent. In addition, interest in kneeboarding has helped to spur sales of water ski boats. The NMMA forecast that the industry should do well into the next century.

Boat dealers in the United States are, for the most part, independent retailers. Although a retailer may choose to feature a particular manufacturer's boat, dealerships are not controlled or owned by that manufacturer. *Boat & Motor Dealer*, the leading periodical of the industry with a circulation of nearly 30,000, named as 1999's top dealerships: Lodder's Marine of Fairfield, Ohio; Baert Marine Inc. of Danvers, Massachusetts; Mariner's Choice Marine of York, Pennsylvania; and Fay's Marina, Inc. of LaPorte, Indiana.

For 2003, the total number of personal watercraft sold was 80,600 units. The average cost per unit was valued at \$8,890. There were also 207,100 units of the outboard boats purchased at \$13,244 per unit. The outboard motors reached 305,400 units sold, and averaged about \$1,547 per unit. Inboard boats—ski/wakeboard boats numbered 11,100 units sold, and the average price per unit was \$36,332. There were 5,600 jet boats purchased at about \$20,584 per unit. There were 11,100

Total Number of Recreational Boats in Use, 1989–2003

In millions

SOURCE: United States Coast Guard/National Marine Manufacturers Association, 2003

cruisers purchased at \$36,332 per unit. Kayaks numbered 324,000 units that sold for \$466 each.

According to U.S. Bureau of the Census figures, the number of people employed in the boat retail industry averaged 31,000 throughout the 1990s. Also, there were an average of 4,700 boat dealer establishments in the United States during the 1990s.

SIC 5561**RECREATIONAL VEHICLE DEALERS**

This industry includes establishments primarily engaged in the retail sale of new and used motor homes, recreational trailers, and campers (pickup coaches). Establishments primarily engaged in the retail sale of mobile homes are classified in **SIC 5271: Mobile Home Dealers**,

and those selling utility trailers are classified in **SIC 5599: Automotive Dealers, Not Elsewhere Classified.**

NAICS CODE(S)

441210 (Recreational Vehicle Dealers)

INDUSTRY SNAPSHOT

In 2001, according to the U.S. Census Bureau there were 3,134 establishments engaged in the retail sale of new and used motor homes, recreational trailers, and campers (pickup coaches). They employed some 34,829 people with an annual payroll of \$1.2 billion. The majority of the dealers were small employing less than five people. The total number of dealers climbed to 4,396 in 2003, according to D&B Sales & Marketing Solutions. In addition, the average sales per establishment were approximately \$2.80 million. The National RV Dealers Association (RVDA) estimated that recreational vehicle dealers, as well as the rental market generated \$15.75 billion annually.

Recreational vehicle dealers represented the largest sector of the industry with 2,243 establishments, with 51 percent of the market. Recreational vehicle parts and accessories numbered 744 businesses and represented about 17 percent of the market. Motor home dealers numbered 4,934 establishments. The remaining sectors include camper and travel trailer dealers, campers (pick-up coaches) for mounting on trucks, and travel trailers (automobile, new and used). States with the majority of recreational dealers were California, Florida, Michigan, Pennsylvania, and Texas. Combined, they shared about 44 percent of the market.

Retailers in this industry sell new and used recreational vehicles ranging in size from pop-up camper trailers to large, luxury motor homes. The prices for these vehicles range from around \$2,000 for a new camper trailer to more than \$100,000 for some motor home models. In addition to new and used vehicles, the 3,000 dealers nationwide sell parts and accessories to accompany the vehicles and trailers, as well as extended warranties and service contracts. Most dealers also operate repair centers to service the vehicles and trailers they sell. Some dealers supplement the sales operation by renting recreational vehicles on a short-term basis. Other dealers have taken on lines of related recreational products like snowmobiles to try to balance out the slightly seasonal nature of the business.

The industry is dominated by smaller dealers who own single locations. However, there is a small but growing trend toward multiple location dealers, similar to that seen among dealers of new and used automobiles. Recreational vehicle dealers are more commonplace in states traditionally known as being recreation or retirement

destinations, such as California, Texas, Michigan, and Florida.

The relative health of the industry is closely tied to the health of the national economy. Because of this, the fortunes of retailers of new and used recreational vehicles across the country have risen and fallen with national economic cycles.

ORGANIZATION AND STRUCTURE

The sale of new and used recreational vehicles is not a purely regional industry. New and used recreational vehicle dealers are spread across the country, although areas that attract seasonal or tourist business have greater numbers of dealerships.

The dealers in this industry do not rely on exclusive franchises from manufacturers to carry and sell manufacturer's goods. The dealers operate on nonexclusive sales contracts, though some dealers do carry only one brand of product. Though there are a large number of manufacturers of recreational vehicles, a few produce the bulk of product sold by dealers. The various brands produced by the public company Fleetwood Enterprises (Coleman, Pace Arrow, Southwind, Cambria, Limited, Jamboree, Tioga) account for about 37 percent of the sales made by dealers in the industry. Other manufacturers like Winnebago, Jayco, Coachman, and Thor provide dealers with both vehicles and parts and accessories.

Dealers sell a wide array of products with hopes of filling as many economic or recreational needs as possible. The smallest product sold is a camping trailer with collapsible sidewalls that fold for towing. Truck campers are designed to be loaded onto the bed or chassis of a truck and are designed to serve as temporary living quarters. Van conversions, a relatively new presence on dealers' lots, were the largest segment of the recreational vehicle market in 1998, with 148,600 units shipped to dealers for resale to consumers. Travel trailers, typically between 12 and 35 feet in length, made up the second largest segment of the recreational vehicle market. Self-contained motor home units, pickup truck conversions, and sport-utility vehicle conversions also were popular.

According to RVIA, 33 percent of dealers have sales between \$1.5 and \$3 million per year. Another 29 percent of the dealers have sales between \$3 and \$5 million annually, while 22 percent post annual sales of \$5 to \$10 million. Only seven percent sell more than \$10 million of vehicles, accessories, and repairs; nine percent of the dealers in the industry had less than \$1.5 million in sales.

BACKGROUND AND DEVELOPMENT

Even prior to the introduction of the automobile, travelers hooked trailers to their horse-drawn carriages in order to carry extra gear that would make long trips more enduring. However, with the growth of motor travel, the

need for easily accessible eating and sleeping facilities grew. According to Carlton Edwards' *Homes for Travel and Living: The History and Development of the Recreational Vehicle and Mobile Home Industry*, the first tent trailers were made by individuals who tired of setting up and taking down their camping gear with every stop. In 1926, the Norwich, New York-based Chenango Camp Trailer Company started up the first production line dedicated to the manufacture of recreational vehicles. By the end of the decade, a handful of entrepreneurs around the country were engaged in the production of tent campers and trailers.

The first manufacturers of trailers and motor homes sold directly to the consumer, primarily through word of mouth and referrals. As companies went into production on a larger scale, they set up regional distributorships. Distributors were responsible for selling the product by establishing dealer networks and servicing dealer accounts. Early dealers of recreational vehicles typically were already involved in the sale of automobiles or had some experience servicing them through gas/service stations. Many dealerships sold automobiles and recreational vehicles side-by-side.

By the late 1940s, regional distributorships were discontinued after manufacturers established direct relationships with their dealers. Vehicle dealers enjoyed the freedom to choose the product line they wished to carry from all those offered by manufacturers. The dealer gained the authority to discontinue lines when they weren't profitable or when the brands carried had too much product overlap. This arrangement also allowed dealers to add new lines in order to augment the selection and variety of vehicles offered.

Dealers were rocked in the 1970s by the oil embargo, recessionary conditions, and the credit crunch of the 1970s. However, sales bounced back in the early 1980s, and by the mid-1980s business was booming for manufacturers like Winnebago and Fleetwood and the dealers who sold their brands. In 1988, approximately 427,000 units were shipped to dealers. According to the Recreational Vehicle Industry Association (RVIA), manufacturers shipped 292,700 new units to dealers in 1998. The retail value of these units was \$8.36 billion. In addition to new units, dealers also sell used vehicles, which account for some 30 percent of unit sales income.

Since the early days of the industry, dealers, along with manufacturers, have recognized the importance of camping and motor home parks to their fortunes. Availability and access to the parks was vital to the industry. The continued presence and popularity of national parks and other recreation areas have thus been a vital factor in recreational vehicle dealers' success. National parks had more than 60 million visitors in the mid-1990s, with 3.4 million overnight stays in recreation vehicles.

The Recreation Vehicle Dealers Association of America (RVDA) noted that, in 1995, the industry showed a 4.7 percent decrease in units shipped. This was expected, as shipments had been increasing since 1991, and reductions often occur after three or four years of increases. Even so, demand for new units in 1995 was the second highest total in at least a decade; the demand has risen since then. The retail value of those units actually hit an all-time high.

RV manufacturers are offering a variety of high-tech amenities, which add to comfort (and price). According to RVIA, new technologies include moving walls that expand the RV's interior (sometimes doubling the available floor space) at the touch of a button; compact direct broadcast satellite antennas; global positioning systems to help travelers track their exact location; WebTV, which allows travelers access to the Internet; and space-saving appliances.

An Internet survey conducted by *RV News* offered encouraging results for the industry. Seventy-two percent of visitors to the RV American Web site already owned an RV, and 75 percent said they intended to purchase an RV within the next two years. Eighty percent were searching for parts and accessories; 75 percent were looking for dealers; 72 percent needed service facilities; and 68 percent sought information on new RVs.

About 1 household in 10 owned a recreation vehicle in 1996. Younger buyers tended to favor folding camper trailers and truck campers, while older buyers preferred motor homes and van campers. In the 1990s, the industry began courting baby-boomers, as that cohort moved into the prime RV buying age bracket of 45 to 54.

CURRENT CONDITIONS

Recreational vehicles continue to be a lucrative market for the dealers that retail them. Total 2003 RV shipments, which include motor homes, travel trailers, fifth-wheel travel trailers, truck campers, and folding camping trailers numbered 320,800 units. The RVIA reported that this was a 3.2 percent over 2002. However, most impressive was the 21 percent increase in 2002, over 2001. According to a study conducted by the University of Michigan, in 2001, the projected number was expected to increase 15 percent from 2001 through to 2010. These results were based on the aging of the "baby boomers." The survey also concluded that there were 7.2 million recreational vehicles scattered over the highways in the United States, or some 7.8 million households. Travel trailers were the most popular and accounted for the largest shipment valued at \$147 billion. Fifth wheels generated \$67.4 billion, folding camper trailers were valued at \$35.7 billion, truck campers retailed \$8.8 billion, and motor homes represented \$61.9 billion.

INDUSTRY LEADERS

The industry was led by a few massive dealership operations. Holiday RV, based in Orlando, Florida, had 1999 sales of \$78.5 million and 193 employees. Other companies include Cruise America and RV Centers. Fleetwood Enterprises, which manufactures RVs, also distributes through its own retail outlets. The company, based in Riverside, California, had 1999 sales of \$3.5 billion.

In 2003, the industry leader for travel trailers was Coachmen with 5.5 percent of the overall market, followed by R—Vision Inc. with 5.4 percent; Fleetwood Enterprises Prowler with 5.1 percent; and Thor Industries Dutchmen with 4.5 percent. Fleetwood Wilderness and Forest River Wildwood shared 3.5 percent; Thor Industries Keystone had 2.8 percent; K—Z Inc. Sportsmen had 2.7 percent; and Forest River Salem had 2.7 percent. Other significant companies include Winnebago, National RV, Monaco, Jayco, Starcraft RV, Forest River, and Gulfstream. Fleetwood and Winnebago dominated the motor home market.

WORKFORCE

According to the U.S. Bureau of Labor Statistics, the industry employed approximately 25,600 people in the mid-1990s. Most dealerships within the industry are relatively small operations, employing a small number of people. Forty-two percent of the dealers employ between 1 and 7 people; 8 to 15 people are employed by 33 percent of the establishments. Only 11 percent of industry dealers employ between 16 and 25 people, while another 13 percent of all dealers employ 26 or more people. The number of people on the dealership payroll may fluctuate according to the season and the strength of business. Part-time, low-wage employees may be temporarily hired to clean returned rental vehicles or those taken in on trade. Temporary employees are occasionally used to prepare sold vehicles for delivery.

On behalf of dealers, the RVDAA has set up courses at a few local community colleges in the southeastern United States in an effort to improve the quality of education given to dealership service technicians. The courses are open to those interested in working as a repair technician, as well as to those already employed by dealerships.

SIC 5571

MOTORCYCLE DEALERS

This category includes establishments engaged in the retail sale of new and used motorcycles. This classification also includes those dealers who sell motor scooters, mopeds, and all-terrain vehicles.

NAICS CODE(S)

441221 (Motorcycle Dealers)

INDUSTRY SNAPSHOT

Motorcycling remains one of America's most popular forms of recreation and transportation. The number of people who enjoy motorcycle activities is comparable to the number of people who engage in fishing, golfing, and camping. Because there are many sizes of vehicles available, motorcycling has become a family recreational activity. In addition to providing enjoyment, motorcycles, scooters, and all-terrain vehicles are used in industry in various ways.

Retail motorcycle, moped, and all-terrain vehicle dealers are divided according to whether they are engaged primarily in selling new or used vehicles. Vendors of new motorcycles, mopeds, and all-terrain vehicles own franchises to sell products of specific vehicle manufacturers. Dealers who do not operate as new vehicle franchises sell used motorcycles in addition to vehicle parts, accessories, and clothing. Almost all dealers, however, have vehicle service departments, which are also sources of significant revenue.

In 2001, the U.S. Census Bureau recorded approximately 4,271 establishments engaged in the retail sale of new and used motorcycles. There were about 43,249 people employed within the industry that shared \$1.4 billion in annual payroll. In 2003, the total number increased to 9,603 and together they generated about \$9.9 billion in sales. The average business represented approximately \$1.10 million. The total number of people working within the industry also climbed to 55,658. The majority of these businesses, 1,149, were located in California, followed by Texas with 652, Florida with 609, and Pennsylvania with 425.

There were a total of 3,583 businesses engaged in the retail of motorcycles and they controlled almost 40 percent of the market. Motorcycle parts and accessories numbered 2,886, or about 30 percent of the market. Motorcycle dealers numbered 2,381 establishments, or more than 24 percent of the market. There were 471 businesses that sold all—terrain vehicles, as well as parts and accessories. In addition, there were 133 motor scooter retailers, 84 moped retailers, and 65 motorized bicycle retailers.

As a public service and a sign of commitment to their customers, most franchise dealers have joined or formed nonprofit associations to act as advocates for their products and to provide education about the use and enjoyment of these vehicles. They provide information about safe riding practices and work to increase owners' awareness of the impact that their motorcycles, scooters, and all-terrain vehicles can have on the environment.

ORGANIZATION AND STRUCTURE

Although there were more than 7,000 nonfranchised retailers in the industry, it was the 3,400 franchised outlets that garnered more than 80.0 percent of the industry's business. According to industry statistics, the average franchised motorcycle outlet had total motorcycle related sales and services of \$700,000 in the mid-1990s, compared to \$122,500 for the average nonfranchised outlet. On average, sales of new motorcycles, scooters, and all-terrain vehicles made up approximately 54.0 percent of a franchised dealer's business, while 23.2 percent was attributed to sales of parts, accessories, and apparel. In contrast, 68.0 percent of nonfranchised outlet sales was parts, accessories, and apparel.

There were franchised and nonfranchised retail outlets in all 50 states and the District of Columbia. Although California had almost two times more retail outlets than any other state, the business was otherwise evenly distributed across the United States. According to MIC statistics from 1997, approximately 6.5 million motorcycles were owned in the United States, representing approximately 2.5 motorcycles for every 100 persons. In terms of rider distribution, California, Texas, New York, Florida, and Ohio accounted for more than one-third of all motorcycle ownership in the United States, while the West enjoyed the highest motorcycle penetration, with 2.9 motorcycles per 100 persons. In 1995 outlets in the Midwest generated 27.9 percent of the industry's retail sales of new motorcycles. The South was the second leading region, representing 27.2 percent of the total. Retail outlets in the East sold 22.3 percent of new motorcycles, and businesses in the West garnered 22.1 percent.

BACKGROUND AND DEVELOPMENT

The history of the motorcycle dealer industry is closely related to the development of the U.S. motorcycle

manufacturing industry. The earliest motorcycles were basically bicycles powered by small engines, and the motorcycle was considered a relatively cheap alternative to the more expensive, early automobiles. Many U.S. manufacturers produced motorcycles before World War I, contributing to a dynamic, if not booming, domestic market. Literature from the Harley-Davidson company reported that by 1911, their motorcycles were among the 150 brands of vehicles vying for space on America's roads. Orient, Henderson, Cyclone, and Indian were the primary competitors of Harley-Davidson at that time. Henry Ford's affordable Model-T, however, doomed many motorcycle manufacturers. In fact, by the end of the Great Depression, the only remaining manufacturers and sellers of motorcycles were Indian and Harley-Davidson. Indian closed down production and distribution in 1953.

Harley-Davidson is one of the most recognizable brand names in the United States. The company began production in 1903 in Milwaukee, Wisconsin. By 1907, William and Arthur Davidson and William Harley had incorporated and issued their first advertising catalog. Their business grew by diversifying their product lines to include a variety of vehicles with different-sized engines, improving engine technology, and increasing sales of their motorcycles to the U.S. government for military use. Harley-Davidson watched carefully as the "motorcycle culture" developed in the late 1950s and early 1960s, often being labeled an "outlaw" lifestyle. Motorcycle gangs, in particular, prompted the public's negative opinions of cycling; in the early 1990s, however, the company maintained that fewer than 1 percent of all motorcyclists fit that category.

New motorcycle sales (including on- and off-highway models as well as scooters) increased 23 percent through the first three quarters of 1999 as compared to the same period in 1998, according to the Retail Sales Report conducted by the Motorcycle Industry Council (MIC). This increase marked the seventh consecutive year of rising new motorcycle sales. Retail sales of new motorcycles in 1997 amounted to \$2.9 billion, or 28.3 percent of the estimated \$10.2 billion generated by the motorcycle industry overall from consumer sales and services, state taxes, and licensing that year. Apparel sales and accessory sales in 1998 each amounted to \$1.2 billion, while repairs and parts sales contributed \$1.5 billion to the combined \$3.9 billion aftermarket, according to the 1998 Motorcycle Owner Survey conducted by Irwin Broh & Associates for the MIC.

Competition. The late 1950s and early 1960s saw the first influx of low-priced, smaller Japanese motorcycles and scooters into the United States. Honda began U.S. distribution of its products in 1959, with the slogan, "You meet the nicest people on a Honda," to combat the

negative image associated with the sport. Yamaha starting selling motorcycles in the United States during 1960; Suzuki followed in 1963; and Kawasaki joined the competition in 1967. BMW opened a U.S. distribution arm in 1975, incorporating in New Jersey. Harley-Davidson ended years of private ownership in 1965 with a public offering of its stock, and eventually merged with industrial giant AMF in 1969.

The oil crisis in the 1970s prompted the popularity of the smaller motorcycles, mopeds, and scooters that were made primarily by Japanese manufacturers. Dealers sold vehicles to those interested in conserving gas and finding cheap transportation. Harley-Davidson's market share, already dropping, was further threatened by Honda's 1969 entrance into the heavy and super heavyweight segment of the market. By the late 1970s Harley-Davidson faced severe production quality problems in addition to stiff competition. A management buyout in early 1981 set the course for the company's revitalization. It was protection under higher tariffs however, recommended by the International Trade Commission, that helped shut Honda out of Harley-Davidson's key market. In response, Japanese manufacturers evaded the tariffs by setting up assembly plants in the United States. For example, Honda built a plant in Ohio and Kawasaki opened a facility in Nebraska.

Harley-Davidson's resurrection and Honda's sagging sales worked to even the motorcycle market by the early 1990s. Harley-Davidson's bikes, in particular, were enjoying increasing popularity, and the company also received praise for its marketing initiatives, innovations in customer service, and improved dealer-customer communications. In 1997 the company had 340,000 members in its Harley Owners Group (HOG), 275,000 of whom were located in the United States. Members received a bimonthly magazine, a touring handbook that included city and state maps and a list of dealers in each state, and other benefits. Each authorized Harley-Davidson dealer may sponsor a local HOG chapter. In 1997 there were 590 HOG chapters in the United States and 940 worldwide.

Safety Concerns. The public's perception of motorcycling safety also has a large impact on the industry's prospects. In the ten years after 1988, motorcycle injury crashes dropped 47 percent and fatalities declined 42 percent. Since 1973 the nonprofit Motorcycle Safety Foundation developed motorcycle rider education courses for beginning and experienced riders. More than 120,000 riders were trained annually in these courses, most of which received state funding.

In the mid-1980s, three-wheel, all-terrain vehicle sales were negatively affected by concern over their safety. The Consumer Product Safety Commission tar-

geted the vehicles and disabled Honda's sales efforts. *Business Week* reported that before the "crusade," 40 percent of Honda's North American business had been in all-terrain vehicles. Consequently, Honda quickly lost its market dominance to Yamaha, whose four-wheel vehicles were considered safer and therefore less controversial.

Economic Trends. The retail motorcycle, moped, and all-terrain industry is strongly affected by national economic trends. Recessionary and expansionary trends essentially dictate the retail consumption levels of vehicles. The number of new motorcycle registrations climbed until the early 1980s, but fell dramatically in the second half of that decade. Total motorcycle registrations dropped from a high of 5.7 million in 1980 to 4.1 million in 1991. The *U.S. Industrial Outlook 1994*, however, reported that this trend had bottomed out, and projected an increase in shipments from motorcycle manufacturers to dealers in the mid-1990s. After letting their inventories drop in the late 1980s, dealers began replenishing their stocks of motorcycles, mopeds, and all-terrain vehicles in the early 1990s, as buyers began shopping for new, larger motorcycles.

In 1995 the industry generated approximately \$4.8 billion in revenues. Sales of new vehicles accounted for about 45.0 percent, or \$2.2 billion of total revenues; 30.7 percent, or about \$1.5 billion, came from sales of parts, accessories, and riding apparel. Sales of used vehicles accounted for 13.8 percent, or approximately \$668 million of the industry's 1995 revenues; and service labor charges accounted for 9.1 percent, or \$440 million. Income from other motorcycle-related sales, primarily insurance and extended warranties, represented 1.3 percent of total industry sales, or approximately \$63 million in 1995. The 53,589 industry employees earned an approximate payroll of \$987 million in 1996, including owner and manager salaries and advances. Business was conducted at 10,715 retail outlets in all 50 states and the District of Columbia.

Market-share rankings fluctuated dramatically in the years leading up to the 1995 figures. While Honda remained the market-share leader, its share slipped almost 10 percentage points from 39.0 percent in 1988 to 29.2 percent in 1995. Gains made by other brands, therefore, had come at Honda's expense. In 1988 Kawasaki was the third-largest brand, holding 13.9 percent of the market. By 1995 Kawasaki actually gained market share but was in fourth place among the six major brands, with 14.1 percent of the market. Yamaha was the third-largest player, holding 15.2 percent of the market in 1995, and Suzuki accounted for 13.2 percent of new motorcycle sales. German manufacturer BMW, with 1.6 percent of the total, was sixth among the top brands. Harley-Davidson, fifth in 1988 with 9.4 percent of the market,

experienced an 11-point market-share increase over four years, moving into second place in the early 1990s. In 1995 Harley-Davidson still held second place, with 23.3 percent of the market.

The livelihood of franchised dealers depends on the franchise they hold. In the mid-1990s, the industry was dominated by six brands of motorcycles. The MIC indicated that together, these brands accounted for 96 percent of the new motorcycles sold in 1997. Harley-Davidson's domestic motorcycle shipments broke the 100,000 unit mark in 1998, rising to 110,902 from 96,216 in 1997. Harley-Davidson's domestic shipments of 97,540 for the first three quarters of 1999 already surpassed 1997 totals. Meanwhile, Honda motorcycle sales slipped 9 percent over the second quarter of 1999, though this figure represented international sales, which were sluggish in Asia.

The average motorcycle rider was a 38-year-old married male with a college education earning \$44,250 per year, according to Irwin Broh & Associates's 1998 survey. More than a third of motorcycle owners surveyed earned at least \$50,000 per year, up from 20 percent in 1990. This profile represented an increase from just two years earlier, when the average motorcycle owner was 32 years old, with a median household income of \$33,100, according to the *Motorcycle Statistical Annual 1996*. These older, more affluent riders of 1998 could afford heavier, more comfortable, more expensive motorcycles. Also, the ranks of women motorcyclists continued to grow in the 1990s, rising from 6.4 percent of riders in 1990 to 8.2 percent in 1998.

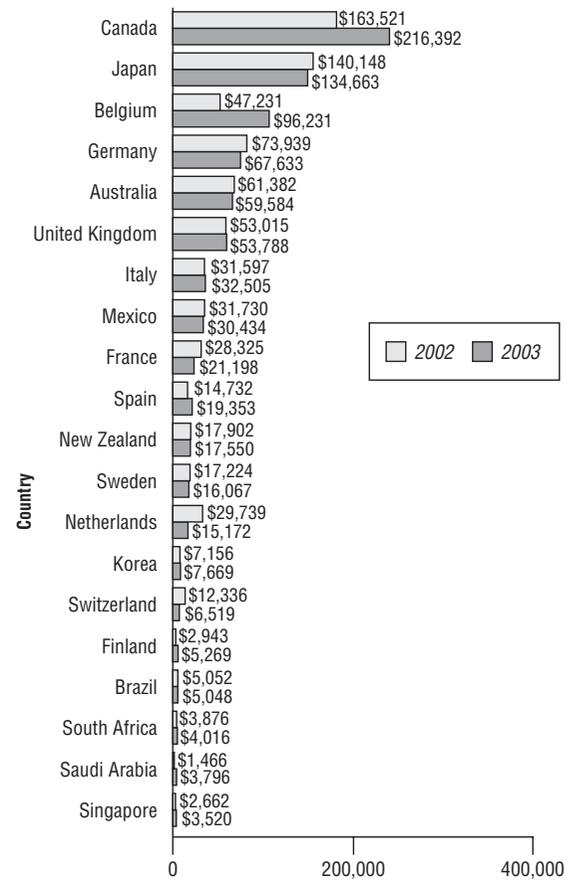

Industry experts suggested that dealers would see more showroom traffic from middle-aged (35-54-year-old males and females) consumers as manufacturers focused on designing new products targeted at this market segment. This group has historically had the highest levels of disposable income. Motorcycle dealers had success selling technologically advanced, luxury vehicles to this generation of buyers in the past and hoped to capitalize on them in future. Manufacturers also began offering improved safety features on popular heavyweight (850 cc and up) bikes.

CURRENT CONDITIONS

The growth from exports became a major player for the motorcycle industry in 2000. In fact, exports totaled about \$563 million, which was up 20 percent and accounted for 30 percent of the overall domestic sales in 2001. The dominant player was Japan, followed by Canada, Australia and Germany. The demand by the foreign market was expected to continue well into 2007. Some countries such as India, and China were experiencing larger cash flows, which could generate sales of mopeds, scooters, and motorcycles. The Freedonia Group pre-

Top Destinations for U.S. Motorcycles and Parts Exports, 2002-2003

Value of exports, in thousands of dollars

SOURCE: U.S. Department of Commerce, U.S. Treasury, and U.S. International Trade Commission, 2004

dicted an annual increase of 5.2 percent to more than 35 million units valued at \$46 billion in 2007.

On December 23, 2003, the Environmental Protection Agency (EPA) enacted the newest set of emission standards for highway motorcycles. According to Mike Leavitt, EPA administrator, "motorcycles currently produce more harmful exhaust emissions per mile than cars or even large sport utility vehicles." Beginning in 2006, motorcycle manufacturers would have "to reduce emissions of HC and oxides of nitrogen NOx by 60 percent." The new standards would also include the previously exempt small scooters mopeds. In 2010, the new standards will cost about \$75 for each motorcycle.

Japan generated about \$216.4 million in U.S. motorcycle sales in 2003. Belgium accounted for \$96.2 million, which warranted a 103.7 percent jump over 2002. Most

impressive was Saudi Arabia with an increase in demand of 158.9 percent.

SIC 5599

AUTOMOTIVE DEALERS, NOT ELSEWHERE CLASSIFIED

Establishments in this industry are primarily engaged in the retail sale of new and used automotive vehicles, equipment, and supplies, not elsewhere classified, such as snowmobiles, go-karts, dune buggies, utility trailers, and golf carts. Also included in this industry are establishments primarily engaged in the retail sale of aircraft. Not included in this classification are automobiles, light trucks, recreational vehicles, motorcycles, boats, motor scooters, all-terrain vehicles, and personal watercraft.

NAICS CODE(S)

441229 (All Other Motor Vehicle Dealers)

In 2001, the U.S. Census Bureau reported 2,216 establishments engaged in the retail sale of new and used automotive vehicles, equipment, and supplies, not elsewhere classified. The total number of retailers climbed to 5,683 in 2003, with annual sales of approximately \$4.8 billion, and there were 24,785 employees. The average establishment had sales of about \$900,000. States with the highest number of stores within this industry were Texas with 536, California with 530, Florida with 499, New York with 258, and Michigan with 203. Together, they enjoyed more than 35 percent of the U.S. market.

Businesses within this industry sell a wide range of products at the retail level. Products as different as snowmobile helmets and single-piston aircraft are sold by retail establishments that vary greatly in size and scope of business.

Automotive dealers, (not elsewhere classified) represented 1,271 establishments, or 22 percent of the market. Dealers of utility trailers numbered 1,176 and 20 percent of the market. Snowmobile dealers numbered 776, and powered golf cart dealers numbered 726. Aircraft dealers had 611, and self-propelled aircraft numbered 444.

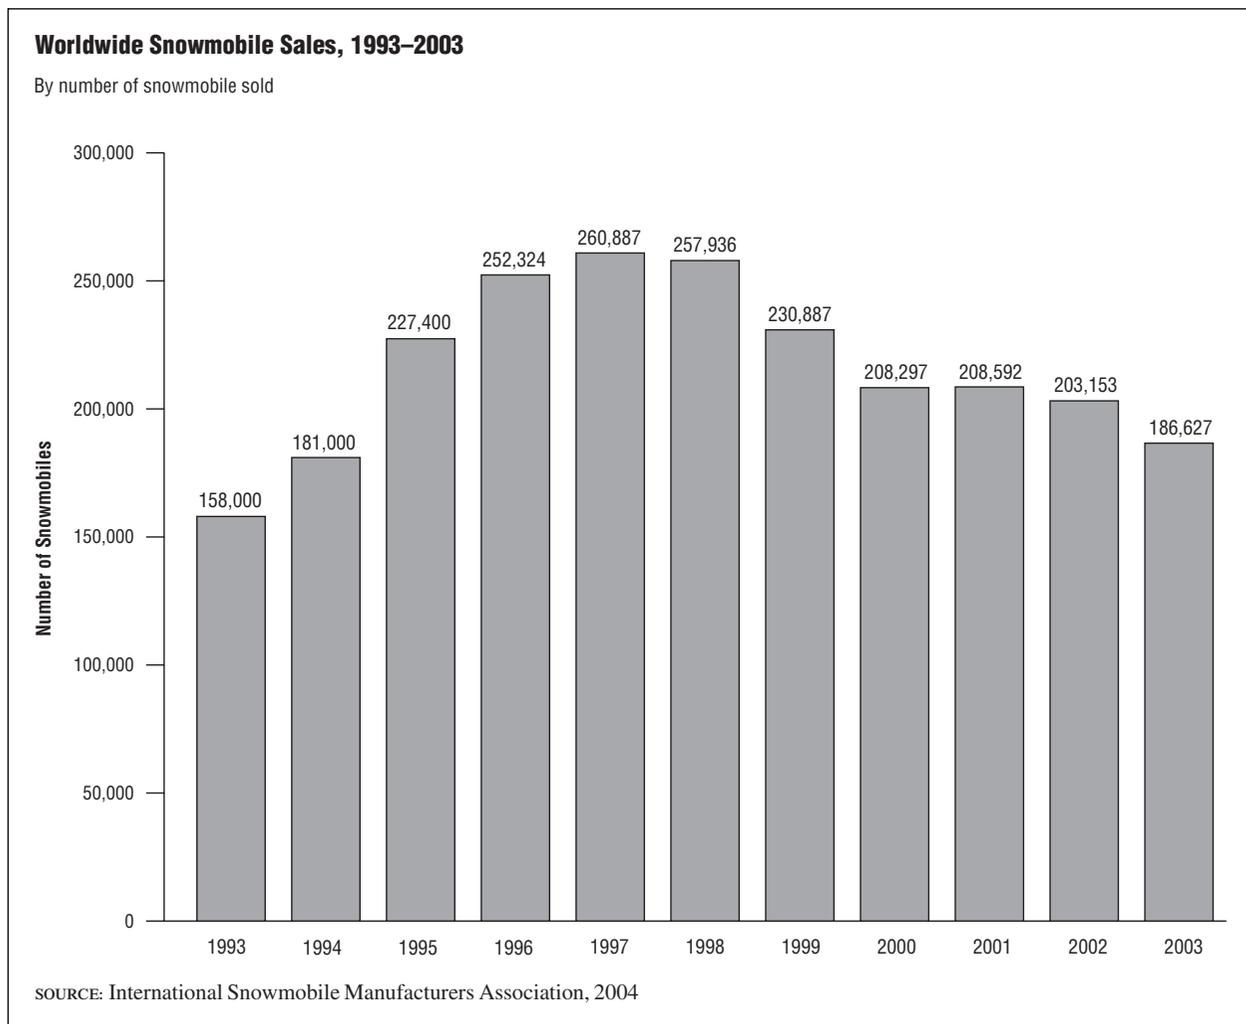

An estimated 1,678 establishments in the automotive dealers, not elsewhere classified, industry employing approximately 9,100 workers were in operation in 1997. These establishments brought in sales of an estimated \$2.5 billion in 1997.

Snowmobile retailers sell new and used snowmobiles, parts, and equipment and are involved in the servicing of the vehicles. Dealers contract to carry the product lines supplied by the four snowmobile manufacturers worldwide. Because business depends on snow, retailers are located in the states in which winters are marked by snow accumulation that stays on the ground long enough for a respectable snowmobiling season. Dealers also often carry other types of recreational vehicles, such as all-terrain vehicles and personal watercraft, to balance out the seasonal swings in business.

The sport of snowmobiling is relatively new; the first snowmobile was mass produced about 50 years ago by Bombardier, Inc., a Canadian company. *Forbes* estimated that the market peaked in 1971 when dealers sold approximately 500,000 units. The International Snowmobile Manufacturers Association (ISMA) estimated that in the late 1990s, dealers were selling more than 147,000 units a year in the United States at an average unit price of \$5,780. The *Statistical Abstract of the United States* estimated that, by the late 1990s, the United States purchased approximately \$930 million worth of snowmobiles and related equipment.

ISMA reported 114,927 snowmobiles purchased in the United States in 2003, with an additional 50,209 sold in Canada. The average retail price was about \$6,380. In all, there were 2.7 million registered snowmobiles, 1.6 million in the U.S. alone. The total number of licensed snowmobile dealers were 1,560 in the United States, 1,060 in Canada, and 403 in Scandinavia. The leading manufacturers are Artic Cat, Bombardier Inc., Polaris Industries, and Yamaha Motor Corporation.

Most of the business in the aircraft sector of this category is done in the buying and selling of used aircraft and parts. An article in *Business and Commercial Aircraft* magazine suggested that used aircraft has historically outsold new aircraft at a margin of three to one. The

same article maintains that 95 percent of turbine equipment is sold to existing users of business aircraft. The National Aircraft Resale Association reported that 1,525 used jet and 1,312 turboprop sales transactions were completed in 1997. For 2000, the figures changed to 1,567 used jet and 1,358 turboprop sales, respectively. The figures were compiled by NARA's associate member, AMSTAT Corporation, a research organization that compiles statistics for the aviation business industry.

According to the Kart Marketing Group, Inc., publisher of *Kart Marketing International* magazine, go-karts generated approximately \$500 million in business per year in North America in the late 1990s. There are two different types of go-karts and two types of retailers to sell them. "Fun" karts built for general usage and priced between \$700 and \$900 are sold through lawn and garden stores and hardware stores. "Racing" karts built especially for high-speed track usage and priced from \$3,000 to \$5,000 are sold through outlets dedicated to kart sales. Approximately 200,000 fun karts were sold at the retail level in the late 1990s, compared to sales of

approximately 10,500 racing karts. The retail outlets selling racing karts range from individuals selling parts and equipment on a part-time basis to storefront establishments. Also, there are many Web sites dedicated to mail order of fun karts, racing karts, and accessories.

SIC 5611**MEN'S AND BOYS' CLOTHING AND ACCESSORY STORES**

This category includes establishments primarily engaged in the retail sale of men's and boys' ready-to-wear clothing and accessories.

NAICS CODE(S)

448110 (Men's Clothing Stores)

448150 (Clothing Accessories Stores)

INDUSTRY SNAPSHOT

In 2002 Americans spent \$50.9 billion on men's clothing, down 7 percent from the previous year. The decline can be primarily attributed to a sluggish economy and a decade-long trend for increasing casual attire in the workplace. Whereas good suit, tie, and accessories cost around \$400, a pair of khakis and casual shirt can be purchased for around \$100. Conservative spending by consumers following the terrorist attacks of September 11, 2001 exacerbated already slow sales in the industry. In the first quarter of 2003, industry insiders were waiting out the war with Iraq, hoping for an upswing in the second half of the year.

Although the industry is notorious for its aversion to trends and shifts in fashion, men's apparel is offered in a wide variety of retail formats, including upscale design and specialty shops, department stores and retail giants, and discount men's clothing stores. Casual attire continues to be khakis and a polo shirt, but the suit is beginning to make a comeback. However, the return of the suit may not be of significant help to the lagging industry until the economy stabilizes. Men are more likely to pull an old suit out of their closet than invest in a new one until consumer spending rebounds.

ORGANIZATION AND STRUCTURE

The men's and boys' segment of the apparel and accessories industry was relatively small. Historically, marketers focused on the women's market, assuming that they were more concerned about fashion than men. In 1990, the men's and boy's category generated just over 10 percent of total sales in the accessory and apparel category. At that time, the women's ready-to-wear and specialty stores commanded close to 67 percent of the category, while the family clothing stores garnered roughly 29 percent. Businesses in the industry hoped that growing fashion awareness among men and boys would increase the industry's percentage of sales.

Since they carried narrow product lines but great depth within those lines, men's and boys' apparel and

accessory stores were classified as specialty retailers. Historically, retailers of men's and boys' clothing and accessories focused on particular segments of the industry. These segments usually mirrored the five divisions into which menswear manufacturers were divided: tailored clothing, including suits, overcoats, topcoats, sport coats, and separate trousers; furnishings, including shirts, neckwear, sweaters, knit tops, underwear, socks, robes, and pajamas; heavy outerwear, including jackets, snowsuits, ski jackets, and parkas; work clothes, including work shirts, work pants, overalls, and related items; and other, including uniforms, hats, and miscellaneous items.

For nearly 150 years, these categories prevailed at the retail level. Even department stores organized their men's and boys' wear departments according to these categories. Beginning in the late 1960s, however, men's and boys' wear stores moved away from specialization into more diversified retail formats that offered a variety of clothing lines.

The trend toward large diversified stores accelerated during the 1980s. By the 1990s, superstores offering huge selections at discount prices were flourishing. Companies such as S&K Famous Brands, Inc., Today's Man, Inc., and The Men's Wearhouse, Inc. that were started in the late 1960s and early 1970s enjoyed tremendous growth in the 1990s as consumers flocked to the stores in search of stylish clothing at a discount. Although these stores focused on the tailored wear segments, they also carried huge selections in all categories in an effort to provide convenient one-stop shopping for customers.

The locations of men's and boys' stores underwent changes as the superstore format became popular. Many men's and boys' wear retailers moved out of the high-rent cities and malls into less expensive, but larger, suburban locations. The new superstores, which were sometimes more than 20,000 square feet, were often located in strip shopping centers or stand-alone buildings. To avoid high rents, these superstore retailers were quite willing to locate off the beaten track.

Competitive Structure. Owing to an increase in the overall fashion consciousness of American men, the industry experienced a rapid growth stage during the 1960s. The nature and intensity of competition in this industry has varied considerably since then. During most of that decade, rising demand for men's clothing and accessories encouraged new entrants. By the 1970s, however, the number of menswear stores was decreasing. Competition increased during the 1970s as department stores and specialty retailers battled for market share in a declining market. Demand picked up again in the mid-1980s resulting in a rapid increase in the number of stores.

Throughout the 1970s, department stores, which enjoyed the advantages of location and customer recogni-

tion, appeared to have a competitive edge over the specialty stores. For this reason, many retailers that entered the industry in the 1970s were off-price stores that hoped to compete with department stores by offering low-priced merchandise. It was not until the mid-1980s that department stores were the main competition of the men's and boys' specialty retailers.

The downward economic trend of the late 1980s, however, was a boon for discounters. By 1990, many off-price specialty retailers enjoyed a competitive advantage over department stores whose merchandise was often priced 30 percent higher than that of the discounters. Heading into the mid-1990s, market conditions favored the discount retail formats. Since even affluent customers were increasingly willing to shop at off-price stores, traditional retail formats continued to decline.

Financial Structure. Businesses in this industry were often small, privately owned stores, although there were many chain stores in operation. In 1990, the smaller businesses typically generated more than \$1 million on an initial investment of approximately \$295,500. The sales figures for chain retailers were quite disparate owing to the varied size and success of different chains; some of the larger chains grossed upwards of \$300 million in sales, while industry-leader Hartmarx Specialty Stores generated over \$1 billion.

Statistics showed that men's and boys' wear stores were more expensive to operate than women's or children's wear stores; therefore, the financial structure of businesses in this category differed from other segments within the retail category. Annual payroll, for example, in men's and boy's stores averaged \$13,274 per employee, while women's accessory and specialty store payroll averaged about \$10,000. Inventory costs were relatively high in the men's and boy's segment as well. The short fashion cycle and resulting quick turnover of merchandise in women's apparel explains much of the disparity in inventory ratios. Men's fashions changed so infrequently that stores could carry inventory without worrying about significant changes in customer preferences.

BACKGROUND AND DEVELOPMENT

Developed in the late 1700s, the menswear industry is the oldest of the domestic apparel industries. The industry began in the northeast, where Samuel Slater built the first textile mill and where sailors off ships needed ready-to-wear clothing when they arrived in port. As the seamen could not afford custom-tailored clothing, tailors in port cities like New Bedford, Boston, and New York made standard size suits for them to wear as soon as they arrived on land. These early garments were made of the roughest cloth and were also frequently purchased by southern plantation owners for their workers.

The industry continued to develop as the demand for ready-to-wear clothing increased. The steady stream of immigrants who arrived in the United States with few clothes of their own, the Gold Rush in 1849, and the Civil War all stimulated the industry. When the Civil War ended, opportunities in the industry continued since people moving to the newly opened land in the West purchased ready-made clothing before they departed.

In response to the growing popularity of ready-to-wear men's clothing, dry goods stores featuring men's apparel sprang up throughout the country. These early experiments in retailing were the predecessors of the modern department store and shaped the direction of the modern retail industry. Many of the stores that were started during the early 1800s continued to do business into the 1990s. Heading into the twenty-first century, Brooks Brothers, founded in 1818, was the nation's oldest clothing store still in business.

One of the pioneers in men's retailing, John Wanamaker, introduced many of the merchandising strategies that are still used in the retailing industry. Wanamaker, together with his brother-in-law Nathaniel Brown, started a men's and boys' clothing store in 1861 in Philadelphia. Wanamaker, who had almost become a minister, proclaimed that he and his brother-in-law would follow the "Golden Rule of Business." Guarantees of satisfaction or money-back refunds were the hallmark of Wanamaker's businesses. So badly did Wanamaker want to get his message across that after making \$24.67 on his first day of business, Wanamaker invested \$24 in advertising. He was one of the first merchants to purchase a full-page newspaper advertisement. Wanamaker's, with a reputation for having fine clothing and accessories, became a shopping legend for all ages and both sexes. The end of an era came in 1995 and 1996 when most Wanamaker stores were bought out by the May Company and converted to Lord & Taylor stores. The Wanamaker's name had actually died some years earlier, although its former flagship store in Philadelphia still gives many shoppers a strong sense of the Wanamaker past.

Although many of the early men's and boys' clothing and accessory stores evolved into large department stores, the small independent shops continued to flourish throughout the nineteenth and twentieth centuries. These stores were typically conservative and specialized. Often, for example, a store would offer only tailored clothing or work clothes. For roughly 150 years, the men's and boys' wear industry retained the same selling practices.

A new segment of men's and boys' retailers developed in the 1960s: the casual and sportswear stores. Changes in lifestyle and increased demand for more variety in men's wear led to the decline of many tailored wear retailers. By the 1970s, leisurewear was the fastest-growing segment of men's and boys' retailing.

Dual Distribution. Unlike other apparel industries, the men's and boys' clothing business has been connected with dual distribution since its inception. The term "dual distribution" refers to the practice of selling manufactured goods on both a wholesale and on a retail level.

As the country expanded, the manufacturers in the north found themselves far away from their customers. Although the factories were located in mill towns like Lowell, Massachusetts, and in big cities like New York, the population was growing rapidly in places like New Orleans. Initially, the apparel manufacturers were willing to sell their goods to clothing stores in the South. It did not take long, however, for clothing producers to realize that owning retail stores would be profitable. By the 1830s, manufacturers operated outlet stores in large southern ports such as New Orleans and Charleston. Most factories also continued to sell apparel to independent stores at the wholesale level.

Many well-known names in this industry, such as Hartmarx Corporation, Botany Industries, and Phillips Van Heusen, practiced dual distribution. In women's apparel, on the other hand, this policy was unusual. The industry watched the decline of tailored wear, especially suits. By the mid-1990s, the suit segment had been declining about 5 percent a year since 1989. The number of suits being manufactured reflected the trend: in 1990, 15.5 million men's and boy's suits were manufactured, down from 18.4 million in 1989. The suit industry was at its apex in 1979, when 25 million suits were made for the U.S. market.

In the place of the suits, the tailored separates product line was prospering. An inexpensive and flexible alternative to the traditional men's suit, tailored separates allowed customers to mix and match jackets and pants of different sizes and colors according to their needs. The separates were once considered a cheap way of selling clothes and were typically carried by bargain outlets or mass retailers like J.C. Penney. Heading into the mid-1990s, however, upscale retailers such as Brooks Brothers were carrying tailored separates as well. In fact, Brooks Brothers' separates line, called the Wardrobe Collection, represented over 30 percent of its sales by the mid-1990s.

In addition to the tailored separates, retailers in the men's and boys' clothing and apparel industry discovered that the inexpensive product lines such as ties and hats were very lucrative. Although the recession convinced many men to forgo major purchases like suits, the lower priced items were popular. In fact, ties enjoyed faddish popularity even among teenagers. In response to increased demand, retailers of men's and boys' casual wear, such as The Gap, added ties to their merchandise in the early 1990s. Tie sales continued to grow into the mid-1990s, as new styles and fabrics continued to catch the attention of consumers. Baseball hats were also popu-

lar during this period. Sportswear stores stocked hundreds of baseball hats featuring college and professional team logos.

Among the best-selling casual lines was licensed clothing. Merchandise featuring characters from popular television shows and movie releases sold extremely well in the early 1990s, as did licensed sports team apparel. The popularity of sports logos was no surprise to the men's and boys' apparel retailing business. The proliferation of new sports franchises during this period contributed to the fad. Department stores accounted for 79 percent of all licensed apparel sold in 1995.

Warner Brothers' Looney Tunes characters enjoyed tremendous popularity beginning in the early 1990s. Looney Tunes and the National Basketball League teamed up to produce apparel and accessories featuring both licenses. This line was popular with the young men's segment, especially in urban areas.

In addition to changes in the types of merchandise sold, the men's and boys' apparel and accessories industry moved more toward using private labels than it had in the past. David Feld, CEO of industry-leader Today's Man, summarized the shift by noting that "years ago, retailers were representatives of manufacturers. Today, we see ourselves as the buying agent of the consumers."

Many of the large discount retailers discovered that private label merchandise was more profitable than brand-name clothing. Men's wear retailers who sold private label merchandise avoided having to mark up prices to allow for manufacturer and distributor profits. The savings was passed on to the consumer in the form of lower prices. In the value-oriented climate of the 1990s, this pricing advantage gave private label retailers a competitive advantage.

Advertising. Historically, advertising in this industry was subdued compared with other segments of the apparel and accessory category. Even men's wear manufacturers did little national advertising, preferring instead to rely on time honored reputation and brand recognition. During the 1970s and 1980s, some manufacturers provided retailers with newspaper and magazine advertisement and the necessary materials for radio and television commercials. This cooperative advertising continued to be popular into the 1990s.

By the late 1980s, however, men's and boys' retailers, especially discount chains, were aggressively advertising. Houston-based The Men's Wearhouse, for example, began advertising in local newspapers during the 1970s, but by 1993, the company spent close to \$14 million on promotions, the majority of which were television commercials. Companies that focused on small to mid-size markets like Memphis, Tennessee, and Charlotte, North Carolina, valued advertising as a competitive

tool. In these markets, advertising helped gain market share quickly. Discounters in these areas typically spent 5 to 6 percent of sales on advertising, though The Men's Wearhouse spent nearly 8 percent of 1992 sales on commercials.

Trade Groups. Trade groups also figured prominently in the publicity efforts of menswear retailers. Major national publicity campaigns were often organized and sponsored by a number of trade groups.

Based in Washington, D.C., the Menswear Retailers of America organization drew its membership from independent menswear stores located throughout the country. The organization was originally called the National Association of Retail Clothiers and Furnishers whose principal purpose was to lobby on behalf of the menswear retail community. By the 1990s, the organization provided its members with a monthly newsletter and an annual business survey. The group also organized national conventions and seminars for industry executives.

A more niche-oriented trade association, the Big and Tall Associates concentrated on a market that represented less than 5 percent of all the nation's men. These customers were over 5 feet 11 inches tall and/or had a chest measurement of more than 48 inches. Roughly 60 menswear manufacturers and 40 merchants were members of the association.

The importance of Father's Day for menswear merchants was underscored by the existence of the Father's Day Council, Inc. Although the council was a nonprofit organization supported by manufacturers and department stores, it provided much publicity for stores in the men's and boys' apparel accessory industry. Through various campaigns, The Father's Day Council promoted gift giving on Father's Day. One of the organization's oldest traditions was the National Fathers of the Year awards. Each year, the recipients were chosen from various professions.

In January 2000, the American Apparel Manufacturers Association (AAMA) voted to allow retailers into their organization. The reasons for this move were related to the shifting marketplace: retailers had begun sourcing directly from overseas contractors, online commerce promised increased sales, and similarities between retailers and manufacturers were growing. Retailers had been allowed to join AAMA in the past as associate members, but revisions to the bylaws in January 2000 afforded them full membership status.

CURRENT CONDITIONS

The challenging economic conditions of the early 2000s have resulted in some shifts within the industry. Traditional department store retailers, such as J.C. Penney and Sears, have long been the biggest market source

for men's wear. However, as consumers trade down in value, discount superstores, including Target, Wal-Mart, and such hybrids as Kohl's, are commanding a larger share of consumer attention. Whether this trend points to the inevitable slow death of the department store has yet to be played out, but clearly the men's wear industry has taken notice.

As consumers seek value-priced apparel, numerous men's wear providers have followed suit. Mossimo Giannulli signed a multibillion-dollar deal with Target in 2000, and Columbia Sportswear has become a highly successful line at Kohl's. In 2003 Levi Strauss began supplying Wal-Mart with an exclusive line of denims. As brands originally found only at department stores move down to discount stores, other higher-end brands are also stepping down from specialty shops to become available in the department stores.

Following a decade that emphasized a dressed-down work environment, some industry analysts anticipated the return of fashion to the office. With no one wanting to be mistaken for a t-shirt-wearing dot-com dropout, men are starting to reconsider the business suit. A new emphasis on men's fashion may be due in part to the increasing number of men who shop for themselves. In the mid-1990s, 75 percent of men's clothing was purchased by women. However, as women have become busier, men are increasingly picking out their own clothes. In 2002, 45 percent of men were shopping for themselves, a number that was expected to reach 70 percent by 2007, according to *Crain's New York Business*. This trend has led to a shift in men's wear marketing strategies, which traditionally attempted to appeal to female shoppers. Because men's fashion is overwrought with sameness and men are likely to have many similar choices in similar price ranges, stores are emphasizing those features that appeal specifically to male shoppers, including gadgetry, convenience, and customer service.

Overall, fashion changes slowly in men's clothing, and retailers continue to rely on tried-and-true staples in their offerings. The situation leads the industry into stagnation as mega-brands and those that imitate them flood the market. Although industry analysts call for innovation and new brands, there is a sense that stepping outside the box of traditional fashion is risky business, which could be detrimental to the bottom line. At least until the economy once again swings up and the United States moves beyond the second Gulf War, the menswear industry is expected to remain a relatively conservative environment for innovation.

INDUSTRY LEADERS

Although the men's and boys' clothing and accessory industry was fragmented, a few of the companies in the industry were growing faster than the competition.

These businesses were able to capitalize on the changes in consumer preferences and spending habits that were rapidly changing this traditionally conservative industry.

Retail Giants. Sears, Roebuck, and Co. added substantially to its clothing lineup with the 2003 purchase of Lands End for \$1.9 billion. The company posted \$41 billion in sales in 2002. J.C. Penney, another department store giant, reported sales of \$32 billion in 2002. Wal-Mart, the world's largest company, is also the nation's largest retailer with \$218 billion in sales in 2002. The company is becoming more serious about its clothing selection, including adding an exclusive line of Levi Strauss fashions in 2002. Target, with 2002 sales of \$39.9 billion, has also begun taking its apparel lines seriously, accentuating the trendy with its offerings from Mossimo, Cherokee, Stephen Sprouse, and Ecko's Phys. Sci.

Traditional Retailers. Another industry leader involved in retail and manufacturing, and the oldest men's retail store in America, is Brooks Brothers. This company was started in 1818 by Henry Sands. Brooks Brothers was the company that invented the button-down shirt and the argyle sock. The company outfitted notable Americans like Abraham Lincoln and Franklin D. Roosevelt and continued as the last bastion of conservatism in the men's clothing industry.

According to Brooks Brothers executives, their company has been successful over the years because its name represents American style. Brooks Brothers' clothes have changed very little over time. In fact, the button-down shirt, invented by Brooks Brothers in the nineteenth century, remained practically unchanged as of 2003. Brooks Brothers offered the stable conservative type of clothing that appealed to U.S. presidents as well as young men out of college who wanted to dress appropriately for a first job interview.

Although the Brooks Brothers name has been associated with conservative clothing, the company has also demonstrated flexibility. Recognizing that men were buying fewer suits and were dressing more casually at work, Brooks Brothers introduced Friday Wear. The line was more relaxed than a suit, making it appropriate for casual Fridays at the office. Brooks Brothers also introduced the "Wardrobe Collection," a line of tailored separates. These and other innovations helped Brooks Brothers prosper despite that fact that many of their products have not changed since they were first introduced in the nineteenth century.

The company has 160 retail and outlet stores throughout the United States. It also has 75 stores in Japan and two in Hong Kong. Owned from 1988 to 2001 by the British firm Marks & Spencer, the chain was sold in 2001 to Retail Brand Alliance for \$225 million. Brooks Brothers' sales in 2001 were \$634.6 million.

Joseph A. Bank Clothiers, Inc., founded in 1905, specializes in suits and other business attire, although it too offers casual wear. It also sells golf wear under the David Leadbetter label. The company operates more than 150 stores in 30 states and had sales in 2002 of \$234.4 million.

Discount Leaders. An important departure from tradition in the men's wear businesses was the willingness of consumers to purchase tailored wear at bargain outlets. Two of the leaders in this fast growing segment were S&K Famous Brands and The Men's Wearhouse. Both of these stores used similar strategies in pricing, promotion, and location, and represented a stark contrast to traditional men's wear retailers like Brooks Brothers.

S&K Famous Brands, Inc. was started in 1967 by I. J. Siegel and Abe Kaminsky as a wholesale business. The founders started their operation after retirement: they would spend their days buying one retailer's overstock and selling it to another retailer. Eventually, the volume of merchandise exceeded the space available in the car the two men used as their base of operations. Siegel and Kaminsky rented space in a former thrift store and eventually attracted retail customers.

Siegel's son, Stuart, joined the business in the early 1970s and initiated its expansion. By 1973, S&K Famous Brands operated five stores; when the company went public in 1983, it had grown to 13 stores with sales of \$10 million. The initial public offering generated \$2.6 million, most of which was used for expansion.

Despite rapid growth, S&K Famous Brands maintained tight control of its finances. Its expansion was gradual and internally financed. Owing to this conservative approach, the company had little long-term debt as it entered the mid-1990s. By 2002 S&K had nearly 240 stores in operation in 27 states, and annual sales totaled \$162.2 million.

An off-price retailer, The Men's Wearhouse had humble beginnings similar to S&K Famous Brands. The first Men's Wearhouse store was started in 1972 with a \$7,000 investment by George Zimmer, an apparel salesman. Zimmer carried brand-name men's suits and sold them well below department store prices. In 1992, after 20 years of operation, the company went public.

The Men's Wearhouse battled aggressively with department stores. The company invested heavily in television advertising featuring George Zimmer attacking his competitors by name. Zimmer's ads were scathing enough to provoke Nordstrom Inc., a Seattle-based retail chain, to file a suit against The Men's Wearhouse for false and misleading advertising. Despite this challenge, by 2002 the company had grown into a 680-store chain with a presence in 43 states, Washington, D.C., and Canada. The company posted net revenue of \$42.4 million on sales of \$1.3 billion in 2002.

WORKFORCE

The U.S. Department of Labor, Bureau of Labor Statistics reported that the total number of individuals employed in this industry was estimated at 80,300 during 2001. Over 77 percent of all jobs were sales related. Retail sales positions totaled 46,350, or nearly 58 percent of the work force, and had a mean annual salary of \$18,230. Managers and supervisors, totaling 11,210 or 14 percent of the workforce, earned an average annual salary of \$32,930. Tailors, dressmakers, and custom sewers, totaling 4,380 or 5 percent of the workforce, reported a mean annual salary of \$27,340. Management-level positions, consisting primarily of general and operations managers, accounted for less than 4 percent of the workforce and had mean annual salary of \$65,310.

AMERICA AND THE WORLD

As the industry moved into the mid-1990s, American companies began to establish specialty retail operations abroad. Manufacturers of men's and boys' clothing and accessories were well aware of the opportunities abroad, and many had established joint ventures in foreign markets. The retailers, however, found it more difficult to penetrate foreign markets.

One company successful in negotiating a retail joint venture was Eddie Bauer. A division of Spiegel, Eddie Bauer was a leader in the men's and boys' wear industry in the United States with successful retail and mail order operations. In 1993, Spiegel announced that it had successfully negotiated an agreement with Otto-Sumisho in Japan to form a joint venture to sell Eddie Bauer products through retail stores and catalogs. Company executives forecasted that they would open between 75 and 100 stores in Japan and that the venture would generate from \$400 to \$450 million in sales.

The fact that Eddie Bauer was able to negotiate this agreement was a positive signal to other retailers. In the tailored wear sector, however, global expansion was difficult since European and Far Eastern-made suits were widely regarded as being superior to American manufactured suits. Opportunities did exist, however, in the casual wear segments, as Eddie Bauer's success indicated.

RESEARCH AND TECHNOLOGY

Inventory management became a major strategic priority in the early 1990s. Most retail environments, including the men's and boys' apparel segment, were forced to improve inventory management techniques through advanced automation. S&K Famous Brands, for example, implemented a merchandising information system that tracked store inventories on a daily basis. The system improved efficiency and helped maintain the correct match of inventory to demand. Other types of state of the art technologies were sweeping men's and boys' wear

retail operations and the retail industry as a whole. Many businesses invested in cash registers that could calculate discounts, approve credit, accept credit cards, and schedule deliveries. This new technology promised cost saving in the long run, but in the short run the cost of the technology itself was prohibitive for smaller stores.

Most industry experts agreed that technology enabled retailers to react to their businesses much more quickly. Before computerized tracking systems, managers would wait until Monday morning for weekly sales figures. With the aid of technology, this information became available on a daily basis. The timeliness of this information gave retailers the ability to respond to sales by placing reorders, taking markdowns, and spotting trends on an accelerated basis.

Some apparel retailers complained about the amount of useless information the technology produced. Some industry executives pointed out that the technology revolution produced so much data, they wasted time sorting through the information. One industry analyst summarized the problem, noting that "The technology makes it possible for retailers to be better, provided [they] also have the systems capabilities to deal with a large mass of data, to analyze and summarize, to distill what is important and what is extraneous." Despite these criticisms, however, industry experts agreed that automation was a prerequisite for success in the 1990s retail environment.

Using technology to enhance retail businesses is critical to the success of men's and boys' apparel and accessory retailers. The intensely competitive market coupled with shifting consumer preferences made flexibility and low price important competitive weapons. The ability to enhance reaction time and to streamline operations using automation helped retailers compete in this environment.

SIC 5621

WOMEN'S CLOTHING STORES

This industry includes establishments primarily engaged in the retail sale of a general line of women's ready-to-wear clothing. This category also includes establishments primarily engaged in the specialized retail sale of women's coats, suits, and dresses. Custom tailors primarily engaged in making women's clothing to individual order are classified in **SIC 5699: Miscellaneous Apparel and Accessory Stores**.

NAICS CODE(S)

448120 (Women's Clothing Stores)

INDUSTRY SNAPSHOT

The economic recession, begun in 2001 and fueled by the terrorist attacks of September 11, 2001, progressed relatively unabated into 2003 when the United States went to war with Iraq. During these times of economic instability, consumers became conservative spenders, which left its mark on the women's apparel industry. Women's apparel sales reached \$89.3 billion in 2002, a 6.7 percent decrease from the previous year. In the women's apparel market, women opted for more practical but stylish and affordable clothing suitable for both work and leisure.

Several of the nation's retailers failed to catch on to the new trend, putting many retail stores in trouble. How-

ever, industry leaders like The Gap, Inc., with \$14.5 billion in sales, and Limited Brands, Inc., (formerly The Limited), with \$8.4 billion in sales, performed quite well in 2002. The two industry giants succeeded during the slump by exploring new markets and responding to customer needs.

ORGANIZATION AND STRUCTURE

The structure of the U.S. retail industry, including women's clothing stores, has changed significantly since the early 1990s, moving from a production-driven market to a consumer-driven market. Nontraditional retailers, such as discounters, off-priced stores, and factory outlets, fared well.

Because of continuing competition from nontraditional retailers, department stores such as J.C. Penney and specialty stores such as The Limited increased their focus on private labels. For example, J.C. Penney's Arizona clothing line offered uniqueness and style that national brand labels sold by discounters and outlet stores did not provide.

In the mid-1990s, consumers demanded more convenience and quicker service from growing no-store retailing, particularly in direct-mail order, television, and online shopping. An Internet shopping study by Ernst & Young LLP reported that the number of retailers selling online tripled in 1998 to 39 percent. The online market was estimated to reach \$13 billion in sales at the end of 1999.

The relationship between larger retailers and suppliers significantly intensified because a growing number of retailers were taking on entrepreneurship roles traditionally performed by apparel producers. Larger retailers and direct-mail order companies were making decisions in areas such as product design, fabric selection and procurement, and apparel production, which in turn influenced production scheduling, pricing, and delivery dates.

BACKGROUND AND DEVELOPMENT

Women's clothing stores were introduced in Europe in the late 1700s—slightly later in the American colonies—at a time when productive capability, population, and prosperity allowed clothing production to move out of the house and into the factory, and clothes to move into retail stores. Around this time, seamstresses began opening shops offering custom-made hats, dresses, cloaks, or other garments. These garments of the latest fashion were for those who could afford to hire out the work of stitching. Trading posts in the frontier areas carried cloth and some ready-made apparel.

The invention of the sewing machine, the rise of mass production, and the proliferation of retail stores by the late nineteenth century led people first to sample and later to rely on ready-made clothing for sale as a reliable

means of obtaining fashionable clothing. In the 1890s, ready-to-wear clothing came into its own, and by the turn of the century ready-made women's wear was available in abundance in the United States. By the 1920s, it was considered more fashionable to buy clothing from a store than to make it at home.

For many years, the department store and the downtown women's shop were the mainstays of women's wear retailing. Department stores offering a vast selection of goods and specialty stores catering to unique tastes dotted the urban landscape. For those with enough money, shopping became a social event. Along with the growth of women's clothing retailing came the increasing importance of fashion.

The women's apparel industry established a voice in government through the National Retail Federation (NRF), the trade group representing the entire spectrum of the nation's retail industry. In the early and mid-1990s, the NRF lobbied the U.S. Congress on issues such as minimum wages and the proposed health care plan. The NRF was opposed to an increase in the minimum wage on the grounds that many retailers would have to close down operations or fire staff to meet expenses with a higher wage base.

In 1994, *Women's Wear Daily* reported that the NRF opposed the Clinton administration's proposed universal health coverage on the grounds that more than 700,000 jobs would have to be eliminated in all retailing. At that time only 35 percent of retail workers received health care benefits. The NRF supported a plan that emphasized offering health coverage but did not require employers to pay for that coverage and allowed for the creation of purchasing pools for group insurance.

Posting modest returns in the mid-1990s, women's clothing sales were expected to remain strong into the twenty-first century. Dedicated women's stores, however, faced renewed competition from alternative retail venues offering specialty or general line women's apparel in addition to other product lines.

Sporting goods retailers were devising new strategies to increase women's apparel business. In 1995, women's apparel ranged from 10 percent to 40 percent of store merchandise. Sporting goods retailers saw strong potential in the women's apparel market. Retailers increased floor space to accommodate women's products; set up women's departments; increased stock of best-selling brands; and held store events to draw more female customers.

Department stores also responded to the increased demand for women's apparel and began repositioning themselves to win back the customers they had lost to more focused outlets like The Gap and The Limited. Such retailers as Bloomingdale's and Dayton Hudson Depart-

ment Stores reexamined the big picture in 1995 and revamped the women's apparel collections.

The large-sized women's clothing market grabbed the attention of clothing retailers in the mid-1990s with sales reaching \$20 billion and claiming 24.7 percent of the market. The key factors that influenced these sales were an increase in fashions featuring younger silhouettes and the use of better fabrics. Lane Bryant, a division of The Limited Inc., brought in more fashionable clothes and worked to change the perception of large-size fashion. "Our customer wants to wear the exact same fashion her skinny friends wear," noted Lane Bryant's chief executive Jill Dean in a 1999 *Wall Street Journal* interview.

One of the hottest growth areas in retailing during the late 1990s was discounting. Clothing retailers saw an opportunity to bring fashionable clothes at reasonable prices to the masses. In 2002, Target was the country's third largest discounter and a \$40 billion division of the Dayton Hudson Corporation. Nearly 35 percent of Target's sales come from the clothing department. Old Navy, a division of The Gap, was launched in 1994 to compete with stores like Sears and Target with this concept in mind."

CURRENT CONDITIONS

As the United States initiated the war with Iraq in March of 2003, the U.S. economy remained soft and consumers remained cautious. As a result, the clothing industry reported sales numbers below those previously forecasted, down 6 to 7 percent rather than the anticipated 3 to 4 percent for the month. The retailers with the most success—or least amount of decline—were those that offered moderate-priced, affordable sportswear that combined the right amount of fashion with value. The industry was expected to remain stagnant until the United States' involvement with Iraq concluded and the economy recovered.

Fashion and marketing of fashion began to change as the large population of Baby Boomers reached their fifties. The demographic shift to an older America essentially harmed the clothing industry because older shoppers tend to spend less on clothing. However, the aging of the Baby Boomer generation, a population that does not want to look or act "old," is motivating retailers to provide new lines that modify fashionable junior looks in styling and fit to better accommodate a mature woman.

Retailers continue to target junior shoppers as a consistent source for revenues. Young consumers, who tend to have more disposable income than older shoppers, spend more money on clothing and are more conscious of fashion trends. For example, according to NPD Fashionworld, in the first nine months of 2002, junior business reported a 9 percent gain, increasing from \$8.8 billion to \$9.6 billion during the same time period of the previous

year. On the other hand, misses business, the largest sector of the women's clothing industry, reported a decline of 8 percent, from \$29.2 billion to \$26.8 billion. Women between the ages of 17 and 24 increased spending on clothing by 1 percent, whereas purchases by women between the ages of 35 and 44 fell by 10 percent, and purchases by women over the age of 55 dropped off 13 percent.

During the first nine months of 2002, of all women's apparel sales, national brands accounted for 34 percent; private label, 36 percent; and designer brands, less than 5 percent. In units of clothing sold, national brands took 40 percent; private label, 37 percent, and designer label, less than 3 percent. Dresses, skirts, and tailored clothing all declined in sales and units sold, but increases were seen in jeans and in knit shirts.

INDUSTRY LEADERS

The leaders in the women's clothing store retail industry in the United States were The Gap, Inc. and Limited Brands, Inc. The Gap, founded in 1969 by Don and Doris Fisher in San Francisco, has become an international specialty retailer offering men's, women's, and children's casual clothing and accessories. The Gap operated nearly 4,250 stores in six countries in 2002, including The Gap, GapKids, Baby Gap, GapBody, Banana Republic, and Old Navy Clothing Co. The Gap has stores in the United States, Japan, the United Kingdom, Canada, France, and Germany. The company reported \$478 million in net income on \$14.5 billion in revenues for the fiscal year ending January 2003.

The Gap expanded quickly in the 1980s, purchasing the Banana Republic chain in 1983, launching GapKids, and BabyGap in 1986, and opening its first overseas store in London in 1987. By 1990 The Gap was one of the most successful apparel retailers and the second largest clothing brand in the United States. One of the biggest successes for The Gap was the Old Navy division, launched in 1994. In less than three years, The Gap opened 282 Old Navy stores and hit sales of \$1 billion. Gap Online was introduced in November 1997. In 1998, The Gap reported a 28.8 percent return on capital and 17 percent average annual sales growth. The company planned to increase its international presence by opening 400 new U.S. stores and 100 new international stores in 1999. The company budgeted \$1 billion for 1999 store openings.

Limited Brands, Inc., the top U.S. women's apparel retailer, was founded in 1963. The Limited distributes and sells women's and men's apparel. The company operated 4,600 specialty stores in 2002 under the retail names of The Limited Stores, Express, Lerner New York, Lane Bryant, Henri Bendel, and Structure.

The mid-to-late 1990s marked a number of changes for Limited Brands. The company spun off the Victoria's

Secret and Bath & Body Works chains in 1995, creating Intimate Brands Inc., 84 percent owned by Limited Brands. In 1995, Limited Brands also purchased the Galyan Stores, a chain of outdoor-oriented stores. The company took a cautious approach to adding more stores, opening three new stores in 1996 and four in 1997. However, during the summer of 1999, Limited Brands sold its majority stake in Galyan's to the investment firm of Freeman Spogli & Co. The deal left Limited Brands with a 40 percent stake in the company. Limited Brands made Abercrombie & Fitch Co. its own public company in 1998, and in 1999, The Limited spun off The Limited Too to shareholders.

After enormous success throughout the 1980s, Limited Brands experienced financial difficulties in the mid-1990s. The company redesigned its women's division by re-staffing, new advertising, and improving quality. Sales for the 2002 reached \$8.4 billion, resulting in a net profit of \$502 million, a decline of 3.3 percent from the previous year. Limited Brands hoped to improve profits by carrying deeper inventories of fewer styles. Lane Bryant, offering fashionable clothes for women in sizes 14 to 28, became one of the company's strongest performers.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics Women's clothing stores employed an estimated 263,850 people in 2001. Nearly 84 percent of all jobs in the industry are sales related. The mean annual salary of a salesperson in the women's clothing industry in 2001 was \$16,450. Managers and supervisors of sales associates had a mean annual salary of \$28,600. Management occupations, which accounted for 2.5 percent of the workforce, had an annual average salary of \$56,940. Buyers, which hold .5 percent of the jobs, had an average annual salary of \$45,370. Employment prospects in women's clothing are traditionally most abundant in sales, where the majority of the workforce is female. Prospects for employment of women were expected to remain strong in the sector despite flat growth.

There were three basic categories of jobs in women's apparel retailing: sales associates, store management, and merchandisers. Larger chains may have also employed their own product testers, fashion consultants, and comparison shoppers. As U.S. retailing firms became more diverse and turned increasingly toward international markets, a corresponding increase in the need for multilingual personnel in all of these categories was predicted.

Sales associates are responsible for performing customer service and a variety of operational duties such as setting up displays and organizing stock. Store managers oversee sales, operations, and personnel functions. Merchandisers work with the apparel manufacturers to select

apparel for the retailer and control merchandise expenses. Training for merchandisers and buyers usually includes college course work or fashion school.

Wages in the retail industry are typically lower than the average across industries, and working hours often span a seven-day week. However, the effect of the seven-day week is eased by the use of part-time employees. In some shops and departments, the sales staff received a combination of salary and commission.

AMERICA AND THE WORLD

According to *Advertising Age International*, with the success of global expansion, "the world will be a lot like a giant shopping mall by the year 2000." Expectations were that more consumers would be able to shop at the same popular retail stores anywhere in the world. In 1995, U.S. apparel retailers were occupied with expanding into Canada, Europe, and Japan.

Historically, Canada offered little market opportunity to retailers, putting restraints on size and economics, according to a survey in *Chain Store Age*. However, because the U.S. apparel retailers offered new concepts and were more advanced in customer service, market research, and distribution, Canadian consumers were more receptive to their arrival.

Eddie Bauer, a men's and women's apparel retailer, entered into the European market in 1997, joining apparel giant The Gap. Eddie Bauer UK was expected to open two retail stores and operate a catalog division in the United Kingdom. The Gap operated stores in the United Kingdom, Canada, Japan, France, and Germany by the end of 1999.

According to *U.S.A. Today*, "U.S. mid-price apparel retailers are doing well in Japan." The new trend in the Japanese market was a push toward affordable casual clothing and convenience. Eddie Bauer operated 15 stores in Japan and planned to operate more than 50 stores by the year 2000. The Gap opened four stores in Tokyo and opened its first freestanding store in 1996.

WOMEN'S ACCESSORY AND SPECIALTY STORES

This category includes establishments primarily engaged in the retail sale of women's clothing accessories and specialties, such as millinery, blouses, foundation garments, lingerie, hosiery, costume jewelry, gloves, handbags, and furs (including custom made furs).

NAICS CODE(S)

448190 (Other Clothing Stores)

448150 (Clothing Accessories Stores)

INDUSTRY OVERVIEW

Due to the recessive economy of the early 2000s, made worse by the uncertainty of the wartime climate of 2003, U.S. sales of women's accessories and specialty items have, at best, remained steady and, in many cases, declined. When consumer confidence is low, discretionary spending becomes limited because shoppers stick to the basics and the essentials. Two exceptions in the stagnant industry are plus-sized items and costume jewelry, which both saw growth in 2002. Furs, which were socially taboo during the 1980s and 1990s, are also making a comeback with designers, who are finding renewed success at high-end specialty shops.

ORGANIZATION AND STRUCTURE

Stores in this industry offered a vast selection within limited product lines and therefore were considered specialty retailers. Traditionally, these businesses were small, independently owned shops that provided distinctive merchandise and superior customer service, often at premium prices. During the 1990s, however, the women's accessory and specialty store industry experienced structural changes that paralleled changes in the retailing industry as a whole—the small, traditional retailer was being replaced by larger chains that emphasized value and convenience.

Store size was a contributing factor to a retailer's overall profitability. The size of women's accessory and specialty stores tended to be smaller than many other retail outlets. Although the size of larger chain stores in the industry averaged approximately 3,000 square feet, most accessory stores had less than 1,000 square feet of selling space. Accessory stores enjoyed relatively low overhead costs due to small store size and the low cost of goods. In fact, Claire's Stores, Inc., one of the larger retail chains, reported that new stores required an initial investment of only \$85,000 for leasehold improvements and fixtures and \$20,000 for inventory.

Store location often determined store size. Women's specialty and accessory stores, especially fur stores, were deliberately positioned in classy, urban retail centers such as Fifth Avenue in New York. The location of these boutiques in high-rent urban areas often encouraged the small store format. In contrast, chain stores were frequently situated in suburban shopping malls, where larger store size was financially feasible. Store size increased in the 1990s as businesses in this industry followed consumers out of the cities into suburban malls and shopping centers.

Although women's accessory and specialty stores were moving out of trendy, expensive areas, stores were

designed to accommodate the fashion and status-conscious shopper. Consumers shopping at these specialty stores were interested in unique versions of basic products. With the exception of furs, the products offered by accessory stores, such as lingerie, hosiery, and handbags, were not particularly expensive and were readily available at department and variety stores. A specialty accessory store, however, offered the consumer distinctive merchandise in a stylish shopping atmosphere.

Competition. Until the mid-1980s, department stores were the main competitors of women's accessory and specialty retailers. Department stores often leased space to prominent accessory manufacturers such as Crystal Brands, the Monet jewelry manufacturer, and Coach Leather goods. Like the small, independently owned accessory shops, these leased departments are staffed with knowledgeable salespeople and provide strong customer service in a pleasant shopping atmosphere. Competition in this industry shifted, however, from department stores to off-price merchandisers and discount retail stores that carried a variety of accessories and specialty items at prices well below those offered by department stores and specialty shops.

Although competition from discount stores increased in the early 1990s, the industry remained fragmented. Due to the variety of merchandise included in this category, no one company dominated the industry. Nevertheless, in the mid-1990s, the popularity of the "category killer" retail format posed a threat to the women's specialty and accessory business. The lack of market leaders coupled with the small boutique-style store format made the industry vulnerable to attack from large retailers anxious to capitalize on the fragmented industry structure.

BACKGROUND AND DEVELOPMENT

Traditionally, the women's specialty and accessory store industry has been dominated by fur retailers. Fur coats and accessories were widely coveted luxury items and status symbols in the United States; fur retailers were tremendously successful throughout much of the twentieth century. It appeared that the fur business peaked in 1987 when sales reached \$1.8 billion. In the late 1980s and early 1990s, however, cultural and economic forces caused fur sales to plummet, and many fur retailers faced bankruptcy. Some large department stores such as Nordstrom's and Lord and Taylor dropped their fur departments. The industry was also adversely affected by a luxury tax imposed on furs, jewelry, and other costly non-essentials. In early 1992, a group of Senate democrats argued that fur merchants could not withstand the combined effects of recession and additional taxation, and they sought a repeal of certain sections of the luxury tax legislation. The luxury tax on furs valued at more than \$10,000 was repealed the following year.

Threats to the fur industry, however, were not only economic and legislative. Widespread negative perceptions of this business and changing cultural values also resulted in significant sales declines for fur retailers. In fact, the animal rights movement, once on the periphery of the mainstream American consciousness, saw sweeping acceptance by the mid-1980s. Heightened regard for animal rights and the growing perception that fur coats were symbols of greed and cruelty, drastically decreased demand for fur coats and accessories.

The setbacks suffered by the fur industry during the late 1980s caused changes in the mix of businesses in the women's specialty and accessory industry; however, they did not slow its development. While fur retailing suffered losses, other categories such as hats, scarves, and lingerie flourished. These categories gained popularity during the 1980s and fueled the growth of the industry in the early 1990s.

Despite a poor economic climate, the women's accessory and specialty store industry experienced solid growth in the early 1990s. While the women's clothing industry struggled to keep pace with inflation, the accessory and specialty store industry grew more than 8 percent annually during the early 1990s. The growth of specialty stores made this industry one of the few bright spots in the otherwise bleak retailing sector. Accessory retailers benefited from promotional campaigns launched by manufacturers and positive buying patterns. Some observers noted that the relative prosperity of the industry was a result of indulgence buying and pent-up demand. Additionally, national statistics revealed that specialty retail stores generally outperformed department stores during the early 1990s.

In the mid-1990s, businesses in this industry operated in a changing retail environment. The recession of the late 1980s and early 1990s caused a conservative shift in spending behavior, as consumers began to emphasize savings over consumption. Spending on intangible goods such as education and healthcare took precedence over purchases of tangibles such as new clothing. In this price-conscious atmosphere, retailers of non-essentials were challenged to offer products at prices that were consistent with consumer expectations of quality and value.

Fearing that demand would soften, sales and marketing strategies for accessories were re-evaluated in the early 1990s. In addition to improving merchandise presentation, some retailers implemented trend shop concepts, whereby merchandise was grouped into a single fashion trend and sold in one shop. At larger accessory and specialty stores, management used dedicated sales staffs to promote particular product lines. These retailer-based strategies were augmented by increased marketing efforts by manufacturers. Promotional resources, such as videos describing different ways to wear scarves, also

supported salespeople's efforts. Often these sales and marketing strategies were similar to successful approaches used by cosmetics departments.

Consumer buying patterns provided another boost to accessory sales as the industry entered the mid-1990s. Some analysts observed that consumers, having endured the recession of the late 1980s and early 1990s and lacking encouraging news on the health of the economy, engaged in indulgence purchasing. Others noted that years of saving caused pent-up demand. Accessories were well suited for this purchasing mentality because they were relatively inexpensive. Industry analysts noted that the "special occasion" segment of the accessories business, with its glitzy holiday and party orientation, benefited most from this trend.

According to *Manufacturing USA: Industry Analyses, Statistics, and Leading Companies*, sales in the women's accessory and specialty store industry totaled more than \$4.3 billion in 1996, up 16 percent from \$3.6 billion in 1992. This fragmented retail segment was comprised of an estimated 9,500 small, independently owned businesses and some large chain stores. Due to the abundance of small, privately owned stores, financial data on the industry is difficult to compile. In 1995, however, the industry's top 10 companies generated more than \$1.7 billion in sales, or about 40 percent of total industry revenues. These companies carried such product lines as furs, handbags, lingerie, costume jewelry, millinery, and hair accessories. The industry employs more than 50,000, most of whom are part-time sales people.

CURRENT CONDITIONS

The women's accessory industry followed similar trends as the women's clothing industry, which in the late 1990s veered toward casual wear over business wear as women found that they could fulfill their professional attire needs with casual styles. However, segments of the accessory industry were adversely affected by the sluggish economy and a decline in consumer spending for discretionary goods. The overall women's clothing industry was down 6 percent in 2002 from 2001, but lingerie sales fell between 10 and 15 percent. Upscale intimate apparel was particularly hard hit, with slow sales of bras in the \$150 price range and coordinating panties for \$80 to \$100. In the midrange of prices, such promotions as buy-one-get-two helped move merchandise but did little to improve the bottom line.

Total innerwear sales for 2002 totaled \$12 billion. Full-figured intimates, which account for approximately one-third of lingerie sales, was the only innerwear category to see an increase in sales, with a growth of 4 percent over the previous year. Pantyhose sales fell more than 9 percent on the year. Costume jewelry, propelled by a new trend back to metals by setting turquoise and other

natural stones in coppertone, goldtone, and silvertone, reported double digit growth during 2002.

According to the Fur Information Council of America, an industry trade organization, U.S. fur retail sales jumped in the late 1990s and hit a decade-long high of \$1.69 billion in 2000 before falling to \$1.53 billion in 2001. The renewed interest in furs pushed designers to incorporate fur into new lines that featured contemporary styling, as well as making use of new treatment and shearing techniques that allow the fur to be used unlined. In 2000, the average age of the fur customer was 48; just two years later, in 2002, that figure had dropped to 35. Despite the industry's seemingly successful attempts to ignore the anti-fur movement, some shops also carried synthetic versions of items for customers who might be turned off by natural furs.

If furs are making a comeback with younger shoppers, the pantyhose sector is attempting the same. As fashion begins to return to the workplace, retailers are hoping the new trend toward dressy rather than casual business attire will fuel the return of hosiery. In 2002, only 25 percent of women under 25 years old wore sheer hosiery. To attract the younger customer base to hosiery, a category that produces \$6 billion in annual sales, manufacturers were accentuating the bare, natural look and repackaging products to add new appeal to shoppers.

INDUSTRY LEADERS

Although the women's accessory and specialty store market was quite fragmented, a few larger companies were gaining market share in the mid-1990s. While the small, boutique-style stores competed on their superior customer service and unique product offerings, the larger companies focused on rapid expansion of their chains, enhanced store design, and national advertising.

Victoria's Secret Stores, a subsidiary of Intimate Brands, Inc., which in turn is owned by Limited Brands, Inc., discovered success in the 1980s by introducing a new approach to lingerie sales. The Victoria's Secret concept was originated by Roy Raymond in San Francisco. After studying the lingerie market, Raymond saw an opportunity to target men who liked to buy lingerie for their wives or girlfriends, yet were embarrassed to venture into the intimate apparel section of a department store. Victoria's Secret stores were designed to provide a comfortable and provocative environment in which men could shop.

The business was started in 1977 with \$40,000 and grew quickly. By 1982, Raymond operated five stores and generated \$6 million in sales. In addition to the Victoria's Secret Stores, Raymond developed a successful lingerie catalogue service. The concept saw tremendous success and rapid growth. In 1982, The Limited, Inc. offered Raymond the backing to expand the com-

pany to more than 700 stores. Raymond, however, did not want to be involved in such a large operation and ultimately sold his business for \$1 million in The Limited, Inc. stock and other undisclosed benefits.

Dubbed "The Intimate Category Killer" by *Women's Wear Daily* in 1995, Victoria's Secret Stores continued to grow. Although Raymond had sold expensive designer fashions, under The Limited, Victoria's Secret Stores offered a moderately priced product line of lesser quality. The change in merchandise did not inhibit Victoria's Secret's success; its sales doubled from \$600 million in 1990 to \$1.2 billion in 1994, when it was Intimate Brands' most profitable division. For the fiscal year ending January 2002 Victoria's Secret posted \$2.4 billion in sales.

Victoria's Secret diversified its advertising strategy in 1998 from just window displays and catalog distribution to a full-on media assault with commercials that aired on national television 40 weeks a year. Victoria's Secret also hosted an Internet fashion show in January 1999 that proved so popular, attracting one billion viewers, that many who tried to access the event online got locked out.

As Victoria's Secret became more popular through the 1990s, the parent company Intimate Brands, Inc. pursued a more aggressive strategy to grow Victoria's from a mainstream retailer of moderately priced lingerie to a prestigious global brand with a diversified line, adding fragrances to their menu in the late 1990s. Victoria's Secret bras sold for \$14.98 on average in 1995, whereas by 1999 they sold for \$30 on average, increasing the company's profit margins. Same-store sales at Victoria's Secret stores increased 11 percent in November 1999, and Victoria's Secret Direct, which mailed out nearly 375 million catalogues each year, reported an 8 percent increase in sales. For the fiscal year ending January 2002, Victoria's Secret Direct reported sales of \$869 million.

Frederick's of Hollywood followed the same strategy as Victoria's Secret, though Frederick's tended to be bolder, appealing to women who were very confident of their sexuality and adventurous regarding their lingerie. The company operates around 170 stores, mostly mall based, as well as a catalogue division and Web site. Frederick's, which posted revenues of \$140 million for the fiscal year ending July 2001, was unable to compete with Victoria's Secret and filed for bankruptcy in July 2000. The company's financial situation was also put under a heavy debt load associated with the switch from public to private ownership status in 1997. The company did not emerge from bankruptcy proceedings until the fall of 2002.

Claire's Stores, Inc., of Florida, a leading retailer of costume jewelry and fashion accessories typified the

multi-product accessory store concept, with a price range of \$2 to \$20. This company operated boutiques, primarily located in malls in the United States, the Caribbean, Canada, Great Britain, and Japan under various names. The stores averaged 850 square feet of selling space. Although the company had relatively low overhead and a 15 percent operating margin, it endured a period of decline in 1991.

In response, Claire's Stores underwent a reorganization which included a company-wide refocus on its core business. All non-accessory businesses were sold, and stores were redesigned. The company also launched a national magazine advertising campaign targeting customers who were 13 to 40 years old. These changes rejuvenated the chain, which grew from about 1,000 stores in 1992, to nearly 1,500 by the end of 1995, and to 2,900 by the end of 2002. Claire's launched its European development that same year with the acquisition of 50 stores of the bankrupt British Bow Bangles chain. In the fiscal year ending January 2002, its net income totaled \$77.8 million on sales of \$1 billion.

Claire's entered the twenty-first century by recognizing key demographic patterns: teenage girls love to shop, but they do not tend to spend much cash on their mall trips. Claire's tapped this growing demographic market by launching in 1998 its "just nikki" catalog. Teens could peruse the catalog at home and then have a parent call in an order with a credit card. Orders averaged \$70, compared to the \$9 average sales at stores.

Off-price merchandisers also made strong gains in this segment. Leaders included One Price Clothing Stores, Inc., with \$340.4 million in sales (fiscal year ending January 2002) and Deb Shops Inc., with revenues of \$317.7 million (fiscal year ending January 2003). Other leading accessory-based companies were Ray Ban and Foster Grant, both sellers of fashionable sunglasses. Nine West, once known only for its shoes, made a hit in the accessories market, and Totes-Isotoner, maker of fashionable but durable umbrellas, gloves, and rainwear, continues as a mainstay in the accessories industry.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, women's accessory and specialty stores employed more than 55,000 people in 2001. The vast majority of these jobs, some 87 percent, were sales related, with a sales associate in a retail setting earning a mean annual salary of \$16,870. Like much of the retail industry, accessory and specialty stores provide low-paying sales jobs, which are sometimes supplemented with a commission based on sales. There is heavy use of part-time employees. Managers and supervisors earned a mean annual salary of \$27,530. Manage-

ment occupations, which accounted for just over 2.5 percent of all jobs, reported a mean annual salary of \$51,520.

AMERICA AND THE WORLD

Fears that the domestic market was becoming oversaturated encouraged some accessory and specialty retailers to look overseas to expand in the mid-1990s. According to an August 1996 article in *Women's Wear Daily* Japan and Canada were America's most fertile target markets. The magazine noted that "Japan was the fastest growing foreign market for accessories, importing \$31.4 million worth of merchandise for the year, a 95.1 percent jump." By mid-decade, Claire's Stores had acquired or established locations in Japan, Canada, Puerto Rico, and Great Britain.

The advent of electronic commerce over the World Wide Web facilitated the growth of global targeting and sales, as consumers could order online from anywhere in the world. This medium particularly aided brands such as Victoria's Secret, which was trying to globalize its name simultaneous with the e-commerce explosion in the late 1990s.

RESEARCH AND TECHNOLOGY

Victoria's Secret went on-line December 4, 1998, and sales increased 100 percent monthly, with 40 percent new customers who had not bought the Victoria's Secret brand previously. Moreover, selling over the Internet upped the number of male customers to 30 percent from 10 percent for store and catalog sales. Apparently, the Internet fulfilled Raymond's original concept of appealing to men, offering more comfort than Victoria's Secret stores or its catalog.

This industry lagged behind many retailers in its use of technology. Although computerized inventory management became a major strategic priority in the early 1990s, the small accessory and specialty retailers did not embrace automation. The structure of the industry accounted for the resistance to using technology. Most of the small independent business owners considered the cost of automation to be prohibitive. Moreover, since inventory was not expensive and turned over quickly, the effect of poor inventory management was not as pronounced in this industry as it was in others. Accessory and specialty retailers, nevertheless, faced increasing pressure from manufacturers and vendors to adopt automated systems to ease administrative tasks. In the competitive 1990s, retailers were forced to adopt computerized cost-saving systems.

Cost-saving systems were not the only new technologies in this category, however. In the 1990s, retailers became increasingly dependent on video marketing and computerized self-help systems. One such

technology was available in Japan in the early 1990s. Developed by Wacoal, a leading Japanese lingerie manufacturer, this software package helped a woman enhance her figure by identifying her correct size of lingerie. Customers stripped down to their underwear and then stood in front of a video camera that displayed their outline on a computer screen. The screen allowed the customer to compare her figure with what the store consultants considered ideal for her age. Next, the customer tried on lingerie designed to enhance her figure and then returned to the computer screen for a look at her improved outline. Japanese stores using the system reported a 10 percent increase in lingerie sales.

CHILDREN'S AND INFANTS' WEAR STORES

This category includes establishments primarily engaged in the retail sale of children's and infants' clothing, furnishings and accessories. Such establishments may specialize in either children's or infants' wear, or they may sell a combination of children's and infants' wear.

NAICS CODE(S)

448130 (Children's and Infant's Clothing Stores)

INDUSTRY SNAPSHOT

The infants' and children's wear business consists of hundreds of small independently owned shops and dozens of larger retail chains. Because many of the companies in this industry are privately owned, the exact size of the industry is difficult to determine. The U.S. Census Bureau's 2000 listing of 5,600 infants' and children's wear stores included only those with a payroll that totaled \$700 million.

Children's wear, a relatively small market in the apparel industry, has traditionally lacked the fierce competitiveness of other clothing sectors. Even in children's specialty shops, apparel on average only accounts for 17 percent of floor space and 16 percent of sales (baby furniture accounts for two-thirds of space and revenues). From 1995 to 2001 space dedicated to children's apparel in malls more than doubled but still only totaled 2.7 percent. However, during the first years of the twenty-first century, more national brands began producing small-sized versions of their teen and adult lines and invested heavily in expanding their infant and children clothing brands.

ORGANIZATION AND STRUCTURE

This industry has traditionally been highly seasonal, as with other clothing businesses. Industry sales generally peak between late August and December. During this period, stores compete for precious back-to-school sales and holiday gift purchases. Stores typically generate between 30 and 40 percent of their annual sales in these months. With record high numbers of infants, toddlers, and children attending preschool throughout the year, clothing purchases for this segment are becoming less cyclical.

Because children's and infants' wear stores carry narrow product lines, they are classified as specialty retail stores. Traditionally, children's and infants' wear stores, and specialty stores in general, were small boutique-style operations. These "mom and pop" stores were often

undercapitalized and had high overhead costs in proportion to their sales; however, they did not compete on the basis of price alone. Rather, they pursued customer satisfaction strategies, such as offering products with low turnover rates and providing more sales expertise than their competitors.

Competition. Until the mid-1980s, department stores were the main competitors of children's and infants' wear specialty retailers. As this industry moved into the mid-1990s, however, the growing popularity of off-price and discount retailers presented new challenges. By 1994, discount stores accounted for 36.5 percent of children's and infants' wear sales. These low price retailers expected to expand by outselling both specialty children's wear stores and department stores. Department stores accounted for approximately 35 percent of sales in 1994; children's and infant wear stores accounted for 13 percent.

In addition to off-price and discount retailers, smaller children's and infants' wear stores experienced increased competition from chain stores. Eager to capitalize on growth opportunities in the children's wear market, apparel chains such as The Gap, Inc. and The Limited, Inc. launched children's versions of their successful adult stores—GapKids and Limited Too. Toys "R" Us launched their children's wear stores, Kids "R" Us. All of these companies are publicly traded and have access to tremendous amounts of capital. Their entry into the children's and infants' wear industry during the mid-1980s began a shift toward consolidation in the competitive structure of the industry.

BACKGROUND AND DEVELOPMENT

At the beginning of the 1990s, the industry felt the impact of a minor recession. Buyers were markedly value-oriented. Children's wear retailers noticed that consumers routinely bought basic commodity-like items such as t-shirts but did not splurge on accessories. Although consumers resisted buying nonessentials, they were willing to purchase new and exciting children's fashions if the price was consistent with their concept of value. Some retailers speculated that infants' wear sales were not as affected by the recession as other retail markets because most items purchased for infants were essential clothing items.

Changing demographics made the children's and infants' wear industry attractive to new entrants and, therefore, extremely competitive. Large retail chains began to penetrate the market. As the industry moved into the mid-1990s the smaller shops experienced intense competitive pressure from these new industry players. Nonetheless, sales continued to grow. Fueling this growth was a rise in birth rates in the late 1980s and early 1990s, which increased demand for infants' and toddlers' wear.

One trend during the 1990s and into the 2000s in the industry is a continued relocation of stores to shopping malls. Working parents with limited time schedules like the convenience one-stop shopping malls provide. In the malls, children's and infants' wear stores and department stores are in close proximity. This arrangement gives customers an opportunity to comparison shop for price and quality. Price points become critical competitive priorities in the mall environment, particularly during a recessionary economic climate.

Product Lines. Casual merchandise was often carried by retailers throughout the 1990s. Customers purchased fewer frilly girls' styles and moved toward a more informal look. Denim, activewear, and fleece separates were popular fashions for both girls and boys. In the mid-1990s Osh Kosh B'Gosh, a large children's wear manufacturer, estimated that department and specialty retailers sold \$500 million in fleece separates alone—a full 15 percent of the industry's total retail sales. Throughout the 1990s, a casual look continued to be in vogue for toddlers and kids as well as teenagers.

Licensed-clothing is among the best-selling casual lines. Items featuring characters from popular television shows and movie releases sold extremely well in the 1990s. Every successful children's show or movie was released with a line of clothing connected to it. The clothing, featuring cartoon, television, and movie characters, was extremely popular. Sharing the spotlight with the ever-popular Disney characters are new characters such as public television's Barney the Dinosaur and other commercial cartoon characters such as Power Rangers and Pokemon.

Other popular children's clothing items in the 1990s included sports apparel. The proliferation of new sports franchises during the 1990s and the fact that children who grew up with team logo apparel in the 1970s were buying this look for their own kids in the 1990s, contributed to the success of sports-team clothing.

CURRENT CONDITIONS

National brands are jumping on the bandwagon of children's wear. Dolce & Gabanna, Mudd, I.e.i., Unionbay, and P.L.U.G.G., all successful marketers to the teen crowd, have introduced small-sized versions of their clothing lines. With the introduction of national brands to the sector, there has developed a trendiness in children's clothing. National brands are not just making kids' clothing, they are replicating the same fashions for the younger, smaller crowd. The challenge has become to shape more mature fashions, such as low-rise jeans, into an age-appropriate product for the younger set.

With the infants' and children's wear sector growing, the industry's foundational products continue to be

licensed apparel, such as Scooby Doo, Star Wars, Bob the Builder, and Blues Clues as well as sports-related licenses. For younger kids, new licensing deals are being struck daily, including Carter's new line of author Eric Carle's characters and Kushie Baby Products introduction of clothing based on the best-selling children's book *Guess How Much I Love You*.

As has all apparel-related industries, infants' and children's wear has been adversely affected by the sluggish economy and the overall apprehension that was brought to focus by the terrorist attacks of September 11, 2001, and perpetuated by the United States' initiation of a war with Iraq in 2003. However, such uncertain times are likely to add additional fuel to the growing children's wear sector as the birth rate has seen a significant increase since the terrorist attacks, promising to bring new customers who need the smallest sizes into the stores over the next several years.

INDUSTRY LEADERS

Discount/Department Store Retailers. Although the children's and infants' wear retail market was comprised primarily of small independently owned stores, a few large retail chains dominated sales. The large retailers' competitive strategies ranged from aggressive price-cutting to unique product offering. Typically, since such firms derive income from a variety of operations, sales figures are not reported by market sector (e.g., children's/infants' clothing sales) but rather as gross sales from retail operations. Regardless, total revenue reported from retail operations provide some insight regarding the presence these firms have in the children's/infants' clothing wear industry. After the close of fiscal year 2002, J.C. Penney reported \$32 billion in retail sales (43 percent of revenues came from the company's drugstore chain Eckerds); Target, \$43.9 billion; Sears, Roebuck and Co., \$41.3 billion; and Wal-Mart, a whopping \$244.5 billion.

In 2002 Wal-Mart was the largest retail operation in the United States and the largest retailer in the entire world. Operating some 4,600 outlets as Wal-Mart, Sam's Club, and Wal-Mart Supercenters, the firm was larger than the combined market presence of its nearest U.S. competitors, Sears, Kmart, and J. C. Penney. As Wal-Mart entered the new century, it planned to continue its historically unchallenged growth by converting older outlets into Wal-Mart Supercenters and continuing to expand operations in Canada, Mexico, South America, Asia, and Europe.

The business strategy of Sears, Roebuck and Co. depended, in part, on promoting apparel in its 1,300 specialty stores, 870 mall-based outlets, and 770 independently owned dealers in the United States. Slow to reach out into the global marketplace, Sears operated seven department store outlets in the Americas and, through

Sears International Marketing Inc. (SIMI), sought to increase sales not solely by following the industry trend of promoting discount pricing at department store retail outlets. The company strategy also depended on wholesale export of the Sears brand name products. Sears added significantly to its apparel line by purchasing catalogue company Lands End for \$1.9 billion in 2002.

Target Corporation owns more than 1,475 stores in the form of its Target discount chain; Mervyn's, a mid-range department store chain; and Marshall Fields, its upper-end department store chain. Target stores, along with its large-scale store versions of SuperTarget and Target Greatland, account for 80 percent of the corporation's revenues. The company had found a profitable niche in the market by providing more fashionable, trendy clothing than Wal-Mart, but at prices lower than its department store competitors such as Sears and J.C. Penney.

J.C. Penney Company operated about 1,150 J. C. Penney department stores; a majority were in the United States, but some were in Mexico, Puerto Rico, and Brazil (operated there as Renner department stores). Only a nominal amount of revenue from clothing sales is derived from its 2,600 stores operated by subsidiary, Eckerd Corporation. J.C. Penney projected an increase in sales into the new millennium based on its strategy to operate boutiques within each store and by expanding private-label brands such as Arizona Jean Co., St. John's Bay, and Worthington.

Chain-Store Retailers. Many chain retailers realize that private label merchandise is more profitable than brand-name clothing. One industry leader, The Children's Place Retail Stores, Inc., developed its own label, "The Place," after years of selling branded merchandise. Children's wear retailers who sold private label merchandise did not have to mark up prices to allow for manufacturer and distributor profits; savings were passed on to the consumer. In a consumer climate that increasingly demanded retail discounting, this pricing advantage gave private label retailers a competitive advantage. Consequently, the Children's Place became popular among young mothers. The toddler and children's clothes there were modeled after adult styles. The Children's Place constantly added and updated its inventory to keep its merchandise current. In 1999, the Children's Place had revenues of \$671.4 million.

One of the leaders in private label retailing was The Gymboree Corporation, a large franchise retailer whose 2002 sales were \$546.8 million. The company was founded in 1976 by Joan Barnes, a part-time co-director of a children's recreation program at a local community center and mother of two. Barnes developed a popular 45-minute exercise-to-music class that she ultimately ex-

panded to other sites. Her business was a success, and in 1979, Barnes began franchising her baby-exercise classes. By 1985, she had established 204 play centers, but she was not generating profits. Forced to re-examine her business, Barnes decided that "Gymboree could mean more than play classes. Gymboree would mean everything significantly wonderful for kids under five." In 1986, she decided to use the exercise class as a basis for selling children's clothing, which now accounts for 99 percent of Gymboree's annual sales.

The Gap introduced GapKids in 1985 to provide well-designed comfortable clothing for boys and girls aged 2 to 12. GapKids expanded its target market segment in 1990 when it opened BabyGap as a department of a San Francisco GapKids store. By 1993, most of the 272 GapKids stores also offered infants' and toddlers' clothes in the BabyGap department. By 1995 there were 369 GapKids stores in operation. By 2002, Gap operated nearly 2,100 stores in the United States, Canada, France, Germany, Japan, and the United Kingdom.

A wholly-owned subsidiary of Toys "R" Us, the world's largest and fastest growing children's specialty retail chain in both sales and earnings, Kids "R" Us focused on selling brand name clothing at cut-rate prices. By 2003, the Kids "R" Us clothing store division operated about 185 stores. A retail spin-off, Babies "R" Us, operated 113 outlets that focused on infant/toddler apparel and infant/toddler furniture and feeding supplies. Operations were conducted in 25 countries with the largest market presence in Canada, Europe, and Japan. Kids "R" Us sales for 2002 were \$11.3 billion.

AMERICA AND THE WORLD

In the 1990s, the industry began to establish specialty retail operations abroad. Manufacturers of children's and infants' clothing and accessories were well aware of the opportunities overseas, and many had established joint ventures in various foreign markets. Such market penetration efforts, however, have not been very successful.

Japan and Europe were two particularly attractive markets for children's wear. In Japan, American products, especially licensed character and team logo apparel, were popular with young people. This demand, coupled with Japan's large market and high discretionary income, made the country a coveted retail market. Europe also boasted a large consumer market and historically high discretionary income. However, the stiff competition from European hypermarkets deterred smaller retailers. Nevertheless, GapKids stores were operating in the United Kingdom in the early 1990s.

Some of the barriers to global expansion in this industry were clothes sizing and fashion differences. GapKids and The Children's Place, which sold private

label merchandise, controlled the manufacture of their clothing and were able to size clothing appropriately for any market. All retailers did not have this flexibility. Toys "R" Us, for example, successfully placed 167 toy stores in 11 different countries including Spain, Japan, and Malaysia by 1993. They had not, however, taken Kids "R" Us international because the brand-name clothing that they offered was difficult to sell overseas. Despite the obstacles, children's and infants' wear retailers continued to investigate opportunities abroad, and they expanded into new markets after the implementation of the North American Free Trade Agreement.

RESEARCH AND TECHNOLOGY

Inventory management through advanced automation was a major strategic priority in the retail environment, including the children's wear segment. Larger retailers, for example, implemented automated inventory replenishment systems management to reduce inventory ownership while ensuring that each store was supplied with the correct product mix. The system electronically linked distribution centers, inventory control, and store demand in order to determine the optimal individual store distribution. Other technologies implemented in the children's and infants' retail operations and the retail industry as a whole included cash registers that could calculate discounts, approve credit, accept credit cards, and schedule deliveries. Although this type of technology brought cost savings in the long run, in the short run, the cost of the technology was prohibitive to smaller stores.

FAMILY CLOTHING STORES

This industry consists of establishments primarily engaged in the retail sale of clothing; furnishings; and accessories for men, women, and children. Generally referred to as retail family clothing stores, this industry includes jeans stores and unisex clothing stores, but excludes stores targeted at one sex or age group.

NAICS CODE(S)

448140 (Family Clothing Stores)

INDUSTRY SNAPSHOT

According to the U.S. Census Bureau, in 2000 there were 150,900 apparel and accessory stores and roughly 20,900 retail family clothing stores in the United States, with sales totaling more than \$44.8 billion annually. The clothing store industry was highly competitive, and marketing research, advertising, and sales promotions were central to these companies' operations. Other factors affecting sales in this industry included national economic trends, regional population growth, seasonal factors such as weather and holidays, and dramatic changes in fashions and clothing trends.

ORGANIZATION AND STRUCTURE

According to the National Retail Federation, the vast majority of family clothing outlets in the late 1990s were chain stores; roughly 20 percent of these were operated as franchises. Family clothing stores were either chain stores (including department stores) or independently owned.

The large companies that owned clothing outlets across the nation generally operated distribution centers where clothes were received from the manufacturers and shipped to the outlets. Unlike warehouses, these distribution centers did not store items for a long period of time; generally goods stayed at a distribution center for only about 48 hours before being shipped to the retail stores that had placed the orders. The link between manufacturer and retailer was maintained by manufacturers' sales representatives and the retailers' merchandise buyers.

Small clothing retailers generally did not own distribution centers, though they still received items that were held at these centers. These smaller retailers tended to purchase inventory from distributors who represented several manufacturers. These retailers also ordered items solicited through distributor catalogs.

The organization of the retail family clothing store industry has changed since the beginning of the 1990s. The 1991 recession caused many firms to buy other, usually smaller, retailers. With these mergers, the decentralized purchasing practices of smaller retail chains were centralized and handled strictly by the main office, thereby cutting down on the number of buyers employed by any one company.

The internal structure of companies in this industry varied. Some companies made buying trips to manufacturers and wholesalers, while other companies were called on by manufacturers' representatives. These companies also differed in the way that the various internal departments related to one another. In some companies, buyers and merchandise managers worked closely with the advertising department in deciding the type of promotional media to use and the layout of item displays. Other companies hired autonomous advertising agencies for the promotional aspects of the business. Some retail clothing stores sold clothes under their own brand name. In these cases, the retailer typically designed the clothes and had them produced by a clothing manufacturer, while the retailer maintained a staff of employees to monitor the work of the manufacturers.

The advent of discount retailers has affected the structure of family clothing stores. These retailers have gained large market share by offering low cost, high quality merchandise as well as maintaining low overhead costs.

BACKGROUND AND DEVELOPMENT

Retail family clothing stores originated in America during colonial times. In these early days, stores were extensions of tailor shops. There were few stores relative to the size of the growing population, however, because owning a variety of clothes was considered a luxury. During the 1800s, with the expansion westward, clothing retailers were mostly manufacturers who sold their merchandise through catalogs. In the late 1800s, with innovations in mass manufacturing and the growth of cities most retail clothing stores began operating exclusive of tailor shops.

During the twentieth century, retail family clothing stores moved from individually run small stores to regional chains, and then, in the 1990s, to nationwide chains of large stores. This consolidation trend resulted from stores moving from smaller spaces in the cities during the 1970s and 1980s into suburban shopping malls, where larger store space and new buildings were available. Such vast quantities of space also facilitated the growth of off-price retail stores, which offered discounted merchandise in large superstores, such as Wal-Mart, or in regional outlets, such as Hit or Miss.

Typically, off-price clothing outlets were in more favorable, remote suburban or newly developed areas where real estate was inexpensive, or they were in subur-

ban shopping strips with other off-price retailers. Lower costs meant higher profits for such establishments. These outlets also kept prices down by purchasing large volumes at low prices from manufacturers; usually manufacturers were not able to profit on the items—often due to the rapid change in fashion trends—and were only seeking to cut their losses.

Other types of stores to emerge from the growth of suburban shopping were price clubs, warehouse stores, and hypermarkets. Price clubs and warehouse stores, where customers could purchase clothes at significantly reduced prices, also resulted in part from the recession at the end of the 1980s and early 1990s. Hypermarkets also featured reduced prices, but their appeal was in the variety of stores and services offered under one roof. Often referred to as “malls without walls,” these stores first appeared in France. All of these larger stores carried an average of 40,000 items at any given time, compared with 25,000 items at typical retail family clothing outlets.

Despite the growth in store size, automation did little to change the basic operations in stores. Computerized cash registers allowed for more efficient management of money and inventory, but these systems were not fully employed throughout the industry. In some cases, the retailer did not have the capital to pay for point-of-sale scanners that record the exact item sold, including color and size, and related technologies, in addition to the costs of retraining employees.

The retail family clothing store industry has also made significant marketing changes and advances over the years. The marketing abilities of individual establishments were key within this highly competitive industry. The primary factors in the marketing mix were marketing research and promotion.

Marketing research, in the retail family clothing industry, has traditionally come from knowledge of what items sell the most or have the fastest turnover. Sales staff and inventory workers monitored merchandise levels, and successful retailers later supplemented their employees' knowledge with electronic inventory controls, such as point-of-sale scanners. For example, Russell Mitchell of *Business Week* attributed a large part of The Gap's success as the fastest growing company in this industry during the early 1990s to “its high-tech distribution network that keeps 1,200 Gap stores constantly stocked with fresh merchandise.” The basics of supply and demand are quite evident in this industry.

The family clothing store industry also conducted its marketing research by surveying customers and various representative groups in the population. At the same time, this industry frequently surveyed the effectiveness of its television and radio commercials and magazine advertisements, its three main forms of advertising.

Other companies in the retail family clothing industry experimented with interactive television as a way of promoting and selling clothing. In 1994, Nordstrom, Inc., an industry leader, began an operation using catalogs and interactive television. Similar to home-shopping networks, the television portion involved displaying the items on television with call-in numbers for ordering; however, added to this was the idea of viewers calling in to see items in the catalogs and asking questions about them, along the lines of call-in talk shows. Nordstrom predicted that these types of events would bring in \$50 to \$100 million in sales annually in two to three years.

Low-budget marketing strategies have also worked well in this industry. For example, Wal-Mart stores spent about one-third as much on advertising as their competitors; they did not run many promotional sales, but they did keep prices low at all times. In 1996 and 1997, Wal-Mart began a “Falling Prices” program, backed by both television and print media. The aim of the campaign was that even though Wal-Mart had low prices, it would continually drop them even lower. Wal-Mart also utilized employees and their family members in place of professional models in their advertisements to help lower costs and improve company image.

Another strategy was to use a sale on one product line to draw customers into a store. One company to use this approach successfully was Goody's Family Clothing Stores. *Forbes* described the company's strategy: “Jeans are great bait. In the past five years Goody's sales and earnings have tripled, and the number of stores it leases and operates in small towns throughout the Southeast has almost doubled. The jeans shelves are in the back of Goody's stores, meaning customers must walk as much as 35 yards past racks of merchandise on which Goody's makes its real money.”

Other marketing factors that characterized retail family clothing businesses were service and location. Consumers often formed their impressions of a store by the courtesy and efficiency of its sales staff. The Nordstrom clothing stores built their reputation on their courteous sales staff, which became part of their marketing strategy. Nordstrom knew that it was the only U.S. department store chain that had employees who would change flat tires and carry bags to customers' cars. Location was important in terms of store visibility and the relative closeness of competitors. A large shopping mall generally has at least two anchor stores for this reason. Anchor stores are considered larger in both product diversity and size. Some key anchor stores are J.C. Penney, Lord and Taylor, Nordstrom, and Hecht's.

Upon entering the 1990s, family clothing retailers were affected by a weak economy and loss of their market share to other types of retailers, namely specialty stores and large department stores. The industry re-

sponded by increasing its marketing efforts, stocking more off-price merchandise, and investing in computer systems to predict market trends and reduce operating costs. Increasing marketing efforts included a trend toward scrambled merchandising—selling items normally not carried by a given retailer. This technique allowed retailers to test new merchandise and, at the same time, bring new customers into their stores to buy the standard line of apparel.

The success of off-price retailing during the recessions of the 1970s and 1980s encouraged many family clothing retailers to enter this end of the market as well. Off-price retailing also was helped by the collapse of real estate prices in the late 1980s and early 1990s. Cheaper real estate allowed this sector of the industry to acquire the large buildings it needed to move enough volume to sustain a strong profit margin on the reduced-price items.

The weak real estate market also helped to start a new trend of stores moving back into the cities, where downtown areas sought retail operations to fill locations emptied during the late 1980s. Companies with small clothing stores continued to open new stores in downtown areas. In 1992, Russell Mitchell in *Business Week* described The Gap as “taking advantage of recessionary blues by locking up sweet lease deals, moving into downtown and urban neighborhoods, and opening on the main streets of mid-size cities.”

In 1993, retail apparel and accessory stores recorded sales of \$106 billion. Although this was an increase of 7 percent (after inflation) over the previous year, it was not as great an increase as the industry witnessed during the 1970s and 1980s. This sector continued to see growth into the mid-1990s.

In 1997, the clothing industry saw approximately \$170 billion in retail sales. Women’s apparel brought in \$89.4 billion, men’s apparel accounted for \$50.8 billion, and children’s wear captured \$29 billion. Family clothing stores alone accounted for \$45.1 billion in sales. According to the American Apparel Manufacturers Association, the breakdown on total share of retail sales was as follows: specialty stores, 22 percent; discounters, 19 percent; department stores, 19 percent; major chains, 17 percent; off-price stores, 7 percent; mail order, 6 percent; outlets, 4 percent; and other stores, 7 percent.

This industry remained quite competitive in the late 1990s. Successful advertising campaigns and Internet marketing were key in attracting new and existing customers. For example, in the first period of 1999, The Gap spent \$122.5 million in advertising for its stores, including Old Navy and Banana Republic; this figure was an increase of 84 percent from the previous year.

Online shopping also became much more popular in the late 1990s. According to the National Retail Federa-

tion, Internet retail sales surpassed \$17 billion in the year 2000 and reached some \$40 billion in 2002. Clothing retailers have jumped aboard the superhighway and have started to use the Internet to offer online shopping and to market their products. Some retailers began offering their catalogs online as well and would even e-mail customers with updates, promotions, and fashion information.

Off-price retailing continued to play a major role in this industry in the late 1990s. With the success of Wal-Mart and the TJX Corporation, other family clothing retailers were forced to offer quality merchandise and lower costs. The Gap, for instance, had seen remarkable success with its Old Navy stores; these stores offered Gap-like merchandise, at lower prices.

Successful introduction of private label brands, such as Wal-Mart’s Kathie Lee line and Target’s Xhilation line, have also chipped away at traditional family clothing stores’ market share. With clothing offered at lower prices, apparel has experienced a price deflation in the late 1990s. According to the American Statistics Index, “apparel consumers are demanding a greater selection of good quality merchandise at low price as well as added convenience in readily finding merchandise.”

CURRENT CONDITIONS

According to WSL’s survey “How America Shops” as reported by *Women’s Wear Daily* in 2002, 46 percent of consumers shop for most of their clothes at department stores, down from 53 percent in 2001. Mass markets held 17 percent of the market, and specialty stores soared from 3 percent in 2001 to 16 percent in 2002. However, a similar survey conducted by Retail Forward found that discounters garnered 36 percent of shoppers’ purchases of casual wear and 20 percent of dress wear. Fourteen percent of consumer bought the majority of their casual wear at department stores and 21 percent of their dress wear. According to the Zandl Group, yet another marketing research firm, specialty stores have grown in popularity with the 13- to 25-year-old segment and department stores have declined in popularity with the same age group.

As the retail clothing industry waited out the slow economy and the freeze on spending in the midst of the war initiated by the United States on Iraq in 2003, industry analysts attempted to foresee the future of the industry. During the twentieth century traditional family clothing stores were outpaced by department stores, which were then themselves overcome by discounters. Whereas some predict the eventual extinction of the department store chains and the relegation of traditional family stores to high-end specialty shops during the twenty-first century, others see cracks in the mass merchants’ future hold on consumers.

Mass merchants, such as Wal-Mart, rely on moving massive volumes of inventory to keep the profit margin

thin yet still profitable. Department stores have a larger profit margin but less merchandise, and specialty shops rely on an even higher profit margin but even less selection. How these three distinct formats for family clothing will balance the three basic ingredients to retail success—convenience, value, and price—remains to be seen. Mass merchants' may continue to pull shoppers away from malls so long as they can continue to move enough volume to sustain the giant operations that they have become.

INDUSTRY LEADERS

The industry leaders in gross annual sales in 2002 were Wal-Mart Stores, Inc. (owner of Sam's Clubs) with more than \$244.5 billion in total sales for all departments; The Gap, Inc., with \$14.5 billion in sales; The TJX Companies, Inc. (owners of Marshalls and TJ Maxx stores) with \$12 billion in 2002 sales; and Nordstrom with \$6 billion in sales.

Wal-Mart Stores, Inc. stood as the world's largest retailer in 2003. Wal-Mart was founded by two brothers, Sam and J. L. (Bud) Walton, who entered the clothing industry as owners of Ben Franklin franchises in Arkansas. In 1962 the Waltons opened their first store, Wal-Mart Discount City in Rogers, Arkansas, in order to reduce prices more than the Ben Franklin franchises would allow at the time. The brothers soon opened stores in other small towns and, by 1970, they had 18 Wal-Mart Stores in addition to 15 Ben Franklin franchises.

During the 1970s, Wal-Mart built its own warehouses to cut costs and exercise greater influence over the channels of distribution. Under this system, the company would buy in volume and store the merchandise at the warehouses, gradually build a network of stores within 200 miles of each warehouse. This system was used throughout the 1990s.

By the end of the 1970s, Wal-Mart owned and operated in-store pharmacies, auto service centers, and jewelry and shoe divisions. In 1980, Wal-Mart stores appeared in 11 states, taking in a total of \$1.25 billion annually. The 1980s marked the company's greatest period of growth and the opening of its Sam's Clubs, which were discount warehouses, and its Hypermarket USA, a combination discount department store and grocery store with restaurants, banks, video rentals, and other services. With prices reduced by up to 40 percent, the Hypermarket USA store grew rapidly in popularity, and, by 1992, Wal-Mart had opened four of these stores. By 1992, Wal-Mart employed more than 28,800 workers and owned several other subsidiaries, such as Kuhn's Big K Stores Corp.; North Arkansas Wholesale Co., Inc.; and Wal-Mart Properties.

Wal-Mart has been criticized over the years for forcing small retailers out of business with its location strategies and buying practices. Wal-Mart typically dealt di-

rectly with manufacturers, bypassing their sales representatives and distributor representatives, which made it more difficult for independent retail buyers to conduct business and increased Wal-Mart's profit margin. By 2003, the company had a store volume larger than Sears, Kmart, Dayton Hudson, and J.C. Penney combined. Wal-Mart operated 4,600 stores, including supercenters and Sam's Clubs, and employed nearly 1.4 million workers.

Another notable industry leader was The Gap, Inc., which has been one of the top retailers in America since its beginnings. The company was started by Donald Fisher and his wife Doris in 1969. After Donald could not find Levi's jeans in his size in a department store, he realized that market demand for jeans strongly outweighed the supply. The Gap started with a small shop near San Francisco State University, which carried only records and Levi's jeans, a combination that appealed to young people. The success of The Gap concept was almost immediate, and Fisher added outlets throughout the San Francisco area.

The company grew during the 1970s with the acceptance of jeans as casual wear by people of all ages; however, baby boomers still made up the majority of Gap customers. In 1971, The Gap's sales stood at \$2.5 million annually and, by 1976, sales were up to \$97 million annually with 186 stores in 21 states. The company's success was also helped by Levi's, which remained the only brand Gap carried and extensively advertised.

With the recession at the end of the 1970s and the baby boomers growing out of blue jeans fashion, Gap began experiencing financial difficulties. The company reacted by changing its line of clothes to a larger variety of casual items and by selling more of its own labels. In the early 1980s, The Gap was revamped after it hired Mickey Drexler to be its new president. Under Drexler, The Gap would only carry Gap-labeled clothes and emphasize natural fibers and casual clothing styles that would appeal to both genders and a wide age range.

Upon entering the 1990s, Gap's earnings were \$225 million annually, including the company's principle subsidiaries, GapKids and Banana Republic clothing stores. The Gap expanded the size of its stores to accommodate new lines of less casual, dressier clothes. At the same time, the clothing chain converted some of its poorest performing stores into warehouse stores to compete in the discount clothing market. In 1996, Gap's sales totaled \$5.28 billion, and a total of 1,854 stores were in operation.

By the late 1990s, Gap was extremely successful. With \$824.5 million in net income—an increase of 54.4 percent from 1997—the company was becoming increasingly popular by its television ads and the emergence of its Old Navy stores. In 1999, The Gap had more than 1500

stores—including GapKids and BabyGap—in the United States, 297 U.S. Banana Republic stores, and 442 Old Navy Stores. Continuing to grow rapidly into the twenty-first century, in 2002 Gap's sales totaled \$14.5 billion, and a total of 2,450 stores worldwide were in operation

TJX Companies, Inc., the industry's third largest leader in sales, was considered the world's number one off-price family clothes store. In 1998, the company had \$424.2 million in net income, an increase of 39.2 percent over 1997. Employees totaled 62,000.

The company was incorporated in 1962 as Zayre Corp., which was a chain of department stores based in New England. In 1969, Zayre bought the Hit or Miss chain, which moved the corporation towards the upscale off-price clothing market. During the 1970s, the Hit or Miss chain grew rapidly across the country. By 1977, Zayre decided to expand further into the off-price clothing market by opening its first T.J. Maxx store.

Both Hit or Miss and T.J. Maxx prospered during the late 1970s as a result of the recession. Zayre then expanded its off-price fashion operations into the mail-order market by forming Chadwick's of Boston. Chadwick's sold women's clothes and accessories, the same brands found in Hit or Miss, through catalogs.

The 1980s saw growth for off-price fashion retailing, but not for Zayre's department stores. Competition from Wal-Mart, Kmart, and other large department store chains forced Zayre to make large investments in its clothing stores. By 1986, the company had 420 Hit or Miss stores throughout the United States. By 1987, the company restructured, with T.J. Maxx becoming the major subsidiary, and sold 400 of its Zayre stores to Ames Department Stores, Inc.

In the early 1990s, the T.J. Maxx stores were the company's leading business, and Chadwick's of Boston was also performing well. However, Hit or Miss stores were feeling the strain of competition and a weak economy. In 1995, TJX sold both the Hit or Miss and the Chadwick's divisions, and it purchased Marshalls, Inc. for \$550 million within the same year. Marshalls had been TJ Maxx's direct competition. In 1996, TJX Companies had 578 T.J. Maxx stores and 454 Marshalls throughout the United States. The company employed a total of 38,000 people.

By the late 1990s, TJX operated over 620 T.J. Maxx stores. With sales and profits increasing, the company also operated Winners Apparel (a Canadian chain of family clothing stores), HomeGoods, A.J. Wright, and T.K. Maxx. In 2002 TJX reported a net income of \$578 million on \$12 billion in sales and employed 89,000.

Another industry leader for retail family clothing stores was Nordstrom, Inc. Founded in 1901 by the Nordstroms, a family of Swedish immigrants, in Seattle,

Washington, the company started out in the shoe business and did not sell clothing until 1960, when it purchased Best Apparel, a women's clothing store. In 1966, the company purchased Nicholas Ungar, a retail fashion outlet, and soon began selling men's clothes. By 1968, under the ownership of a third generation of the Nordstrom family, the company achieved \$40 million in annual sales. Within a few years, expansion allowed sales to double to \$80 million. The company grew at a steady pace for the remainder of the 1970s by diversifying with a large variety of clothing departments within each store.

By the start of the 1980s, the company had expanded to offer stores in southern California, Alaska, Oregon, Utah, and Montana. Later in the 1980s, the chain started opening stores on the East Coast. Despite diversification and growth over the years, however, shoes still accounted for 20 percent of Nordstroms' sales.

Also during this period the company developed its reputation for having exceptionally friendly sales people who would do things like change customers' flat tires in the parking lot, deliver merchandise to offices, and send tailors to people's homes. However, in 1989, a group of unionized employees charged that they were not being paid for providing such extra services. As a result, the government forced Nordstrom to change its compensation and record-keeping policies.

Upon entering the 1990s, the recession caused Nordstrom's sales to drop for the first time in the company's history. Despite this setback, the company continued to expand into new regional markets. In 1995, women's clothes and accessories accounted for 58 percent of Nordstrom's sales; men's clothes, 16 percent; and shoes, 20 percent.

By the end of the decade, Nordstroms had operations in 23 states and remained known for its upscale apparel and excellent service. Net income in 1998 was \$206.7 million, up 11 percent from 1997. The company operated more than 70 stores and 25 outlets and had more than 42,000 employees. In 2002 the company reported a net income of \$90 million on \$6 billion in sales and employed 50,000.

WORKFORCE

According to the U.S. Department of Labor, Bureau of Labor Statistics, in 2001 the family clothing industry employed 455,680 people. Of this total, 363,810, or nearly 80 percent, were sales-related positions. In all, sales associates accounted for almost 60 percent and were paid a mean annual salary of \$17,140. Managers and supervisors earned an annual salary of \$30,070. Office and administrative support occupations totaled 10 percent and had a mean annual salary of \$19,520. Retail and wholesale purchases, which accounted for less than 0.5 percent of the workforce, earned an annual salary of

\$43,140. Chief executives earned an average \$104,960 annually and general managers and sales managers earned \$52,110 and \$56,550, respectively. Part-time sales positions in this industry were expected to be most available due to turnover. In addition, sales staff would continue to be hired on a temporary basis during peak selling periods, such as Christmas and tourist seasons.

AMERICA AND THE WORLD

As the American apparel market matured in the late 1990s, international operations became increasingly necessary. With little room to grow in the United States, companies looked overseas to boost revenue and income. The Gap, for instance, had penetrated certain markets abroad by 1999. The company operated—including GapKids and babyGap—121 stores in Canada, 35 stores in France, 12 stores in Germany, 39 stores in Japan, and 114 stores in the United Kingdom. Banana Republic had operations in Canada, as did Nordstroms.

The Asian economic crisis was expected to affect apparel sales abroad, as the region experienced a recession in 1998 and 1999. However, the advent of the Euro was expected to make entry into European markets more attractive. According to Wal-Mart's 1999 annual report, "the company's foreign operations are comprised of wholly owned operations in Argentina, Canada, Germany, and Puerto Rico; joint ventures in China and Korea; and majority-owned subsidiaries in Brazil and Mexico. As a result, the company's financial results could be affected by factors such as changes in foreign currency exchange rates or weak economic conditions in the foreign markets in which the company does business."

The apparel industry was also seen as having a smoother entry into foreign markets compared to others. A 1998 *Stores* article stated that "apparel retailing is one of the most viable businesses on a global scale. Several key strategic advantages set it apart from other formats, including that apparel is extremely merchandise and marketing driven, has a relatively narrow focus, and can produce high gross margins sufficient to offset occupancy costs and still provide a superior profit margin."

RESEARCH AND TECHNOLOGY

Developing technology to improve the channels of distribution remained an essential component of the future growth of the retail family clothing store industry in 1999. Like other retail businesses, establishments in this industry continually increased their reliance on computers, which simplified many of the routine buying functions and improved the efficiency of in-store sales staff. Retail buyers and merchandisers came to rely upon point-of-sale computer terminals, rather than manual on-hand counts, for up-to-date inventory and sales information. Point-of-sale data came directly from an item's bar code

as it was sold and provided information regarding price, model number, color, and size.

Another growing trend in the apparel industry was the use of the Internet to sell clothing. In 1999, Gap teamed up with America Online Inc.(AOL) to offer its clothing line in AOL's online marketplace. More than 46 million members had access to Gap apparel as a result of the deal. The company's Web site also offered online shopping in 1999, and it launched Web sites for Banana Republic and Old Navy in 1998.

With Internet sales expected to increase to nearly \$30 billion by 2001, family clothing stores faced increased competition not only from large discount chains, but from Internet entrepreneurs as well. Many chains also had to add IT and IS specialists to their workforce as a result of technology trends.

SHOE STORES

Establishments in this industry are primarily engaged in the retail sale of men's, women's and children's

footwear; these establishments frequently carry accessories, such as gloves, socks and hosiery.

NAICS CODE(S)

448210 (Shoe Stores)

INDUSTRY SNAPSHOT

Every year U.S. consumers spend over \$20 billion in footwear. Shoes are sold in a number of venues, including specialty shoe stores, family shoe stores, department and discount stores, and vendor-owned outlets. According to the Census Bureau's *Statistical Abstract of the United States: 2002*, the number of shoe stores in 2000 dropped to 29,700 (from 37,200 in 1996). Along with the entire U.S. retail sector, the footwear industry has been adversely affected by the recessive U.S. economy during the first years of the twenty-first century and by low consumer confidence that has stagnated spending. The bright spot in shoe sales has been in the teen market, as teenagers continue to buy at a strong pace, seemingly unaffected by the sluggish economy or the U.S. involvement in war with Iraq in early 2003.

ORGANIZATION AND STRUCTURE

Establishments in this industry are either chain stores or individually owned stores. The National Retail Federation categorizes the vast majority as franchises that belong to large chain operations. Parent company involvement varies in daily franchise operations.

This industry further divides itself into family shoe stores, which sell a broad range of sizes and styles, and specialty shoe stores, where a specific selection (such as athletic footwear or women's footwear) is offered exclusively. Athletic shoe stores were the largest specialty category, increasing market share in 1998 to 19.9 percent from 19.4 percent in 1997. Other outlets, such as department stores, apparel stores, vendor outlet mall stores, and mail-order catalogs, also generate shoe sales.

BACKGROUND AND DEVELOPMENT

Products. Products sold in this industry fall into several general categories: athletic footwear, dress shoes, casual shoes, sandals, work/duty footwear, hiking/hunting/fishing boots, western/casual boots, and "other." While athletic shoe sales dominated the marketplace for several years, Sporting Goods Manufacturers Association (SGMA) reported that during the second quarter (April through June) of 1999, total spending for athletic shoes declined 10 percent, to \$3.056 billion from \$3.403 billion for the same period in 1998. Sales of men's models rose during that period, the association reported, but sales of women's and children's models declined.

History. This industry developed from the cobbler stores that date back to medieval times and the mass

manufacturers that emerged during the late nineteenth century. Modern stores that exclusively sold shoes began operating at that time. One of the oldest shoe retailers in the United States, Thom McAn, began when McAn opened several stores to sell his footwear.

Like other retailers that benefited from the country's growing population, shoe stores did well from the beginning of this century through the 1920s. During the early 1930s, however, they were badly hurt by the Great Depression and sales dropped by an average of 20 percent. The industry expanded rapidly as the economy strengthened and became highly competitive by the 1950s, when fashion trends changed and footwear styles grew more diverse. At that time, the improved post-war financial conditions also allowed new small-business owners to enter this industry by purchasing franchise outlets.

The retail shoe industry experienced another boom during the late 1970s and throughout the 1980s, as athletic footwear sales increased dramatically along with America's infatuation with fitness. Stores specializing in running shoes, tennis shoes, and general sport shoes spread rapidly across the country. Sales of these shoes doubled during the 1980s, and by 1990 athletic footwear became a \$5 billion business as some retail price tags topped \$100. The industry was impacted even further by this segment when athletic shoe leader Nike, Inc. opened its own giant Niketown retail outlets, led by a 90,000-square-foot flagship store in New York City, as well as others in Japan, Germany, and the United Kingdom. During the late 1990s, the athletic footwear segment experienced a leveling off of sales due to the oversupply of retail selling space and as consumers' fashion taste moved away from athletic shoes to "brown shoes." For the first time since 1992, sales for athletic footwear declined by 8 percent in 1998 to \$8.7 billion (wholesale). The Sporting Goods Manufacturers Association "1999 State of the Industry Report" noted that "many traditional athletic footwear companies expanded into the 'brown shoe' and fashion categories, enabling them to continue to increase sales and expand their market reach."

Marketing. The shoe store industry, like other retail industries, relied heavily on marketing departments and advertising agencies to generate consumer interest. One key marketing consideration has involved store location because, by the 1980s, the majority of U.S. shoe stores were located in malls. This arrangement allowed chains to operate small stores without high overhead costs, but the operation became increasingly competitive as many footwear retailers often competed within the same mall. In 1993, Harlan S. Byrne told *Barron's* that Famous Footwear owed its considerable success to "its locations in strip centers, where competition is less than in shoe-happy malls." A NSRA survey in 1995 confirmed this

conclusion, finding per-store profits were 4.1 percent at strip stores and 0.7 percent at mall stores.

Another important marketing device was store design. Off-price or discount shoe stores, like off-price clothing stores, typically drew bargain shoppers with large undecorated spaces filled with racks of shoes. Moderately priced and upscale shoe stores generally used simple, modern designs to attract a target audience. Seeking new ways to differentiate themselves from the competition, some innovative retailers began using additional aids to attract sales: *Footwear+* reported in 1997 that subtle use of “sensory merchandising; the process of appealing to consumers’ sense of smell, sight, sound, color, and touch,” had been shown to increase sales by up to 20 percent.

Since the U.S. fitness craze took hold two decades ago, industry advertising on television and in newspapers and magazines has grown significantly; much of this media attention, however, highlights manufacturers or manufacturing divisions of shoe store chains. Advertising campaigns in the 1980s and 1990s that featured sports celebrities have been credited with popularizing athletic footwear among all age groups. But while younger people remain this segment’s largest buying group, the overall aging of the U.S. population and increasing participation in sports by women and girls have caused many retailers to refocus programs to reflect these new demographics.

One additional trend of significance reported in the mid-1990s involved the development of “outlet malls,” which offered huge selections of brand name products at lower prices. According to the International Council of Shopping Centers, outlet malls brought in \$12.2 billion in 1997 sales. Footwear companies such as Birkenstock, Rockport, Easy Spirit, Florsheim, Naturalizer, Nike, and Reebok opened stores in outlet malls in the late 1990s. Some retailers carrying the regularly priced brands felt that outlet malls diminished the image of brands and took customers away from their stores who knew that the same shoe brands were available at a cheaper price at the outlet stores. Manufacturers countered by saying that outlet stores carried a different mix of styles than the full-price stores, usually past-season styles and colors or factory seconds.

The widespread popularity of athletic footwear helped shoe stores through the recession that impacted other retailing segments more seriously during the late 1980s and early 1990s. In 1995, SGMA measured the value of the U.S. athletic footwear market at almost \$11.4 billion and said it accounted for approximately 40 percent of all shoes purchased. Additionally, this segment’s overseas market expanded rapidly through the first half of the 1990s. A weakened economy and the highly competitive nature of this industry, however, forced many stores to

close. Total sales in the athletic category were basically flat from 1992 through 1998. According to the 1998 *Sporting Goods Business Year-End Survey*, 19.1 percent of stores surveyed reported flat sales in athletic footwear.

Many stores attributed low sales growth to the “glut of inventory” carrying over from 1998 to 1999 and the fashion trends moving away from sneakers and sweat-pants towards casual shoes and khakis. In 1999, *Sporting Goods Business* reported Faye Landes, footwear analyst with Salomon Smith Barney, as saying that an industry-wide slowdown could be expected throughout 1999, as companies consolidated their business and closed stores. John Shanley of Van Kasper and Company estimated that there was “20-25 percent too much store space dedicated to athletic footwear in malls” across the United States. Second quarter results for 1999 did reflect a 10 percent decline in athletic footwear sales. “Results for the first six months reflect what we expected going into the year, an unsettled and difficult market,” said Gregg Hartley, executive director of the Athletic Footwear Association.

CURRENT CONDITIONS

In line with other apparel and accessory sectors, during the 1990s and into the 2000s, dominance in the footwear market has made a fundamental shift away from department and mall-based specialty stores to favor large discount chains. General discounters, such as Wal-Mart and Target, as well as shoe discounters, including Payless Shoe Source, Famous Footwear, and Shoe Carnival, have taken center stage in the industry.

The next major struggle for market share on the horizon appears to be forming between vendor-owned stores and traditional retailers. Under previously normal business conditions, vendors developed shoe styles that were then sold at wholesale to retailer, who carry a range of selections from numerous vendors. During the 1990s vendors began opening outlet-based stores to sell off overstocks and discontinued items. By the 2000s numerous vendors had discovered that the outlet locations—relatively cheap real estate compared to a mall-based store—were generating significant traffic and providing impressive sell-through figures. As a result, vendors began opening additional stores that provided a full selection of first runs and new trends, thus directly competing with their wholesale customers, the local retailers.

Vendors argue that retailers too often demand price breaks and mark downs on their orders and often only buy a small segment of the vendor’s shoe line to display on the independent, chain, or department retail shelves. Vendor-owned retail settings give the company a chance to set out its entire product line in one place, which allows it to test trends and new products before selling to retail customers. The vendor can then attest to a shoe style’s popularity and sell-through value so the retailer knows

the shoe is a good choice for the store's product line. At the same time, retailers, who must compete with the new spread of vendor outlets, do not tend to agree with the vendors' belief that "what's good for us is good for you." However, despite retail disapproval, vendors including Aerosoles, Rockport, and Johnson & Murphy have plans for continued retail expansion.

Overall, the shoe store sector will ride out the sluggish economy as well as possible by cutting back on inventory, reducing product lines as well as color and size selection. They will also focus on increasing sales to the teen and young adult markets, which tend to spend a larger portion of their income on apparel and shoes and tend to be less economically and emotionally affected by a recessive economy or wartime conservative spending.

INDUSTRY LEADERS

Payless ShoeSource. Payless ShoeSource, the country's number one shoe retailer, began as a private subsidiary of the May Department Stores Company in 1956. Its stores are characterized as off-price discount outlets because they use the self-service concept to offer low prices. Payless was one of the fastest growing shoe chains in the United States during the mid-1990s, increasing 55 percent in sales, 27 percent in stores, and 33 percent in employees between 1992 and 1996. In 1997, Payless ShoeSource Inc. acquired Parade of Shoes in a deal with J. Baker, Inc. In 1998, Payless employed more than 24,000 workers and had 4,549 stores in the United States and Puerto Rico. These stores were leased to franchise owners for a period of 10 to 15 years with renewal options. In 2002 Payless reported a net income of \$105.8 million on \$2.9 billion in sales and employed 28,400 at its 4,970 stores.

Footstar. Through its Meldisco division, Footstar, formerly a division of the Melville Corp., operates leased footwear departments in approximately 5,800 discount stores, including Kmart. The company sells private label as well as licensed brands that include Everlast, Route 66, and Thom McAn. Footstar's athletic division includes 500 Footaction stores and 90 Just for Feet stores. In 2003 the company struck a deal with Wal-Mart to provide the mega-discounter with its Thom McAn line of footwear. Sales for 2001 totaled \$2.5 billion.

Major changes took place in 1996 and 1997 at the Melville Corp., which started with a small string of shoe stores in the 1890s and within a century became one of the largest retailing conglomerates in the United States. This company created one of its most recognized subsidiaries, Thom McAn Shoes, in 1922 when it developed a method to mass produce shoes and sell them at low prices through chain stores. The Thom McAn chain grew to more than 300 stores within five years and, despite a setback during the Great Depression, increased to more

than 650 stores by the end of the 1930s. Sales of Thom McAn shoes continued to climb, and in 1955 Melville owned 12 factories and 850 stores. By the end of the 1960s, Melville was America's largest shoe retailer, operating 1,400 stores.

Melville moved into other retail markets during the 1970s by purchasing drug stores, household furnishing outlets, and toy store chains. Diversification shifted the company's emphasis from shoes, and during the 1980s it closed more than one-third of its Thom McAn outlets. In 1990, Melville operated more than 7,700 stores and employed 119,000 people. Two years later, Melville's three shoe subsidiaries—Meldisco, Thom McAn, and the Footaction USA athletic chain—tallied more than \$2.1 billion in sales.

Footaction had become the nation's third largest athletic shoe retailer by the fall of 1996—with 438 stores and about \$500 million in sales—when Melville spun it off as part of a footwear subsidiary called Footstar Inc. The parent company also converted some 85 of its Tom McAn stores to Footaction stores and closed the rest. Melville then changed its name to CVS Corp. to reflect a new emphasis on the drugstore business it had first entered in 1969, sold off Footstar, and exited the footwear business.

The Brown Shoe Company. The Brown Shoe Company owns three chains: Famous Footwear, the largest branded family shoe chain in the United States with more than 900 stores in 44 states; Naturalizer stores, of which more than 440 operated in North America; and F.X. LaSalle, with more than a dozen Canadian locations. In addition to its own brands, including Naturalizer and Buster Brown, Brown also sold licensed brands like Barbie, Lion King, and Dr. Scholl's. In 1995 the company acquired the upscale Larry Stuart Collection and Le Coq Sportif athletic shoes and began selling off several non-shoe operations. For the fiscal year ending January 2003, the company reported \$45.2 million in income on \$1.8 billion in sales and employed 11,500.

WORKFORCE

Sales and marketing personnel comprise the bulk of the retail shoe industry's workforce. According to the Department of Labor, Bureau of Labor Statistics, in 2001 about 86 percent of the industry's 187,080 jobs were sales related. On average a shoe sales associate earned a mean annual salary of \$16,260. Supervisors earned \$29,530. Management occupations, which accounted for just over 3 percent of the workforce, reported a mean annual salary of \$59,610. Office and administrative support occupations, totaling 7 percent of the workforce, reported a mean annual salary of \$21,140.

The job outlook for retail sales and marketing staff is expected to improve faster than the average for all work-

ers through 2005. Part-time positions in this industry have often been available due to a high turnover rate, and sales staff is often hired on a temporary basis during peak selling periods, such as Christmas and tourist seasons. Other occupations in this industry include bookkeepers, accountants, and secretarial and clerical staff.

AMERICA AND THE WORLD

American shoe retailers have performed well in overseas markets and are expected to continue to grow internationally through the remainder of the twentieth century. Mass manufacturing techniques have largely been responsible for this success. American-owned athletic footwear stores also gained a strong advantage outside the United States because of the popularity of American sports celebrities and the athletic goods they endorsed.

The SGMA "1999 State of the Industry Report," reported that "China, Asia, and Mexico will continue as preferred sourcing locations by companies planning expansion. Export sales will continue to grow, but U.S. manufacturers can no longer expect the international market to counter the sluggish growth in the United States." The SGMA expected that while the Asian economic crisis may be over, the economies in these regions will need time to improve. Due to high unemployment in Western Europe (about 11 percent) and tax policies, consumers in European markets will have less disposable income to spend on imported U.S. goods. According to the SGMA, the "European trade pact and unified currency (Euro) will help contribute to an environment more conducive to growth for U.S. manufacturers."

RESEARCH AND TECHNOLOGY

Because they simplify many routine ordering procedures and improve sales staff efficiency, establishments in this industry have continued to increase the reliance on computers. Product counts and point-of-sale data, which includes price, model number, color, and size imprinted on an item's bar code, are regularly gathered electronically to provide managers with current inventory and sales information. For sales staff, point-of-sales systems have proven useful in calculating discounts, approving credit, and scheduling deliveries.

Industry trade journal *Footwear News* declared in 1995 that all shoe stores, no matter how small, must computerize in order to stay competitive. It also reported on special software that allows footwear retailers to order directly from many major manufacturers and wholesalers, often at a discount.

According to a study conducted by Ernst & Young, the number of retailers on-line, selling products to consumers, grew from 12 percent in 1997 to 39 percent in 1998. The interactive capabilities of the Internet allow

retailers to customize messages and services. In 1999, the Venator Group announced a partnership with Excite, "a global media company which provides its Foot Locker brands a presence on Excite shopping, sports and lifestyle channels, as well as search and banner integration." The effect of Internet shopping for footwear on the traditional "bricks and mortar" stores will be seen as retailing moves into the next century.

SIC 5699**MISCELLANEOUS APPAREL AND ACCESSORY STORES**

This industry consists of establishments primarily engaged in the retail sale of specialized apparel and accessories, such as bathing suits, belts, raincoats, riding and other sports apparel, T-shirts, umbrellas, uniforms, and wigs and toupees. This industry also includes men's and women's custom tailors.

NAICS CODE(S)

315000 (Included in Apparel Manufacturing Subsector Based on Type of Garment Produced)

448190 (Other Clothing Stores)

448150 (Clothing Accessories Stores)

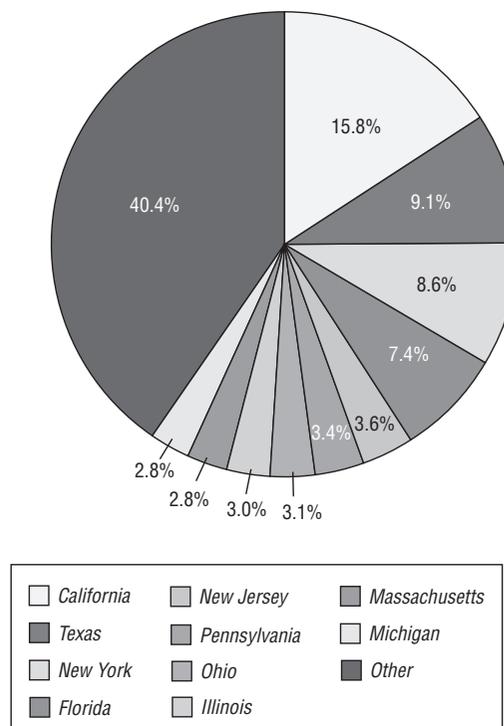

A few of the items that are categorized within this industry are uniforms and work clothing, costumes and wigs, sports apparel, customized clothing and apparel, custom tailoring, including custom shirts, designer apparel, formal wear, leather garments, square dance apparel, costumes, masquerade or theatrical, marine apparel, and military goods and regalia. The sector that includes miscellaneous apparel and accessory stores represents the majority of retail stores, as well as market share. That was followed by sports apparel, which represented more than 15 percent of the market.

In 2001, the U.S. Census Bureau reported 5,860 establishments engaged in the retail sale of specialized apparel and accessories. The industry employed approximately 28,860 people. The industry shared more than \$10 million for 2003. The majority of establishments were small—employing less than five people. In 2001, 1,850 companies had less than five employees. States with the highest number of establishments were California, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas.

In 1998, the four industry leaders brought in more than 90 percent of the industry's total sales of \$275 million. The industry leader, Lost Arrow, Inc., had \$170 million in annual sales in 1998 and employed 900 people at its retail chain stores. Life Uniforms and Shoe Shops Corp. of Missouri, the second largest company, took in an estimated \$76 million in sales in 1998 and employed more than 1,300 people. Other industry leaders included Crazy Shirts Inc., with \$25 million; Retail Star, with \$12 million in sales; and Norcostco Inc., also with \$12 million. The remainder averaged less than \$5 million in annual sales. Cintas Uniforms of Cincinnati, Ohio, was the largest supplier of uniforms within the United States. Cintas posted annual sales of \$2.7 million for 2003.

States with the Most Miscellaneous Apparel and Accessory Stores

By percent of total number of stores

SOURCE: D & B Sales & Marketing Solutions, 2003

Despite gains made in the late 1990s, the industry was cautious and mindful of a possible economic downturn in the future. Various apparel and accessory stores began focusing on cash rich teens as a primary market. Though discount stores and home shopping were direct competitors, smaller establishments lured back customers by repositioning themselves in the marketplace. A greater threat was the Internet, which emerged in the late 1990s as a potent retail force. Many companies chose to fight fire with fire by establishing a presence on the World Wide Web, such as Crazyshirts.com and Sheplers.com.

The structure and organization of stores in the industry is similar to that of the retail apparel and shoe business. Establishments are either chain stores or individually owned.

Large companies own distribution centers, where merchandise is sent by manufacturers, held for a short time, then shipped to outlets or stores. Manufacturers' sales representatives and the retailers' merchandise buyers link the manufacturer and retailer. Small retailers generally do not own distribution centers. They tend to purchase inventory from distributors representing several

manufacturers, including items solicited through distributor catalogs.

Unlike other stores in the fashion industry, establishments dealing in miscellaneous apparel and accessories traditionally have relied on catalogs and the Web, and less on television and magazines for advertising and customer sales. The specialty nature of the business gave the stores smaller share of the apparel market.

SIC 5712

FURNITURE STORES

This classification covers establishments primarily engaged in the retail sale of household furniture, including beds and springs, cabinet work, juvenile furniture, mattresses, and outdoor furniture. These stores also may sell home furnishings, major appliances, and floor coverings.

NAICS CODE(S)

- 337122 (Nonupholstered Wood Household Furniture Manufacturing)
- 337110 (Wood Kitchen Cabinet and Counter Top Manufacturing)
- 337121 (Upholstered Wood Household Furniture Manufacturing)
- 442110 (Furniture Stores)

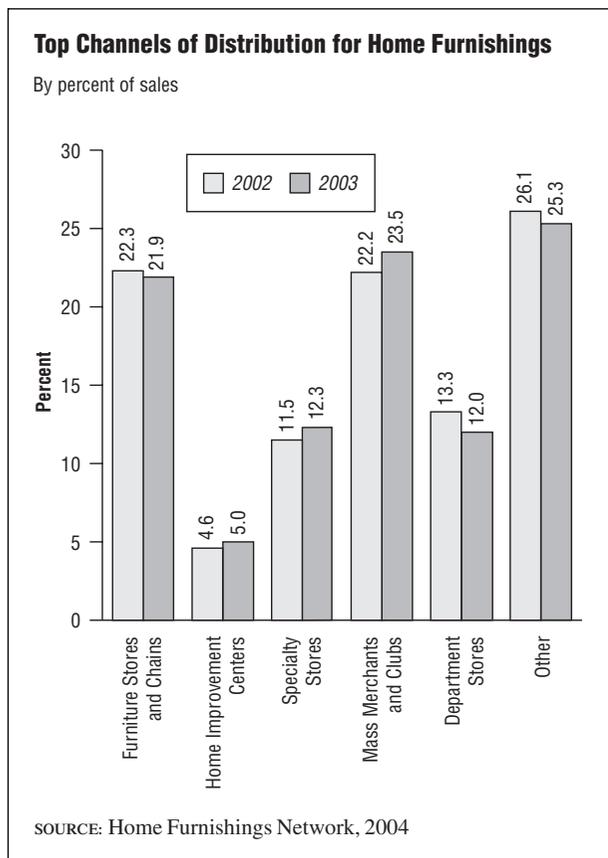

The U.S. Census Bureau reported 29,920 establishments engaged in the retail sale of household furniture, including beds and springs, cabinet work, juvenile furniture, mattresses, and outdoor furniture in 2001. The industry employed about 278,231 people and generated an annual payroll of \$7.5 billion. The total number of establishments grew to 55,553 in 2003, with the number of employees increasing to 334,448. Consumers spent roughly \$48.7 billion within this industry. On the average, consumers spent \$1.1 million per retail store. States with the majority of furniture stores were California with 7,296, Florida with 4,375, Texas with 4,327, New York with 3,133, North Carolina with 2,194, Georgia with 2,049, Illinois with 2,039, Ohio with 1,748, and New Jersey with 1,638.

The furniture store sector dominated the industry with 39,635 establishments. Combined, they generated sales of \$37.9 billion and controlled more than 71 percent of the market. Office furniture followed with 2,623 establishments that shared \$3.3 billion in sales. Mattresses numbered 2,518 stores, beds and accessories accounted for 2,162, and outdoor and garden furniture represented 1,034.

The industry is made up of both large national chains, regional stores, and small independent operations. According to data from the U.S. Bureau of the Census, consumers spent \$55 billion on furniture and other home furnishings in 1997. But throughout the 1990s the fastest growing segment of the retail furniture trade was through new retailers. These new retailers, which sell household and office furniture, mattresses, and related consumer products, included large discount superstores such as Wal-Mart and Target, warehouse stores like Price Club and Office Depot, and one-stop department stores such as Sears & Roebuck and J.C. Penney. Catalog furniture sales also increased. This new competition made the marketplace a much more difficult one for traditional furniture stores.

Entering the 1990s, the retail furniture industry, like many other retail industries, slumped in the face of a general economic recession. Furniture purchases are considered major, discretionary purchases that can be deferred when tough economic times hit. In 1988, the percentage of disposable income spent for household furniture was about 4.6 percent, but by 1991 this figure had dipped to about 3.9 percent. Moreover, retail sales of furniture are historically predicated on new housing construction, which slumped in the late 1980s, a dry period that lasted until 1992-93. But as the recession of the early 1990s had dragged down sales of household furniture and bedding, the economic resurgence of the middle and late 1990s brought a noticeable uptick in these sales.

Furniture typically used to house electronic components, known as ready-to-assemble (RTA) furniture, was one of the fastest growing consumer product categories during the 1990s, according to the Electronic Industries Association. Designed to hold audio, video, and home office products, this type of furniture is shipped unassembled to the store and then is either assembled by the store or the ultimate consumer. Products include home entertainment centers, television and VCR stands, home office furniture, and furniture designed to hold computers and related equipment. Due to the minimal labor in manufacturing, ease in shipping and inventory stocking, and perceived value versus price, the majority of sales of RTA furniture are made through mass merchandisers, specialty stores, and warehouse clubs. However, due to strong demand, many leading furniture stores have begun to sell RTA furniture. RTA furniture sales are expected to continue to grow to more than \$1.3 billion annually.

The top ten retailers of furniture and bedding in 1997 were roughly split between stores in the traditional category and those from the department/discount store segment, according to a 1999 report that appeared in *Furniture Today Retail Planning Guide, 1999*. Topping the list with sales of roughly \$1.7 billion was Heilig-Meyers, a traditional furniture retailer, followed by Levitz, which placed second with 1997 sales of \$839 million. Making up the rest of the top 10 were Office Depot (\$779 million), J.C. Penney (\$747 million), Federated Department Stores (\$743 million), Sears (\$737 million), Ethan Allen (\$736 million), Wal-Mart (\$673 million), Rooms To Go (\$550 million), and Montgomery Ward (\$547 million).

While the economic recession of the early 1990s dealt a blow to the retail furniture industry, primarily due to the bleak performance of the housing industry, increased demand was seen throughout most of the rest of the decade. New housing construction experienced a significant uptrend during the middle and late 1990s, a development that provided a shot in the arm for the retail furniture industry. In 1997, the number of establishments in the industry was put at roughly 48,000, and sales totaled roughly \$55.2 billion. As of March 1997, employment in the industry stood at about 386,600 workers.

The former leaders in furniture retailing remain the top performers, all except Montgomery Ward, who went

bankrupt after being in business for 128 years, in 2000. A survey conducted by *Furniture Today* magazine reported that Wal-Mart was the number one performer in furniture sales for 2002. The survey further concluded that the last time a “non-conventional furniture store” sold more furniture than any other retailer occurred 10 years ago. Wal-Mart posted furniture and bedding sales of \$1.24 billion. That figure was up 14 percent over 2001.

Additional retail furniture leaders, according to Dow Jones, were La-Z-Boy Inc., which included La-Z-Boy Furniture Galleries; Berkshire Hathaway’s furniture division; Sam’s Club; and Costco Wholesale Corp. “Non-conventional” furniture stores accounted for almost half of the top 25 in 2002.

In 2003, according to the Home Furnishings Network, the “channels of distribution” for furniture retailers stood at furniture stores and chains with 21.9 percent, home improvement centers with five percent, specialty stores with 12.3 percent, mass merchants and clubs with 23.5 percent, department stores with 12 percent, and other segments with 25.3 percent combined.

The Business and Institutional Furniture Manufacturer’s Association (BIFMA), in conjunction with Global Insight reported a 8.3 percent decrease in retail sales of office furniture. The slow growth was due to the sluggish economy, and also the lack of office construction. However, the projected sales forecast for 2004 was expected to reach \$9.2 billion over \$8.14 billion in 2003.

Today’s furniture industry faces a more complex and dynamic distribution system than ever before. Traditional retail furniture stores continue to lose ground to their competitors among department stores and the large discount chains. According to the *Furniture Today Retail Planning Guide, 1999*, the four traditional furniture stores—Heilig-Meyers, Levitz, Ethan Allen, and Rooms To Go—among the top 10 retailers accounted for slightly less than 50 percent of the total sales of the top 10.

Another competitive force at work in the retail furniture marketplace is the increasing number of consumers purchasing furniture and office equipment at nontraditional sites such as warehouse clubs, discount superstores, department stores, galleries, and from catalogs. Large furniture retailers, such as Levitz, and smaller furniture retailers compete with department stores, warehouse clubs, and discount superstores. Smaller retail outlets have found the resultant discount prices necessary to compete in the marketplace especially difficult to maintain.

SIC 5713

FLOOR COVERING STORES

This classification primarily includes retail sellers of floor coverings. Although companies in this industry group may also incidentally install floor coverings, contractors who primarily install floor coverings for others are in **SIC 1752: Floor Laying and Other Floor Work, Not Elsewhere Classified**.

NAICS CODE(S)

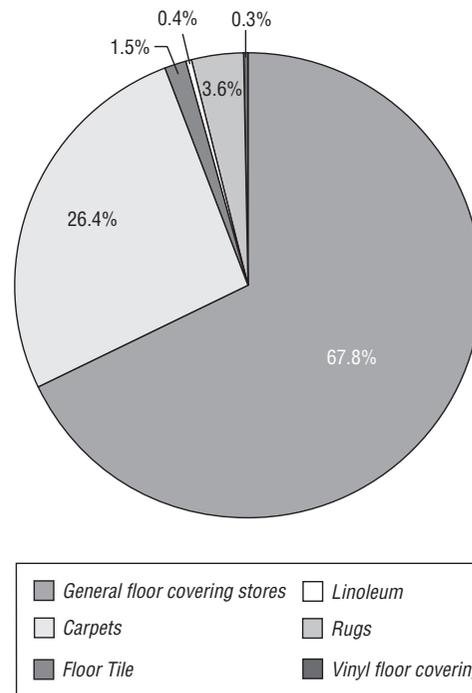

442210 (Floor Covering Stores)

The retail floor covering industry includes sellers of rugs and carpets, linoleum, asphalt tile, and ceramic tile. Floor covering retailers include specialty stores, department stores, home improvement stores, and mass merchandisers. The total number of retail floor covering stores was 30,593 in 2003, with combined sales of \$17.3 billion. The employee number climbed to 128,163, and the average retail store employed four people. States with the majority of establishments were California with 3,459 and sales of \$2.2 billion. Florida had 2,467 establishments and generated \$1.2 billion in sales. Texas numbered 2,091 establishments with shared sales of \$1.1 billion.

Floor covering was the largest segment with 20,733 retail stores, comprising more than 67 percent of the market. Carpet sellers numbered 8,088 and represented more than 26 percent of the market. Retailers of rugs accounted for 1,093 stores. Floor tile numbered 467, linoleum had 117, and vinyl floor covering accounted for 95 stores.

Top Types of Floor Covering Stores by Specialty

By percent of total industry sales

SOURCE: D & B Sales & Marketing Solutions, 2003

According to U.S. government statistics, there were just over 16,600 establishments engaged in this business in 1997, compared with 13,640 in 1992. Sales in 1997 totaled nearly \$16.5 billion, compared with \$9.6 billion in 1992. As of 1997, the industry employed 96,186 workers with a total annual payroll of \$2.46 billion.

Reflecting the buoyancy of the U.S. economy during the mid-1990s, sales at the nation’s floor covering stores surged nearly 72 percent in the five years from 1992 to 1997. This strength in sales allowed retailers to increase the number of establishments engaged in this trade from 13,640 in 1992 to 16,603 in 1997, a gain of nearly 22 percent. Employment in the industry also surged ahead of past totals during this five-year period, rising 40 percent from 1992 to 1997. Even more dramatic was the increase in the size of the industry’s annual payroll, which climbed nearly 90 percent between 1992 and 1997.

At the beginning of the 1990s, the industry was struggling to shake off the effects of an economic recession, which had significantly dampened demand. A sales decline in 1991 was followed by a modest recovery in 1992. The recession hit the floor covering industry particularly hard for a variety of reasons. Among the factors affecting the sector during the slowdown was a sharp decline in residential construction, low consumer confi-

dence, and consumer cutbacks on big-ticket home improvement expenditures. Home remodeling and new home purchases are typically the most important events spurring floor covering sales. Carpeting, in particular, is sensitive to economic fluctuations and is closely tied to the sales' rate for existing homes: most carpet sales occur in the replacement market, rather than the new home market.

In addition, as *Industry Surveys* noted, "the consolidation of the department store industry in the 1980s and the high interest charges that arose from this event forced these retailers to become more cost-conscious. As a result, they pared buying staffs and employed fewer suppliers. They also focused on carrying leaner inventories, historically their largest expense." These business conditions, coupled with competition from mass merchandisers such as Wal-Mart, J.C. Penney, and K-Mart in floor covering retail, combined to pinch floor covering retailers. The improved economy of the middle and later 1990s provided floor covering retailers with much higher sales.

Major players in the floor covering retail business in 1997 were Carpet One, which reported sales of \$2 billion; Home Depot, with floor covering sales of \$1.3 billion; Maxim Group, which posted sales of \$1.2 billion in this sector; Abbey Carpet with \$700 million; Shaw Industries with \$600 million; Sears with \$365 million; Lowe's with \$300 million; Sherwin-Williams with \$200 million; Hechinger/Builders Square with \$150 million; and Federated with \$125 million.

Mohawk Industries, Inc., posted sales of \$5 billion in 2003. Shaw Industries' revenues were \$4.7 billion; Beaulieu of America, LLC, generated \$1.1 billion in sales; and Interface, Inc. sales were \$923.5 million.
